How to use the MICROPAEDIA

The 12 volumes of the MICROPAEDIA contain tens of thousands of shorter articles on specific persons, places, things, and ideas, arranged in alphabetical order. The MICROPAEDIA can be used as an information resource on its own; and it can function as support for the longer articles in the MACROPAEDIA (to which it refers whenever appropriate). The MICROPAEDIA in turn is supported by references in the INDEX and by the lists of suggested readings in the PROPAEDIA. Finally, the MICROPAEDIA is the portion of the *Encyclopædia Britannica* best suited for the reader who wishes to browse among the countless subjects in all fields of human learning and history in all times and places.

Alphabetization

Entry titles are alphabetized according to the English alphabet, A to Z. All diacritical marks (such as in ò, ì, or ñ) and foreign letters without parallels in English (such as ayin ['] and hamza [']) are ignored in the alphabetization. Apostrophes likewise are ignored. Titles beginning with numbers, such as **1812**, **War of**, are alphabetized as if the numbers were written out (**Eighteen-twelve**, **War of**).

Alphabetization proceeds according to the "word-by-word" principle. Thus, **Mount Vernon** precedes **mountain**; any **John** entry precedes **John Henry**, which in turn precedes **Johne's disease**. Any character or string of characters preceding a space, hyphen, or dash is treated as a word and alphabetized accordingly. Thus, **De Broglie** precedes **debenture**, and **jack-o'-lantern** precedes **jackal**. Titles with identical spellings are arranged in the following order: (1) persons, (2) places, (3) things.

For many rulers and titled nobility, chronological order, as well as alphabetical order, governs placement. Rulers of the same given name (e.g., **William**) may be grouped together, separate from other entries, and indicated by the symbol •. They may be subgrouped alphabetically by country and, within each country, arranged chronologically (**William I**, **William II**, etc.). Nobility or peers of the same titled name (e.g., **Essex**, **EARLS OF**) are similarly grouped together, separate from other entries; they are indicated by the symbol • and arranged chronologically.

Places with identical names are arranged in the alphabetical order of the countries where they are located. Identical place-names in the same country are alphabetized according to the alphabetical order of the state, province, or other political subdivision where they are found.

Entry arrangement

The titles of entries are arranged according to the forms commonly found in indexes and dictionaries, with some special conventions.

Entry titles for certain physical features, institutions, structures, events, and concepts are ordinarily inverted to place the substantive word first. Thus, the Bay of Bengal is entered as **Bengal, Bay of**; the Bank of England as **England, Bank of**; the Tower of London as **London, Tower of**; the Siege of Vienna as **Vienna, Siege of**; and the balance of power as **power, balance of**. If the name of a physical feature, institution, structure, event, or concept has two or more descriptors, it is entered under the descriptor appearing first. Thus, the Episcopal Church in Scotland is entered as **Episcopal Church in Scotland** (not **Scotland, Episcopal Church in**); the Leaning Tower of Pisa as **Leaning Tower of Pisa**; and the kinetic theory of gases as **kinetic theory of gases**.

The entries for most Western persons are arranged so that one can read a name in correct order by beginning after the first comma, proceeding to the end of the boldface type, returning to the beginning word or words, and proceeding forward to the first comma. Thus, the entry **March, Patrick Dunbar, 2nd Earl of**, is read "Patrick Dunbar, 2nd Earl of March"; the entry **Orléans, Louis, duc d'**, is read "Louis, duc d'Orléans." Names of Far Eastern origin are given in Oriental order, with the surname preceding the personal name (e.g., **Tōjō Hideki**, **Deng Xiaoping**, **Nguyen Cao Ky**).

Cross-references

Some cross-reference entries appear in the MICROPAEDIA for the purpose of leading a reader from names that are familiar to alternate names that may not be. Cross-references also appear frequently within or at the ends of standard entries, where they are identified by *see*, *see also*, *see under*, *q.v.* (*quod vide*, "which see"), or *qq.v.* (*quae vide*, "which see," plural).

Certain entries serve both as relatively brief essays on general subjects and as cross-references to the same subjects treated at greater length and in greater depth in the MACROPAEDIA. Such an entry (e.g., **igneous rock**) begins with a definition of the subject and then provides the following cross-reference: "A brief treatment of igneous rocks follows. For full treatment, *see* MACROPAEDIA: Minerals and Rocks.

Entries on certain broad subjects (e.g., **music**) direct the reader to several relevant articles in the MACROPAEDIA and also to the PROPAEDIA for listings of related articles in the MICROPAEDIA.

Abbreviations

Abbreviations used in the MICROPAEDIA are given in a list that appears at the end of every MICROPAEDIA volume.

Territorial boundaries

In articles and maps indicating disputed geopolitical boundaries and territories, the attribution of sovereignty or administrative subordination to any specific area does not imply recognition of the status claimed by an administering power.

Bayeu, Francisco, in full FRANCISCO BAYEU Y SUBÍAS (b. March 9, 1734, Zaragoza, Spain—d. Aug. 4, 1795, Madrid), painter, the brother-

"The Painter Francisco Bayeu," oil painting by Francisco de Goya; in the Prado Museum, Madrid
SCALA—Art Resource

in-law of Francisco de Goya and court painter to King Charles III of Spain. Considered by his contemporaries to be the finest Spanish painter of the period, he was greatly influenced by Anton Raphael Mengs and the Italian Giovanni Battista Tiepolo, both painters at the court of Charles.

After studying in Zaragoza under José Luzán Martínez and in Madrid under Antonio González Velázquez, Bayeu was called by Mengs to assist in the decoration of the royal palace in 1763. He created frescoes for the Cathedral of El Pilar in Zaragoza, the Toledo Cathedral, and the royal palaces in Madrid, El Pardo, La Granja, and Aranjuez. Bayeu's mature style was a mixture of French Rococo and the academic classicism of Mengs. Although his drawings, hundreds of which have been preserved, are beautifully animated, his finished frescoes have an academic stiffness. His brothers Ramon and Manuel were also painters.

Bayeux, town, Calvados *département*, Basse-Normandie *région*, northwestern France, on the Aure River, northwest of Caen. As Bajocasses it was a capital of the Gauls, then as

Nave of the Cathedral of Notre Dame, Bayeux, Fr.
Archivo Iconografico S.A./Corbis

Augustodurum and later as Civitas Baiocasium it was an important Roman city that became a bishopric in the 4th century. Captured in 880 by Rollo the Viking, it became a Norman stronghold. While Rouen was completely Gallicized, Bayeux remained Norse-speaking. During the quarrels between the sons of William I the Conqueror, Henry I of England pillaged the town in 1106. Bayeux was besieged and taken on several occasions during the Hundred Years' War and the 16th-century Wars of Religion. Occupied by the Germans in June 1940, it was the first town liberated by the Allies (June 7, 1944) and the first to receive General Charles de Gaulle (June 14) on his promised return to France.

A mix of modern and medieval, the town features half-timbered houses and cobbled streets. The Cathedral of Notre Dame, mainly 13th-century, has an 11th-century crypt. The Bishop's Palace (11th-14th centuries) now serves as the *hôtel de ville* (city hall). The renowned Bayeux Tapestry, depicting the Norman Conquest of England, is displayed there in the William the Conqueror Centre. Another major invasion, the Allied landing in World War II, is commemorated at the Battle of Normandy Memorial Museum.

Bayeux's economy revolves around dairy food processing, manufacturing, financial services, and tourism. Pop. (1999) 14,961.

Bayeux Tapestry, medieval embroidery depicting the Norman Conquest of England in 1066, remarkable as a work of art and important as a source for 11th-century history.

English axman in combat with Norman cavalry during the Battle of Hastings, detail from the Bayeux Tapestry of the 11th century, Bayeux, Fr.
Giraudeau—Art Resource

The tapestry is a band of linen 231 feet (70 m) long and 19.5 inches (49.5 cm) wide, now light brown with age, on which are embroidered, in worsteds of eight colours, more than 70 scenes representing the Norman Conquest. The story begins with a prelude to Harold's visit to Bosham on his way to Normandy (1064?) and ends with the flight of Harold's English forces from Hastings (October 1066); originally, the story may have been taken further, but the end of the strip has perished. Along the top and the bottom run decorative borders with figures of animals, scenes from the fables of Aesop and Phaedrus, scenes from husbandry and the chase, and occasionally scenes related to the main pictorial narrative. It has been restored more than once, and in some details the restorations are of doubtful authority.

When first referred to (1476), the tapestry was used once a year to decorate the nave of the cathedral in Bayeux, France. There it was "discovered" by the French antiquarian and scholar Bernard de Montfaucon, who published the earliest complete reproduction of it

in 1730. Having twice narrowly escaped destruction during the French Revolution, it was exhibited in Paris at Napoleon's wish in 1803-04 and thereafter was in civil custody at Bayeux, except in 1871 (during the Franco-German War) and from September 1939 to March 1945 (during World War II).

Montfaucon found at Bayeux a tradition, possibly not more than a century old, that assigned the tapestry to Matilda, wife of William I the Conqueror, but there is nothing else to connect the work with her. It may have been commissioned by William's half brother Odo, bishop of Bayeux, who is prominent in the later scenes. This conjecture would date the work not later than about 1092, an approximate time now generally accepted. The tapestry has affinities with other English works of the 11th century, and, though its origin in England is not proved, there is a circumstantial case for such an origin.

The tapestry is of greater interest as a work of art. It is also important evidence for the history of the Norman Conquest, especially for Harold's relation to William before 1066; its story of events seems straightforward and convincing, despite some obscurities. The decorative borders have value for the study of medieval fables. The tapestry's contribution to knowledge of everyday life about 1100 is of little importance, except for military equipment and tactics.

Bayezid, also spelled BAYAZĪD, name of Ottoman sultans grouped below chronologically and indicated by the symbol ●.

● **Bayezid I**, byname YILDIRIM (The Thunderbolt) (b. c. 1360—d. March 1403, Akşehir, Ottoman Empire), Ottoman sultan in 1389-1402 who founded the first centralized Ottoman state based on traditional Turkish and Muslim institutions and who stressed the need to extend Ottoman dominion in Anatolia.

In the early years of Bayezid's reign, Ottoman forces conducted campaigns that succeeded in controlling vast Balkan territories. Later, Venetian advances in Greece, Albania, and Byzantium and the extension of Hungarian influence in Walachia and Danubian Bulgaria compelled Bayezid to blockade Constantinople (1391-98), to occupy Tirnova, in what is now Bulgaria (July 1393), and to conquer Salonika (April 1394). His invasion of Hungary in 1395 resulted in a Hungarian-Venetian crusade against the Ottomans. Bayezid inflicted a crushing defeat on the crusaders at Nicopolis (Sept. 25, 1396).

To build a strong Islāmic and Turkish base for his domain, Bayezid began to widen Ottoman suzerainty over the Turkish-Muslim rulers in Anatolia. He annexed various Turkmen emirates in Anatolia and defeated the Karaman emirate at Akçay (1397). These conquests brought Bayezid into conflict with the Central Asian conqueror Timur (Tamerlane), who claimed suzerainty over the Anatolian Turkmen rulers and offered refuge to those expelled by Bayezid. In a confrontation between Bayezid and Timur in Çubukovaş near Ankara (July 1402), Bayezid was defeated; he died in captivity.

• **Bayezid II**, byname BAYEZID THE JUST, Turkish BAYEZİD ADLİ (b. December 1447/January 1448?, Demotika, Thrace, Ottoman Empire—d. May 26, 1512, Demotika), Ottoman sultan (1481–1512) who consolidated Ottoman rule in the Balkans, Anatolia, and the eastern Mediterranean and successfully opposed the Şafavid dynasty of Persia.

Bayezid II was the elder son of the sultan Mehmed II, the conqueror of Constantinople. On the death of his father in 1481, his brother Cem contested the succession. Bayezid, supported by a strong faction of court officials at Constantinople, succeeded in taking the throne. Cem eventually sought refuge with the Knights of Saint John at Rhodes and remained a captive until his death in 1495.

Under the new reign an immediate reaction set in against some of the policies of Mehmed II. Influenced by the *'ulamā'*, interpreters of the law of Islām, and by the great officials aligned with them, Bayezid restored the Muslim properties dedicated to religious and charitable purposes that Sultan Mehmed had taken over for the state. Bayezid also rejected his father's marked pro-European orientation by such acts as removing from the imperial palace the paintings that Italian artists had executed for Mehmed II.

At the same time, Bayezid II continued the territorial consolidation that his father had begun. Hercegovina, in the Balkans, was brought under direct Ottoman control in 1483. The occupation, in 1484, of two fortresses on the estuaries of the Danube and the Dniester rivers strengthened the hold of the Ottomans over the land route to the Crimea, where

the khan of the Crimean Tatars had been, in name at least, a vassal of the sultan since 1475. The war of 1499–1503 directed against the Venetian empire in the Levant and in the Balkans carried the process of consolidation still further. It resulted in the Ottoman conquest of Venetian strongholds in Morea (Peloponnesus) and on the Adriatic shore—a triumph amply justifying the program of naval construction that Bayezid had approved in the years before the beginning of the war.

With the expansion of his rule over much of Anatolia, Bayezid had earlier come into conflict with the Mamlūk sultanate of Egypt and Syria, each side striving to dominate the ill-defined border zones dividing them and to maintain under effective control the small principalities established there. While a Turkish fleet had sufficed to dismantle a large part of Venice's empire, Bayezid, fearing that an alliance of Christian powers using his brother Cem might be formed against him, committed only a modest force against the Mamlūks. The long land war ended in a stalemate.

More formidable still was the situation that arose in the lands to the east of Anatolia. In 1499 the adherents of the Şafavids, a heretical order of Islām, had set out to establish in Persia a powerful regime under their master Ismā'īl. The religious teaching of the Şafavids had met with great success among the nomadic Turkmen tribes of Anatolia, whose warriors formed the main element in the armies of Shah Ismā'īl (or Esmā'īl). It was evident that the propaganda of the Şafavids, if allowed to continue without hindrance, might well undermine Ottoman rule within the Asian lands. The danger was underlined in 1511, when the adherents of the shah rose in rebellion against the Ottomans in Anatolia.

At this same time a dispute over the succession broke out between Bayezid's sons. One of them, Selim, the governor of Trebizond, went to the Crimea in 1511, secured aid there from the Tatar khan, and then crossed the Danube into the Balkans. Defeated in battle against Bayezid, Selim fled to the Crimea. Meanwhile, the Şafavid rebellion had been put down; and Ahmed, another son, who had shared in the victory, marched toward Constantinople. Failing to gain the support of the Janissaries (elite military guards), he turned back to bring most of Anatolia under his control. Bayezid, fearing that Ahmed might seek assistance from Shah Ismā'īl and unable to resist pressures from some of his advisers and from the corps of Janissaries, who favoured Selim, recalled Selim from the Crimea and abdicated (April 1512) in his favour. Bayezid died the following month.

Bayezid II was a pious Muslim, strict in his observance of the precepts of the Qur'an and the Islāmic law. During his reign, much of the state revenue was devoted to the building of mosques, colleges, hospitals, and bridges. He also supported jurists, scholars, and poets, both within and outside the Ottoman Empire. In temperament "molto melancolico, superstizioso e ostinato" ("very melancholic, superstitious, and stubborn"), in the words (1503) of the Venetian ambassador, Bayezid was interested in philosophical and cosmographical studies. (V.J.P.)

BIBLIOGRAPHY. Sidney Nettleton Fisher, *The Foreign Relations of Turkey, 1481–1512* (1948), is a most useful monograph based extensively on Venetian source materials. Dorothy M. Vaughan, *Europe and the Turk: A Pattern of Alliances, 1350–1700* (1954, reprinted 1976); and M.A. Cook (ed.), *A History of the Ottoman Empire to 1730* (1976), serve to illustrate the contemporary attitude of historical scholarship toward Bayezid II. The article "Bayezid II," in *The Encyclopaedia of Islam*, new ed. (1960), the standard work of reference for Orientalist scholars, includes a bibliography.

Bayinnaung, also called BRAGINOCO (fl. late 16th century), king of the Toungoo dynasty (reigned 1551–81) in Myanmar (Burma). He

unified his country and conquered the Shan States and Siam (now Thailand), making Myanmar the most powerful kingdom in mainland Southeast Asia.

In 1550 a revolt broke out among the Mons of southern Myanmar, and Bayinnaung's brother-in-law, Tabinshwehti, was assassinated at Pegu in 1551 by a Mon prince. Bayinnaung marched to Toungoo, eliminated a pretender to the throne, and proclaimed himself king; then he marched south, captured the city of Pegu, and executed the rebel leader, Smim Htaw. The other Mon rulers then surrendered, and the revolt was at an end. Bayinnaung made Pegu his capital, as Tabinshwehti had.

In 1554 Bayinnaung set out against Shan chiefs, who occupied the ancient Myanmar capital of Ava. He captured it the following year. The Shans were placed under Myanmar suzerainty, and Bayinnaung was consequently in a position to attack his most powerful enemy, Siam.

In 1563 Bayinnaung took as a pretext for war the refusal of the Siamese to acknowledge his suzerainty. The following year he captured the Siamese capital of Ayutthaya and brought the Siamese royal family to Myanmar as hostages. In 1568, when a revolt flared up, Bayinnaung again invaded Siam. Because the Siamese put up fierce resistance, Ayutthaya was not captured until August 1569. The Myanmar king installed a new vassal on the throne and deported thousands of Siamese into Myanmar as slaves. The Myanmar dominated Siam for more than 15 years; they were expelled by a liberation movement led by a Siamese prince, Naresuan (reigned 1590–1605).

Bayinnaung was a patron of Buddhism; he built pagodas, gave generous donations to monasteries, and maintained extensive diplomatic relations with the Buddhist kingdom of Ceylon. When Pegu was burned in a Mon revolt in 1564, he rebuilt it on an even grander scale, making one of the richest cities in Southeast Asia.

Baykalskoye Ozero (Siberia): *see* Baikal, Lake.

Bayle, Pierre (b. Nov. 18, 1647, Carla-le-Comte, Fr.—d. Dec. 28, 1706, Rotterdam, Neth.), philosopher whose *Dictionnaire historique et critique* (1697; "Historical and Critical Dictionary") was roundly condemned by the French Reformed Church of Rotterdam and by the French Roman Catholic church because of its numerous annotations deliberately designed to destroy orthodox Christian beliefs.

Bayle was the son of a Calvinist minister and briefly embraced Roman Catholicism in 1669. He acted as tutor, then taught philosophy (1675–81) at the Protestant Academy of Sedan. After moving to Rotterdam in 1681 to teach philosophy and history, he published (1682) his anonymous reflections on the comet of 1680, deriding the superstition that comets presage catastrophe. He also questioned many Christian traditions, thus arousing the ire of a Calvinist colleague, Pierre Jurieu. Bayle's plea for religious toleration (even for atheists) eventually convinced Jurieu that Bayle was an atheist in disguise. The rift between the two was complete when Bayle advocated a conciliatory attitude toward the anti-Calvinist government of Louis XIV; in 1693 Bayle was deprived of his Rotterdam professorship.

Thereafter, Bayle devoted himself to his famous *Dictionnaire*, ostensibly a supplement to Louis Moreri's dictionary but in fact a work of considerable originality. In this encyclopaedic work the articles themselves—on religion, philosophy, and history—are little more than summary expositions. The bulk of the *Dictionnaire* consists of quotations, anecdotes, commentaries, and erudite annotations that cleverly undo whatever orthodoxy the articles contain. Vehement objections were voiced, particularly to the article "David," to

Bayezid II, miniature by an unknown Ottoman artist, c. 1580; in the Topkapı Sarayı Museum, Istanbul

By courtesy of the Topkapı Sarayı Museum, Istanbul

the bias in favour of Pyrrhonic (radical) skepticism, atheism, and epicureanism, and to the use of Scripture to introduce indecencies. This oblique method of subversive criticism was adopted by 18th-century encyclopaedists.

Bayle was convinced that philosophical reasoning led to universal skepticism, but that nature compelled man to accept blind faith, an extremely popular view in the early 18th century. Bayle's last years were troubled by allegations that he was conspiring with France to detach the Dutch from their Anglo-Austrian alliance. On his death, however, foe and friend alike lamented the passing of a great intellectual.

BIBLIOGRAPHY. Jean Delvolve, *Religion, critique, et philosophie positive chez Pierre Bayle* (1906); Howard Robinson, *Bayle the Skeptic* (1931).

Baylebridge, William, pseudonym of CHARLES WILLIAM BLOCKSIDE (b. Dec. 12, 1883, Brisbane, Queen., Australia—d. May 7, 1942, Sydney), poet and short-story writer considered one of the leading writers of Australia in his day.

The son of an auctioneer, he was educated in Brisbane, then at the age of 25 went to England, where he published his first booklet of verse, *Songs o' the South* (1908). He also travelled to France and Egypt. He returned to Australia in 1919 and published more than 20 books and booklets of verse in private, limited editions.

His work leans heavily on Elizabethan and German models. The best known volumes of his verse are *Love Redeemed* (1934) and *This Vital Flesh* (1939); some excellent short stories about World War I were collected in *Anzac Muster* (1921).

Baylis, Lilian Mary (b. May 9, 1874, London—d. Nov. 25, 1937, London), theatrical manager and founder of the Old Vic as a centre of Shakespearean productions.

Baylis received a musical education, appeared as a child prodigy in London, and went with

Lilian Baylis

By courtesy of the Mander and Mitchenson Theatre Collection, London

her parents, who were singers, to South Africa in 1890. She returned to England in 1898 to assist her aunt, Emma Cons, who had turned the Royal Victoria Theatre into a temperance hall under the name of the Royal Victoria Coffee Music Hall. Taking complete control in 1912, Lilian Baylis created the Old Vic, world famous as the home of Shakespearean production, and in 1931 took over the derelict Sadler's Wells Theatre and made it a centre of opera and ballet; its company became, in 1956, the Royal Ballet. Lilian Baylis was created a companion of honour in 1929.

Bayliss, Sir William Maddock (b. May 2, 1860, Wolverhampton, Staffordshire, Eng.—d. Aug. 27, 1924, London), British physiologist, co-discoverer (with the British physiologist Ernest Starling) of hormones; he conducted pioneer research in major areas of physiology, biochemistry, and physical chemistry.

Bayliss studied at University College, London, and Wadham College, Oxford. He began a long and profitable collaboration with

Starling soon after he obtained a teaching post at University College, London (1888), where he became professor of general physiology (1912–24). Their study in the 1890s of nerve-controlled contraction and dilation of blood vessels resulted in the development of an improved hemopiezometer (a device for measuring blood pressure). Observation of intestinal movements led to their discovery of the peristaltic wave, a rhythmic contraction that forces forward the contents of the intestine.

Bayliss and Starling are best known, however, for determining, in 1902, the chemical substance that stimulates the secretion of pancreatic digestive juices—the first example of hormonal action. In a famous experiment performed on anesthetized dogs, they showed that dilute hydrochloric acid, mixed with partially digested food, activates a chemical substance in the epithelial cells of the duodenum. They found that this activated substance, which they called secretin, released into the bloodstream, comes into contact with the pancreas, where it stimulates secretion of digestive juice into the intestine through the pancreatic duct. They coined the term hormone (Greek *horman*, “to set in motion”) to describe specific chemicals, such as secretin, that stimulate an organ at a distance from the chemical's site of origin.

Bayliss went on to demonstrate how the enzyme trypsin was formed from inactive trypsinogen in the small intestine and to measure precisely the time required for a trypsin solution to digest specific quantities of protein.

Bayliss's World War I investigation of wound shock led him to recommend gum-saline injections that were responsible for saving many lives. He wrote *The Nature of Enzyme Action* (1908) and *The Vaso-Motor System* (1923); his best known work is *Principles of General Physiology* (1915), considered to be the best text on the subject at that time. He was knighted in 1922.

Baylor, Elgin (b. Sept. 16, 1934, Washington, D.C.), U.S. professional basketball player (6 ft 5 in.) who is regarded as one of the game's greatest forwards.

Baylor was an All-American (1958) at Seattle University (1955–58). He signed with the National Basketball Association (NBA) Lakers (Minneapolis and, later, Los Angeles) in 1958 and played for them until his retirement in 1971. During his 14-year career he had a game point average of 27.4, with a 38.2 average in the 1961–62 season. His 71 points in a 1960 game was an NBA record until broken by Wilt Chamberlain's 100 (1962). Baylor was elected to the Basketball Hall of Fame in 1976.

Baynes, Thomas Spencer (b. March 24, 1823, Wellington, Somerset, Eng.—d. May 31, 1887, London), man of letters who was editor of the ninth edition of *Encyclopaedia Britannica* up to and including the 11th volume and who thereafter continued the work in partnership with William Robertson Smith. Bold and progressive in his planning of the edition, Baynes used his reputation as a scholar to persuade authors of “brilliance and character” to contribute. He himself wrote the *Britannica* article on Shakespeare.

bayonet, short, sharp-edged, sometimes pointed weapon, designed for attachment to the muzzle of a firearm and developed, according to tradition, in Bayonne, Fr., early in the 17th century. The Maréchal de Puysegur described the earliest bayonets as having a straight, double-edged blade a foot long with a tapering wooden handle, of equal length, that could be inserted into the muzzle of a musket. The new weapon, considerably shortened, spread through Europe and supplanted the pike.

The plug bayonet, as this first type was called, had some serious defects; once it was inserted into the muzzle, the gun could not be fired, and if driven in too tightly, it could not easily

be removed. Before 1689 a new bayonet was developed with loose rings on the haft to fit around the muzzle. This design was in turn superseded by the socket bayonet that the military engineer Sébastien Le Prestre de Vauban

Plug bayonet, 17th century

introduced into the French Army in 1688. Vauban's bayonet had a sleeve that slipped over the muzzle and was held in place by a stud on the barrel that locked in a right-angled slot in the socket. The blade was normally triangular in cross section. With minor alterations, Vauban's socket bayonet remained the basic form. In the 19th century some were equipped with saw teeth and could be used as engineering tools. Others were designed for use as entrenching tools.

The development of repeating firearms greatly reduced the combat value of the bayonet. Nevertheless, it was retained through World Wars I and II, though shortened into an all-purpose knife, equipped with a hand grip and carried in a scabbard when not affixed to a rifle.

Bayonne, town, Pyrénées-Atlantiques département, Aquitaine region, southwestern France, at the confluence of the Nive with the Adour River, 5 mi (8 km) from its mouth. With Biarritz, the noted Atlantic resort, it forms an urban concentration. As Lapurdum, it was the chief port of Roman Novempopulania, and the coastal zone is still called the Pays de Labourd. The present name is thought to be Basque in origin. Traditionally it was the Bayonne Basques who first used the bayonet. Grand Bayonne on the left bank of the Nive, behind fortifications designed by the 17th-century French military engineer Sébastien Le Prestre de Vauban, contains the Châteaueu Vieux and the Cathédral de Sainte-Marie (13th–16th century, with two 19th-century

Bayonne, Fr., and the Nive River with the Cathédral de Sainte-Marie

Club Ins

towers [210 ft; 64 m]). Across the river in Petit Bayonne are the Château Neuf, the arsenal, and the Musée Basque. Downstream, on the right bank of the Adour, are the port and industrial complexes of Le Boucau and Forges. Formerly busy with imports of English coal and Spanish ores, Bayonne languished until oil production was started at Parentis-en-Born and natural gas was discovered at Lacq in the 1950s. There are associated petrochemical industries, and sulfur and natural gas are extracted. It is still a port for tunny (tuna) fishermen. Pop. (1999) 40,113.

Bayonne, city, Hudson county, northeastern New Jersey, U.S., on a 3-mi (5-km) peninsula between Newark and Upper New York bays, adjacent to Jersey City and within the Port Authority of New York and New Jersey. Bayonne is connected with Staten Island (south) by a bridge over Kill Van Kull. Settled by Dutch traders in 1646, it was known as Konstable Hoeck (Constable Hook) until 1869, when it was consolidated with Bergen Point, Centerville, and Salterville and incorporated as Bayonne. Since 1875 it has been a centre for oil refining, and it is the northern terminus for several pipeline systems, including the Big Inch (1,476 mi long) from Longview, Texas. Manufactures include machinery, textiles, and chemicals. It has extensive docks and shipyards and a U.S. Army ocean terminal. Pop. (2000) 61,842.

bayram (Islām): see 'īd.

Bayreuth, city, Bavaria *Land* (state), east-central Germany, on the Roter (Rcd) Main River between the Fichtelgebirge (mountainous plateau) and the Franconian Jura, north-east of Nürnberg.

First mentioned in 1194, it developed around a castle of the counts of Andechs-Meran and occupied a strategic position at the intersection of several trade routes. After the house of Andechs-Meran died out, Bayreuth passed to the Hohenzollerns in 1248 and became an important centre of the Upper Franconia region. In 1603 the city became the residence of the margraves, who actively patronized the arts and were responsible for many fine Baroque buildings. The reign of the margrave Frederick and his wife, Wilhelmina, the sister of Frederick the Great, was a particularly rich period (1735–63). The New Palace, the old opera house, and parts of the Hermitage (Eremitage) date from that era. Bayreuth was ceded to Prussia in 1791 and passed to Bavaria in 1810.

The city is best known for its association with the composer Richard Wagner. He settled there in 1872, and the foundation stone of the Festival Theatre (Festspielhaus) was laid that same year. It opened in 1876 with the premiere performance of the *Ring of the Nibelungen* cycle. After Wagner's death in 1883, the festivals were carried on by his wife, Cosima, his son Siegfried, and, since 1951, his grandsons Wolfgang and Wieland. The composer's home, villa Wahnfried, has been preserved; the graves of the composer and his wife are in the garden. The composer Franz Liszt and the writer Jean Paul Friedrich Richter are also buried in Bayreuth. The annual music festivals, held in July and August, are a significant factor in Bayreuth's economy.

The University of Bayreuth opened in 1975, and the city is also the site of two education faculties of the University of Erlangen-Nürnberg. Manufactures include machinery, textiles, chemicals, pianos, porcelain, and glassware. Pop. (1998 est.) 76,661.

Bayrisches Meer (Germany): see Chiemsee.

Bayrūt, *muḥāfazah* (governorate), nearly coterminous with Beirut city (its administrative

centre), west central Lebanon, fronting the Mediterranean Sea to the west and north. It consists of part of the coastal plain at the foot of the Lebanon Mountains. It borders Jabal Lubnān *muḥāfazah* to the east and south. The governorate has an area of 26 sq mi (67 sq km) and grows citrus fruit, bananas, and vegetables. Its traditional role as the hub and cosmopolis of the Middle East was shattered by the Lebanese civil war. Major economic activities were centred on trade, banking, and tourism. In addition to Beirut city, Byblos (Jubayl) is a major town. Pop. (1996 est.) 407,403.

Bayrūt (Lebanon) see Beirut.

Baysān (Israel): see Bet She'an.

Bayt al-Muqaddas (Israel): see Jerusalem.

Bayt Lahm (Israeli-occupied Jordan): see Bethlehem.

Bayt Mirsham, Tall (Jordan): see Kiriath-sepher.

Baytown, city, Harris county, southeastern Texas, U.S., on Galveston Bay, 22 mi (35 km) east of Houston. The area was settled in 1822; in 1864 a Confederate shipyard was built at Goose Creek. The unincorporated community of Baytown was annexed by Pelly (incorporated 1920) in 1945; in 1948 Pelly and Goose Creek (incorporated 1919) were consolidated to form the present city of Baytown. Oil (discovered locally in 1916) is shipped from docks on the Houston Ship Channel at Baytown, which has oil refineries, petrochemical and synthetic-rubber plants, and steel-plate mills. Lee College (1934) is located in the city. Pop. (2000) 66,430.

Baza, city, Granada province, in the autonomous community (region) of Andalusia, southern Spain, at the foot of the Sierra de Baza, northeast of Granada city. The city contains the ruins of a Moorish fort (*alcazaba*), and the Gothic collegiate church of Santa María is on the site of the old Gothic cathedral. Called Basti by the Romans and Baṣṭah by the Moors, the city was an episcopal see before the Moorish conquest and later became one of the chief cities of the kingdom of Granada. Its capture by the forces of the Catholic monarchs Ferdinand and Isabella, in 1489, was a famous episode in the history of the Reconquista (reconquest). French Marshal Nicolas-Jean de Dieu Soult won a victory over Spanish forces nearby during the Peninsular War (Aug. 10, 1810). Manufactured products include cement, pottery, and esparto fibre. There are mineral springs in the vicinity. Pop. (1999 est.) 21,336.

bazaar, originally, a public market district of a Persian town. From Persia the term spread to Arabia (the Arabic word *sūq* is synony-

mous), Turkey, and North Africa. In India it came to be applied to a single shop; and in current English usage it is applied both to a single shop or concession selling miscellaneous articles and to a fair at which such miscellany is sold, often for charity.

The familiar bazaar of the ancient Islāmic nations is vividly described in the traditional folktales of *The Thousand and One Nights*. It is a distinct quarter of the town, access to which is forbidden after sundown, bustling and noisy by day, in contrast to the quiet residential quarters. Such a bazaar may be divided into districts, with all the purveyors of one type of merchandise grouped together. In smaller towns the bazaar consists of a single narrow street of stalls. In larger cities, such as Istanbul, it consists of many miles of such passageways. Some bazaars, such as those built at Kāshān and Isfahan (in Iran) in the 17th century, were designed with great architectural integrity. They were usually roofed for protection against the hot desert sun, either with a single roof, with individual vaulted cupolas or domes, or with awnings. Most ancient bazaars have gradually been modernized over the centuries.

Bazaine, Achille (-François) (b. Feb. 13, 1811, Versailles, Fr.—d. Sept. 28, 1888, Madrid), marshal of France who, after distinguished service during the Second Empire, was

Bazaine, detail from a lithograph by Jean-Baptiste-Adolphe Lafosse, 1869
By courtesy of the Bibliothèque Nationale, Paris

sentenced to death for his surrender of Metz and 140,000 men to the Germans on Oct. 27, 1870, during the Franco-German War.

Bazaine was commissioned second lieutenant in 1833. As a colonel he led a brigade in the Crimean War and in 1855 was promoted to major general and appointed governor of Sevastopol. In the Franco-Sardinian war against Austria, he captured Solferino (June 24, 1859). Sent to Mexico in 1863, he conquered Puebla in May of that year, became commander of

Bazaar in Marrakech, Mor.
Shostal Assoc.—EB Inc

the French expeditionary force, and was promoted to marshal on Sept. 5, 1864.

On Aug. 10, 1870, just after the first major battle of the Franco-German War, Bazaine was appointed commander in chief and took field command of the the Army of the Rhine, which comprised the left wing of the French army. He began to move half-heartedly toward Verdun but made a stand at Borny (August 14), where he was wounded, and fought inconclusive battles at Mars-la-Tour and Gravelotte (August 16-18). After Gravelotte he abandoned any effort to break out westward toward Verdun and instead withdrew into the entrenched camp at Metz, where he was besieged by the Germans. After the disastrous French defeat at Sedan (September 1), he negotiated with Otto von Bismarck, the Prussian chancellor, and on October 27 surrendered with his army of 140,000 men still intact.

For this action, Bazaine was sentenced, on Dec. 10, 1873, by a military court to degradation and death. Marshal Patrice de MacMahon, then president of the French Republic, commuted the sentence to 20 years' imprisonment. Bazaine escaped on Aug. 9, 1874, and died in exile and poverty.

Bazalgette, Sir Joseph William (b. March 28, 1819, Enfield, Middlesex, Eng.—d. March 15, 1891, London), civil engineer who designed the main drainage system for London.

After working on projects in Northern Ireland, Bazalgette became a consulting engineer at Westminster (1842). Seven years later he joined the London Metropolitan Commission of Sewers, becoming chief engineer in 1852. He was appointed chief engineer to the Metropolitan Board of Works in 1855.

Financial problems and conflicts among consultants held back work on the London drainage system until 1859. The system, containing 83 miles of intercepting sewers, was opened in 1865 and fully completed in 1875. Other works by Bazalgette included the Victoria (north side) and Albert (south side) embankments (1860-70), the Chelsea embankment (1871-74), Northumberland Avenue (1876), new bridges at Putney and Battersea, and the Woolwich steam ferry. He was knighted in 1874.

Bazaruto Island, Portuguese ILHA DO BAZARUTO, island, Mozambique. It is situated in the Mozambique Channel of the Indian Ocean, about 15 miles (24 km) offshore from the town of Inhassoro and 130 miles (209 km) southeast of Beira. The island is 22 miles (35 km) long and 4 miles (7 km) wide. Prior to the civil strife that followed Mozambican independence in 1975, Bazaruto was one of Africa's most important game-fishing centres. Pop. (mid-1990s est.) 2,300.

Bazille, Jean-Frédéric (b. Dec. 6, 1841, Montpellier, France—d. Nov. 28, 1870,

Beaune-la-Rolande), painter, who, as friend, benefactor, and colleague of the Impressionists, played an important role during the movement's formative years.

Bazille was an unenthusiastic medical student before his wealthy parents permitted him to study painting. While a student in Paris, he met Monet and Renoir, with whom he worked, traveled, and shared his studio when they could not afford their own. He exhibited at the Salons of 1866 and 1868; in the latter, his "Family Reunion" (Louvre, Paris) had some success. As a painter he combined a certain naiveté with a delicate feeling for nature and an exquisite sense of colour. His landscape figures are strangely immobile and have a sculptural, hard-edge quality. Bazille, who seemed destined to occupy a prominent place among the Impressionists, was killed in the Franco-German War.

Bazin, Henri-Émile (b. Jan. 10, 1829, Nancy, France—d. Feb. 7, 1917, Dijon), engineer and member of the French Corps des Ponts et Chaussées ("Corps of Bridges and Highways") whose contributions to hydraulics and fluid mechanics include the classic study of water flow in open channels.

Bazin worked as an assistant to the noted hydraulic engineer H.-P.-G. Darcy (1803-58), whose program of tests on resistance to water flow in channels Bazin finished after Darcy died. The results were published in 1865.

Bazin then carried his study over into the problem of wave propagation and the contraction of fluid flowing through an orifice. In 1854 he enlarged the Canal de Bourgogne and made it profitable for commercial navigation. In 1867 he suggested the use of pumps for dredging rivers, leading to the construction of the first suction dredgers.

Bazin became chief engineer of the Corps des Ponts et Chaussées in 1875 and was placed in charge of the Bourgogne canal system; he became inspector general in 1886. He retired in 1900 and was elected to the French Academy of Sciences in 1913.

Bazin, Hervé, pseudonym of JEAN-PIERRE-MARIE HERVÉ-BAZIN (b. April 17, 1911, Angers, France—d. Feb. 17, 1996, Angers), French author whose witty and satirical novels often focus on the problems within families and marriages.

Hervé was the great-nephew of the Roman Catholic traditionalist novelist René Bazin. After solid academic training, years of family conflict, and financial and professional failure, Hervé, a rebel and bohemian approaching middle age, finally achieved literary fame in 1948 with the autobiographical novel *Vipère au poing* (*Viper in the Fist*). In this book he portrays his unhappy childhood as an unrelenting battle with his mother, a monstrous figure who assumes near-mythic proportions

through the concentrated energy of her own virulence. Bazin's relentless attacks upon the institutions of family, church, and motherhood seemed to many Frenchmen to verge on blasphemy. The revolt continued in *La Tête contre les murs* (1949; *Head Against the*

Hervé Bazin, 1961

Lipnitch—H. Roger-Viollet

Wall), a novel about penal institutions and the judicial system that supports them, and in a second autobiographical novel, *La Mort du petit cheval* (1950; "The Death of a Small Horse").

Having exorcised the demons of his youth in his writings, Bazin underwent a spiritual metamorphosis, from which he emerged a moralist. He discovered paternal love (*Au nom du fils*, 1960; *In the Name of the Son*), spiritual fortitude (*Lève-toi et marche*, 1952; *Constance*, 1955), and conjugal responsibility (*Le Matri-moine*, 1967). He departed from his mellow mood to exorcise a few remaining monsters in his world—a pyromaniac fireman in *L'Inutile sur le feu* (1954; "The Oil on the Fire") and a country Paedra in *Qui j'ose aimer* (1956; *A Tribe of Women*). His later works include the novels *Madam Ex* (1975; "Madam X") and *Un Feu devore un autre feu* (1978; "A Fire Devours Another Fire") and the books of verse *Traits* (1976) and *Ce que je crois* (1977; "What I Believe").

Bazin, René, in full RENÉ-FRANÇOIS-NICOLAS-MARIE BAZIN (b. Dec. 26, 1853, Angers, France—d. July 20, 1932, Paris), French novelist of provincial life, strongly traditionalist in outlook. His works express in simple but elegant style his love of nature, of simple virtues, and of work, especially on the land.

Educated in Paris and Angers, Bazin became a professor of law at the Catholic University at Angers. Throughout his life he remained close to the people and scenes of his native countryside. His early works presented an extremely idealistic view of peasant life, but after travels in Spain and Italy, begun in 1893, he acquired an insight into the universality of peasant themes that is reflected in his later, more forceful novels. *La Terre qui meurt* (1899; "The Dying Earth") deals poignantly with the theme of emigration, as one by one the younger generation of a Vendée family leave their impoverished family farm to seek their fortunes in the city or in America. *Les Oberlé* (1901) concerns the Germanization of Alsace-Lorraine, in depicting the conflicts of divided loyalty within the Oberlé family. *Donatienne* (1903) is an account of the fortunes of a young Breton couple. *Le Blé qui lève* (1907; "The Rising Wheat") portrays the corrupting influence of trade unionism on woodcutters.

Though Bazin's works are now considered obsolete, he was an influential traditionalist in his day and a respected member of the spiritual family of French Catholic writers that includes, among others, Maurice Barrès, Georges Bernanos, and François Mauriac.

"Family Reunion," oil painting by Bazille, 1868; in the Louvre, Paris

Giraudon—Art Resource

Baziotes, William (b. June 11, 1912, Pittsburgh, Pa., U.S.—d. June 4, 1963, New York, N.Y.), American painter who was one of the leading members of the New York Abstract

Baziotes, 1959

© Arnold Newman

Expressionist group from the late 1940s, when it became the most influential movement in international art.

Baziotes studied with Leon Kröll at the National Academy of Design in New York City (1933–36) and worked as a teacher (1936–41) with the WPA Federal Art Project. In the late 1940s he founded the school “Subject of the Artist” with fellow painters Robert Motherwell, Barnett Newman, and Mark Rothko in New York City, where open discussion sessions and lectures were well attended.

Influenced by Cubism in its emphasis on structure and by Surrealism in its emphasis on automatism and the unconscious, Baziotes’ works often develop around biomorphic shapes reminiscent of marine-life forms.

Bazna, Elyesa: see Cicero.

bazooka, shoulder-type rocket launcher adopted by the U.S. Army in World War II. The weapon consisted of a smooth-bore steel tube, originally about 5 feet (1.5 m) long, open at both ends and equipped with hand grip, shoulder rest, trigger mechanism, and sights. Officially titled the M9A1 Rocket Launcher, it was called bazooka after a crude horn of that name used by radio comedian Bob Burns.

The bazooka was developed chiefly for attacking tanks and fortified positions at short range. It launched a 3.5-pound (1.6-kilogram) rocket with a diameter of 2.36 inches (60 mm) and a length of 19 inches (483 mm). The rocket carried 8 ounces (225 g) of pentolite, a powerful explosive that could penetrate as much as 5 inches (127 mm) of armour plate. To escape backblast, the operator held the bazooka on his shoulder with about half the tube protruding behind him. During the Korean War the M20 “Super Bazooka” was used. This was an aluminum tube that launched a 3.5-inch (89-millimetre), nine-pound (four-kilogram) rocket carrying 2 pounds (0.9 kg) of combined RDX/TNT explosive. The chief defects of both bazookas were their cumbersome weight and length and their short effective range (about 120 yards [110 m]). For this reason, beginning in the Vietnam War the U.S. Army abandoned bazookas in favour of light antitank weapons, or LAWs, such as the M72, a one-shot, disposable weapon that weighed 5 pounds (2.3 kg) fully loaded yet could launch its rocket with reasonable accuracy out to 350 yards (320 m).

BCG vaccine, vaccine against tuberculosis, prepared from a weakened strain of tuberculosis bacteria named BCG—*bacille Calmette-Guérin*, for the French scientists who developed the product. The vaccine is of particular importance for those whose occupations carry

a high risk of infection by tuberculosis, such as nurses and physicians, and for persons in countries with high rates of tuberculosis.

BCS theory, in physics, a comprehensive theory developed in 1957 by the American physicists John Bardeen, Leon N. Cooper, and John R. Schrieffer (their surname initials providing the designation BCS) to explain the behaviour of superconducting materials. Superconductors abruptly lose all resistance to the flow of an electric current when they are cooled to temperatures near absolute zero.

Cooper had discovered that electrons in a superconductor are grouped in pairs, now called Cooper pairs, and that the motions of all of the Cooper pairs within a single superconductor are correlated; they constitute a system that functions as a single entity. Application of an electrical voltage to the superconductor causes all Cooper pairs to move, constituting a current. When the voltage is removed, current continues to flow indefinitely because the pairs encounter no opposition. For the current to stop, all of the Cooper pairs would have to be halted at the same time, a very unlikely occurrence. As a superconductor is warmed, its Cooper pairs separate into individual electrons, and the material becomes normal, or nonsuperconducting.

Many other aspects of the behaviour of superconductors are explained by the BCS theory. The theory supplies a means by which the energy required to separate the Cooper pairs into their individual electrons can be measured experimentally. The BCS theory also explains the isotope effect, in which the temperature at which superconductivity appears is reduced if heavier atoms of the elements making up the material are introduced.

BD, abbreviation of *Bonner Durchmusterung* (*q.v.*), an astronomical catalog.

be, any of the hereditary occupational groups in early Japan (*c.* 5th–mid-7th century), established to provide specific economic services and a continuous inflow of revenue for the *uji*, or lineage groups. Each *be* was thus subsidiary to one of the *uji* into which all of Japanese society was then divided, and each *kakibe*, or worker, was effectively owned by the chief of his *uji*. Most *be* were agricultural units, producing rice for themselves and their superiors, but some engaged in crafts, fishing, or specific court functions. Those that acted as scribes, interpreters, diviners, or reciters for the court were national organizations; most other types of *be* were local.

After the Taika-era reforms (AD 645) asserted imperial rule over the various *uji*, all *be* were abolished with the exception of those for specially skilled workers such as musicians and craftsmen, whose services were transferred from the imperial family to individual governmental departments.

beach, sediments that accumulate along the sea or lake shores, the configuration and contours of which depend on the action of coastal processes, the kinds of sediment involved, and the rate of delivery of this sediment. There are three different kinds of beaches. The first occurs as a sediment strip bordering a rocky or cliffy coast; the second is the outer margin of a plain of marine or fluvial accumulation (free beaches); and the third, of fairly peculiar character, consists of the narrow sediment barriers stretching for dozens or even hundreds of kilometres parallel to the general direction of the coast. These barriers separate lagoons from the open sea and generally are dissected by some tidal inlets. Certain sediment forelands, such as spits, points, and tombolos (which connect an island with a mainland), also occasionally are called beaches.

The upper limit of the active beach is the swash line reached by highest sea level during big storms. The lower beach margin is beneath the water surface and can be determined only

if there is a definite border present between the sediment layer and the naked surface of the rocky bench. If the sediment cover extends into deep water, the lowest beach margin may be defined as the line where the strongest waves no longer sort and move the sand. It occurs approximately at a depth equal to one-third the wavelength or 10 times the wave height.

The profile of an active beach varies greatly. Its form and dimensions depend on a number of factors, such as wave parameters, tide height, and sediment composition and distribution. The following, however, constitute some of the profile elements that commonly occur. At the upper part, above high sea level, a beach terrace is located, and there may be a series of beach ridges or berms created by the waves of a previous major storm. This terrace surface is inclined seaward. The next element is a steeper, frontal beach slope or face, and beneath it a low-tide terrace may be developed. If the tides are high enough (more than 2 m [6.6 feet]), the frontal slope may be more than 1 km (0.6 mile) in width in regions with abundant sand and a shallow bottom. In some areas the low-tide terrace terminates with another inclined shoreface, if the nearshore sea zone is rather deep. Finally, one or several parallel, submarine, long-shore bars with intervening troughs may exist along sandy shores; if present, these bars constitute the last profile element.

Some minor relief forms are usually present on the surface of sand beaches. These include oscillation ripples, swash or rill furrows, and the well-known beach cusps (concave seaward) at the beach margin.

Given the established system of strong waves normal to the shoreline, submarine bars are sometimes dismembered and are converted into large crescent elements convex seaward. These relief forms reflect the existence of large water eddies with vertical axes, which form as a result of the ebb and flow of the water. Often the water outflow proceeds in the form of linear rip currents. These may be so strong that they cause erosion of deep channels in the submarine slopes.

In many countries the wind strongly affects the dynamics of the beach. The beach is exposed to the sea wind, and sand is usually blown off to the rear parts of the beach, where it forms small hummocks. As these join together, foredunes are being built, and, if the beach is well-supplied with sand in the right area, several rows of dunes will be formed. When the sand is abundant, dunes will shift to adjacent low-lying plains and may bury fertile soils, woods, and buildings (see Figure).

If sand is no longer delivered to the region of developed dunes, gaps will form in the ridges parallel to the shore. In such zones, parabolic dunes with their summits coastward are created. After long stabilization, the summits of the parabolas may be broken through by the wind, thus gradually forming a series of ridges parallel to the prevailing winds.

Beach sands in temperate latitudes consist mainly of quartz, some feldspars, and a small percentage of heavy minerals. In the tropics, however, calcareous beaches composed of skeletal remnants of marine organisms and precipitated particles, such as oolites, are widespread.

Sometimes the basement layers of the beach are cemented by calcium carbonate, precipitated from the groundwater. This will commonly result if fresh water penetrates a beach from swamps behind it. If the beach undergoes erosion and thus retreats, the cemented strata become exposed; termed beach rock, they are widespread in the tropics and along the shores of the Mediterranean, Black, and Caspian seas.

The practical significance of beaches is not limited to their function as protectors of the coast or as recreation sites. The sorting mech-

Scheme of frontal and parabolic shore dunes behind the beach and the onshore wind resultant

anism-of the offshore waves and currents determines the accumulation of heavy-mineral (specific weight more than 2.7) concentrates. On any sand beach there are thin layers of dark sand that can be seen. Some heavy minerals contain valuable metals, such as titanium, zirconium, germanium, tin, uranium, and gold. In many places the concentrations are so great that they are of industrial significance; placer deposits are worked in India, Brazil, Japan, Australia, Russia, and Alaska. Heavy-mineral concentrates also are extracted from the submarine slopes by means of dredging ships.

Beach, Alfred Ely (b. Sept. 1, 1826, Springfield, Mass., U.S.—d. Jan. 1, 1896, New York City), U.S. publisher and inventor; his *Scientific American* performed signal service in stimulating 19th-century technological innovations, and Beach himself invented a tunnelling shield and the pneumatic tube, among other devices.

While Beach was attending Monson Academy in Massachusetts, his father bought the *New York Sun*, and at 22 Beach became co-publisher with his brother Moses Beach. The new magazine *Scientific American* interested him more, however, and he purchased it, announcing in his first issue that it would secure patents for U.S. inventors. For the next several decades Beach made biweekly trips to Washington, D.C., to carry out this pledge. In 1847 he applied for his own first patent, on a typewriter, and a few years later, at the Crystal Palace Exhibition of 1853, New York City, he displayed a version of his machine that produced embossed letters for the blind.

Beach originally envisioned the pneumatic tube as a means of delivering mail in downtown areas of cities, a use to which it was widely put, but in the 1860s, after experimenting with a cable railway, he conceived the idea of a pneumatic subway. At the Fair of the American Institute in New York City in 1867, he exhibited a tube in which a 10-passenger car was driven back and forth by a powerful fan. Because of the opposition of Boss Tweed, the political ruler of New York City, Beach found it necessary to construct an experimental subway in secret. Obtaining a charter in 1868 for a 4-foot pneumatic tube to demonstrate mail delivery, he actually dug an 8-foot bore tunnel 300 feet (100 metres) under Broadway, between Warren and Murray streets. Because he could not disturb street traffic with a trench, he was forced to drive the tunnel by underground methods and invented a cylindrical tunnelling shield, powered by hydraulic rams; this shield actually antedated that built by James Henry Greathead for the Tower Subway in London. A 100-horsepower blower, operating alternately as an exhaustor, pushed and pulled the single car back and forth in the tunnel. The demonstration was

a success, but adoption was blocked partly by Tweed's opposition, partly by the financial panic of 1873, and finally by the arrival of electric traction. In the 1960s the idea was revived in the form of a proposed gravity-vacuum train for long-distance high-speed transportation.

Beach, Amy Marcy, née CHENEY, married name MRS. H.H.A. BEACH (b. Sept. 5, 1867, Henniker, N.H., U.S.—d. Dec. 27, 1944, New York City), U.S. pianist and composer known for her *Piano Concerto* (1900) and her *Gaelic Symphony*, the first symphony by an American woman composer.

At 16 she became a professional pianist. Largely self-taught as a composer, she was the only woman member of the Boston school of U.S. composers, who were heavily influenced by the German Romantic style. She was a prolific composer of choral works, piano pieces, and songs, of which "Ah, Love, but a Day" and "The Year's at the Spring" became particularly popular.

Beach, Sir Michael Edward Hicks: see Hicks Beach, Sir Michael Edward.

Beach, Sylvia (b. March 14, 1887, Baltimore—d. Oct. 5, 1962, Paris), bookshop operator who became important in the literary life of Paris, particularly in the 1920s, when her shop was a gathering place for expatriate writers and a centre where French authors could pursue their newfound interest in U.S. literature.

The daughter of a Presbyterian minister, Beach developed at 14 a lifelong love of France when her father held a pastorate in Paris among American students. In 1919 she opened her shop, Shakespeare and Company, which included a lending library, on the Left Bank in Paris. Perhaps her most heroic service to literature was her publication in 1922 of James Joyce's *Ulysses* after it had been turned down by several other publishers because of its explicit sexual content. She allowed Joyce the unlimited right to correct the proofs of his complex work, a lengthy process that she guided through typesetters unfamiliar with English. Her shop was closed in 1941, not to reopen, and she was interned for seven months by the occupying Germans. She wrote about her shop and its literary life in *Shakespeare and Company* (1959).

beach flea: see sand flea.

beach grass, also called MARRAM GRASS, PSAMMA, or SAND REED, any of the sand-binding plants in the genus *Ammophila* (family Poaceae). These coarse, perennial grasses are about one metre (about three feet) tall and grow on sandy coasts of temperate Europe, North America, and northern Africa.

American beach grass (*A. breviligulata*) grows along the Atlantic coast and in the Great

Lakes region. European beach grass (*A. arenaria*) has been introduced on the northern Pacific coast of the United States as a dune stabilizer. Both species grow in tufts and have rolled, spikelike leaves. The flower clusters are long, dense, and cylindrical. The tough, scaly underground stems may spread 10 to 13

American beach grass (*Ammophila breviligulata*)

Karlene Schwartz

metres (33 to 43 feet) away from the plant, sending up new shoots throughout the dune. In some areas, beach grass is protected by law.

beach hopper: see sand flea.

Beach-la-Mar (language): see Melanesian Pidgin.

beach pea (*Lathyrus maritimus*, sometimes *L. japonicus*), sprawling perennial plant in the pea family (Fabaceae). It occurs on gravelly and sandy coastal areas throughout the North Temperate Zone. The stem is 30–60 centime-

Beach pea (*Lathyrus maritimus*)

Thomas W. Martin—Rapho/Photo Researchers

tres (1–2 feet) long. The alternate leaves are divided into 6 to 12 leaflets arranged along the leafstalk. The purplish-blue flowers, which appear throughout the summer, are followed by a hairy pod about 3 cm long.

Beachy Head, prominent headland on the English Channel coast in the county of East Sussex, England, in the borough of Eastbourne. Its chalk cliffs, more than 500 ft (150 m) high, represent the seaward extension of the South Downs. The cliffs face southward and are therefore subjected to severe gales from the southwest. Erosion is concentrated along joint planes and tends to produce isolated stacks. There were once seven of these, the Seven Charleses; the last fell in 1875.

Beacon, city, Dutchess County, southeastern New York, U.S., at the foot of Mt. Beacon, on the east bank of the Hudson River, there bridged to Newburgh, 58 mi (93 km) above New York City. It became a city when the 17th-century villages of Matteawan and Fishkill Landing were united in 1913. The name was inspired by the fires that blazed atop Mt. Beacon to warn George Washington of British troop movements; the mountain is now a resort, and the Mt. Beacon Incline Railway (1901) ascends its west spur (1,540 ft [469 m]

above the river). Industrialization began after the War of 1812 when John Jacob Astor and others built a cotton mill and foundry. Manufactures now include clothing, aluminum and rubber fabricated products, and fans. Madam Brett Homestead (1709) in Beacon and Van Wyck Homestead (1732; site of Revolutionary War courts-martial) in Fishkill are preserved as museums. Pop. (2000) 13,808.

Beaconsfield, town in northern Tasmania, Australia. It lies on the west bank of the Tamar River, 29 miles (46 km) northwest of Launceston. The site of the present town, originally known as Cabbage Tree Hill, was renamed Brandy Creek when gold was found nearby in 1870. In 1879 F.A. Weld, governor of Tasmania, gave the town its present name in honour of Benjamin Disraeli, the 1st Earl of Beaconsfield. Between 1877 and 1919 Beaconsfield's Tasmania Mine was the largest single source of gold in the state, reaching its peak in gold production in 1899. Today gold is mined together with copper, lead, and zinc. Beaconsfield is also an agricultural centre producing apples, dairy products, and oysters. Inc. town, 1908. Pop. (1996) 1,014.

Beaconsfield, town, in South Bucks (formerly Beaconsfield) district, county of Buckinghamshire, England, in the Chiltern Hills.

The wide main street of the old town of Beaconsfield, bordered by 18th-century houses, contrasts with the modern town, in which commuters to London—28 miles (39 km) to the southeast—reside. Beaconsfield was adopted by Benjamin Disraeli, the 19th-century British prime minister, for his earl's title and was also the home of Edmund Burke, the 18th-century statesman, who is buried in the parish church. Pop. (1991) 12,292.

Beaconsfield, Benjamin Disraeli, Earl of: see Disraeli, Benjamin.

bead, small, usually round object made of glass, wood, metal, nut, shell, bone, seed, or the like, pierced for stringing. Among primitive peoples, beads were worn as much for magical as for decorative purposes; hence, little variation was allowed in their shapes and materials. In Arab countries in the 20th century, single blue talismanic beads are attached to domestic animals, children, brides, and even automobiles to avert bad luck. Because of the value attached to them as light articles of trade and as substitutes for coinage, beads yield valuable information about ancient trade and cultural patterns.

In prehistoric times, beads were worn not only around the neck but around the hips, over the ears, threaded through the nose, and even attached to the eyelashes. In the Stone Age, the earliest beads probably were plant seeds; but, by Acheulian times, collars of seashells and small fossils were bored for stringing, and, from the Aurignacian and Magdalenian periods, whole necklaces of pierced shells have survived, some of them carried long distances from the sea. Collars made of the pierced canine teeth of Arctic foxes and of chamois and human teeth pierced for stringing also have been found. A type of bilobed bead carved out of mammoth ivory was often worn in Siberian Paleolithic settlements. It was perhaps ancestral to a bone or stone bead of double-ax shape that was popular in the Neolithic period, especially in northern Europe, Britain, and southern France. Beads of stone, bone, and amber, pierced through their narrower ends, became common in the Late Neolithic Period in Scandinavia and are found in Megalithic graves of western Europe.

The earliest Egyptian beads, dating from about 4000 BC, are generally made of stone, usually steatite (soapstone), covered with a near-glass glaze; glass itself is not found un-

til much later. In the pre-dynastic period appeared beads of blue faience that continued essentially the same until Roman times. Other favourite materials were green feldspar, lapis lazuli (possibly from Persia), carnelian, turquoise, hematite, and amethyst. Usually these materials were made into spherical, barrel-shaped, or discoidal beads; but locust, falcon, crouching-baboon, hippopotamus-head, and conus-shell shapes are well represented. Phoenician workshops at Carthage and in the Egyptian delta made fancy beads in the form of comic human faces and animal heads.

In the Sumerian and Indus valley civilizations, variously shaped gold beads were in use by the early 3rd millennium BC. There were tubular, spherical, and melon-shaped beads, but most distinctive was a tubular bead with two semicircular wings attached to each side, as though in imitation of a plant seed. By 2000 BC a spherical bead resembling a nasturtium seed, with light flutings along the line of the piercing, was in use; it remained popular with the Babylonians and lasted into Assyrian times. Meanwhile, the Minoan and Mycenaean peoples of Crete and the Aegean developed gold beads of great originality and beauty in the shapes of polyps, lilies, and lotuses; there are also a number of spherical Mycenaean gold beads decorated with granulated patterns. Beads of opaque glass with impressed circlets of glass of a different colour came to Britain and western Europe in the Late Bronze Age. Their precise origin is unknown, but they probably were manufactured in the Mediterranean.

Among the Indians of North and South America, a great quantity of stone and shell beads commonly was worn, the latter being either complete shells or shaped out of shell. On the whole, except in the classical Inca civilizations of Peru, beads of fine stone were rare. Some, of a curious shape that suggests a double ax, are Peruvian, but there are elaborate Aztec and Inca beads of jadeite and other coloured stones in shapes such as frogs and human skulls. A number of sites in Peru, Guiana, and Honduras have yielded elaborate tubular gold-filigree beads.

Since the European Middle Ages, beads have been used extensively for trade and barter. Explorers have found them invaluable as gifts for primitive peoples, and, during the 17th and 18th centuries, this trade in beads was enormous. Their importance was well known to the Spanish conquistadores, whose gifts of Renaissance glass beads manufactured in Venice are said to have been worn until recent times by primitive peoples of Brazil. The use of beads as personal decoration has continued on and off throughout history, the richness of ornamentation varying with fashions.

bead lightning, also called CHAIN LIGHTNING, form of lightning of long duration that appears as a string of luminous segments instead of a continuous channel. It occurs infrequently but has been observed many times. Its causes are unknown, but among the theories proposed are the following: portions of the lightning channel are slanted toward or away from the observer and thus seem brighter; parts of the channel are obscured by rain or clouds; and sections of the channel with large radii cool more slowly than do those with small radii.

Beadle, George Wells (b. Oct. 22, 1903, Wahoo, Neb., U.S.—d. June 9, 1989, Pomona, Calif.), American geneticist, Nobel laureate, and president of the University of Chicago (1960–68), who helped found biochemical genetics when he showed that genes affect heredity by determining enzyme structure.

After earning his Ph.D. in genetics from Cornell University (1931), Beadle went to the laboratory of Thomas Hunt Morgan at the California Institute of Technology, where

Beadle

By courtesy of California Institute of Technology, Pasadena

he did work on the fruit fly, *Drosophila melanogaster*. Beadle soon realized that genes must influence heredity chemically. In 1935, with Boris Ephrussi at the Institut de Biologie Physico-Chimique in Paris, he designed a complex technique to determine the nature of these chemical effects in *Drosophila*. Their results indicated that something as apparently simple as eye colour is the product of a long series of chemical reactions and that genes somehow affect these reactions.

After a year at Harvard, Beadle pursued gene action in detail at Stanford University in 1937. Working there with Edward Tatum, he found that the total environment of a red bread mold, *Neurospora*, could be varied in such a way that the researchers could locate and identify genetic changes, or mutants, with comparative ease. They exposed the mold to X rays and studied the altered nutritional requirements of the mutants thus produced. These experiments enabled them to conclude that each gene determined the structure of a specific enzyme that, in turn, allowed a single chemical reaction to proceed. This "one gene—one enzyme" concept won Beadle and Tatum (with Joshua Lederberg) the 1958 Nobel Prize for Physiology or Medicine. Further, the use of genetics to study the biochemistry of microorganisms, outlined in the landmark paper "Genetic Control of Biochemical Reactions in *Neurospora*" (1941), by Beadle and Tatum, opened up a new field of research with far-reaching implications. Their methods immediately revolutionized the manufacture of penicillin and provided insights into many biochemical processes.

In 1946 Beadle became professor and chairman of the biology division at the California Institute of Technology and served there until 1960, when he was invited to succeed R. Wendell Harrison as chancellor of the University of Chicago; the title of president was reassigned to the position a year later. He retired from the university to direct (1968–70) the American Medical Association's Institute for Biomedical Research. His major works include *An Introduction to Genetics* (1939; with A.H. Sturtevant), *Genetics and Modern Biology* (1963), and *The Language of Life* (1966; with Muriel M. Beadle).

beadwork, use of beads in fabric decoration; beads may be individually stitched, applied in threaded lengths, or actually woven into the material, the weft threaded with beads before being woven in. Glass beads were used decoratively in ancient Egypt, Greece, and Rome and by the druids in religious rites.

During the Middle Ages, when embroidery was an important art form, beads sometimes were used in the finest embroidery work. The magnificent Butler-Bowden cope, a long ecclesiastical vestment (English, c. 1330; Victoria and Albert Museum, London), was elaborately embellished with seed pearls and green beads. Examples of beadwork of a purely pictorial, rather than decorative, nature also survive from this period. A series of small portraits of apostles executed entirely with coloured beads

stitched to a vellum backing are believed to have come from the Halberstadt (Germany) cathedral and may have been inspired by small contemporary Byzantine mosaics.

During the Renaissance, pearls and beads often were sewn in patterns on the clothing of the wealthy. In Elizabethan England, purses and other small objects often were liberally adorned with gilt thread, beads, and seed pearls. By the third quarter of the 17th century, beadwork had become so popular in England that many articles—chiefly fancy boxes, small pictures, and a particular form of basket—were decorated all over with beads. In southern Italy and Sicily, a bold form of decoration with gilt thread and coral beads was produced, apparently in considerable quantity, during the 17th century and later.

In the 18th century beadwork fell out of favour in Europe, but it became popular again during the 19th century. Purses knitted with bead-threaded cotton were particularly popular shortly after 1800, and throughout the 19th century such small articles as gloves, mittens, belts, garters, stockings, and parasol covers frequently were decorated with beads. A great many women's dresses were richly ornamented with beads of all kinds. Beadwork as dress decoration recurred periodically in the 20th century.

The simplest and earliest American Indian beadwork may have been a string made from bone, shell, or seeds. The introduction of glass trade beads by Europeans between the 15th and 19th centuries stimulated more complex designs. Among the Plains Indians, beadwork designs originally were geometrical, similar to the old porcupine-quill or moose-hair embroidery, and were placed on skin clothing, bags, and other articles. In the 19th century, floral designs became popular. The Eskimos of Greenland and North America use beadwork to ornament thigh boots, capes, and tunics.

Throughout Africa beadwork is used to ornament ceremonial headdresses, tunics, masks, baskets and other vessels, dolls, and a variety of other objects. Motifs and palettes vary

solidly built dog, heavy for its height. It generally excels as a rabbit hunter and is typically an alert, affectionate dog. There are two sizes recognized in the breed: beagles standing less

Beagle
Sally Anne Thompson—EB Inc

than 13 inches (33 centimetres) and weighing about 18 pounds (8 kilograms) and those standing about 15 inches (38 centimetres) and weighing about 30 pounds (13.5 kilograms).

Beagle, British naval vessel aboard which Charles Darwin served as naturalist on a surveying expedition (1831–36) in the Pacific and elsewhere. On that sailing, the *Beagle*, a brig displacing about 240 tons, was commanded by Robert Fitzroy (*q.v.*). Darwin sailed from Devonport, Eng., in the *Beagle* on Dec. 27, 1831. After circumnavigating the globe, the *Beagle* arrived back at Falmouth, Eng., on Oct. 2, 1836. The voyage provided Darwin with the observations that led him toward the theory of evolution.

Beagle Channel, strait in the Tierra del Fuego archipelago at the southern tip of South America. The channel, trending east–west, is about 150 mi (240 km) long and 3 to 8 mi wide; it separates the archipelago's main island to the north from Navarino, Hoste, and other smaller islands to the south. At its western end the channel splits into two branches that encircle Isla Gordon. The eastern portion forms part of the Chile–Argentina border, while the western portion lies entirely within Chile. The three islands at the channel's eastern end, Picton, Nueva, and Lennox islands, were the subject of a territorial dispute between Chile and Argentina that began in the 1840s and which almost led to war between the two nations in 1978. The dispute officially ended on May 2, 1985, when a treaty awarding the three islands to Chile went into effect between the two countries. The Beagle Channel was named for the British ship *Beagle*, in which Charles Darwin explored the area (1833–34).

beak, also called **BILL**, stiff, projecting oral structure of certain animals. Beaks are present in a few invertebrates (*e.g.*, cephalopods and some insects), some fishes and mammals, and all birds and turtles. Many dinosaurs were beaked. The term bill is preferred for the beak of a bird, platypus, or dinosaur. Many beaked animals, including all birds and turtles, lack teeth.

A bird's bill is composed of the upper and lower jaws covered by a horny sheath of skin. The nostrils are found dorsally, usually at the base of the bill. Bills take many shapes and sizes, adapted for food-getting, preening, nest-building, and other functions. Feeding modifications alone include the pouched fish-netting bill of pelicans; the serrated grazing bill of geese; the long, slim nectar-sipping bill of hummingbirds; and the sturdy, curved nut-cracking bill of parrots.

beak style, distinctive use of birdlike forms in human figures carved in wood in the lower Sepik and Ramu regions of Papua New

Guinea. The head of the figure is generally placed on a short neck that connects it to a thick body, over which a long, beaklike nose often projects. Facial features have a thin, linear quality that emphasizes the downward thrust of the nose and contrasts with the robust heaviness of the limbs of the full-length figures.

Examples of the beak style are seen in masks, statues, and utilitarian objects such as headrests, which are frequently painted and decorated with shells, tufts of hair, feathers, and bits of fibre and cloth. A sculptural form similar to the beak style is known in Vanuatu

Painted wooden neckrest in the beak style with cowrie-shell decoration, c. 1870, from the Sepik River district, Papua New Guinea; in the Rautenstrauch-Joest-Museum, Cologne

(formerly the New Hebrides) and New Caledonia.

beaked nightshade (plant): *see* buffalo bur.

beaked whale, any of a family (Ziphiidae, or, in some classifications, Hyperoodontidae) of medium-sized toothed whales (suborder Odontoceti), encompassing 6 genera and about 18 species, including the bottlenose whales. Members of the family are characterized by an extended beaklike snout, small rounded flippers, a dorsal fin set toward the rear, two throat grooves that meet under the chin, and the lack of a central notch in the wide flukes. The stomach is compartmented, containing up to 14 sections. In almost all beaked whale species, functional teeth are limited to one or two pairs, present only in the lower jaw and usually erupting through the gums only in the male whale. In the remarkable strap-toothed whale (*Mesoplodon layardii*), these teeth curve up and out, around the upper jaw, holding it partially shut. Shepherd's beaked whale (*Tasmacetus*) is also unusual, as it has numerous small functional teeth.

Beaked whales are distributed throughout the world, although certain species are limited to one ocean. Ranging in size from 3.5 metres (12 feet) for Hector's beaked whale, *M. hectori*, to 12.8 m for the giant bottlenose whale, *Berardius bairdii*, these whales weigh between 1,000 and 11,000 kilograms (1.1 and 12 tons). Colour is variable but is usually some combination of gray or black with white. Their bodies are often covered with long scars from fighting with each other. Beaked whales are the least known of the large mammals, and the mystery continues as the bodies of undescribed species occasionally drift ashore.

Rapid swimmers and deep divers, beaked whales are teuthophagous (squid-eating), although most also eat fish and bottom-dwelling

Arapaho beaded storage bag c. 1890; in the Denver Art Museum, Colorado
By courtesy of the Denver Art Museum, Colorado

among the peoples, with a vivid and sophisticated geometry predominating. Beadwork in Africa has also been used to convey information (*e.g.*, Zulu love messages).

Beads are used over most of Southeast Asia, mainly as dress and weapon ornaments. Borneo beadwork, exceptionally, uses curvilinear zoomorphic ornament, mostly in black, yellow, and red. Oceanic beadwork is simpler and, except in Melanesia, tends to rely on natural materials such as wood and shell.

beagle, small hound-dog breed popular as both a pet and a hunter. It looks like a small foxhound and has large brown eyes, hanging ears, and a short coat, usually a combination of black, tan, and white. The beagle is a

invertebrates. Some are solitary or travel in small groups, while others may appear in pods of 30 or more. Groups often surface and dive in unison. *See also* bottlenose whale.

Beaker folk, Late Neolithic–Early Bronze Age people living about 6,000 years ago in the temperate zones of Europe; they received their name from their distinctive bell-shaped beakers, decorated in horizontal zones by finely toothed stamps. (Their culture is often called the Bell-Beaker culture.) The graves of the Beaker folk were usually modest single units, though in much of western Europe they

Beaker found at Denton, Lincolnshire, Eng.
By courtesy of the trustees of the British Museum

often took the form of megalithic tombs. A warlike stock, they were primarily bowmen but were also armed with a flat, tanged dagger or spearhead of copper, and a curved, rectangular wrist guard. Their extensive search for copper (and gold), in fact, greatly accelerated the spread of bronze metallurgy in Europe. Probably originally from Spain, the Beaker folk soon spread into central and western Europe in their search for metals. In central Europe they came into contact with the Battle-Ax (or Single-Grave) culture, which was also characterized by beaker-shaped pottery (though different in detail) and by the use of horses and a shaft-hole battle-ax. The two cultures gradually intermixed and later spread from central Europe to eastern England.

beam, in engineering, originally a solid piece of timber, as a beam of a house, a plow, a loom, or a balance. In building construction, a beam is a horizontal member spanning an opening and carrying a load that may be a brick or stone wall above the opening, in which case the beam is often called a lintel (*see* post-and-lintel system). The load may be a floor or roof in a building, in which case the beam is called a floor joist or a roof joist. In a bridge deck the lightly loaded longitudinal beams are the stringers; the heavier, transverse members are called floor beams.

Large beams carrying the ends of other beams perpendicular to them are usually called girders. Metal girders may be single rolled pieces or, to permit greater stiffness and longer spans, may be built up in the form of an I by rivetting or welding plates and angles. Concrete girders are also widely used.

Beams may be of wood, steel or other metals, reinforced or prestressed concrete, plastics, and even brickwork with steel rods in the bond between bricks. For weight reduction, beams of metal are formed as an I or other shape having a thin vertical web and thicker horizontal flanges where most of the strain appears. *See also* cantilever.

Beamon, Bob (b. Aug. 29, 1946, Bronx, New York City), U.S. long jumper who set a world

record of 29 ft 2½ in. (8.90 m) at the 1968 Olympic Games at Mexico City. He was then a student at the University of Texas at El Paso. The new record surpassed the preceding one by 21½ in.

Beamon began jumping at Jamaica High School (Long Island, N.Y.) and first attended North Carolina Agricultural and Technical College (Greensboro). Later he transferred from El Paso to Adelphi University (Long Island), where he also played basketball. After his 1968 record, he competed irregularly and retired before the 1972 Olympics. In 1973 he turned professional; later he was a track coach, did youth work, and participated in various sports-related activities, including fund raising for the U.S. Olympic Committee in 1984.

bean, seed or pod of certain leguminous plants of the family Fabaceae, originally of *Vicia faba*, an Old World species called Windsor bean, broad bean, and horsebean. The mature seeds of the principal beans used for food, except soybeans (*q.v.*), are rather similar in composition, although they differ widely in eating quality. Rich in protein and providing moderate amounts of iron and vitamins B₁ and B₂, beans are used worldwide for cooking in either fresh or dried form.

Most varieties of the common bean grow either as an erect bush 30–75 centimetres (12–30 inches) tall or as a climbing plant 1.2–2.1 metres (50–80 inches) long, but a few important kinds are of intermediate form. Dwarf and semiclimbers are grown extensively. When the climbing type is grown for its immature pods, artificial supports are necessary to facilitate harvesting. Varieties differ greatly in size, shape, colour, and fibrousness or tenderness of the immature pods. In general, varieties grown

Bean (*Phaseolus vulgaris*)
Walter Chandoha

for dry mature seeds produce pods that are too fibrous to be eaten at any state of development. Most edible-podded beans produce relatively low yields of mature seeds, or seeds that are of low eating quality. Seed colours range from white through green, yellow, tan, pink, red, brown, and purple to black in solid colours and countless contrasting patterns. Seed shapes range from nearly spherical to flattened, elongated, and kidney-shaped. Pods are of various shades of green, yellow, red, and purple and splashed with red or purple; pod shapes range from flat to round, smooth to irregular, and straight to sharply curved; length ranges from 75 to 200 millimetres (3 to 8 inches) or more.

The common bean of Central and South American origin (*Phaseolus vulgaris*) is second to the soybean in importance. It is called French bean, haricot bean, and kidney bean in various countries; in the United States, however, kidney bean refers to a specific type that is definitely kidney-shaped and red, dark

red, or white. Some varieties of common bean are grown only for the dry seeds, some only for the edible immature pods, and others for the seeds, either immature or mature. Brazil, China, and the United States produce more than a third of the world's supply of this bean in the mature state. This bean figures prominently in Latin-American and Creole cuisines.

Third in importance, the principal bean of Europe though little known in the United States, is the Windsor, or broad, bean (*Vicia faba*). The broad bean will not tolerate hot weather; it is grown in summer only in the cool parts of the temperate zone and during the winter in the warmer parts. Unlike other beans described, it tolerates slight freezing. The plant is erect, from 600 to 1,500 mm tall, and bears few branches; the stem and branches are crowded with short-petioled leaves; the pods are nearly erect in clusters in the axils of the leaves; the seeds are large and irregularly flattened.

Most edible-podded beans can be grown over wide ranges of territory if they are planted at suitable times. The edible-podded varieties are popular in many countries, especially in Europe. In the United States the predominant edible-podded bean is the common string, snap, or green bean (*P. vulgaris*).

Of Central American origin, the lima bean (*P. limensis*) is of commercial importance in few countries outside the Americas. Grown only for food, dry mature lima beans constitute approximately 2½ percent of the total dry-bean production in the United States. There is a wide range of pod size and shape and of seed size, shape, thickness, and colour in both bush and climbing forms. Pods are wide, flat, and slightly curved. The lima bean is readily distinguished by the characteristic fine ridges in the seed coat that radiate from the "eye." A perennial in the tropics, elsewhere it is normally grown as an annual; it requires a longer season and warmer weather than most varieties of common American bean.

The scarlet runner bean (*P. coccineus*) is native to tropical America. Naturally a perennial, it is grown to a small extent in temperate climates as an annual. It is a vigorous climbing plant with showy racemes of scarlet flowers, large, coarse pods, and large, coloured seeds. The scarlet runner bean is grown in Great Britain and Europe for the attractive flowers and fleshy immature pods.

The mung bean, or green gram (*P. aureus*), is native to India. The pods and seeds are by far the smallest of any of the beans named here. The pods are slender, 75–100 mm long, and contain 10–14 spherical-to-oblong seeds about 3 mm in diameter. Extensively grown in the Orient for food, as bean sprouts and otherwise, the mung bean is little known in Europe and the Americas except for the preparation of sprouts. In this form the beans are a good source of vitamin C.

The horse gram (*Dolichos biflorus*) and the bonavist bean, native to India, are related, large, tropical climbing plants, the immature seeds of which are commonly used for food in Asia. The dry seeds are large, dark to black, nearly round to slightly flattened and elongated.

Bean, Alan I(aVern) (b. March 15, 1932, Wheeler, Texas, U.S.), astronaut, participant in the Apollo 12 mission (Nov. 14–22, 1969), in which two long walks, totalling nearly eight hours, were made on the Moon's surface. Bean and Comdr. Charles Conrad, Jr., piloted the Lunar Module to a pinpoint landing on the Moon, while astronaut Richard F. Gordon, Jr., orbited overhead in the Command Module.

Bean entered the U.S. Navy upon graduation (1955) from the University of Texas, Austin, and served as a test pilot before entering the manned spaceflight program in 1963. In addition to the Apollo 12 mission, Bean was

commander of the Skylab 3 mission (July 28–Sept. 25, 1973), during which he, Owen K. Garriott, and Jack R. Lousma formed the second crew to occupy the orbiting laboratory.

Bean, 1969

By courtesy of the National Aeronautics and Space Administration

Bean retired from the Navy in 1975 but remained with the National Aeronautics and Space Administration as chief of the astronaut candidate operations and training group.

Bean, Roy (b. 1825?, Mason County, Ky., U.S.—d. March 16, 1903, Langtry, Texas), justice of the peace and saloonkeeper who styled himself the “law west of the Pecos.”

For much of his life from the time he left his Kentucky home in 1847, Bean moved from town to town—in Mexico, Southern California, New Mexico, and Texas—getting into and fleeing from one scrape after another, killing at least two men in duels. During the Civil War he first served with Confederate regulars and then was a blockade runner in Texas, becoming so prosperous that he could live married in San Antonio for some 16 years at ease. In 1882 he moved on, west of the Pecos River, and set up a saloon, the Jersey Lilly, next to a railroad line through Dead Man’s Canyon. He named the site Langtry (after the actress Lillie Langtry) and eventually established himself as justice of the peace, with the approval of the Texas Rangers. He knew neither law nor court procedure and became celebrated for his rulings, which were variously hard, common-sensical, and prankish; he once reportedly fined a dead man \$40 for carrying a concealed weapon and pocketed the proceeds.

bear, large carnivore of the family Ursidae, closely related to the dog (family Canidae) and raccoon (Procyonidae). The bear is the most recently evolved of carnivores. Its ancestral line appears to have diverged from canid stock during the Miocene and to have developed, through such forms as the Pliocene *Hyaenarctos* (of Europe, Asia, and North America), into modern types such as the black and brown bear (*Ursus*).

Generally massive and short legged, bears vary in size from the smallest sun bear (27–46 kilograms [59–80 pounds]) to the huge Alaskan brown bear (see grizzly bear), which attains a weight of 780 kg. Despite this bulkiness, most bears climb with ease and swim strongly. They walk with their soles on the ground in plantigrade fashion, as does man, with the heel touching the ground. Each foot has five digits, ending in nonretractile claws (sometimes particularly adapted for digging, as in the sloth bear).

Lengthening of the canine teeth, reduction or absence of the first three premolars, and modifications for crushing with the molars (broad and flat crowned) characterize ursid dentition, completed with typical incisors. Bears constitute a generally omnivorous family, but individual dietary preferences range from seals for the extremely carnivorous polar bear to vegetative materials for the largely herbivorous spectacled bear; most bears enjoy honey. Usu-

ally gaining weight beforehand, a bear often sleeps fitfully through much of the winter; this long slumber, however, does not constitute true hibernation. Bears in the wild live from 15 to 30 years. The life span in captivity is considerably longer.

The bear may be hunted for trophy value or for its various economic assets, hides for clothes or rugs and meat and fat for food. Local names, derived particularly from their geographic locations, abound for these bears (the more usual equivalents are in the column on the right):

local and occasional names	more common names
American bear	black bear
Andean bear	spectacled bear
moon bear	Asiatic black bear
bhalu	sloth bear
brown bear	brown bear or black bear
bruang	sun bear
cinnamon bear	black bear
Himalayan bear	Asiatic black bear
ice bear	polar bear
Japanese bear	brown bear
Malay bear	sun bear
Mongolian bear	brown bear
sea bear	polar bear
Siberian bear	brown bear
silvertip	grizzly bear
Tibetan bear	brown bear or Asiatic black bear
water bear	polar bear
white bear	polar bear

Bear Flag Revolt (June–July 1846), short-lived independence rebellion precipitated by American settlers in California’s Sacramento Valley against Mexican authorities. In 1846 approximately 500 Americans were living in California, compared with between 8,000 and 12,000 Mexicans. Nonetheless, early in June a group of about a dozen Americans seized a large herd of horses from a Mexican military commandant. On June 14 another group captured Sonoma, the chief settlement north of San Francisco. Led by William B. Ide, the Americans issued a declaration of independence and hoisted a flag, its white ground emblazoned with a grizzly bear facing a red star. On June 25 Capt. John Charles Frémont arrived at Sonoma and gave his support to the Bear Flag Revolt. And on July 5 the insurrectionists elected Frémont to head the “Republic of California.”

But the Republic was quick to fall. On July 9 forces under Commodore John D. Sloat occupied San Francisco and Sonoma, claimed California for the United States, and replaced the bear flag with the American flag.

bear grass, also called **TURKEY BEARD**, one of two species of North American plants comprising the genus *Xerophyllum* of the lily family (Liliaceae). The western species, *X. tenax*, also is known as elk grass, squaw grass, and fire lily. It is a smooth, light-green mountain perennial with a stout, unbranched stem, from 0.6 to 2 metres (2 to 6 feet) high, which rises from a woody, tuber-like rootstock and cordlike roots. The stem bears a dense basal tuft of narrow, grasslike, rough-edged leaves, about one metre long; the leaves of the upper part of the stem are similar but much smaller. Flowering occurs at five to seven years. The top of the stem develops a large cluster of many small, creamy white flowers.

The turkey beard (*X. asphodeloides*) of southern North America is a similar plant that grows in dry pine barrens. In the southern and southwestern United States the name bear grass is given to various kinds of yucca, especially to *Yucca filamentosa* and *Y. glauca*; also to the camas (*Camassia scilloides*) and the aloelike *Dasyliirion texanum*, all of which have grasslike leaves.

bear market, in securities and commodities trading, a declining market. A bear is an in-

vestor who expects prices to decline and, on this assumption, sells a borrowed security or commodity in the hope of buying it back later at a lower price, a speculative transaction called selling short. The term bear may derive from the proverb about “selling the bearskin before one has caught the bear” or perhaps from selling when one is “bare” of stock. *Compare* bull market.

bearbaiting, alternatively **BULLBAITING**, the setting of dogs on a bear or a bull chained to a stake by the neck or leg. Held from the 12th to the 19th century, when they were banned as inhumane, these spectacles were usually staged at theatre-like arenas popularly called bear gardens.

In England many large groups of bears were kept expressly for the purpose. For a baiting attended by Queen Elizabeth I in 1575, 13 bears were provided.

When a bull was baited, its nose was often blown full of pepper to further arouse it. Specially trained dogs were loosed singly, each attempting to seize the tethered animal’s nose. Often, a hole in the ground was provided into which the bull might thrust this vulnerable part. A successful dog was said to have pinned

Bearbaiting, a miniature from the Luttrell Psalter, English, c. 1340; in the British Library

By courtesy of the trustees of the British Library

the bull. Some of the variations of these activities included whipping a blinded bear and baiting a pony with an ape tied to its back. Dogfighting and cockfighting were often provided as companion diversions.

A sport called bull-running also developed in some places, usually as an annual affair. The townspeople, armed with clubs, chased a bull until all were exhausted; then the bull was killed.

Baiting and its variations declined, although very slowly, from the late 17th century onward, the sports having been banned in England by the Puritans during the Civil Wars and Commonwealth (1642–60). The spectacles were permanently outlawed by act of Parliament in 1835.

Allied activities had scattered revivals on the U.S. frontier: typical examples included dogs being matched against badgers, or a chained bull being matched against a grizzly bear. In each case the battle ended when one killed the other. As U.S. frontiers disappeared, these pastimes disappeared as well.

bearberry, also called **KINNIKINNICK** (*Arctostaphylos uva-ursi*), flowering, prostrate, evergreen shrubs, of the heath family (Ericaceae), occurring widely throughout North America in rocky and sandy woods and open areas. It has woody stems that are often 1.5–1.8 metres (5–6 feet) long. Roots develop from the stem joints, and the plant spreads, forming a broad, massive ground cover. The foliage turns bronzy in winter. The leaf margins are

rolled and fringed with hairs. The flowers, which may be white, pink, or pink-tipped in

Bearberry (*Arctostaphylos uva-ursi*) showing (top) flowers, (bottom) berries

(Top) Ingmar Holmasen, (bottom) Joan E. Rahn—EB Inc

colour, are in the shape of a narrow-mouthed bell. The berries are red.

Beard, Charles A(ustin) (b. Nov. 27, 1874, near Knightstown, Ind., U.S.—d. Sept. 1, 1948, New Haven, Conn.), American historian, best-known for his iconoclastic studies of the development of U.S. political institutions. His emphasis on the dynamics of socioeconomic conflict and change and his analysis of motivational factors in the founding of institutions made him one of the most influential American historians of his time.

Rearing in a prosperous family, Beard attended De Pauw University, Greencastle, Ind., and after his graduation in 1898 he studied at the University of Oxford. In 1899 he helped found a workingmen's school in Oxford. He visited the United States briefly in 1900, when he married Mary Ritter, returned to England, and permanently returned to the United States

Beard, 1917

in 1904 to teach political science at Columbia University.

Beard subsequently became one of the intellectual leaders of the Progressive movement and of American liberalism. He was a leader in movements seeking improvements in municipal government and administration and in national planning. He was initially interested in European history, and he collaborated with J.H. Robinson in writing several widely used textbooks on that subject. He then developed a schema of historical explanation that found its most famous expression in *An Economic Interpretation of the Constitution of the United States* (1913). In this book he claimed that the Constitution had been formulated by interest groups whose motivations were just as much personal financial ones as they were political ones. Although American politicians were generally outraged at the implications of material interests embodied in the Constitution by the Founding Fathers, the book was received by academicians as an innovative study on motivational factors among socioeconomic groups. In *The Economic Origins of Jeffersonian Democracy* (1915), Beard placed somewhat more emphasis on the philosophical context of political struggles, but he nevertheless reaffirmed his view of the importance of economic interests in governmental action. Beard and his wife, Mary R. Beard, subsequently produced a monumental synthesis of the history of the United States entitled *The Rise of American Civilization*, 2 vol. (1927). This widely acclaimed work was supplemented by two more volumes, *America in Midpassage* (1939) and *The American Spirit* (1942).

In 1917 Beard resigned from Columbia University in protest against the investigation and dismissal of several faculty members on charges of disloyalty and subversion. He was a cofounder of the New School for Social Research in New York City in 1919. His intellectual orientation in the next years began to shift toward the problem of historical knowledge, which occupied him during the early 1930s. Beard pointed out the subjective nature of the historian's selection and arrangement of facts on the basis of his own relationship to contemporary thought.

In the 1930s and '40s Beard's interests turned to the history of U.S. foreign policy. In 1934 he began writing a series of books and articles in which he attacked President Franklin D. Roosevelt's foreign policy. In such books as *American Foreign Policy in the Making, 1932-1940* (1946) and *President Roosevelt and the Coming of War, 1941* (1948), he charged Roosevelt with virtually maneuvering the United States into war with Japan. Beard was criticized as an isolationist because of these views, and his reputation declined somewhat after the publication of his last works, but he is still considered to be one of the most influential American historians of the 20th century.

Beard* (1957); Richard Hofstadter, *The Progressive Historians: Turner, Beard, Parrington* (1968, reprinted 1979); and Ellen Nore, *Charles Beard, an Intellectual Biography* (1983).

beard grass: see bluestem.

beard lichen, any member of the genus *Usnea*, a yellow or greenish fruticose (bushy, branched) lichen with long stems and disk-shaped holdfasts, which resembles a tangled mass of threads. It occurs in both the Arctic and the tropics, where it is eaten by wild animals or collected as fodder. In the past it was used as a remedy for whooping cough, catarrh, epilepsy, and dropsy. It has been used also as an astringent, a tonic, and a diuretic. Old-man's-beard (*U. barbata*) was first described in 300 BC as a hair-growth stimulant. Hanging moss (*U. longissima*) looks like gray threads about 1.5 m (5 feet) long hanging from

Old-man's-beard (*Usnea barbata*)

Loise K. Broman—Root Resources

tree branches in humid, mountainous regions. Some species of *Usnea* also produce an orange dye. It is the "beard moss," or "tree moss," of the poets and Shakespeare's "idle moss." It is sometimes confused with the plant known as Spanish moss, which is similar in appearance but is unrelated to lichens.

bearded seal (*Erignathus barbatus*), nonmigratory seal of the family Phocidae, distinguished by the bushy, bristly whiskers for which it is named; it is also known as "square-flipper" after the rectangular shape of the foreflipper. Highly valued by Eskimos for its hide, meat, and blubber, the bearded seal is a grayish or yellow-brown animal that lives alone or in small groups in coastal Arctic waters. It attains a length of about 2.4-3.7 m (8-12 feet) and a weight of about 225-454 kg (500-1,000 pounds); the female is somewhat smaller than the male. An adept diver, the bearded seal feeds mainly on clams and other bottom animals, possibly using its whiskers to scrape for prey. The female breeds every other year, bearing a single dark-gray pup after about 11 months' gestation.

bearded tit (bird): see reedling.

bearded culture: see lammergeier.

Bearden, Romare (Howard) (b. Sept. 2, 1914, Charlotte, N.C., U.S.—d. March 11, 1988, New York City), American painter whose collages of photographs and painted paper on canvas depict aspects of American black culture in a style derived from Cubism.

Bearden studied at the Art Students League in New York City with George Grosz (1936-37) and at Columbia University (1943). His early paintings were realistic and often religious in theme (e.g., "The Annunciation," 1942). After military service during World War II, he lived in Paris (1950-51), studied at the Sorbonne, and traveled extensively in Europe. During this period he developed his mature, semiabstract collage style. He first achieved recognition in the mid-1940s, and by the 1960s he had come to be regarded as the preeminent collagist in the United States.

The narrative structure of Bearden's paintings is simple and archetypal; ritual, music, and family are his pervasive themes. His works' complexity lies in their poetic abstraction, in which layered fragments of colour and pattern evoke the rhythms, textures, and mysteries of a people's experience (e.g., in "Family," 1969).

beardfish, any of the five species of fishes in the genus *Polymixia* constituting the family Polymixiidae (order Beryciformes). Beardfishes are restricted primarily to deep-sea marine habitats in tropical and temperate regions of the Atlantic and Pacific oceans.

They generally are found at depths from about 200 to 600 metres (650 to 2,000 feet). The term beardfish comes from the beardlike appearance of two enlarged barbels that extend downward from the chin region. Beardfishes are not particularly large; the widely distributed stout beardfish (*P. nobilis*) attains a length of less than 20 centimetres (8 inches).

Beardmore Glacier, glacier in central Antarctica, descending about 7,200 ft (2,200 m) from the South Polar Plateau to Ross Ice Shelf, dividing the Transantarctic Mountains of Queen Maud and Queen Alexandra. One of the world's largest known valley glaciers, it is 125 mi (200 km) long and is 25 mi in width. The British explorers Ernest Henry Shackleton (1908) and Robert Scott (1911) discovered the glacier on their route to the South Pole. Later scientific research found the glacier to contain petrified wood and fossils of ferns and coral, evidence of a time when Antarctica possessed a temperate climate.

Beardsley, Aubrey (Vincent) (b. Aug. 21, 1872, Brighton, Sussex, Eng.—d. March 16, 1898, Menton, Fr.), the leading English illustrator of the 1890s and, after Oscar Wilde, the outstanding figure in the Aestheticism movement.

Drawing was a strong interest from early childhood, and Beardsley continued with it while earning his living as a clerk. A meeting with the English artist Sir Edward Burne-Jones in 1891 led to his attending evening classes at the Westminster School of Art for a few months—his only professional instruction.

In 1893 he was commissioned to illustrate a new edition of Sir Thomas Malory's *Morte Darthur*, and in 1894 he was appointed art editor and illustrator of a new quarterly, *The Yellow Book*. His illustrations for Oscar Wilde's play *Salomé* (1894) won him widespread notoriety. He was greatly influenced by the elegant, curvilinear style of Art Nouveau (*qv*) and the bold sense of design found in Japanese woodcuts. But what startled critics and public alike was the obvious sensuality of the women in his drawings, which usually contained an element of morbid eroticism. This tendency became pronounced in his openly licentious illustrations to Aristophanes' *Lysistrata* (1896). Although Beardsley was not homosexual and was quite outside the scandals surrounding Wilde, he was dismissed from *The Yellow Book* in the general revulsion against Aestheticism that followed Wilde's exposure in 1895. He then became principal illustrator of an-

other new magazine, *The Savoy*, and he illustrated numerous books, including Alexander Pope's *Rape of the Lock* (1896). During this period he also wrote some poems and a prose parody, *Under the Hill* (1903; the original unexpurgated version, *The Story of Venus and Tannhauser*, appeared in 1907).

Delicate in health from the age of six, when he first contracted tuberculosis, he was attacked again by the disease when he was 17. From 1896 he was an invalid. In 1897, after being received into the Roman Catholic Church, he went to live in France, where he died at the age of 25. His work enjoyed periodic revivals, most notably during the 1960s.

beardworm, also called **POGONOPHORAN**, any of a group of marine invertebrates constituting the phylum Pogonophora. Pogonophorans live a sedentary life in long, protective tubes on seafloors throughout the world. The common name beardworm refers to the beardlike mass of pinnate (feather-like) tentacles borne

by the free or fused tentacles, intermesh to form a filter. Beside each pinnule base is a ciliary tract. In each intertentacular region, ciliary tracts produce a current of water that carries in microorganisms and other nutrients; these are filtered through the pinnule filter. Digestive enzymes probably are secreted by gland cells located at the pinnule bases. Water leaves by an opening at the base of certain tentacles. The digested food may be absorbed by the pinnules. The pinching off of small food particles in the outer layers of the pinnules during a process known as pinocytosis also has been observed. Direct penetration of amino acids from sea-water into the tentacles also has been reported to take place.

Reproduction is sexual. Eggs, which have a high yolk content, are laid by the female in the anterior part of the tube, in which fertil-

Female *Spirobrachia beklemishevi*, ventral view with posterior one-sixth of trunk not shown

From A. V. Ivanov, *Zoologische Jahrbucher Abt. 1 Systematik*, 85 (1957). Gustav Fischer Verlag.

at the anterior end of many species. An intestine, which forms in embryos, disappears as development progresses. Males of the phylum are generally similar in appearance to females. Pogonophorans are the only multicellular animals that have neither mouth nor anus.

Pogonophorans were first classified as a distinct phylum in the middle of the 20th century. The first species, *Siboglinum weberi*, described in 1914, came from the seas of the Malayan Archipelago; the second species, *Lamellisabella zachsi*, which came from the Okhotsk Sea, was described in 1933. In 1937 a new class called Pogonophora was established for *Lamellisabella*. In 1955 a close affinity between *Siboglinum* and *Lamellisabella* was proved, and the members were placed in the newly established phylum Pogonophora.

Pogonophorans usually inhabit marine waters to depths that exceed 1,000 metres (32,800 feet); some species have been found at depths ranging from 7,000 to 10,000 metres. A native population inhabits the trenches of the Pacific and the Indian oceans. Many genera have a discontinuous distribution.

Natural history. The tentacles, probably used during feeding, vary in number according to body size. The tentacles are long processes containing blood vessels and are continuous with the body cavity, or coelom. Rows of very thin single-celled units called pinnules are found on the tentacles. The pinnules, which extend into the intertentacular cavity formed

by the free or fused tentacles, intermesh to form a filter. Beside each pinnule base is a ciliary tract. In each intertentacular region, ciliary tracts produce a current of water that carries in microorganisms and other nutrients; these are filtered through the pinnule filter. Digestive enzymes probably are secreted by gland cells located at the pinnule bases. Water leaves by an opening at the base of certain tentacles. The digested food may be absorbed by the pinnules. The pinching off of small food particles in the outer layers of the pinnules during a process known as pinocytosis also has been observed. Direct penetration of amino acids from sea-water into the tentacles also has been reported to take place.

Reproduction is sexual. Eggs, which have a high yolk content, are laid by the female in the anterior part of the tube, in which fertil-

ization and early development to formation of a swimming larva also occur. Cleavage leads to the formation of a bilaterally symmetrical embryo. A cell layer called the endoderm first is represented by a few yolk-rich cells, which form a primary intestine; the intestine disappears as the yolk is utilized. Both mouth and anus fail to develop. A secondary body cavity is formed by separation of coelomic pockets from the primary intestine. The embryo develops into a larva having two ciliary belts and three body segments.

Form and function. The wormlike body varies in length from several centimetres to 0.5 metre (1.64 feet), the body diameter, from 0.06 millimetre to 4 millimetres (0.002 inch to 0.16 inch). *Lamellibrachia barhami* is one of the largest species. The body consists of three segments: two small anterior regions are called protosome and mesosome; the long trunk section is called the metasome. Each segment has its own coelom. The small protosome bears tentacles. The mesosome contains a structure known as a bridle, also called a frenulum, a pair of oblique cuticular ridges that extend backward to meet in the midventral line. The bridle supports the protruding worm on the edge of its tube. The metasome is divided into two sections by a pair of parallel ridges called belts; these have rows of small platelets containing minute teeth. One part of the metasome, in front of the belts, has a groove bordered by low folds.

"A Footnote," self-portrait, drawing by Aubrey Beardsley, 1896

The protective tube is submerged in mud at the lower end; the very thin tubes of *Sclerolinum*, however, pierce pieces of sunken wood. The tube, secreted by special glands, contains a hard substance called chitin. Although the animals never leave their tubes, they are able to move inside them.

The body wall consists of an outer layer of epidermal cells covered by a cuticle. Beneath the epidermal cells is a layer of longitudinal muscle cells. The nervous system, found within the epidermis, forms an almost continuous network. There are no sense organs. The circulatory system consists of two long vessels: in one, blood flows forward; in the other, backward. At the base of the tentacles, the vessel through which blood flows forward is differentiated into a muscular heart, which serves to push blood into the tentacle vessels. The blood contains the pigment hemoglobin. The excretory system consists of a pair of nephridia, or coelomoducts, which connect the body cavity with the exterior.

The reproductive system consists of a pair of sexual glands that lie in the trunk. In females, ovaries are found in the anterior part of the metasome, while the sexual openings, or oviducts, are found in the middle of the body. In males, the testes are located in the posterior part of the body, and the sexual openings, called sperm ducts, in the anterior part. Numerous capsules containing sperm form in the sperm ducts of the males.

Evolution and classification. The Pogonophora may be separated into two classes, Afrenulata and Frenulata. The Afrenulata contains one species—*Lamellibrachia barhami*, which has been found in the Pacific Ocean near the coast of California. The class Frenulata contains 16 genera in six families. A total of 110 species of Pogonophora thus far have been identified; it is probable that many more species remain to be identified.

According to general body plan and embryological development, Pogonophora should be included with the large group of animals that have a secondary body cavity; this group also includes Chaetognatha, Tentaculata, Hemichordata, and Echinodermata. A rich fossil Pogonophora fauna has been found in deposits of the Cambrian period (570 to 505 million years ago) and Ordovician period (505 to 438 million years ago) near St. Petersburg, in Poland, and in Siberia.

bearing, in machine construction, a connector (usually a support) that permits the connected members to rotate or to move in a

separated by a film of liquid (usually oil) or gas; these are sliding bearings, and the part of the shaft that turns in the bearing is the journal. The surfaces in a bearing may be separated also by balls or rollers; these are known as rolling bearings. In the illustration, the inner race turns with the shaft.

Under certain combinations of load, speed, fluid viscosity, and bearing geometry, a fluid film forms and separates the contacting surfaces in a sliding bearing; this is known as a hydrodynamic film. An oil film can also be developed with a separate pumping unit that supplies pressurized oil to the bearing; this is known as a hydrostatic film.

Because shaft speed is required for the development of a hydrodynamic film, the starting friction in these bearings is higher than in ball or roller bearings. To minimize friction when metal-to-metal contact occurs, low-friction-bearing materials have been developed; among these are bronze alloys and babbitt metal. *See also* ball bearing; roller bearing.

Béarn, historic and cultural region encompassing mountainous regions of the southwestern French *département* of Pyrénées-

The province of Béarn

Atlantiques and coextensive with the former province of Béarn.

Béarn's name can be traced to the town of Beneharnum (Lescar). Béarn was conquered by the Vascones (the ancestors of the modern Basques) in the 6th century and in 819 became a viscounty feudally dependent on the dukes of Aquitaine; in the 11th century the viscounts ceased to acknowledge any suzerain. Their coinage, the "morlans" (of Morlaas), was famous.

representative government with *cours plénières* ("plenary courts") composed of deputies from the three estates (nobility, clergy, people).

Until the early 20th century the inhabitants of the mountains were largely seminomadic and practiced transhumance, moving their flocks between the highlands of Ossau in the summer and the lowlands around Pau in the winter. Pastures were collectively owned. Settlements in the valleys of the centre subsequently grew at the expense of the mountain regions, and the population has become predominantly urban. The usual farmstead of the valleys has two stories and is roofed with slate shingles. Stables occupy the ground floor; living quarters are upstairs. Immigrants from other French regions and repatriates from North Africa are of considerable social and economic importance.

Roman Catholicism predominates; Protestantism made some inroads during the second half of the 16th century but is now largely limited to the town of Orthez. The regional dialect, which shows strong Gascon influence, was used in public acts between 1589 and 1789. The Gaston Phébus School was founded in 1897 in Pau and has been instrumental in preserving the literary traditions of Béarn.

Regional cuisine features trout, mushrooms, and cheese from sheep's milk. *Tourin* is a soup of onions, tomatoes, and garlic; *cousinette* is a soup whose ingredients include mallow, chard, sorrel, and chicory. Jurançon produces renowned white wines. Madiran is an outstanding red wine from Gers.

Béarn, Henri de Bourbon, prince de: *see* Henry IV under Henry (France).

Bearsden and Milngavie, district, Strathclyde region, southwestern Scotland. Created by the reorganization of 1975, it is part of the former county of Dunbarton. The district, area 28 square miles (73 square km), consists of the small burghs of Milngavie, the seat of the district authority, and Bearsden, with a little countryside on the northwest. The burghs, though they have some industry, are northern outer suburbs of Glasgow and are mainly residential. Pop. (1990 est.) 40,900.

Beartooth Range, segment of the northern Rocky Mountains in the United States, extending east-southeastward for 50 miles (80 km) from the Stillwater River, in southern Montana, to the Clarks Fork of the Yellowstone River, in northwestern Wyoming. Many peaks rise to more than 12,000 feet (3,700 m), including Granite Peak (12,799 feet [3,901 m]), the highest point in Montana. It was through these mountains that Chief Joseph led the Nez Percé Indians on their attempt to reach Canada in 1877.

The range serves as a source region for the Clarks Fork (stream) and includes the Granite Range (a northwestern extension), parts of the Gallatin, Custer, and Shoshone national forests, and the Absaroka Beartooth Wilderness area. Scenic granite formations, alpine peaks, high plateaus, glaciers, and lakes attract many tourists.

Beās River, also spelled *biās*, ancient (Greek) *HYPHASIS*, Sanskrit *VIPĀSĀ*, river in Himāchal Pradesh and Punjab states, northwestern India. It is one of the five rivers that give the Punjab ("Five Rivers") its name. It rises at an elevation of 14,308 feet (4,361 m) in the Rohtang Pass in the Punjab Himalayas, in central Himāchal Pradesh. From there it flows south through the Kulu valley, receiving tributaries from the flanking mountains, and then turns west to flow past Mandi into the Kāngra valley. After crossing the valley, the Beās enters Punjab state and veers south and then southwest to its confluence with the Sutlej River at Harike after a course of about 290 miles (470 km). The Beās River was the approximate eastern limit of Alexander the Great's invasion of India in 326 bc.

Rolling bearings

(Left) Roller (cylindrical) bearing, (right) ball bearing

By courtesy of Anti-Friction Bearing Manufacturers Assoc., Inc.

straight line relative to one another. Often one of the members is fixed, and the bearing acts as a support for the moving member.

Most bearings support rotating shafts against either transverse (radial) or thrust (axial) loads. To minimize friction, the contacting surfaces in a bearing may be partially or completely

In 1290 the viscounty passed to the counts of Foix, from whom it was transmitted to the kings of Navarre. When Henry III of Navarre became Henry IV of France in 1589, Béarn became a holding of the French crown.

From the 12th century until the French Revolution in 1789, the Béarnais had a form of

beast epic, popular genre in various literatures, consisting of a lengthy cycle of animal tales that provides a satiric commentary on human society. Although individual episodes may be drawn from fables, the beast epic differs from the fable not only in length but also in putting less emphasis on a moral.

The earliest European beast epics were in Latin, but vernacular epics in French, German, and Dutch existed in the late Middle Ages. Among the most famous are the 10th- and 11th-century cycles in which the hero is Reynard the Fox. The cycle includes the tale of the Fox and Chanticleer the Cock, the basis later of "The Nun's Priest's Tale" in Geoffrey Chaucer's *The Canterbury Tales*. John Dryden used the beast epic as the framework of the poem *The Hind and the Panther* (1687), and Joel Chandler Harris' *Uncle Remus: His Songs and His Sayings* (1880) derived many episodes from beast tales carried to the United States by African slaves. *Animal Farm* (1945), a dystopian satire by George Orwell, is a modern adaptation of the beast tale.

The best-known Asian collection of beast tales is the *Pañca-tantra* of India.

beat, in music, the basic rhythmic unit of a measure, or bar, not to be confused with rhythm as such; nor is the beat necessarily identical with the underlying pulse of a given piece of music, which may extend over more than a single beat. The number and relative positions of accented and unaccented beats furnish the basis of proper metric articulation, with the strongest accent usually falling on the first beat after the bar line. In Western musical notation the number of beats to the measure is indicated by the upper figure of the time signature at the beginning of a musical composition, while the time value of each separate beat (e.g., a quarter or eighth note) is indicated by the lower figure. *See also* metre; rhythm.

beat, in physics, the pulsation caused by the combination of two waves of slightly different frequencies. The principle of beats for sound waves can be demonstrated on a piano by striking a white key and an adjacent black key at the bass end of the keyboard. The resulting sound is alternately soft and loud—that is, having characteristic pulsations, or throbs, called beats. Toward the treble end of the keyboard, the beat frequency is greater because the difference in frequency of adjacent keys is more than at the lower end. The figure depicts two waves n_1 and n_2 with respective frequencies of 24 and 30 vibrations per second (hertz); the beat frequency N is their difference, 6 beats per second.

The phenomenon of beats is employed in various ways. For example, in the tuning of instruments, if a tuning fork and piano key of the same note are struck simultaneously and no beat is heard, then they are of identical pitch. Ultrasonic vibrations (having

Wave graphs illustrating how beat notes are produced by two different frequencies

Encyclopædia Britannica, Inc.

a frequency higher than is audible), such as the vocal sounds made by bats and dolphins, may be detected by superimposing a sound of different frequency to produce audible beats. The principle is also used in the superheterodyne reception of radio waves, in which a low-frequency signal from an oscillator is beat

against an incoming high-frequency radio signal to produce an intermediate (beat) frequency that can be amplified to produce audible signals.

Beat movement, also called **BEAT GENERATION**, American social and literary movement originating in the 1950s and centred in the bohemian artist communities of San Francisco's North Beach, Los Angeles' Venice West, and New York City's Greenwich Village. Its adherents, self-styled as "beat" (originally meaning "weary," but later also connoting a musical sense, a "beatific" spirituality, and other meanings) and derisively called "beatniks," expressed their alienation from conventional, or "square," society by adopting an almost uniform style of seedy dress, manners, and "hip" vocabulary borrowed from jazz musicians. Generally apolitical and indifferent to social problems, they advocated personal release, purification, and illumination through the heightened sensory awareness that might be induced by drugs, jazz, sex, or the disciplines of Zen Buddhism. Apologists for the Beats, among them Paul Goodman, found the joylessness and purposelessness of modern society sufficient justification for both withdrawal and protest.

Beat poets sought to liberate poetry from academic precisosity and bring it "back to the streets." They read their poetry, sometimes to the accompaniment of progressive jazz, in such Beat strongholds as the Coexistence Bagel Shop and Lawrence Ferlinghetti's City Lights bookstore in San Francisco. The verse was frequently chaotic and liberally sprinkled with obscenities but was sometimes, as in the case of Allen Ginsberg's *Howl* (1956), ruggedly powerful and moving. Ginsberg and other major figures of the movement, such as the novelist Jack Kerouac, advocated a kind of free, unstructured composition in which the writer put down his thoughts and feelings without plan or revision—to convey the immediacy of experience—an approach that led to the production of much undisciplined and incoherent verbiage on the part of their imitators. By about 1960, when the faddish notoriety of the movement had begun to fade, it had produced a number of interesting and promising writers, including Ferlinghetti, Gregory Corso, Philip Whalen, and Gary Snyder, and had paved the way for acceptance of other unorthodox and previously ignored writers, such as the Black Mountain poets and the novelist William Burroughs.

Beata Ridge, submarine ridge of the southern Caribbean Sea floor. The Beata Ridge trends south-southwest from Beata Cape on the island of Hispaniola and divides this part of the sea into two distinct areas, the Colombian and the Venezuelan abyssal plains. The Aruba Gap, a narrow connection between these two basins, truncates the Beata Ridge before it reaches the continental slope of South America.

beatification, in the Roman Catholic church, second stage in the process of canonization (q.v.).

Beatitude, any of the blessings said by Jesus in the Sermon on the Mount as told in the biblical New Testament in Matthew 5:3–12 and in the Sermon on the Plain in Luke 6:20–23. Named from the initial words (*beati sunt*, "blessed are") of those sayings in the Latin Vulgate Bible, the Beatitudes describe the blessedness of those who have certain qualities or experiences peculiar to those belonging to the Kingdom of Heaven.

The four blessings in the Sermon on the Plain

may have been the nucleus of the expanded nine in the Sermon on the Mount. In addition to these two compilations, other Beatitudes are found in other places in the New Testament (e.g., Matthew 11:6, Luke 7:23, and John 20:29).

In the Revised Standard Version, the nine Beatitudes of Matthew 5:3–12 read as follows:

Blessed are the poor in spirit, for theirs is the kingdom of heaven.

Blessed are those who mourn, for they shall be comforted.

Blessed are the meek, for they shall inherit the earth.

Blessed are those who hunger and thirst for righteousness, for they shall be satisfied.

Blessed are the merciful, for they shall obtain mercy.

Blessed are the pure in heart, for they shall see God.

Blessed are the peacemakers, for they shall be called sons of God.

Blessed are those who are persecuted for righteousness' sake, for theirs is the kingdom of heaven.

Blessed are you when men revile you and persecute you and utter all kinds of evil against you falsely on my account. Rejoice and be glad, for your reward is great in heaven, for so men persecuted the prophets who were before you.

The four Beatitudes of Luke 6:20–23 read as follows:

Blessed are you poor, for yours is the kingdom of God.

Blessed are you that hunger now, for you shall be satisfied.

Blessed are you that weep now, for you shall laugh.

Blessed are you when men hate you, and when they exclude you and revile you, and cast out your name as evil, on account of the Son of man! Rejoice in that day, and leap for joy, for behold, your reward is great in heaven; for so their fathers did to the prophets.

Beatles, the, English musical group that enjoyed worldwide popular adulation in the 1960s; the group ushered in the climactic phase of rock music (mid-1960s–70s).

The four members of the group, all born in Liverpool, were (James) Paul McCartney (b. June 18, 1942), John (Winston) Lennon (b. Oct. 9, 1940—d. Dec. 8, 1980, New York City), George Harrison (b. Feb. 25, 1943—d. Nov. 29, 2001, Los Angeles, Calif.), and Ringo Starr (original name Richard Starkey, b. July 7, 1940). The common perception that the Beatles came from humble origins may be more apocryphal than fact, although the band members in their early years of fame did little to downplay this myth-enhancing notion. In 1955 Lennon formed his first band, the Quarrymen, as an outlet for his burgeoning interest in rock and skiffle music. During a chance meeting at a village festival in 1957, McCartney impressed Lennon with his knowledge of rock songs and guitar chords and was asked to join the band; McCartney's younger friend, Harrison, was inducted into the lineup soon thereafter. The band performed under a variety of names, and with a succession of players on other instruments, before adopting the name the Beatles in 1960. For the next few years, they performed at clubs in Liverpool and in Hamburg, which served as a proving ground for popular musicians. Other members during this period included bassist Stuart Sutcliffe, who left the band in 1961 and died of a cerebral hemorrhage the following year, and drummer Pete Best, who was replaced by Ringo Starr in August 1962.

Band manager Brian Epstein secured for the Beatles a recording contract with Parlophone records in 1962. When the subsequent commercial release (1962–63) of such songs as "Love Me Do," "Please Please Me," "She

Loves You," and "I Want to Hold Your Hand" made them the most popular rock group in England, the British press coined the term "Beatlemania" to describe their corybanic fan following. In 1964 they attained even greater heights of fame in the United States and throughout the world. The first appearance on American television, for a Feb. 9, 1964, broadcast of *The Ed Sullivan Show*, was the most-watched TV program in history to that date, with an audience estimated at more than 70 million.

The Beatles' music, originally inspired by such U.S. performers as Chuck Berry, Elvis Presley, and Bill Haley, recaptured much of the freshness and excitement of the earliest days of rock and roll and, in combination with the simple but engaging lyrics of Lennon and McCartney, kept the group at the top of popularity charts for several years. They won recognition from the music industry in the form of awards for performances and songs and from Queen Elizabeth II, who named each of them to membership in the Order of the British Empire. Their long hair and tastes in dress proved influential throughout the world, as did their highly publicized experimentation with hallucinogenic drugs and Indian mysticism. With a solid financial basis—any single record or album of theirs was virtually guaranteed sales of more than a million—they felt free to experiment with new musical forms and arrangements. The result was a variety of songs ranging from ballads such as "Yesterday" to complex rhythm tunes like "Paperback Writer," from children's songs such as "Yellow Submarine" to songs of social comment, including "Eleanor Rigby." Their public performances ended in 1966.

In 1967 they produced "Sgt. Pepper's Lonely Hearts Club Band," an album conceived as a dramatic whole rather than as a collection of miscellaneous songs; it was novel, too, in its use of electronic music and in its being explicitly a studio work unreproducible on stage. Their prestige won attention to their experiments from their predominantly young audience, opening up new possibilities for musical expression that other performers were quick to

follow, and it attracted other, more serious listeners as well. The Beatles engaged in other artistic pursuits, together in two critically well-received films, *A Hard Day's Night* (1964) and *Help!* (1965), and separately. Finally, the pressures of their public lives, their growing outside interests, as well as their disparate personalities, led to the group's official dissolution in 1970. McCartney produced solo albums and in 1971 formed his own band, Wings; the album *Band on the Run* (1973) is generally regarded as their best recording. Harrison's *All Things Must Pass* (1970) and Starr's *Ringo* (1973) are also considered among the superior albums by former Beatles. Lennon released a series of albums throughout the early '70s, some in collaboration with his wife, the avant-garde artist Yoko Ono. His stark, soul-baring albums *John Lennon/Plastic Ono Band* (1970) and *Imagine* (1971) received high praise from critics. Soon after returning to the music scene in 1980 following a five-year hiatus, Lennon was murdered outside his New York City apartment.

Since Lennon's death, McCartney has remained the most prolific among former Beatles. His critically praised albums have included *Tug of War* (1982), *Flowers in the Dirt* (1989), and *Flaming Pie* (1997). He has also dabbled in classical composing with *Liverpool Oratorio* (1991), *Standing Stone* (1997), and *Working Classical* (1999). He was knighted by Queen Elizabeth II in 1997. Harrison's most notable achievement during the '80s and '90s was as a member of the Traveling Wilburys, an all-star "supergroup" in which he joined forces with Bob Dylan, Roy Orbison, Tom Petty, and Jeff Lynne; the group recorded two best-selling albums. Starr remained visible mostly through live performances with his "All-Starr Band," a touring unit with an ever-changing lineup of rock luminaries.

The most surprising and significant development of later years was the reuniting of the three surviving Beatles for the *Anthology* project, an ambitious effort that encompassed three double-CDs of Beatles outtakes (released 1995–96), a three-night television special in late 1995, a ten-hour video box set (1996), and the book *The Beatles Anthology* (2000). For this project, McCartney, Harrison, and Starr added vocals and instrumentation to two homemade recordings by Lennon to create the "new" Beatles songs "Free as a Bird" and "Real Love." Further proof of the Beatles' durability came with the release of *The Beatles 1* (2000), a collection of 27 of their hits that became one of the biggest-selling albums in music history and afforded the band wide exposure among another generation of fans. The Beatles were inducted into the Rock and Roll Hall of Fame in 1988, and Lennon (1994), McCartney (1999), and Harrison (2004) were also inducted as solo performers.

Beaton, Sir Cecil (Walter Hardy) (b. Jan. 14, 1904, London—d. Jan. 18, 1980, Broadchalke, Salisbury, Wiltshire, Eng.), photographer, important primarily for his decorative portraits of celebrated persons.

His interest in photography began when, as a young boy, he admired the portraits of society women and actresses circulated on picture postcards and in Sunday supplements of newspapers. His nurse taught him camera work and photographic printing, and, when he got his first camera at the age of 11, he imitated those portraits by costuming and posing his sisters.

In the 1920s, Beaton became a staff photographer for *Vanity Fair* and *Vogue*, magazines for which he did most of his work. He continued to develop a style of portraiture in which the sitter became merely one element of an overall decorative pattern dominated by backgrounds specially made of materials such as aluminum foil or papier-mâché. The results were alternately exquisite, exotic, or bizarre, but always chic. Many of these portraits are

Sir Cecil Beaton, 1968
Louanne Richards

gathered in his books *The Book of Beauty*, *Persona Grata*, and *It Gives Me Great Pleasure*.

During World War II, Beaton served in the Ministry of Information, covering the fighting in Africa and the Far East. But the most effective of his wartime photographs are those of the siege of Britain, published in the photographic book *Winged Squadrons* (1942). After the war Beaton resumed portrait photography, but his style was much less flamboyant. He also broadened his activities, designing the costumes and sets for a revival of Oscar Wilde's play *Lady Windermere's Fan* and the costumes for the musical comedy *My Fair Lady*. Beaton was knighted in 1972.

Beaton, David, Beaton also spelled BETHUNE (b. c. 1494—d. May 29, 1546, St. Andrews, Fife, Scot.), Scottish cardinal and statesman who promoted a close alliance between Scotland and France and who was an implacable opponent of the Scottish Reformation.

Beaton became archbishop of St. Andrews in 1539 and papal legate in Scotland in 1544. Beginning his political career in 1529, he eventually became the trusted counsellor of King

David Beaton, oil painting by an unknown artist; in a private collection

By courtesy of the Scottish National Portrait Gallery, Edinburgh

James V. He dissuaded the King from following the Reformist religious policies of Henry VIII of England and helped arrange James's two successive marriages to French noblewomen. After James's death in 1542, Beaton's opposition to the pro-English policies of James Hamilton, 2nd earl of Arran—regent for James's daughter, Mary Stuart—led to his imprisonment from January to April 1543. After Arran changed sides, Beaton became chancellor and virtual ruler of Scotland and initiated a persecution of Protestants. By blocking the proposed marriage of Mary Stuart to the future king Edward VI of England, he frustrated Henry's design for the

subjugation of Scotland and provoked the abortive English invasion of 1544.

Beaton had the popular reformer George Wishart burned at the stake on March 1, 1546, and in revenge a band of Protestant nobles murdered him in St. Andrews Castle.

Beaton, James, Beaton also spelled BETHUNE (b. 1470?—d. 1539, St. Andrews, Fife, Scot.), primate of Scotland from 1522 and chancellor from 1513 to 1526.

Uncle of the cardinal David Beaton, he was abbot of Dunfermline, Kilwinning, and Arbroath and successively archbishop of Glasgow (1509–22) and of St. Andrews (1522–39). As treasurer of Scotland (1505–09) and chancellor, he was a powerful figure during the minority of James V, when he was one of the regents allied with the party that wished to preserve Scottish ties with France. It was chiefly due to his efforts that James's first marriage, with a daughter of Francis I of France, was arranged. As primate, Beaton set an example for his nephew David Beaton by burning the first Scottish martyr, Patrick Hamilton, in 1528, and later three other reformers. David Beaton succeeded him as archbishop of St. Andrews.

Beatrice, the woman to whom the great Italian poet Dante dedicated most of his poetry and almost all of his life, from his first sight of her at the age of nine ("from that time forward, Love quite governed my soul") through his glorification of her in *La divina commedia*, completed 40 years later, to his death in 1321.

Beatrice is usually identified as Beatrice Portinari, the daughter of a noble Florentine family, who married Simone de' Bardi and died at the age of 24 on June 8, 1290. Dante wrote a chronicle of his relationship with her in *La vita nuova* (c. 1293; *The New Life*), a prose work interlaced with lyrics. Dante tells of his meetings with her, praises her beauty and goodness, describes his own intense reactions to her kindness or lack of it, tells of events in both their lives, and explains the nature of his feelings for her. *La vita nuova* also tells of the day when Dante was informed of her death and contains several anguished poems written after that event. In the final chapter, Dante vows to write nothing further of Beatrice until he writes "concerning her what hath not before been written of any woman." The promise is fulfilled in *La divina commedia*, which he composed many years later, expressing his exalted and spiritual love for Beatrice, who is his intercessor in the *Inferno*, his goal in traveling through *Purgatorio*, and his guide through *Paradiso*. At first sight of her, in *Purgatorio*, he is as overwhelmed as he was at the age of nine, and he is dazzled by her presence throughout the journey, until she ascends again to her place in heaven. This expression of sublimated and spiritualized love ends with Dante's total absorption in the divine.

Beatrice, city, seat of Gage county, in the Big Blue River valley, southeastern Nebraska, U.S. Established in 1857, it was named for the

Homestead National Monument of America near Beatrice, Neb.

Mitt and Joan Mann from CameraMann

daughter of one of its founders, Judge John Kinney. Beatrice is the seat of the Martin Luther Home for retarded children and the Beatrice State Developmental Center for the mentally ill. The Homestead National Monument of America, comprising the Dan Freeman farm, the first claim entered under the Homestead Act of 1862, is 4 miles (6 km) northwest. The city's economy depends on agriculture and light manufacturing. Inc. town, 1871; city, 1873. Pop. (1990) 12,354.

Beatrix, in full BEATRIX WILHELMINA ARM-GARD (b. Jan. 31, 1938, Soestdijk, Neth.), queen of The Netherlands from 1980.

The eldest of four daughters born to Princess (later Queen) Juliana and Bernhard of Lippe-Biesterfeld, Beatrix went into exile with her family when the Germans overran The Netherlands in World War II, and she spent the war years in Britain and Canada. When Juliana ascended the throne in 1948, Princess Beatrix received the title of heiress presumptive. From 1956 to 1961 she attended the State University of Leiden, studying mainly social sciences, law, and history.

Beatrix

By courtesy of the Royal Netherlands Embassy photograph, Max Kool

In 1965 her betrothal to a German diplomat, Claus George Willem Otto Fredrick Gcert von Amsberg, caused a national furor because of his past membership in the Hitler Youth and the German army, even though he had been cleared by an Allied court. On March 10, 1966, they were married, and the hostility apparently dimmed with the births of Willem-Alexander (1967), Johan-Frisco (1968), and Constantijn (1969), the first male heirs in the House of Orange since 1890.

In 1980 Queen Juliana abdicated, and Beatrix ascended the throne on April 30.

Beattie, James (b. Nov. 5, 1735, Laurencekirk, Kincardine, Scot.—d. Aug. 18, 1803, Aberdeen), Scottish poet and essayist, whose once-popular poem *The Minstrel* was one of the earliest works of the Romantic movement.

Beattie was a farmer's son. He graduated from Marischal College, Aberdeen, and became professor of moral philosophy there. At the age of 25, he published *Original Poems and Translations* (1760), which already showed a Romantic attitude toward nature. With his *Essay on the Nature and Immutability of Truth, in Opposition to Sophistry and Scepticism* (1770), a vigorous defense of orthodoxy against the rationalism of David Hume, he achieved fame. Addressed to the layman, the essay is based on social rather than metaphysical arguments and enjoyed wide popularity. The next year he published the first part of *The Minstrel*, a poem in the Spenserian stanza tracing the development of a poet's mind under the influence of nature. The second part was published in 1774. Although the setting is artificial and the moralizing tedious, the poem reflects the author's gentleness and sensitivity to natural beauty.

To his generation it was a revelation, and it influenced Robert Burns, Sir Walter Scott, and Lord Byron. This double success, as the defender of Christianity and the poet of a new

Beattie, detail of an engraving by William Ridley after a portrait by an unknown artist

By courtesy of the trustees of the British Museum, photograph, J.R. Freeman & Co. Ltd

era, opened all doors. Beattie was welcomed into Samuel Johnson's circle, sat for his portrait by Sir Joshua Reynolds, and was given a life pension by George III. Success brought little happiness. His wife became insane and his sons, one of whom was a promising poet, died young. Beattie, who published the elder son's writings with a memoir in 1794 (*Essays and Fragments in Prose and Verse*), was overwhelmed by the death of the younger son and never recovered his health.

Beatty, Clyde (Raymond) (b. June 10, 1903, Bainbridge, Ohio, U.S.—d. July 19, 1965, Ventura, Calif.), American trainer of wild animals, known for his "fighting act," designed to show his courage and mastery of the ferocious animals under his control. In one of the most daring acts in circus history, he mixed 40 lions and tigers of both sexes and also used dangerous combinations of tigers, lions, leopards, pumas, hyenas, and bears.

Beatty left home at the age of 18 to be a circus cage attendant. A year later he had his own animal act. From 1925 through 1934 he toured with the Hagenbeck-Wallace Circus. From 1931 through 1934 he appeared with the Ringling Bros. and Barnum & Bailey Circus in its New York City and Boston appearances. He also performed with the Cole Bros. Circus from 1935 through 1938. Beatty bought a circus in 1945 that later merged with Cole Bros. (1958) to form the largest tent show on the road in the United States at that time. He appeared in several motion pictures, including *The Big Cage* (1933) and *Ring of Fear* (1957).

Beatty, David, 1ST EARL BEATTY, VISCOUNT BORODALE OF WEXFORD, BARON BEATTY OF THE NORTH SEA AND OF BROOKSBY (b. Jan. 17, 1871, Howbeck Lodge, Stapleley, near Nantwich, Cheshire, Eng.—d. March 11, 1936, London), British admiral of the fleet, who commanded Britain's battle cruisers in the Battle of Jutland (1916).

Beatty was the son of Captain David Longfield Beatty. He began training as a naval cadet in 1884. From 1896 to 1898 he served in Egypt and the Sudan and then in 1900 in China during the Boxer Rebellion. He was promoted to captain at the early age of 29. In 1911, as a rear admiral, he became naval secretary to the first lord of the Admiralty, then Winston Churchill, and in 1913 was appointed to command the battle cruiser squadron.

Soon after the outbreak of World War I in August 1914, Beatty's naval force made a raid into the Helgoland Bight and sank three cruisers and one destroyer without loss. A few months later he intercepted the German

squadron under Admiral von Hipper in its third attempt on the English coastal towns. In a running fight, the rear German battle cruiser "Blücher" was sunk by British gunfire. This action was known as the Battle of the Dogger Bank.

In the Battle of Jutland on May 31, 1916, the battle cruiser fleet under Beatty was heavily engaged in a running fight with the German battle cruisers in the van under Hipper. Although Beatty's battle cruisers were superior in numbers, they proved unable to sustain the gunfire of the German ships, with the result that the "Indefatigable" and "Queen Mary" were sunk. Nevertheless, Beatty succeeded in his main object of drawing the combined German high sea fleet to the northward, whence Admiral Jellicoe, with the whole British grand fleet, was hastening to meet and engage it. The resulting engagement, the Battle of Jutland, proved indecisive. In December 1916, on Jellicoe's being appointed first sea lord, Beatty became commander in chief of the grand fleet.

From 1919 to 1927 Beatty served as first sea lord, and in this capacity he had to deal with the creation of a much smaller, modernized peacetime navy. In 1921 he was a British delegate at the Washington Conference on the limitation of armaments. He received the Knight Commander of the Bath in 1914 and the Order of Merit in 1919, when he was created Earl Beatty.

Beatty, Louise Dilworth: *see* Homer, Louise.

Beatus Rhenanus, also called BEATUS BILD (b. Aug. 22, 1485, Schlettstadt, Alsace—d. July 20, 1547, Strasbourg). German humanist, writer, and advocate of Christian reform whose editorial work helped to preserve a wealth of classical literature.

In 1505 Rhenanus received the master of arts degree from the University of Paris, where he studied Aristotelian philosophy. In 1511 he settled in Basel, Switz., where for the next 15 years he was one of the scholars working for the scholar-printer Johann Froben. Using recently discovered Rhineland manuscripts whenever possible, he edited the works of Tertullian (1521, first printed edition) and of the historians Curtius Rufus (1518), Velleius Paterculus (1520, first printed edition), Procopius, Jordanes, and Agathias (1531), Tacitus (1533), and, in collaboration with Sigismund Gelenius, those of Livy (1535). Influenced by Tacitus' study of German history and culture, Rhenanus in 1531 wrote the first extensive commentary on the origins and cultural achievements of Germanic peoples, *Rerum Germanicarum libri tres* ("Three Books on Germanic Matters").

At Basel, Rhenanus befriended Desiderius Erasmus, the Dutch humanist and critic of the medieval church. Both men sympathized with the principles of religious reform enunciated by Martin Luther, but when Protestant Reformers openly broke with the papacy, Rhenanus and Erasmus did not join them. In vain, Rhenanus attempted a reconciliation among Luther, Calvin, and Zwingli. He became the beneficiary of Erasmus' letters and treatises and was the first to catalog and edit the scholar's works (1540). His biography of Erasmus is valuable for its sensitive and detailed account of its subject.

Beau Bassin-Rose Hill, town, the second largest settlement on the island of Mauritius, in the western Indian Ocean. It lies on the western slope of the island, just south of Port Louis, the capital. The town was originally two separate communities, Beau Bassin and Rose Hill, but these have now merged into one, as a consequence of the rapidly increasing island population. The town is a busy

market and shopping centre and a residential suburb. The British Council Library is located in Beau Bassin-Rose Hill, along with some secondary schools and law courts. Pop. (1983 est.) 87,520.

Beau de Rochas, Alphonse(-Eugène) (b. April 9, 1815, Digne, Fr.—d. March 27, 1893, Vincennes), French engineer who originated the principle of the four-stroke internal-combustion engine. His achievement lay partly in his emphasizing the previously unappreciated importance of compressing the fuel-air mixture before ignition.

Beau de Rochas patented his idea in 1862 but did not build such an engine, leaving the development to others. As a result of the work of Nikolaus A. Otto of Germany and Étienne Lenoir of France, four-stroke engines almost completely displaced all other types of internal combustion engines and came into universal use.

Beaubourg, Centre (museum): *see* Pompidou Centre.

Beucaire, town, Gard département, Languedoc-Roussillon region, southeastern France. It lies along the Rhône River, opposite Tarascon, to which it is linked by several bridges. Called Ugerum by the Romans, its modern name comes from the medieval Belli Quadrum, which described the pine-clad rock rising abruptly from the river. Atop the rock is a castle built by the counts of Toulouse in the 13th century. Beaucaire suffered severely in the wars of religion when both the town and its castle were destroyed on the Cardinal de Richelieu's orders in 1632. The chief remains of the castle are its Romanesque chapel and the triangular keep, or stronghold. From its gardens there is an extensive view over the Rhône Delta and the Camargue. The most important buildings of the old town itself are the churches of St. Paul (15th century) and the hôtel de ville (1683).

The Château de Montmorency at Beaucaire, Fr.
Editions "La Cigogne"—Hachette

Beucaire was formerly an important river port, and for more than six centuries (13th–20th) the July Beaucaire fair was known throughout Europe, attracting as many as 300,000 visitors a year. Most goods were brought to Beaucaire by boat, however, and thus the market subsequently declined with the coming of the railways. Now a purely local event, the fair deals mainly in leather goods. The port, which is connected with Aigues-Mortes and the Canal du Midi, is still an outlet for wine and quarried stone produced in the vicinity. Pop. (1982) 10,622.

Beauce, region, northwestern France. It stretches southwest of Paris toward the Forêt d'Orléans. One of the great traditional granaries of France, Beauce is a flat, fertile, treeless limestone plain that was once planted mainly with wheat and sugar beets. Since the "Maize Revolution" of 1956, however, the countryside has been transformed—corn (maize), irrigated in the summer, now predominates. Petit Beauce is a similar section between the Loir and Loire rivers. Agriculture here is modern, completely mechanized, and yields very high production levels. The

church spires, grain silos, and water towers of the market towns thrust vividly out of the unrelieved flatness. Chartres, Châteaudun, Étampes, and Pithiviers are the main towns, all having agricultural markets.

Beauchamp, Alphonse de (b. 1767, Monaco—d. June 1, 1832, Paris), French historian whose many works were of popular interest; though they were based upon authentic documents, they were largely compilations and not wholly trustworthy.

Beauchamp became an officer in a Sardinian regiment (1784), but after the outbreak of war between Sardinia and the French republic in 1792 he refused to fight for what he considered an unjust cause and was imprisoned for about a year. Upon his release in 1793 he went to Paris and was employed in the office of the committee of general security. After taking part in the conspiracy that led to the fall and execution of the revolutionary leader Maximilien de Robespierre, Beauchamp was transferred in 1794 to the bureau of the minister of police in the capacity of superintendent of the press. His position gave him access to materials that he used in his first and most popular book, *Histoire de la Vendée et des Chouans*, 3 vol. (1806; "History of the Vendée and the Chouans"), an account of a counterrevolution in the west of France in the 1790s. Accused of revealing state secrets, he was relieved of his post; when the third edition appeared in 1809, he was banished from Paris and went to live in Reims. In 1811 he obtained permission to return and again received a government appointment.

Beauchamp wrote extensively for newspapers and magazines; his numerous biographical and historical treatises include biographies of Gen. Jean-Victor Moreau (1814) and Marshal Joachim Murat (1815), a history of the Napoleonic campaigns in Spain and Portugal (1819), and the edited and revised memoirs of Joseph Fouché (1824), the notorious police minister.

Beauchamp, Edward Seymour, Baron: *see* Hertford, Edward Seymour, earl of.

Beauchamp (of Hache), Edward Seymour, Viscount: *see* Somerset, Edward Seymour, 1st duke of.

Beauchamp, Kathleen Mansfield: *see* Mansfield, Katherine.

Beauchamp, Pierre, Beauchamp also spelled BEAUCHAMPS (b. 1636, Versailles, Fr.—d. 1705, Paris), French ballet dancer and teacher whose contributions to the development of ballet include the definition of the five basic positions of the feet.

In 1661 Beauchamp was appointed director of the Académie Royale de Danse, which in 1672 under the composer Jean-Baptiste Lully became a part of the Académie Royale de Musique, now called the Paris Opéra. As a dancer Beauchamp was noted for his dignified style and for his technique, particularly his pirouettes; in 1681 he appeared as Louis XIV's female partner in Lully's ballet *Le Triomphe de l'amour*. Considered the first choreographer of the Paris Opéra, Beauchamp arranged many court ballets and staged the dance sequences in several of Molière's plays as well as Lully's operas.

He also devised a system of dance notation that, though never published, was used by his pupils, one of whom was Raoul Feuillet, author of one of the earliest published systems of dance notation. With Lully and Louis XIV, Beauchamp was largely responsible for the increasing professionalization of ballet; through his teaching he helped raise technical standards so that specialized training became necessary and amateur dancers from the royal court were no longer the sole performers of ballet. He retired in 1687 following Lully's death.

Beauchamp, Richard: see Warwick, Richard Beauchamp, 5th Earl of.

Beauchamp, Thomas II de: see Warwick, Thomas II de Beauchamp, 4th Earl of.

Beauchemin, Nérée (b. Feb. 20, 1850, Yamachiche, Que., Can.—d. June 29, 1931, Trois-Rivières, Que.), French-Canadian poet and physician who is regarded as the leading poet of Le Terroir (French: "The Soil") school of Quebec regionalist poetry.

A traditionalist noted for his perfection of poetic form, Beauchemin drew on the religion and culture of Quebec and on a love of the Canadian landscape for his material. He published only two collections of poems, *Les Florissans matutinales* (1897; "The Morning Efflorescence") and *Patrie intime* (1928; "Intimate Birthplace").

Beaudesert, town, southeastern Queensland, Australia, on the Logan River. A livestock station was established there in 1842 and named after Beaudesert, Staffordshire, Eng. In 1863 the state's first cotton plantation was begun nearby, using Kanakas (South Sea islanders) as labourers. The community that developed became a town in 1876. Beaudesert lies along the Mount Lindesay Highway and a rail line to Brisbane (37 miles [60 km] north). It is now the centre for a district of dairy, fruit, pig, corn (maize), alfalfa (lucerne), and pumpkin farming. It has sawmills, butter works, and meatworks. The town, which has become increasingly important as a resort, holds an agricultural show in September. Pop. (1996) 3,734.

Beaufort, colonial seaport town, seat of Carteret county, southern North Carolina, U.S. It lies opposite Morehead City on Beaufort Harbor (there bridged) and is linked to the Atlantic by Beaufort Inlet, between Bogue and Shackleford Banks, which there receives the Newport River. Laid out in 1715 on the site of an Indian village (Wareiok), it was incorporated in 1723 and named for Henry Somerset, 2nd Duke of Beaufort (1684–1714). More than 100 colonial houses remain along narrow oak-lined streets, and the town's Old Burying Ground has interesting colonial markers. Beaufort Harbor was the base of the pirate Edward Teach (Blackbeard) and his ship *Queen Anne's Revenge*. In 1862, during the American Civil War, the town was occupied by Union troops to thwart blockade running through Beaufort Inlet. Tourism is now an economic mainstay. Fish meal is a leading product, and there is some boat building and lumber milling. The Hampton Mariner's Museum features maritime history exhibits. Pop. (2000) 3,771.

Beaufort, city, seat of Beaufort county, southern South Carolina, U.S. It is situated on Port Royal, one of the Sea Islands. Its harbour was first visited by Spaniards in 1521. Early settlement attempts in the area were made by French Huguenots (1562), English (1670), and Scottish Covenanters (1684). A fort was built by the British in 1711 and the town, founded about 1712, was named for Henry Somerset, 2nd Duke of Beaufort (1684–1714). It was occupied by invading forces during the Revolutionary and American Civil wars. Between wars it thrived on a plantation economy, exporting indigo, rice, and cotton. An antebellum atmosphere with numerous colonial buildings and historic landmarks has been preserved; these include the Episcopal church (built in 1724 and later remodeled) and the arsenal (built in 1795).

Mitt and Joan Mann from CameraMann

ing, garment manufacturing, lumber milling, tourism, and the U.S. Marine Corps Recruit Depot (on Parris Island, 5 miles [8 km] south) contribute to the city's economy. After 1959 Beaufort College (1852) became a branch of the University of South Carolina. The city is also the site of Beaufort Technical Education Center. The South Atlantic Sailing Regatta is held each July during the Beaufort Water Festival. Inc. 1803. Pop. (2000) 12,950.

Beaufort FAMILY, English family comprising the descendants of Edward III's son John of Gaunt, Duke of Lancaster, by his liaison with Catherine Swynford; the name derived from a lordship that Gaunt had held in France, the modern Montmorency-Beaufort near Bar-sur-Aube. The four offspring of the union were legitimized after their parents' subsequent marriage (1396) but were, by their half brother, Henry IV, expressly excluded from succession to the crown. The first generation comprised John (d. 1410), created Marquess of Somerset and Marquess of Dorset; Henry, cardinal bishop of Winchester; Thomas (d. 1426); and a sister, Joan. In the next generation, the possible claim to the throne of John's third (but then first surviving) son, Edmund Beaufort, 1st Duke of Somerset (d. 1455), precipitated the Wars of the Roses, in which the remaining male members of the house were killed. Margaret Beaufort, Edmund's niece, became the mother of the future king Henry VII.

Beaufort, Edmund: see Somerset, Edmund Beaufort, 1st Duke of.

Beaufort, François de Vendôme, duc de (duke of) (b. Jan. 16, 1616, Paris—d. June 25, 1669, Crete), French prince, one of the leaders of the Fronde (1648–53) and later admiral in the Mediterranean.

François de Vendôme, duc de Beaufort, engraving by J.-B. Humbelot, 17th century

By courtesy of the Bibliothèque Nationale, Paris

Beaufort won a high reputation in King Louis XIII's army during 1635–40 but linked himself with the opposition to Louis's minister, Cardinal de Richelieu, and became known as

a devoted partisan of the queen, Anne of Austria. In 1642 Beaufort fled to England to avoid interrogation about the conspiracy of Cinq-Mars, but upon Richelieu's death later that year he promptly returned to France. When Jules Mazarin became head of the government after Louis XIII's death in 1643, Beaufort, with others, plotted to supplant Mazarin but was arrested (September 1643) and imprisoned.

In May 1648 Beaufort escaped. In January 1649 he presented himself to the rebellious Parlement of Paris and became one of the generals of the first Fronde (Fronde of the Parlement, June 1648–March 1649). His handsome appearance and sincerity, as well as his sorties against the royal forces blocking Paris, won him the adoration of the populace.

After the Peace of Rueil (March 1649) he allied himself with J.F.P. de Gondi, later Cardinal de Retz, who obtained from the court Beaufort's designation as admiral. Gondi plotted with Anne and Mazarin the arrest of their rival, the Prince de Condé (January 1650). This event triggered the second Fronde, or Fronde of the Princes. After Condé's release and Mazarin's flight from Paris (February 1651), Beaufort organized the patrols around the Palais-Royal to prevent Anne from taking the young Louis XIV to join Mazarin. Thereafter Beaufort and Gondi became progressively estranged.

When Mazarin returned to France from exile (January 1652), Beaufort led the troops of Gaston, Duke d'Orléans, on Condé's side against the royalist forces. On July 30, 1652, he shot his sister Elisabeth's husband, Charles-Amédée de Savoie, Duke de Nemours, in a duel. Upon the collapse of the Fronde he was banished from Paris.

Restored to royal favour in 1658, Beaufort concerned himself with his duties as admiral. In 1664 he led the first French attempt on Algeria. Sent as admiral and as "general of the church" to Crete to help the Venetians in Candia against the Turks, he was lost in battle.

Beaufort, Gabrielle d'Estrées, duchesse de (duchess of): see Estrées, Gabrielle d'.

Beaufort, Henry (b. c. 1374—d. April 11, 1447, Winchester, Hampshire, Eng.), cardinal and bishop of Winchester and a dominant figure in English politics throughout the first 43 years of the 15th century. From about 1435 until 1443 he controlled the government of the weak King Henry VI.

Beaufort's father was John of Gaunt, Duke of Lancaster, son of King Edward III, and his mother was Catherine Swynford. During the reign of his cousin King Richard II, he became chancellor of Oxford University (1397) and bishop of Lincoln (1398).

With the accession of his half brother, Henry IV, in 1399, Beaufort was guaranteed a prominent place in politics. In 1403 he became chancellor of England and a royal councillor. In the following year he was appointed bishop of Winchester, one of the richest sees in the country. He then resigned his chancellorship and led the opposition within the council to Henry IV's chief minister, Thomas Arundel, archbishop of Canterbury. When Beaufort's nephew and political ally became king as Henry V in 1413, Beaufort again received the chancellorship. In order to climb still higher, the ambitious bishop sought a position with the papacy. Pope Martin V made him a cardinal and papal legate in 1417, but the king, fearing that Beaufort would be an all too effective spokesman for papal policies, soon forced him to resign these ecclesiastical offices.

Upon the accession of the infant Henry VI in 1422, however, Beaufort's talents were allowed to flourish. Already wealthy, he en-

riched himself further by lending money to the insolvent crown at high interest rates. Beaufort's financing of the state solidified his power; there was little his enemies could do against the man on whom the solvency of the government depended. Beaufort was made cardinal

Henry Beaufort, detail of a portrait on painted glass, c. 1633; in Queen's College, Oxford

of St. Eusebius and papal legate in 1426, a move for which he was continually attacked by his uncle, Humphrey, duke of Gloucester, who criticized him for simultaneously holding high positions in church and state. But Beaufort survived Gloucester's sniping, and with

the support of the young Henry VI, by the mid-1430s the government was firmly back in his hands. In 1435 and 1439 he attempted without success to negotiate an end to the Hundred Years' War (1337-1453) between England and France, and in 1443 he retired from politics. Beaufort was arrogant, self-serving, and greedy to the point of rapacity, but his political and financial acumen were unrivaled in the England of his time. His career is authoritatively recounted in L.B. Radford's *Henry Beaufort* (1908).

Beaufort, Henry: see Somerset, Henry Beaufort, 2nd duke of.

Beaufort scale, in full BEAUFORT WIND FORCE SCALE, scale devised in 1805 by Comdr. (later Admiral and Knight Commander of the Bath) Francis Beaufort of the British Navy for observing and classifying wind force at sea. Originally based on the effect of the wind on a full-rigged man-of-war, in 1838 it became mandatory for log entries in all ships in the Royal Navy. Altered to include observations of the state of the sea and phenomena on land as criteria, it was adopted in 1874 by the International Meteorological Committee for international use in weather telegraphy.

The Beaufort scale as originally drawn up made no reference to the speed of the wind, and various attempts, particularly during the 20th century, have been made to correlate the two. An attempt made in 1912 by the International Commission for Weather Telegraphers was interrupted by World War I. In 1921 G.C. Simpson was asked to formulate equivalents, which were accepted in 1926 by the Committee. In June 1939 the International Meteorological Committee adopted a table of values referring to an anemometer at a height of 6 metres (20 feet). This was not immediately adopted by the official weather services of the United States and Great Britain, which used the earlier scale referring to an anemometer at an elevation of 11 metres (36 feet). The Beau-

fort force numbers 13 to 17 were added by the U.S. Weather Bureau in 1955 (see Table).

The scale is now rarely used by professional meteorologists, having been largely replaced by more objective methods of determining wind speeds. Nevertheless, it is still useful in estimating the wind characteristics over a large area, and it may be used to estimate the wind where there are no wind instruments. The Beaufort scale also can be used to measure and describe the effects of different wind velocities on objects on land or at sea. As is evident in the Table, the terms for winds that are used by the U.S. National Weather Service sometimes differ from those used by other countries.

Beaufort Sea, outlying sea of the Arctic Ocean situated north of Canada and Alaska. It extends northeastward from Point Barrow, Alaska, toward Lands End on Prince Patrick Island, and westward from Banks Island to the Chukchi Sea. Its surface area is about 184,000 sq mi (476,000 sq km). The average depth is 3,239 ft (1,004 m) and the greatest depth 15,360 ft. It is named for the British rear admiral Sir Francis Beaufort.

The continental shelf is narrow, especially near and east of Point Barrow; it widens somewhat north of the Mackenzie River mouth but nowhere exceeds 90 mi (145 km). The usual depth is less than 210 ft, although the slope descends steeply to 5,000 or 6,500 ft in the sea's upper part. Small gravel islands or shallows are often found. The largest islands are west of the Mackenzie River mouth—Herschel (7 sq mi) and Barter (5 sq mi). Very small islands and banks are found in the Mackenzie River Delta.

The continental slope of the sea is cut by numerous submarine valleys. The Beaufort plateau, with depths from 6,500 to 10,000 ft, protrudes far into the sea, west of Banks Island. The geological structure of the bottom is that of a massive platform, and seismic data

The Beaufort scale of wind (nautical)

Beaufort number	name of wind	wind speed		description of sea surface	sea disturbance number	average wave height	
		knots	kph			ft	m
0	calm	<1	<1	sea like a mirror	0	0	0
1	light air	1-3	1-5	ripples with appearance of scales are formed, without foam crests	0	0	0
2	light breeze	4-6	6-11	small wavelets still short but more pronounced; crests have a glassy appearance but do not break	1	0-1	0-0.3
3	gentle breeze	7-10	12-19	large wavelets; crests begin to break; foam of glassy appearance; perhaps scattered white horses	2	1-2	0.3-0.6
4	moderate breeze	11-16	20-28	small waves becoming longer; fairly frequent white horses	3	2-4	0.6-1.2
5	fresh breeze	17-21	29-38	moderate waves taking a more pronounced long form; many white horses are formed; chance of some spray	4	4-8	1.2-2.4
6	strong breeze	22-27	39-49	large waves begin to form; the white foam crests are more extensive everywhere; probably some spray	5	8-13	2.4-4
7	moderate gale (or near gale)	28-33	50-61	sea heaps up and white foam from breaking waves begins to be blown in streaks along the direction of the wind; spindrift begins to be seen	6	13-20	4-6
8	fresh gale (or gale)	34-40	62-74	moderately high waves of greater length; edges of crests break into spindrift; foam is blown in well-marked streaks along the direction of the wind	6	13-20	4-6
9	strong gale	41-47	75-88	high waves; dense streaks of foam along the direction of the wind; sea begins to roll; spray affects visibility	6	13-20	4-6
10	whole gale (or storm)	48-55	89-102	very high waves with long overhanging crests; resulting foam in great patches is blown in dense white streaks along the direction of the wind; on the whole the surface of the sea takes on a white appearance; rolling of the sea becomes heavy; visibility affected	7	20-30	6-9
11	storm (or violent storm)	56-63	103-114	exceptionally high waves; small- and medium-sized ships might be for a long time lost to view behind the waves; sea is covered with long white patches of foam; everywhere the edges of the wave crests are blown into foam; visibility affected	8	30-45	9-14
12-17	hurricane	64 and above	117 and above	the air is filled with foam and spray; sea is completely white with driving spray; visibility very seriously affected	9	over 45	over 14

indicate a similarity between the crust of the Canadian Basin and of the oceans.

The coasts along the Beaufort Sea are low-lying and almost entirely covered with tundra. Only west of the Mackenzie River's mouth do spurs of the Brooks Range approach the coastline. Banks and Prince Patrick islands are also fairly low, maximum elevations being from about 900 to 2,450 ft.

The Beaufort Sea is under ice almost the year round; only in August and September does the ice break up, and then only near the coasts. Four water masses may be distinguished. The surface water mass is nearly 330 ft thick and ranges in temperature from 29.5° F (-1.4° C) in late summer to 28.8° F (-1.8° C) in winter. The subsurface water mass, formed by the waters of the Pacific Ocean and the Bering Sea flowing through the Bering Strait, is much warmer than the surface water and almost reaches the North Pole. The deep Atlantic water is the warmest of all, its temperature ranging from 32° to 34° F (0° to 1° C). The bottom water has temperatures ranging from 30.6° to 31.3° F (-0.4° to -0.8° C).

The direction of the surface and subsurface currents is closely related to the general current system of the Arctic Ocean. A clockwise water gyre flows north of the Beaufort Sea; the majority of the sea's currents are thus westward or southwestward. Only in the vicinity of the mouth of the Mackenzie River is an eastward current recorded.

The Mackenzie River deposits about 15 million tons of sedimentary material annually into the sea, including high concentrations of dolomite and calcium carbonate, which are found at great distances from the river delta. Gravel, pebble, and sand deposits, sometimes mixed with mud, are widely distributed on the continental shelf underlying the sea.

More than 70 phytoplankton species are found in the Beaufort Sea, but the total biomass is not large. Nearly 80 zooplankton species have been found, and the bottom fauna consists of nearly 700 species of polychaetes, bryozoans, crustaceans, and mollusks.

The chief settlement along the Beaufort Sea is Prudhoe Bay, Alaska, which is the centre of petroleum production on the coastal lowland known as the North Slope. The Trans-Alaska Pipeline carries crude oil south from Prudhoe Bay to Valdez, an ice-free port almost 800 miles (1,300 km) away on Alaska's southern coast. Fishing and sea hunting along the Beaufort Sea are for local supply only.

Beaufort Series, Permo-Triassic rock strata of the Karoo System that overlie strata of the Ecca Series and underlie rocks of the Stormberg Series. The Beaufort is especially well developed and has been extensively studied in South Africa. It is primarily composed of sandstones, with some shales and coal lenses (lens-shaped strata, thinner at the edges), and reaches a maximum thickness of about 3,000 m (10,000 feet).

Of special importance is the fact that the Beaufort Series contains a rich and diverse reptilian fauna, characterized by an almost unparalleled mammal-like therapsid assemblage. This assemblage has enabled the Beaufort to be further subdivided into six faunal zones, each of which is characterized by a particular and distinctive assemblage.

The boundary between the Lower and Upper Beaufort Series is recognized as the boundary between the Permian and Triassic systems (*i.e.*, about 245 million years ago). Although some therapsid groups did suffer reduction in the Triassic Period, faunal continuity is evident across the boundary, but close analysis discloses that there were critical shifts in faunal assemblages. The gorgonopsian therapsids (specialized sabre-toothed carnivores) became extinct at the end of the Permian, and the thecocephalians and dicynodonts ("two-tusked") were reduced; the more generalized cynodont

therapsids, however, remained abundant. Over time, the typical reptilian Mesozoic assemblages, characterized by archosaurs and thecodonts, gradually became dominant.

Beaufre, André (b. Jan. 25, 1902, Neuilly-sur-Seine, France—d. Feb. 13, 1975, Belgrade, Yugos.), French military strategist, an exponent of an independent French nuclear force.

In 1921 Beaufre entered the military academy at Saint-Cyr, where he met the future French president Charles de Gaulle, who was an instructor. In 1925 he saw action in Morocco against the Rif, who opposed French rule. Beaufre then studied at the École Supérieure de Guerre and at the École Libre des Sciences Politiques and was subsequently assigned to the French army's general staff. While serving as permanent secretary of national defense in Algeria in 1940–41 during World War II, he was arrested by the French Vichy regime, and after his release in 1942 he served in the Free French Army on several fronts until the end of the war in 1945. Beaufre then saw service in Indochina and Algeria and commanded the French forces in the Suez campaign against Egypt in 1956.

Beaufre later became chief of the general staff of the Supreme Headquarters, Allied Powers in Europe in 1958. He was serving as chief French representative to the permanent group of the North Atlantic Treaty Organization (NATO) in Washington in 1960 when he was named *général d'armée*.

During the early 1960s Beaufre came to prominence as a theoretical military strategist and as an advocate of the independent French nuclear force, which was a major priority of President Charles de Gaulle. Beaufre remained on good terms with the U.S. authorities who opposed nuclear proliferation but argued that French nuclear independence would give the West greater unpredictability vis-à-vis the Soviet Union and thus strengthen the deterrent capacity of the NATO alliance.

Beaufre was the author of many books, including *Introduction à la stratégie* (1963); *An Introduction to Strategy*; *Le Drame de 1940* (1965; 1940: *The Fall of France*); *L'O.T.A.N. et l'Europe* (1966; *NATO and Europe*); *Mémoires 1920–1940–1945* (1969); and *La Nature de l'histoire* (1974).

Beaugency, town, Loiret département, Centre région, north-central France. It lies on the right bank of the Loire River. The lords of Beaugency were powerful from the 11th to the 13th century. The first Council of Beaugency (1104) excommunicated Philip I, who had repudiated his queen and abducted and married the Count of Anjou's wife. The second council (1152) annulled the marriage of Louis VII with Eleanor of Aquitaine, who later married Henry Plantagenet (Henry II) and gave almost all of southwestern France to the English crown. Beaugency was an important bridge crossing of the Loire, and the town's restored 13th-century 26-span bridge is still in use. The town fell to the English four times in the Hundred Years' War and was delivered by Joan of Arc in 1429. In 1567 it was burned by the Protestants. In December 1870 the Germans defeated the French Army of the Loire northwest of the town. A nearby 15th-century château is a regional museum and has a massive 11th-century keep. Bedding and automobile seats are manufactured in the town. Pop. (1990) 7,102.

Beauharnais, Alexandre, Viscount (vicomte) de (b. May 28, 1760, Martinique—d. June 23, 1794, Paris, France), first husband of Joséphine (later empress of the French) and grandfather of Napoleon III; he was a prominent figure during the Revolution.

He married Joséphine Tascher de La Pagerie in Martinique in 1779. Known as a liberal noble, he rose after the French Revolution to important posts in France, presiding over

the Constituent Assembly in 1791 and serving with gallantry in the army. In 1793 he was named general in chief of the Army of the Rhine and, soon after, was nominated minister of war but declined the latter offer. During the Reign of Terror he was seized—in large measure, simply because he was a noble—and guillotined. By his marriage to Joséphine he fathered Eugène de Beauharnais and Hortense, who became the queen of Holland and the mother of Napoleon III.

Beauharnais, Eugène de (b. Sept. 3, 1781, Paris, France—d. Feb. 21, 1824, Munich, Bavaria [now in Germany]), soldier, prince of the French First Empire, and viceroy of Italy for Napoleon I, who was his stepfather (from 1796) and adoptive father (from 1806).

Eugène de Beauharnais, detail of a portrait by François Gérard, in the Château de Versailles, France

Giraudon - Art Resource

His father, the general Alexandre, Viscount de Beauharnais, was guillotined on June 23, 1794. The marriage of the general's widow, Joséphine Tascher de La Pagerie, to Napoleon Bonaparte on March 9, 1796, was at first resented by Eugène and his sister Hortense, but their stepfather proved kind and genuinely interested in their welfare. Eugène in turn was a useful military aide to Napoleon, particularly in the coup d'état of 18 Brumaire (Nov. 9, 1799) and the victory over the Austrians at Marengo (June 14, 1800). In 1804 Eugène received the title of prince and was appointed archchancellor of state.

In 1805, when Napoleon proclaimed himself king of Italy, Eugène became his viceroy there. He reorganized public finances and the civil service, built roads, and introduced the French legal system.

In the war against Austria in 1809, Eugène, as commander of the Italian army, won an important victory at Raab (Győr) and fought well at Wagram. He also distinguished himself in Russia in 1812 and in Germany the following year. In 1814 he held out as long as possible in Italy against the Austrians and the Neapolitans, resisting their attempts to induce him to desert Napoleon. Finally, however, he had to conclude the armistice of Schiarino-Rizzino (April 16, 1814). He then retired to Munich, to the court of the Bavarian king Maximilian I, whose daughter Amelia Augusta he had married in 1806 and who gave Eugène the title of Duke von Leuchtenberg.

Beauharnais, Eugénie-Hortense de: *see* Hortense.

Beauharnois, city, Montérégie region, southern Quebec province, Canada, on the southern shore of Lac Saint-Louis—a widening of the St. Lawrence River—at the mouth of the

Saint-Louis River. Founded in 1819, it was named for the Marquis de Beauharnois, governor of New France and owner of the seigneurie in which the city developed. Beauharnois, 22 miles (35 km) southwest of Montreal city, together with the village of Melocheville, is now an industrial centre and rail hub on the east outlet of Beauharnois Canal—a major link in the St. Lawrence Seaway. A large hydroelectric station at the Beauharnois Dam west of the city supplies power for much of the province and fosters local industries, which include steel and paper milling, printing, and the manufacture of aluminum, metal alloys, chemicals, furniture, sashes, and doors. Pop. (1991) 6,449.

Beaujeu, Pierre, Seigneur de: see Bourbon, Pierre II, 7^e duc de (7th duke of).

Beaujolais, ancient province of France, of which Beaujeu and Villefranche were successively the capital and which corresponded in area to much of the modern *département* of Rhône, with a small portion of Loire. Crossed by the mountains of Beaujolais (Monts du Beaujolais) and bounded on the east by the Saône River, it is a fertile region noted for its fine wines, marketed at Belleville.

From the 10th to the 13th century, the seigneurs (lords) of Beaujeu gradually enlarged their possessions into a considerable feudal lordship. Édouard I de Beaujeu, marshal of France, fought at the Battle of Crécy (1346) and perished in the Battle of Ardes in 1351. His son died without issue in 1374 and was succeeded by his cousin Édouard II, who gave his estates of Beaujolais and Dombes to Louis II, Duke de Bourbon, in 1400. In 1531 the province was united to the French crown, but in 1560 King Francis II gave it back to the house of Bourbon-Montpensier, from which it passed to that of Orléans. The title Count (comte) de Beaujolais was borne by Louis-Charles d'Orléans, youngest son of Philippe Egalité.

Beaujolais, region of east-central France, just east of the Massif Central and west of the Saône River. Most of the region is located within Rhône *département*. The local relief is broken and culminates in Mount Saint-Rigaud, 3,310 feet (1,009 m); well-wooded, the region supports a local forestry industry. Small family farmsteads characterize the region west of Mount Saint-Rigaud. To the east of it, the limestone escarpments of the Côte Beaujolaise, drier in climate, support a world-famous red wine industry.

Beaujolais, one of the most widely drunk red wines in the world, produced in the Beaujolais region of southern Burgundy, France. The wine is made from the Gamay grape; it is medium red in colour, with a relatively light body and a fruity, refreshing taste.

Wines from the southern part of the region are simply called Beaujolais. Wines from certain areas in the northern part of the region with the appellation Beaujolais-Villages generally have more colour and body and are considered to be superior in quality. Ten villages in the north produce the best Beaujolais, classified as Grands Crus; notable among them are Moulin-à-Vent and Fleurie.

The popularity of Beaujolais increased rapidly in the latter half of the 20th century. It became fashionable to drink it shortly after harvest; this very young wine is called Beaujolais nouveau. By the early 1990s more than half the production was drunk as nouveau. Beaujolais, and particularly Beaujolais nouveau, is often served chilled.

Beaujoyeux, Balthazar de, also spelled BALTHASAR DE BEAUJOYEUX, Italian BALTAZARINI DI BELGIOIOSO (b. early 16th century, Piedmont region, Italy—d. 1587, Paris, France), composer and choreographer who influenced the development of theatrical dance and opera.

In 1555 the Duke de Brissac brought Beaujoyeux to the French court of Queen Catherine de Médicis as a violinist. He became valet de chambre to the royal family and unofficially arranged court festivals.

For the marriage of the Queen's sister, Marguerite de Lorraine, to the Duke de Joyeuse, Beaujoyeux staged the *Ballet comique de la reine*, a 5½-hour spectacle costing 3,600,000 gold francs. Presented on Oct. 15, 1581, the ballet portrayed the vanquishing of Circe by the King of France. Considered the first ballet of which there is a complete printed account, it included poetry, spoken dialogue, singing, and orchestral music as well as dance. Beaujoyeux's choreography, performed by members of the court, incorporated overall structural patterns and a geometric arrangement of the dancers; these innovations contributed to the development of theatrical dance. As a precursor of opera, which developed about 20 years later in Italy, the work was unique among court entertainments in that it was unified by a plot. It also contained passages of sung recitative accompanied by simple chords, a style fully developed (with more emotional power) in the early Italian operas.

Although its tremendous cost prohibited repeat performances of the *Ballet comique de la reine*, imitative and similar ballets were later produced, particularly after the publication of the ballet's libretto in 1582. Its impact was diplomatic as well as aesthetic, and monarchs of other lands hastened to emulate it with lavish court ballets of their own that, a century later, would metamorphose into the beginnings of professional ballet.

Beaumarchais, Pierre-Augustin Caron de (b. Jan. 24, 1732, Paris, France—d. May 18, 1799, Paris), French author of two outstanding comedies of intrigue that still retain their freshness, *Le Barbier de Séville* (1775; *The Barber of Seville*, 1776) and *Le Mariage de Figaro* (1784; *The Marriage of Figaro*, 1785).

Pierre Beaumarchais, oil painting by Jean-Marc Nattier
Giraudon—Art Resource

Although Beaumarchais did not invent the type character of the scheming valet (who has appeared in comedy as far back as Roman times), his Figaro, hero of both plays, became the highest expression of the type. The valet's

resourcefulness and cunning were portrayed by Beaumarchais with a definite class-conscious sympathy. *Le Barbier de Séville* became the basis of a popular opera by the Italian composer Gioacchino Rossini. The second play, which inspired W.A. Mozart's opera *Le nozze di Figaro* (1786), is openly critical of aristocratic privilege and somewhat anticipates the social upheavals of the Revolution of 1789.

Beaumarchais's life rivals his work as a drama of controversy, adventure, and intrigue. The son of a watchmaker, he invented an escapement mechanism, and the question of its patent led to the first of many legal actions. For his defense in these suits he wrote a series of brilliant polemics (*Mémoires*), which made his reputation, though he was only partly successful at law.

After 1773, because of his legal involvements, Beaumarchais left France on secret royal missions to England and Germany for both Louis XV and Louis XVI. Despite growing popularity as a dramatist, Beaumarchais was addicted to financial speculation. He bought arms for the American revolutionaries and brought out the first complete edition of the works of Voltaire. Of his dramatic works, only his two classic comedies were to have lasting success. Because of his wealth, he was imprisoned during the French Revolution (in 1792), but, through the intervention of a former mistress, he was released.

Beauménard, Mademoiselle (French actress): see Bellecour, Madame.

Beaumont, city, seat (1838) of Jefferson county, southeastern Texas, U.S., at the head of navigation on the Neches River (an arm of the Sabine-Neches Waterway), 85 miles (137 km) east-northeast of Houston. With Port Arthur and Orange, it forms the "Golden Triangle" petrochemical and industrial complex.

The Lucas Gusher Monument, Spindletop Park, Beaumont, Texas

By courtesy of the Texas Highway Department

In 1825 Noah Tevis founded the settlement of Tevis Bluff; in 1835 he sold 50 acres (20 hectares) of land for a townsite to Henry Millard, who supposedly named it for his brother-in-law, Jefferson Beaumont. Lumbering, rice cultivation, and shipping were early activities, and in the 1890s five railroads came through the site. Spindletop, the first major oil field in Texas, was discovered nearby when the Lucas Well blew in 1901, and a typical boom city sprang up. After the completion of a deep-river channel (1916) Beaumont became a key port of the Texas petrochemical industry with large oil refineries and shipbuilding, grain storage, and rice-processing facilities. Salt and sulfur domes are also worked in the area. Lamar University (1923) is in the city. The Lucas Gusher Monument and the reconstructed Gladys City-Spindletop Boomtown commemorate the oil strike. Inc. town,

Beaumont, Charles, chevalier d'Éon de; see Éon de Beaumont, Charles-Geneviève-Louis-Auguste-André-Timothée), chevalier d'.

Beaumont, (Jean-Baptiste-Armand-Louis-Léonce) Élie de (b. Sept. 25, 1798, Canon, Fr.—d. Sept. 21, 1874, Canon), geologist who

Élie de Beaumont, medallion by David d'Angers
H Roger-Viollet

prepared the great geological map of France in collaboration with the French geologist Ours Pierre Dufrénoy.

Beaumont was appointed professor of geology at the École des Mines, Paris, in 1835. He was engineer in chief of mines in France from 1833 to 1847, when he was appointed inspector general. In 1861 he became vice president of the Conseil-Général des Mines. In his work *Notice sur les systèmes des montagnes* (1852; "Review of Mountain Systems"), he summarized his theories on the origin of mountain ranges, attributing them to cataclysmic upheavals caused by the slow cooling and shrinking of the Earth.

Beaumont, Francis (b. c. 1584, Grace-Dieu, Leicestershire, Eng.—d. March 6, 1616, London), English Jacobean poet and playwright

Francis Beaumont, engraving by George Vertue, 1729

By courtesy of the trustees of the British Museum, photograph, J.R. Freeman & Co. Ltd

who collaborated with John Fletcher (*q.v.*) on comedies and tragedies between about 1606 and 1613 or 1614.

The son of Francis Beaumont, justice of common pleas of Grace-Dieu priory, Charnwood Forest, Leicestershire, Beaumont entered Broadgates Hall (later Pembroke College), Oxford, in 1597. His father dying the following year, he abruptly left the university without a degree and later (November 1600) entered London's Inner Temple—again, however, without much enthusiasm for legal studies, becoming instead a frequenter of the Mermaid tavern.

In 1602 there appeared the poem *Salmacis and Hermaphroditus*, generally attributed to Beaumont, a voluptuous and voluminous expansion of the Ovidian legend, marked by a long-winded and fantastic diffusion of episodes and conceits. At the age of 23 he prefixed to Ben Jonson's *Volpone* (1607) some verses in

honour of his "dear friend" the author. John Fletcher contributed verses to the same volume, and, by about this time, the two were collaborating on plays for the Children of the Queen's Revels. According to John Aubrey, a 17th-century memorialist, "They lived together on the Banke side, not far from the Play-house, both batchelors; lay together . . .; had one wench in the house between them . . .; the same clothes and cloake, &c., betweene them" (*Brief Lives*). Their collaboration as playwrights was to last for some seven years: in 1613 Beaumont married an heiress, Ursula Isley of Sundridge in Kent, retired from the theatre, died in London in 1616, and was buried in Westminster Abbey.

As a playwright, Beaumont remains a shadowy figure whose contributions to drama are not as clear as Fletcher's. Of the 54 plays with which their names or the names of their other collaborators are associated, only one was written by Beaumont alone and only 10 were written by Beaumont and Fletcher in collaboration; three others were written with a third collaborator, Philip Massinger.

Beaumont's unaided work, *The Knight of the Burning Pestle*, parodies a then popular kind of play—sprawling, episodic, with sentimental lovers and chivalric adventures. It opens with The Citizen and his Wife taking their places on the stage to watch "The London Merchant"—itself a satire on the work of a contemporary playwright, Thomas Dekker. Citizen and Wife interrupt, advise, and insist that their apprentice should take a leading part. In it, Beaumont indulgently satirizes bourgeois naïveté about art. The play, however, was not immediately popular.

In the three masterpieces of the Beaumont and Fletcher collaboration—*The Maidens Tragedy*, *Phylaster*, and *A King and No King*—Beaumont is assumed to have been the controlling hand, since the plays manifest a firmer structure than Fletcher's single or collaborative efforts. Attempts to disentangle the various shares of Beaumont and Fletcher in any given work are complicated by the fact that Beaumont sometimes revised scenes by Fletcher, and Fletcher edited some of Beaumont's work.

MAJOR WORKS. The dates of composition given here for the individual plays are largely conjectural.

Poems (1640), with additions (1653).
Play by Beaumont unaided. The Knight of the Burning Pestle (1607).

Plays by Beaumont and Fletcher in collaboration. The Woman Hater (1606); *Phylaster* (1608-10); *The Coxcombe* (1608-10); *The Maidens Tragedy* (1608-11); *The Captaine* (1609-12); *A King and No King* (1611); *Cupids Revenge* (1611); *The Scornful Ladie* (1613-17); *Loves Pilgrimage* (?1616); *The Noble Gentleman* (c. 1625).

Plays by Beaumont, Fletcher, and Philip Massinger. Thierry and Theodoret (date of composition unknown, printed 1621); *The Beggars Bush* (?1622); *Loves Cure* (?revised 1625).

Beaumont, Sir John, 1ST BARONET (b. 1583, Grace-Dieu?, Leicestershire, Eng.—d. April 1627, London?), English poet who cultivated literary "order" and precision, together with natural simplicity of style. He wrote a drama for James I, *The Theatre of Apollo* (1625); a poem about the Battle of Bosworth (fought in 1485) and other poems to James I and Charles I; and elegies on the poet's friends and relatives, published posthumously.

Beaumont was an elder brother of Francis, the dramatist. After studying at Oxford University (1597), he studied law but settled at Grace-Dieu Priory, from 1605, because he was a Roman Catholic recusant. Through court connections he was made a baronet in January 1627.

Beaumont, William (b. Nov. 21, 1785, Lebanon, Conn., U.S.—d. April 25, 1853, St. Louis, Mo.), U.S. army surgeon, the first per-

son to observe and study human digestion as it occurs in the stomach.

On June 6, 1822, while serving at Fort Mackinac (now in Michigan), Beaumont was sum-

William Beaumont, painting by Chester Harding; in the collection of the New York Academy of Medicine
By courtesy of the New York Academy of Medicine

moned to Michilimackinac to treat Alexis St. Martin, a 19-year-old French-Canadian trapper, who had been wounded at close range by a shotgun blast. The shot had removed a portion of the abdominal wall and left a perforation in the anterior wall of the stomach. During the year it took for the wound to heal, the aperture in the abdominal wall never sealed but was held closed by the inversion of tissue surrounding it. As a result, a gastric fistula, or passage, remained. When it was depressed with the finger, Beaumont could view the activities occurring within St. Martin's stomach.

Three years after the near-fatal accident Beaumont began physiological studies of St. Martin's stomach. He believed that the process of digestion was essentially a chemical process carried out by chemicals in the stomach. Determined to prove this hypothesis, he collected samples of gastric juice and sent them for analysis to several chemists, who established the presence of free hydrochloric acid in the juice. Beaumont also reported on the effects of different foods on the stomach, finding that vegetables were less digestible than other foods, that milk coagulated prior to the onset of digestion, and that cold gastric juice had no effect upon food. In 1833 he published *Experiments and Observations on the Gastric Juice and the Physiology of Digestion*.

Beaumont's experiments threw new light upon the nature of gastric juice and the digestive process in general, and established alcohol as a cause of gastritis (inflammation of the stomach's mucous membrane).

Beaune, town, Côte-d'Or département, Bourgogne region, east central France, on the Bouzaise River, southwest of Dijon. Settled since prehistoric times, it prospered under the Romans as a centre for cattle and viticulture and is still the wine capital of Burgundy. In the 3rd and 4th centuries it was fortified against Germanic invasions and was the seat of a count under Charlemagne. The first Burgundian Parliament (Jours Généraux) met at Beaune in 1227, and the dukes of Burgundy resided there. France took the town from the Burgundians in 1478. During the religious wars Beaune expelled the Catholic

League's partisans and welcomed Henry IV. The town's prosperity declined with the flight of the Huguenot weavers and leather workers at the revocation of the Edict of Nantes in 1685, but its fortunes revived with the wine trade of the 18th century. Beaune has given its name to part of the celebrated wine country of Burgundy, the limestone hills (*côtes*) of the Côte de Beaune.

The town, circular in shape, is still partly protected by walls that retain 13th- and 16th-century towers. In other parts, promenades have replaced the ramparts and separate town from suburb. Two towers of the dismantled château survive. The Hôtel-Dieu (1443), which owns some of the finest vineyards, remains operational; one of its wards is a museum for Rogier van der Weyden's great altarpiece, "The Last Judgment," commissioned by the hospital's builder, Nicolas Rolin, last chancellor of the Burgundian dukes. The Collégiale

The medieval hospital of Saint-Esprit, Beaune, Fr.
Jean Feuille

Notre-Dame (begun in the 12th century) has a beautiful series of 15th-century tapestries. The Musée du Vin de Bourgogne is a wine museum.

The regional wine sales (including Beaune, Pommard, Volnay, and Meursault) are in Beaune. Pop. (1990) 22,171.

Beauport, city, Québec region, southeastern Quebec province, Canada. A northeastern suburb of Quebec city, it is situated on the north bank of the St. Lawrence River. In 1634 Robert Giffard established there one of the first European settlements in Canada. The name Beauport probably comes from the bay in the historic province of Brittany in France. In 1976 the surrounding towns of Courville, Giffard, Montmorency, Saint-Michel-Archange, Sainte-Thérèse-de-Lisieux, and Villeneuve were incorporated into Beauport. The city is largely residential, with some light industry. Pop. (1991) 69,158.

Beauregard, P.G.T., in full PIERRE GUSTAVE TOUTANT BEAUREGARD (b. May 28, 1818, near New Orleans, La., U.S.—d. Feb. 20, 1893, New Orleans), Confederate general in the American Civil War.

Beauregard graduated from the U.S. Military Academy at West Point, N.Y. (1838) and served in the Mexican War (1846–48). After the secession of Louisiana from the Union (January 1861), Beauregard resigned from the U.S. Army and was commissioned a brigadier general in the Confederate Army; he eventually became one of the eight full generals of the Confederacy and participated in almost every important theatre of the war. He commanded the forces that bombarded Fort Sumter, S.C., was on the field at the First Battle of Bull Run (1861), and assumed command at Shiloh after the death of General Albert Sidney Johnston (1862). He later conducted the defense of Charleston and toward the end of the war defended the southern approaches to Richmond. Though he proved to

Beauregard
By courtesy of the National Archives, Washington, D.C.

be a capable combat commander and often displayed sound strategic sense, Beauregard revealed serious deficiencies as a general officer. His penchant for questioning orders bordered on insubordination.

After the war he returned to Louisiana, where he became a railroad director, adjutant general of the state, and manager of the Louisiana lottery. His last years were marked by bitter quarrels with Joseph E. Johnston, Jefferson Davis, and William Preston Johnston over their published accounts of the war and Beauregard's role in it. Beauregard was the author of *Principles and Maxims of the Art of War* (1863) and *Report on the Defense of Charleston* (1864).

beauty bush (*Kolkwitzia amabilis*), ornamental flowering shrub of the family Caprifoliaceae, native to central China; it is the only member of its genus. Its paired, bell-like flowers, one above the other, range in colour from

Beauty bush (*Kolkwitzia amabilis*)
J.C. Allen and Son

white to pink and are massed at the branch tips.

The early summer flowers of the beauty bush are followed by brown, bristly fruits that persist on the bush into winter. The leaves are oval, and the maximum height of the shrub is about 2.5 m (8 feet).

beauty leaf, also called ALEXANDRIAN LAUREL, or DILO OIL TREE (*Calophyllum inophyllum*), ornamental plant, of the family Clusi-

Beauty leaf (*Calophyllum*)
Douglas David Dawn

aceae, native to tropical Asia and cultivated as an ornamental for its handsome leathery, glossy foliage and fragrant white flowers. Beauty leaf often is grown near the ocean for its resistance to salt spray and its leaning habit. The multibranched, often gracefully crooked tree reaches 16–19 m (50–60 feet). It produces upright sprays of yellow-centred flowers on white stalks. Dilo, a strongly scented medicinal oil, is extracted from the seeds.

beauty-of-the-night (plant): see four-o'clock.

Beauvais, town, capital of Oise département, Picardie région, northern France, at the juncture of the Thérain and Avelon rivers, north of Paris. Capital of the Bellovaci tribe, it was first called Caesaromagus after its capture by Caesar in 52 BC, and later Civitas de Bellovacis. In the 9th century it became a countship, which passed to the bishops who became peers of France in 1013. The Cathedral of Saint-Pierre was ambitiously conceived as the largest in Europe; the apse and transept have survived several collapses, and the choir (157 ft [48 m]) remains the loftiest ever built. The whole dates from the 10th to the 16th century, with the Romanesque church of the Basse Oeuvre standing in the space planned for the cathe-

The Cathedral of Saint-Pierre and the towers of the Palace of Justice, Beauvais, France
Editions "La Cigogne"—Hachette

dral nave. Other public buildings date from the 14th century to the 16th. An annual June celebration commemorates Jeanne Hachette, who seized a standard from besieging Burgundian troops in 1472. Marshal Ferdinand Foch directed battle operations from the town hall in 1918. Badly bombed in 1940, Beauvais was rebuilt on the original plan. The Beauvais tapestry factory, which in the 17th and 18th centuries produced many tapestries of exceptionally high quality, was destroyed in World War II. The city's modern manufactures include carpets, blankets, felt, chemicals, and tractors. Pop. (1982) 51,542.

Beauvais tapestry, any product of the tapestry factory established in 1664 in Beauvais, Fr., by two Flemish weavers, Louis Hinnart and Philippe Behagle. Although it was under the patronage of Jean-Baptiste Colbert, the finance minister to Louis XIV, and was subsidized by the state, the Beauvais works was a private enterprise.

Tapestries were made at Beauvais for the wealthy bourgeoisie and nobility of France, as well as for export. The royal tapestries for the king were made exclusively at the Gobelins factory. In the 19th century the quality began to deteriorate and production declined.

Beauvoir, Simone (Lucie-Ernestine-Marie-Bertrand) de (b. Jan. 9, 1908, Paris—d. April 14, 1986, Paris), French writer and feminist, a member of the intellectual fellow-

books on China (*La Longue Marche: Essai sur la Chine* [1957]; *The Long March*) and the United States (*L'Amérique au jour de jour* [1948]; *America Day by Day*); and a number of essays, some of them book-length, the best known of which is *The Second Sex*.

Several volumes of her work are devoted to autobiography. These include *Mémoires d'une jeune fille rangée* (1958; *Memoirs of a Dutiful Daughter*), *La Force de l'âge* (1960; *The Prime of Life*), *La Force des choses* (1963; *Force of Circumstance*), and *Tout compte fait* (1972; *All Said and Done*). This body of work, beyond its personal interest, constitutes a clear and telling portrait of French intellectual life from the 1930s to the 1970s.

In addition to treating feminist issues, de Beauvoir was concerned with the issue of aging, which she addressed in *Une Mort très douce* (1964; *A Very Easy Death*), on her mother's death in a hospital, and in *La Vieillesse* (1970; *Old Age*), a bitter reflection on society's indifference to the elderly. In 1981 she wrote *La Cérémonie des adieux* (*Adieux: A Farewell to Sartre*), a painful account of Sartre's last years.

Simone de Beauvoir revealed herself as a woman of formidable courage and integrity, whose life supported her thesis: the basic options of an individual must be made on the premises of an equal vocation for man and woman founded on a common structure of their being, independent of their sexuality.

Beaux-Arts, École des, in full *ÉCOLE NATIONALE SUPÉRIEURE DES BEAUX-ARTS*, school of fine arts founded (as the Académie Royale d'Architecture) in Paris in 1671 by Jean-Baptiste Colbert, minister of Louis XIV; it merged with the Académie Royale de Peinture et de Sculpture (founded in 1648) in 1793. The school offered instruction in drawing, painting, sculpture, architecture, and engraving to students selected by competitive examination; since 1968, architecture is no longer taught there.

Beaux-Arts architectural design has been particularly influential. About 1935 the system of the Paris school began to be displaced by an essentially German curriculum stemming from functionalism and machine-inspired theory taught at the Bauhaus.

Beaux-Arts style (architecture): see Second Empire style.

Beaver, a small, Athabaskan-speaking Indian tribe living in the mountainous riverine areas of northern Alberta. In the early 18th century they were driven westward into this area by the expanding Cree, who, armed with guns, were exploiting the European fur trade. The name Beaver derives from the Indian name for their main site, Tsades, or River of Beavers, now called the Peace River, where the remaining members of the tribe live today.

The Beaver were scattered in many independent nomadic bands, each with its own hunting territory. They hunted moose, caribou, beavers, and bison; lived in skin-covered tepees in winter and brush-covered tepees or lean-tos in summer; and traveled mainly by canoe. Little is known of their religion or ceremony, other than their belief in guardian spirits and in an afterlife.

beaver (*Castor*), any member of the aquatic rodent family Castoridae (order Rodentia), highly prized for its fur and well known for its dam-building activities. Beavers are thickset animals with small, rounded ears, short legs, and large, webbed hind feet. They may grow to about 1.3 metres (4 feet) long, including the flat, scaly, 0.3-m tail, and may weigh more than 27 kilograms (60 pounds). Both sexes possess musk glands that produce a liquid, castoreum, used in perfumes.

The coat, consisting of a dense, fine underfur overlaid with many coarse guard hairs, is glossy tan to dark brown above, paler below.

The search for this fur stimulated some of the early 19th-century explorations of western North America; the pelts were a standard medium of exchange.

Beaver (*Castor canadensis*)

Karl Maslowski

New World beavers (*C. canadensis*) once ranged from northern Mexico to the Arctic. Extensive trapping has reduced their numbers. Old World beavers (*C. fiber*) are now found only in the Elbe and Rhône drainages of Europe. Both species are now protected.

Beavers show preference for streams and small rivers but also live around the margins of forest-edged lakes. Their dams of sticks, stones, and mud may last for years, impounding pools that sometimes cover many acres. Eventually, silt fills the ponds and produces meadows.

Beavers build dome-shaped island lodges of sticks plastered with mud. The interior may be 1.8 m high. The mud freezes in winter, and the lodge becomes impregnable to predators; one or more tunnel entrances open below the ice level. In rivers and lakes, beavers often burrow into banks.

Food usually consists of the tender bark and buds of trees. Saplings and even large trees are felled by gnawing, cut into portable lengths, and dragged or floated through beaver-made canals to the pond. Branches, twigs, and small logs are anchored in the bottom mud in deep water for winter food.

Beavers live in colonies, one or more family groups to a lodge. A family usually consists of a mated pair and two sets of offspring. Breeding takes place in midwinter, and two to eight (usually four) young, or kits, are born four months later. Of placid disposition, beavers often work cooperatively. When alarmed, they immediately seek safety in the water. They warn others of danger by slapping the surface of the water with their tails.

Beaver Island, also called **BIG BEAVER ISLAND**, largest of an island group in northeastern Lake Michigan, U.S., 35 mi (56 km) west of the resort city of Charlevoix, Mich. It extends about 14 mi in length and is 3 to 6 mi wide. It is administered as part of Charlevoix County. French explorers called it Ile du Castor (for the *castors* ["beavers"] found there), and a French settlement (abandoned 1603) was one of the earliest in the area. In 1847 James Jesse Strang took over the island for his Mormon colony, was crowned "king," established his "capital" at St. James, and exercised spiritual and temporal authority. Strang's tyrannical rule aroused resentment among both his followers and people on the mainland, which led to his assassination in 1856 and the disintegration of his "kingdom." The Mormons left in 1895. Irish fishermen then occupied the island, which is now popular with anglers, hunters, and boaters. St. James, the island's only village, with some buildings dating from the Mormon period, has air and ferryboat connections with Charlevoix. Pop. (1990) St. James township, 276.

Simone de Beauvoir
Pictorial Parade—EB Inc

ship of philosopher-writers who have given a literary transcription to the themes of Existentialism. She is known primarily for her treatise *Le Deuxième Sexe*, 2 vol. (1949; *The Second Sex*), a scholarly and passionate plea for the abolition of what she called the myth of the "eternal feminine." It became a classic of feminist literature during the 1960s.

Schooled in private institutions, de Beauvoir attended the Sorbonne, where, in 1929, she passed her *agrégation* in philosophy and met Jean-Paul Sartre, beginning a free, lifelong association with him. She taught at a number of schools (1931–43) before turning to writing for her livelihood. In 1945 she began editing *Le Temps Modernes*, a monthly review, with Sartre.

Her novels expounded the major Existential themes, demonstrating her conception of the writer's commitment to the times. *L'Invitée* (1943; *She Came To Stay*) describes the subtle destruction of the relationship of a couple brought about by a young girl's prolonged stay in their home; it also treats the difficult problem of the relationship of a conscience to "the other," each individual conscience being fundamentally a predator to another. Of her other works of fiction, perhaps the best known is *Les Mandarins* (1954; *The Mandarins*), for which she won the Prix Goncourt. It is a chronicle of the attempts of post-World War II intellectuals to leave their "mandarin" (educated elite) status and engage in political activism. She also wrote four books of philosophy, including *Pour une morale de l'ambiguïté* (1947; *The Ethics of Ambiguity*); travel

Beaverbrook (of Beaverbrook and of Cherkley), Sir (William) Maxwell Aitken, 1st Baron, 1st Baronet (b. May 25, 1879, Maple, Ont., Can.—d. June 9, 1964, near Leatherhead, Surrey, Eng.), financier in Canada, politician and newspaper proprietor in Great Britain, one of three persons (the others were Winston Churchill and John Simon)

Beaverbrook, 1941
Robert Capa—Magnum

to sit in the British Cabinet during both World Wars I and II. A highly idiosyncratic and successful journalist, he never fully achieved the political power that he sought.

A stockbroker in Montreal who had made a fortune by amalgamating the entire cement industry of Canada, Aitken moved to England and was elected to the House of Commons in 1910. As private secretary to Andrew Bonar Law (also Canadian-born), he helped him win the Conservative Party leadership in 1911. He also worked with Law to remove the Liberal H.H. Asquith as prime minister in favour of the Liberal David Lloyd George in December 1916. In the same month Aitken bought a majority interest in the London *Daily Express*. Subsequently, he founded the London *Sunday Express* and acquired the London *Evening Standard* (which then absorbed a noted Liberal paper, the *Pall Mall Gazette*) and the *Glasgow Evening Citizen*.

Failing to receive government office from Lloyd George in 1916, Aitken accepted a baronetcy in that year and a peerage as Baron Beaverbrook the following year. In 1918 he served in the Cabinet as chancellor of the duchy of Lancaster and minister of information. He aided in breaking up Lloyd George's postwar coalition in 1922, and in 1930–31 he tried unsuccessfully to overthrow Stanley Baldwin as Conservative leader. During the 1930s he was notable as one of the "press lords" and as a leader of the United Empire Party. During World War II he was a member of Winston Churchill's war Cabinet as minister of aircraft production (1940–41) and minister of supply (1941–42); he also served as British lend-lease administrator in the United States (1942) and lord privy seal (1943–45).

In his newspapers Beaverbrook colourfully championed individual enterprise and British imperial interests. He also wrote several books about his political experiences, the most important being *Politicians and the Press* (1925) and *Politicians and the War*, 2 vol. (1928). Caricatured in Evelyn Waugh's novel *Scoop* (1938), he was the subject of two biographies, by Tom Driberg (1956) and A.J.P. Taylor (1972), both entitled *Beaverbrook*.

Beaverhead River (Montana, U.S.): see Jefferson River.

Beāwar, town, Ajmer district, Rājasthān state, northwestern India. A major rail and road junction, Beāwar is an agricultural and woollen market centre. Industries include cotton ginning, handloom weaving, hosiery man-

ufacture, and wood carving. Formerly also called Nayānagar, the town was founded in 1835 and grew rapidly in prosperity because of its advantageous position between Udaipur and Jodhpur. It has a government college affiliated with the University of Rājasthān. Pop. (1991) 105,363.

bebeeru (tree): see greenheart.

Bebel, August (b. Feb. 22, 1840, Deutz, near Cologne—d. Aug. 13, 1913, Passugg, Switz.), German Socialist, co-founder of the German Social Democratic Party and its most influential and popular leader for more than 40 years. He is one of the outstanding figures in the history of western European Socialism.

Bebel was the son of a Prussian noncommissioned officer. Growing up in extreme poverty at Wetzlar, where he learned the turner's craft, he began to travel as a journeyman through southern Germany and Austria and in the spring of 1860 settled in Leipzig, where he began his political career.

In 1861 Bebel joined the Leipzig Workers' Educational Association, which, like many others of its kind, was formed through the initiative of members of the liberal bourgeoisie; in 1865 he became its chairman. Political and economic circumstances, however, gave the workers' education movement an increasingly political orientation, which was to be significantly reflected in the development of Bebel's own political views. Like the other young workers in the new associations, Bebel had not yet heard anything of *The Communist Manifesto* or of its authors, Friedrich Engels and Karl Marx.

Bebel, c. 1898
Archiv für Kunst und Geschichte, West Berlin

If in 1863 Bebel believed that the working classes were not ready for the vote, he was already changing his mind when he began his friendship with Wilhelm Liebknecht, who came to Leipzig from Berlin in 1865. Liebknecht, older than Bebel and a man with university training, became in many respects Bebel's mentor. But the more open-minded Bebel always maintained his independence. The Austro-Prussian War (1866), which divided German opinion between the advocates of a Kleindeutschland (Small Germany) and those of a Grossdeutschland (Large Germany), advocated by the Prussian prime minister Otto von Bismarck, drove the Saxon workers' associations into an alliance with the radical anti-Prussian democrats, for Bebel and Liebknecht, the workers' leaders, were implacable opponents of Bismarck. The Sächsische Volkspartei (Saxon People's Party) was thus brought into being, and in 1867 Bebel entered the constituent Reichstag of the North German confederation as a member for this party. Eventually, this and other like-minded parties united in 1869 in the Sozialdemokratische Arbeiterpartei (Social Democratic Labour Party) of Germany.

Already in 1867, as a member of the North German Reichstag, Bebel had protested against the Bismarckian "greater Prussia," believing that it meant "turning Germany into one great barracks." In parliament he continued this protest both before and after the founding

of the German Empire. He and Liebknecht were the only voices to speak against the war loan voted in the Reichstag on July 21, 1870; as a result, they were brought to trial on a charge of high treason at Leipzig in March 1872. Sentenced to two years' imprisonment, Bebel recovered from tuberculosis during this period of enforced idleness. Also, he was able to give himself a systematic education.

Beginning with an earlier sentence in 1869, Bebel spent a total of nearly five years in prison within less than 20 years, though he never faced any graver charge than that of "spreading doctrines dangerous to the state," "lese majesty," "libel of Bismarck," or "libel of the Bundesrat." These sentences were a serious threat to his livelihood. As the party itself could afford only the most essential expenditure and as a member of the Reichstag received no allowances, Bebel continued to rely on his income as a craftsman. He had established himself in Leipzig as a master turner and had married the daughter of a railway worker in 1864. Not until the end of the 1880s was he able to live by his writing.

As a writer Bebel had most success with *Die Frau und der Sozialismus* (1883; *Woman and Socialism*, 1904), which went through many editions and translations. This book was the most powerful piece of Social Democratic propaganda for decades. Above all, by its combination of science and prophecy, it served as a blueprint for German social democracy in the conditions produced by Bismarck's Anti-Socialist Law (1878–90). Bebel himself never doubted that this period of repression under the emergency laws was anything more than an episode, declaring to his opponents in the Reichstag: "Your lances will be shattered in this struggle like glass on granite." His unshakable confidence gave his colleagues the courage to stand firmly together, but he opposed all tendencies toward retaliation by force, since terrorism or attempts at subversion might have endangered the very existence of the party.

These tactics were proved right when the emergency laws were allowed to lapse and when, in the elections of 1890, the Social Democrats received nearly 20 percent of the vote. Bebel's position at the head of the party was now uncontested, and in the Reichstag he was the most prominent opponent of the government. Within the party itself he opposed all the "opportunist" tendencies, which had come out into the open since the ending of the anti-Socialist laws. According to these, features of the existing social and political structure might be developed gradually until social democracy was attained. At the Erfurt congress of 1891 he reproached the leader of the Bavarian Social Democrats, Georg von Vollmar, with belying the "inspiration" of social democracy, without which "a party such as ours cannot exist."

The struggle against open reformism and the theoretical revisionism advocated by Eduard Bernstein at the end of the 1890s reached its climax at the Dresden congress of 1903. Just as he condemned all deviations from the party's official radical creed, so too was Bebel unwilling to yield to left-wing pressure to indulge in extraparlimentary experiments and thus perhaps to bring repression of the party again. His stand was justified, for in election after election the party gained new adherents, and Bebel lived to see the day when, in 1912, it became, with 110 seats, the strongest group in the Reichstag.

Bebel, as no other, embodied the tradition of the German Social Democratic Party. Already in 1882 Engels had described him as "a unique manifestation of the German, indeed of the European working class." A member of the Reichstag from 1867 almost continuously until his death, he achieved his most celebrated triumphs as a parliamentarian. Even his opponents could not withhold their re-

spect in the face of his passionate honesty. A shrewd contemporary, Hellmut von Gerlach, suggested that in politics Bebel lived from hand to mouth: "His political aims were for the most distant future or for the immediate present"; he did not concern himself with what might lie between. This is true. For him and for the leading body of Social Democratic thought he represented, political activity essentially consisted in promoting as effectively as possible the politico-social interests of the working classes. His contradictory combination of futuristic revolutionary sentiment and a social policy rooted in the present reflects the equivocal position of his party under the conditions of the new German Empire. This explains to a great extent both the strength of Bebel's position within the party and the political passivity of German social democracy, already noticeable before his death and fully revealed when, on the fall of the empire, the party had to face its first great political test.

(E.Ma.)

BIBLIOGRAPHY. Bebel's autobiography, *Aus meinem Leben*, 3 vol. (1910–14; new ed., 1953; Eng. trans. of 1st ed., *My Life*, 1912, reprinted 1983), extends only up to 1882. Bebel's significance is discussed in Guenther Roth, *The Social Democrats in Imperial Germany* (1963); and Anne Lopes and Gary Roth, *Men's Feminism: August Bebel and the German Socialist Movement* (2000).

Bebey, Francis (b. July 15, 1929, Douala, Cameroon—d. May 28, 2001, Paris, France), Cameroonian-born writer, musician, and composer, one of the best-known singer-songwriters of Africa. He is sometimes called the father of world music.

Bebey was trained at the Sorbonne and New York University in musicology and French and English literature. He first gained a reputation as a musician and was noted for his poetic lyrics and expressive voice. By 1967 he had made several recordings and had performed in New York City and Paris as well as in Africa. That same year his first novel, *Le Fils d'Agatha Moudio* (1967; *Agatha Moudio's Son*), won the Grand Prix Littéraire de l'Afrique Noire, and the following year *Embarras et Cie: nouvelles et poèmes* (1968; nine short stories, each accompanied by a poem) was published. His later works include *La Poupée Ashanti* (1973; *The Ashanti Doll*) and *Le Roi Albert d'Effidi* (1973; *King Albert*).

Bebey claimed that his wide experience as a radio broadcaster affected the style of his stories, which he directed toward hearers rather than readers. Critics found his first novel a carefully constructed masterpiece of burlesque. Bebey also wrote a book on broadcasting in Africa (having worked on several French-language African radio stations and on a broadcasting project for UNESCO) and two books on African music, notably *African Music: A People's Art* (1975, reprinted 1992). His several recordings found a wide audience.

bebop, also called **BOP**, the first kind of modern jazz, which split jazz into two opposing camps in the last half of the 1940s. The word is an onomatopoeic rendering of a staccato two-tone phrase distinctive in this type of music. When it emerged, bebop was unacceptable not only to the general public but also to many musicians. The resulting breaches—first, between the older and younger schools of musicians and, second, between jazz musicians and their public—were deep, and the second never completely healed.

Whereas earlier jazz was essentially diatonic (*i.e.*, basing melodies and harmonies on traditional Western major and minor 7-note scales comprising 5 whole and 2 half steps), much of the thinking that informed the new movement was chromatic (drawing on all 12 notes of the chromatic scale). Thus the harmonic territory open to the jazz soloist was vastly increased.

Bebop took the harmonies of the old jazz and superimposed on them additional "substituted" chords. It also broke up the metronomic regularity of the drummer's rhythmic pulse and produced solos played in doubletime and having several bars packed with sixteenth notes.

The movement originated during the early 1940s in the playing of trumpeter Dizzy Gillespie, guitarist Charlie Christian, pianist Thelonious Monk, and drummer Kenny Clarke, and the most richly endowed of all, alto saxophonist Charlie "Bird" Parker.

A later style, known as hard bop, or funky, evolved from and incorporated elements of gospel music and rhythm and blues. Horace Silver, Cannonball Adderley, and Art Blakey are among the notable musicians of hard bop.

BIBLIOGRAPHY. The history of bebop and its musicians is chronicled in Leonard Feather, *Inside Bebop* (1949, reprinted as *Inside Jazz*, 1977); Ira Gitler, *Jazz Masters of the Forties* (1966, reprinted 1984), and *Swing to Bop: An Oral History of the Transition in Jazz in the 1940s* (1985); David H. Rosenthal, *Hard Bop: Jazz and Black Music, 1955–1965* (1992); and Thomas Owens, *Bebop: The Music and Its Players* (1995).

becard, any of many tropical American birds belonging to the family Cotingidae (order Passeriformes) that usually builds its large ball nest on an exposed branch near a colony of

Becard (*Pachyrhamphus*)
John S Dunning, Photo-Researchers

stinging wasps. The 15 species of becards (comprising the genera *Platypsaris* and *Pachyrhamphus*) are rather plain, small birds with thick bills hooked at the tip. They pluck fruit and capture insects (particularly caterpillars) in the treetops, often by hovering. The 16-centimetre (6½-inch) rose-throated becard, (*Platypsaris aglaiae*), occurring from Costa Rica to the U.S.–Mexican border, is the farthest north representative of the group and of the family Cotingidae. The becards are considered by some authorities to belong with the tyrant flycatchers in the family Tyrannidae.

Beccafumi, Domenico, also called **DOMENICO DI PACE**, or **MECHERINO** (b. c. 1486, Cortina, Republic of Venice—d. May 1551, Siena, Republic of Siena), Italian painter and sculptor, a leader in the post-Renaissance style known as Mannerism.

Beccafumi was the son of a peasant named di Pace. He adopted the name of his patron Lorenzo Beccafumi. About 1510 he went to Rome to study the work of Raphael and Michelangelo. Returning in 1512 to Siena, Beccafumi and the painter Sodoma decorated the facade of the Palazzo Borghese. In 1517 he was in charge of the painters at the church of San Bernardino and from 1518 to 1546 con-

tributed many fine designs to the *commesso* (white marble inlay with subjects outlined in black) in the pavement of Siena cathedral.

"The Birth of the Virgin," panel painting by Domenico Beccafumi, 1544; in the Pinacoteca Nazionale, Siena, Italy

SCALA—Art Resource/WEB Inc.

These rich, colourful scenes from the Old Testament impressed Charles I of England, who tried unsuccessfully to purchase the original drawings. In 1541, Prince Doria called Beccafumi to Genoa, where he created the fresco "Episode in the Life of Medea and Jason," now lost. Returning to Siena, he executed and cast the bronze angels (c. 1548) of the cathedral. The illuminism, or "chromatic lyricism," that he achieved on the ceiling of the Palazzo Bindi Sergardi and in the Pinacoteca of Siena added to his reputation. His "Birth of the Virgin" and "The Expulsion of the Rebel Angels" in the latter show the typical elongated and foreshortened forms employed by the Mannerists. But his work contained many diverging tendencies.

Beccaria, Cesare, in full **CESARE, MARCHESE (marquess) DI BECCARIA BONESANA** (b. March 15, 1738, Milan [Italy]—d. Nov. 28, 1794, Milan), Italian criminologist and economist whose *Dei delitti e delle pene* (Eng. trans. J.A. Farrer, *Crimes and Punishment*, 1880) was a celebrated volume on the reform of criminal justice.

Early life. Beccaria was the son of a Milanese aristocrat of modest means. From an early age, he displayed the essential traits of his character. A highly volatile temperament resulted in periods of enthusiasm followed by depression and inactivity. He was reserved and somewhat taciturn in his social contacts but placed great value on his personal and family relationships. At the age of eight he was sent to the Jesuit school in Parma. Beccaria later described the education he received there as "fanatical" and stifling to "the development of human feelings." Although he revealed a mathematical aptitude, little in his student days gave indication of the remarkable intellectual achievements that were soon to follow. In 1758 he received a degree in law from the University of Pavia.

Upon completion of his formal training Beccaria returned to Milan and was soon caught up in the intellectual ferment associated with the 18th-century Enlightenment. He joined with Count Pietro Verri in the organization of a literary society and participated actively in its affairs. In 1762 his first writing appeared,

a pamphlet on monetary reform. Later he associated himself with the periodical *Il Caffè*, a journal modeled on the English periodical *The Spectator*, and contributed several anonymous essays to its pages.

Beccaria, engraving by Carlo Faucci, 1766

Criminal-law studies. In 1763 Verri suggested that Beccaria next undertake a critical study of the criminal law. Although he had had no experience in the administration of criminal justice, Beccaria accepted the suggestion, and in 1764 his great work *Dei delitti e delle pene* was published. Almost immediately Beccaria, then only 26 years of age, became an international celebrity. The work enjoyed a remarkable success in France, where it was translated in 1766 and went through seven editions in six months. English, German, Polish, Spanish, and Dutch translations followed. The first American edition was published in 1777. Since then, translations in many other languages have appeared.

Beccaria's treatise is the first succinct and systematic statement of principles governing criminal punishment. Although many of the ideas expressed were familiar, and Beccaria's indebtedness to such writers as the French philosopher Montesquieu (which he generously acknowledged) is clear, the work nevertheless represents a major advance in criminological thought. The argument of the book is founded on the utilitarian principle that governmental policy should seek the greatest good for the greatest number. He lashed out at the barbaric practices of his day: the use of torture and secret proceedings, the caprice and corruption of magistrates, brutal and degrading punishments. The objective of the penal system, he argued, should be to devise penalties only severe enough to achieve the proper purposes of security and order; anything in excess is tyranny. The effectiveness of criminal justice depends largely on the certainty of punishment rather than on its severity. Penalties should be scaled to the importance of the offense. Beccaria was the first modern writer to advocate the complete abolition of capital punishment and may therefore be regarded as a founder of the abolition movements that have persisted in most civilized nations since his day.

Beccaria's treatise exerted significant influence on criminal-law reform throughout western Europe. In England, the utilitarian philosopher and reformer Jeremy Bentham advocated Beccaria's principles, and the Benthamite disciple Samuel Romilly devoted his parliamentary career to reducing the scope of the death penalty. Legislative reforms in Rus-

sia, Sweden, and the Habsburg Empire were influenced by the treatise. The legislation of several American states reflected Beccaria's thought.

Work in economics. Although nothing Beccaria achieved in later life approaches the importance of the treatise, his subsequent career was fruitful and constructive. In 1768 he accepted the chair in public economy and commerce at the Palatine School in Milan, where he lectured for two years. His reputation as a pioneer in economic analysis is based primarily on these lectures, published posthumously in 1804 under the title *Elementi di economia pubblica* ("Elements of Public Economy"). He apparently anticipated some of the ideas of Adam Smith and Thomas Malthus, such as the concept of division of labour and the relations between food supply and population.

In 1771 he was appointed to the Supreme Economic Council of Milan and remained a public official for the remainder of his life. In his public role Beccaria became concerned with a large variety of measures, including monetary reform, labour relations, and public education. A report written by Beccaria influenced the subsequent adoption of the metric system in France.

Beccaria's later years were beset by family difficulties and problems of health. He apparently did not relish the role of celebrity. In 1766 he went to Paris, where he was warmly greeted by distinguished figures of the day, but cut short his visit because of acute homesickness. His wife died in 1774 after a period of declining health. Three months later he remarried. Property disputes initiated by his two brothers and sister resulted in litigation that distracted him for many years. Beccaria's last months were saddened by events in France: although he had initially welcomed the French Revolution enthusiastically, he was shocked by the excesses of the Terror.

Beccaria's rationality, versatility, and insistence on the unity of knowledge were typical of the intellectual life of his time. His treatise, the most important volume ever written on criminal justice, is still profitably consulted two centuries after its first appearance.

(F.A.A.)

BIBLIOGRAPHY. Assessments of his criminal law studies include Coleman Phillipson, *Three Criminal Law Reformers: Beccaria, Bentham, Romilly* (1923, reprinted 1975); Marcello T. Maestro, *Voltaire and Beccaria as Reformers of Criminal Law* (1942, reissued 1972), and *Cesare Beccaria and the Origins of Penal Reform* (1973). On his economic writings, see Joseph A. Schumpeter, *History of Economic Analysis* (1954, reissued 1986).

Becchus (Greek Orthodox leader): see John XI Becchus.

Beccles, town ("parish"), Waveney district, county of Suffolk, England, on the River Waveney. The land was given to St. Edmund's Church at Bury about 956, and Beccles was established as a fishing village, responsible for supplying the Benedictine abbey in Bury with tens of thousands of herring per annum. By the 14th century, however, wool trading and agriculture had begun to predominate. In recent decades light engineering has been associated with agriculturally based industries. Sailing and angling are the chief recreational activities, and the town is noted for its crayfish. The ancient streets on the north and east sides of Beccles are dominated by striking Georgian-style houses (built after a great fire). The 14th-century St. Michael's Church, with its detached campanile, is a fine example of Perpendicular Gothic architecture. Pop. (1991) 10,337.

Béchar, formerly COLOMB-BÉCHAR, town, western Algeria. It lies in the northern reaches of the Sahara, 36 miles (58 km) south of the Moroccan border. The town is named for the nearby Mount Béchar, rising to 1,600 feet (488 m). Béchar's former European quarter

contains a military station and has modern buildings, while the traditional quarter has covered, narrow streets. Surrounded by date-palm groves watered by the Wadi Béchar, the town is noted for its leatherwork and jewelry. It is a trade centre at the junction of trans-Saharan roads, is the terminus of the railroad running southward from Oran, and has an airport. Béchar Djedid (New Béchar), 3 miles (5 km) south, was built to house the employees of the nearby coalfields at Kenadsa.

The surrounding region presents a varied landscape. Near the Moroccan border the land is composed primarily of flat, stony sandstone plateaus (*hamada*). To the southeast the landscape is typified by *ergs* (sand dunes), specifically, parts of the Grand Erg Occidental, the Erg er-Raoui, and the Erg Iguidi. The region is bisected in the north by the Wadi Saoura, which forms the valley where lies the oasis town of Beni Abbes (Béni-Abbas). Along the Saoura (known as Wadi Messaoud

Date-palm grove, Béchar, Alg.
W. Luthy—De Wys Inc.

farther south), date-palm groves extend about 200 miles (320 km). To the west the region is crisscrossed by numerous wadis and ravines, forming a landscape known as *chebka*. Locally important crops include dates, cereals, vegetables, figs, and almonds. Bituminous-coal reserves in the region are exploited minimally because of high transportation costs. Pop. (1998) 131,010.

Beche, Sir Henry Thomas De La (b. 1796, London, Eng.—d. April 13, 1855, London), geologist who founded the Geological Survey of Great Britain, which made the first methodical geologic survey of an entire country ever undertaken.

Educated for the military, De La Beche left the army in 1815 and two years later joined the Geological Society of London. During the following 10 years he traveled widely in Europe and began detailed geologic studies of Cornwall and Devon. The papers resulting from these studies described and illustrated for the first time the Jurassic (208 to 144 million years old) and Cretaceous (144 to 66.4 million years old) strata of those regions. He also investigated the geology of the Pembrokeshire coast, the coasts of France, and the island of Jamaica.

Interest in the mining operations of his country led De La Beche to suggest compiling a geologic map of the United Kingdom as an aid to the scientific development of the mineral industries. Through his efforts the Geological Survey of Great Britain was organized in 1835, with De La Beche as director. He was knighted in 1848, and, in the same year, he

served as president of the Geological Society. In 1851 the combined offices of the Geological Survey, the Museum of Practical Geology, the Royal School of Mines, and the Mining Record Office were opened in London.

His *Geological Manual* (1831), *Researches in Theoretical Geology* (1834), and *How to Observe in Geology* (1835) are important contributions to geological literature.

bêche-de-mer, plural BÊCHE-DE-MER, or BÊCHES-DE-MER, also called TREPANG, boiled, dried, and smoked flesh of sea cucumbers (phylum Echinodermata) used to make soups. Most bêche-de-mer comes from the southwestern Pacific, where the animals (any of a dozen species of the genera *Holothuria*, *Stichopus*, and *Thelonota*) are obtained on coral reefs. Bêche-de-mer is consumed chiefly in China.

Bêche-de-mer, or Beach-la-Mar, is a pidgin English term used in New Guinea and nearby islands, where the trepang trade has long been important. The term Bêche-de-Mer has also come to designate the pidgin English language spoken in these regions.

Becher, Johann Joachim (b. May 6, 1635, Speyer, Bishopric of Speyer—d. October 1682/85, England), chemist, physician, and adventurer whose theories of combustion influenced Georg Stahl's phlogiston theory. Becher believed substances to be composed of three earths, the vitrifiable, the mercurial, and the combustible. He supposed that when a substance burned, a combustible earth was liberated.

During his youth, study was difficult because he had to support his mother and brothers, but at 19 he began an extraordinary career that alternated learned publication with colonization and trade enterprises. His ideas and experiments on the nature of minerals and other substances were set forth in *Subterranean Physics* (1669). At Munich he suggested that the elector of Bavaria establish South American colonies and a cloth-trade monopoly, but

Johann Joachim Becher, detail from an engraving
Histon-Photo

angry merchants forced him to flee. At Vienna he proposed a Rhine-Danube canal and was also employed in experiments to transmute Danube sand into gold. He fell into disgrace and fled the country.

Becher, Johannes Robert (b. May 22, 1891, Munich—d. Oct. 11, 1958, Berlin), poet and critic, editor, and government official who was among the most important advocates of revolutionary social reform in Germany during the 1920s and who later served as minister of culture for the German Democratic Republic (East Germany).

Becher studied medicine, literature, and philosophy and, in 1918, joined the German Communist Party (KPD). He was already an established commentator on the social and artistic scene and a leader of the movement to transform German society through a rev-

olution of the proletariat. Involved in the Expressionist school that dominated German writing in the period 1910–20, he wrote romantic, emotionally complex poetry that mirrored both his personal turmoil and his visions of a new social order.

Though elected to the German Reichstag in 1933, he was forced into exile with the advent of Nazi power and went to Moscow, where he edited a German-language newspaper (1935–45). Life in Moscow disillusioned him about Joseph Stalin's Communism but not Communist ideology itself. Returning to Germany in 1945, he was made president of the Association for the Democratic Rebirth of Germany. In 1954 he became East German minister of culture. Becher's diaries in the decade 1945–55 give intimate insights into the many personal and ideological conflicts that tormented his life as a poet and as a political activist.

Bechet, Sidney (b. May 14, 1897, New Orleans—d. May 14, 1959, Paris), jazz musician known as a master of the soprano saxophone.

Bechet began as a clarinetist at the age of six and by 1914 was a veteran who had worked in several semilegendary local bands, including those of Jack Carey and Buddy Petit. After working in New Orleans with Clarence Williams and King Oliver, pioneer jazz greats, he moved to Chicago and then, in 1919, to New York City. In that year he toured Europe with the Southern Syncopated Orchestra, becoming the first jazz musician ever to be praised by a distinguished classicist, the Swiss conductor Ernest Ansermet. Through the 1920s he gradually concentrated on the soprano saxophone, working briefly with his great admirer Duke Ellington in 1925 before touring Europe again. Intermittently, he worked in the Noble Sissle band (1928–38) and from the late 1940s based himself in Paris, where by the time of his death he had attained the kind of eminence granted to such world-famed Parisians as Maurice Chevalier and Jean Cocteau.

Along with trumpeter Louis Armstrong, Bechet was one of the first musicians to improvise with jazz-swing feeling. He intelligently crafted logical lines atop the New Orleans-style ensemble, double-timing and improvising forcefully and with authority. Bechet produced a large, warm tone with a wide and rapid vibrato. It was his mastery of drama and his use of critically timed deviations in pitch ("note bending") that had the greatest long-lasting influence, because they were absorbed by his disciple Johnny Hodges, Duke Ellington's principal soloist from 1928 to 1970. With a style developed around Bechet's expressive techniques, Hodges became one of the two or three most influential alto saxophonists in the first half of the century. Bechet's autobiography, *Treat It Gentle*, was published in 1960.

Bechtel, Friedrich (b. Feb. 2, 1855, Durlach, Baden [Germany]—d. March 9, 1924, Halle, Ger.), classical scholar who contributed substantially to Greek dialectology and Homeric criticism.

After study under some of the most prominent language scholars of the 19th century, Bechtel became professor at the University of Halle (1895–1924) and published extensively. He collaborated with the German scholar August Fick on *Die griechischen Personennamen nach ihrer Bildung erklärt* (2nd ed., 1894; "Greek Personal Names as Explained by Their Formation"). With the German-American scholar Hermann Collitz he edited *Sammlung der griechischen Dialektinschriften*, 4 vol. (1884–1915; "Collection of Greek Dialect Inscriptions"). *Die griechischen Dialekte*, 3 vol. (1921–24; "The Greek Dialects"), was his last major work.

Bechtel, Stephen D(avison) (b. Sept. 24, 1900, Aurora, Ind., U.S.—d. March 14, 1989, San Francisco), American construction engi-

neer and business executive, president (1936–60) of W.A. Bechtel Company and its successor, Bechtel Corp., one of the world's largest construction and engineering firms. Projects to which his firm and its affiliated companies have substantially contributed include the Hoover Dam, the San Francisco-Oakland Bay Bridge, the Alaska oil pipeline, and rapid transit systems in San Francisco and Washington, D.C.

When his father organized the W.A. Bechtel Company in San Francisco in 1925, Bechtel became, at age 25, a vice president of one of the largest construction companies in the western United States. He became president in 1936. A year later he and John McCone formed the Bechtel-McCone Corporation, which built refineries and chemical plants. Bechtel's companies built ships and aircraft parts during World War II. After the war, the newly formed Bechtel Corporation built pipelines in Canada, the Middle East, and elsewhere and constructed power plants all over the world. In 1977 it was estimated that the various Bechtel companies had designed or built half the nuclear power plants then operating in the United States. Considered an energetic and imaginative manager, Bechtel was frequently called on to handle unusually large or complex projects.

He retired as president of the company in 1960; however, he remained a senior director of what became known as the Bechtel Group, which in the 1970s and '80s was at work on the construction of an enormous city, al-Jubayl, for the Saudi Arabian government.

Bechuana (people): see Tswana.

Beck, Józef (b. Oct. 4, 1894, Warsaw—d. June 6, 1944, Stănești, Rom.), Polish army officer and foreign minister from 1932 to 1939, one of Józef Piłsudski's most trusted confidants, who attempted to maintain friendly relations with both the Soviet Union and Germany while preserving alliances of Poland with France and with Romania.

After service against tsarist Russia in World War I, Beck held various posts in the newly restored Poland, becoming Marshal Piłsudski's *chef de cabinet* in 1926 and foreign minister on Nov. 2, 1932. While maintaining a non-threatening attitude toward the Soviet Union and Germany, he attempted to improve the international position of Poland by strengthening its alliances. After the Germans invaded Czechoslovakia in March 1939, Beck gained the disputed Teschen area for his country and on April 6 signed the alliance with Great Britain that was to bring Britain into World War II after the Germans invaded Poland in September of that same year. Upon the German-Soviet partition of Poland, Beck was interned in Romania, where he died in 1944.

Beck, Ludwig (b. June 29, 1880, Biebrich, Ger.—d. July 20, 1944, Berlin), German general who, as chief of the General Staff (1935–38), opposed Adolf Hitler's occupation of the Rhineland (1936) and who was a central figure in the unsuccessful generals' plot of 1944 against Hitler.

Beck was attached to the General Staff in World War I. After Hitler came to power, he rose rapidly, becoming chief of the elitist Army General Staff in 1935, but he resigned in 1938 after protesting the decision to conquer Czechoslovakia and after failing to organize army opposition to Hitler's expansionist policies. He became the recognized leader of the conspirators against Hitler and was seen as a possible president of Germany with Hitler out of the way. After the failure of the plot to assassinate Hitler on July 20, 1944, Beck attempted suicide, receiving the coup de grace from an attending sergeant.

Beck, Max Wladimir, Baron (Freiherr) von (b. Sept. 6, 1854, Vienna, Austrian Empire—d. Jan. 20, 1943, Vienna), premier (1906–08) of Austria whose administration introduced universal male suffrage to the Austrian half of the Austro-Hungarian monarchy.

Rising quickly in Austrian government service after 1876, Beck served after 1880 in the Ministry of Agriculture, becoming director of legislative and organizational affairs (1888) and departmental chief (1900). He was also adviser to the heir apparent, Archduke Francis Ferdinand. He was named premier for Austria (1906) amid controversy over impending suffrage legislation and a tariff crisis with Hungary. His draft bill of December 1906, establishing universal male suffrage and proportional representation of nationalities in the Reichsrat (legislature), became law in 1907.

During Beck's administration, new programs of social insurance were implemented and two railways were nationalized. His opposition to the Austro-Hungarian annexation of Bosnia cost him the support of Francis Ferdinand, who favoured annexation and who resented that Beck had taken office as prime minister under the emperor Francis Joseph. On Nov. 15, 1908, Beck was forced to resign. Beck is considered to have been one of the ablest Austrian premiers of the late monarchy.

Becke, Friedrich Johann Karl (b. Dec. 31, 1855, Prague, Bohemia, Austrian Empire—d. June 18, 1931, Vienna, Austria), mineralogist who in 1903 presented to the International Geological Congress a paper on the composition and texture of the crystalline schists.

Becke

By courtesy of the Bild Archiv, Osterreichische Nationalbibliothek, Vienna

Published in amplified form in 1913, his paper contained the first comprehensive theory of metamorphic rocks and proved to be singularly fruitful for advances in their study. Becke's subsequent work on retrogressive metamorphism led to a deeper understanding of many ancient mountain belts.

Becke studied mineralogy and allied sciences in Vienna under Gustav Tschermak, whose *Mineralogische und petrographische Mitteilungen* ("Mineralogical and Petrographical Notices") he edited after 1899. Becke was appointed to the chair of mineralogy at the University of Vienna in 1898, became rector of the university in 1921, and retired in 1927.

Becker, Carl (Lotus) (b. Sept. 7, 1873, near Waterloo, Iowa, U.S.—d. April 10, 1945, Ithaca, N.Y.), American historian known for his work on early American intellectual history and on the 18th-century Enlightenment.

Becker studied at the University of Wisconsin (B.A., 1896; Ph.D., 1907) and Columbia University. He taught at the University of Kansas, Lawrence, from 1902 to 1916 and at Cornell University, Ithaca, N.Y., from 1917 until he retired in 1941. In *The Beginnings of the American People* (1915), he elaborated on his doctoral work by advancing the thesis

Carl Becker

of a dual American Revolution—the first being the struggle for self-government and the second the ideological battle over the form such government should take. In *The Eve of the Revolution* (1918) and *The Declaration of Independence* (1922), he further probed the relationship between 18th-century natural-rights philosophy and the American Revolution.

The interwar period was a time of dejection and increasing philosophical skepticism for Becker. During the 1920s, particularly, he began challenging the then-orthodox assumption of the superiority of a scientific methodology in historical study. He maintained that perceived "facts" are basically mental images created by the historian's experience and a larger, socially defined reality that determines the process by which the historian selects his data. His presidential address in 1931 to the American Historical Association, "Everyman His Own Historian" (published in 1932 and expanded to book length in 1935), deals most explicitly with this theme of historical relativism. In one of his best-known books, *The Heavenly City of the Eighteenth Century Philosophers* (1932), Becker not only examined the ideas of the Philosophes, such as their belief in progress and human perfectibility, but also stressed their intellectual fervour and their success in bridging traditional Christianity and Enlightenment secularism. During World War II he repudiated his earlier skepticism, urging the need for a reinsertion of moral statements in historical writing.

BIBLIOGRAPHY. Analyses of Becker's contribution to history are found in Charlotte W. Smith, *Carl Becker: On History & the Climate of Opinion* (1956, reissued 1973); Cushing Strout, *The Pragmatic Revolt in American History: Carl Becker and Charles Beard* (1958, reprinted 1980); and Burleigh T. Wilkins, *Carl Becker: A Biographical Study in American Intellectual History* (1961).

Becker, Gary S., in full GARY STANLEY BECKER (b. Dec. 2, 1930, Pottsville, Pa., U.S.), American economist, awarded the Nobel Memorial Prize in Economic Science in 1992. He applied the methods of economics to aspects of human behaviour previously considered more or less the exclusive domain of sociology, anthropology, and demography.

Becker was educated at Princeton University and the University of Chicago (Ph.D., 1955). He taught economics at the University of Chicago until 1957, when he moved to Columbia University; in 1970 he returned to the University of Chicago, where from 1983 he was professor of economics and sociology.

The central premise of Becker's writings is that rational economic choices, based on self-interest, govern most aspects of human behaviour, not just the purchasing and investment decisions traditionally regarded as economic behaviour. In his dissertation, published in 1957 as *The Economics of Discrimination*, he examined race discrimination in labour markets, concluding that it has costs for both the victim and the perpetrator. In *Human Capital* (1964) he argued that an individual's investment in education and train-

ing is analogous to a company's investment in new machinery or equipment. In studies such as the 1981 *A Treatise on the Family*, Becker analyzed the household as a sort of factory, producing goods and services such as meals, shelter, and child care. Applying theories of production to household behaviour, he was able to make predictions about family size, divorce, and the role of women in the workplace. Subsequent work focused on such subjects as criminal behaviour and addiction.

Becker, George Ferdinand (b. Jan. 5, 1847, New York, N.Y., U.S.—d. April 20, 1919, Washington, D.C.), geologist who advanced the study of mining geology from physical, chemical, and mathematical approaches.

After graduation from Harvard University in 1868, Becker did advanced work at Heidelberg, Ger., and earned a Ph.D. there in 1869. He became a correspondent for the *New York Herald* and covered the Franco-German War (1870–71) until he resumed his studies at the Royal School of Mines in Berlin.

In 1874 Becker became an instructor of mining and metallurgy at the University of California at Berkeley, where he met Clarence King, the first director of the U.S. Geological Survey. Becker obtained a position with the survey and began a study of mining districts on the West Coast. His best-known report from this work is *Geology of the Comstock Lode and Washoe District* (1882).

Becker's main interest was the study of the Earth's interior, and his theoretical work on this topic was presented in a series of important papers in the 1890s; his most important theoretical contribution was *Finite Homogeneous Strain, Flow, and Rupture of Rocks* (1893). He foresaw that such studies could not be prosecuted successfully without a great body of physical data on the rocks and minerals that compose the Earth, and thus he played a major role in the establishment of the Geophysical Laboratory of the Carnegie Institution of Washington, D.C. In 1896 Becker went to South Africa to study the gold and diamond fields, and in 1898–99 he served as geologist to the U.S. Army in the Philippines.

Becker, Wilhelm Adolf (b. 1796, Dresden, Saxony [Germany]—d. Sept. 30, 1846, Meissen), German classical archaeologist, remembered for his works on the everyday life of the ancient Romans and Greeks.

Becker was educated at Schulpforta and Leipzig, and from 1842 he was professor of classical archaeology at Leipzig. His early studies of Plautus' comedies aroused his interest in Roman daily life and led to his publication of *Gallus* (1838), the story of a Roman youth. Derived from Suetonius' *Life of Augustus* and embellished to include all aspects of Roman life and customs, the book became a classic in its field, the English translation passing through 10 editions between 1844 and 1891. A similar work on Greek life, *Charikles* (1840), enjoyed comparable success. His *Handbuch der römischen Altertümer*, 5 vol. (1843–68; "Handbook of Roman Antiquities"), was completed by the classical scholars Theodor Mommsen and Joachim Marquardt.

Becket, Frederick Mark (b. Jan. 11, 1875, Montreal, Que., Can.—d. Dec. 1, 1942, New York, N.Y., U.S.), metallurgist who developed a process of using silicon instead of carbon as a reducing agent in metal production, thus making low-carbon ferroalloys and certain steels practical.

After graduating (1895) from McGill University, Montreal, Becket attended Columbia University, New York City, and embarked on a career of utilizing electrical energy in the production of metals and chemicals. He joined the Union Carbide and Carbon Corporation in 1906, rising eventually to a vice presidency and spending his last years as a consultant. He pioneered in the use of the electric furnace in

Frederick Becket

the production of ferrovanadium, ferromanganese, ferromolybdenum, ferrotungsten, and low-carbon ferrochromium, an essential ingredient of stainless steel. During World War I he made possible tonnage production of ferrozirconium, previously unavailable, and speeded production of silicon for use in making steel shells and aluminum alloys for aviation use. More than 100 patents, covering a wide range of electric furnace and chemical products, were issued to him.

Becket, Saint Thomas, also called THOMAS À BECKET, or THOMAS OF LONDON (b. c. 1118, Cheapside, London—d. Dec. 29, 1170, Canterbury, Kent, Eng.; canonized 1173; feast day December 29), chancellor of England (1155–62) and archbishop of Canterbury (1162–70)

during the reign of King Henry II. His career was marked by a long quarrel with Henry that ended with Becket's murder in Canterbury cathedral.

Early life and career. Thomas was born to Norman parents of the merchant class. He was educated first at Merton priory, then in a City of London school, and finally at Paris. Deeply influenced in childhood by a devout mother who died when he was 21, Thomas entered adult life as a city clerk and accountant in the service of the sheriffs. After three years he was introduced by his father to Archbishop Theobald, a former abbot of Bec, of whose household he became a member. His colleagues were a distinguished company that included the political philosopher John of Salisbury, the Roman lawyer Vacarius, and several future bishops, including Roger of Pont

l'Èvêque, later archbishop of York. Thomas won Theobald's confidence, acted as his agent, and was sent by him to study civil and canon law at Bologna and Auxerre.

His contemporaries described Thomas as a tall and spare figure with dark hair and a pale face that flushed in excitement. His memory was extraordinarily tenacious and, though neither a scholar nor a stylist, he excelled in argument and repartee. He made himself agreeable to all around him, and his biographers attest that he led a chaste life—in this respect uninfluenced by the King.

As chancellor. In 1154 Theobald, as a reward of his services, appointed Thomas archdeacon of Canterbury, an important and lucrative post, and less than three months later recommended him to Henry as chancellor. Here Thomas showed to the full his brilliant abilities, razing castles, repairing the Tower of London, conducting embassies, and raising and leading troops in war. Trusted completely by the King, Thomas was compared by a biographer to Joseph under Pharaoh. To Henry himself Thomas was a welcome companion and intimate friend, both at court and in the chase, aiding the King in his policy of gathering all power into the hands of the monarchy, even when that policy went against claims of the church. Thomas, older than Henry by 15 years and celibate, may well have felt, at least initially, a quasi-paternal or elder-brother affection, mingled with admiration for Henry's talents and charm. He must also have enjoyed the satisfaction of moving in a rank of society to which he had not been born. Henry's attitude is less easy to identify, but the efficiency and intelligence of Thomas must have recommended him to a king surrounded by uneducated and at times truculent barons.

Whether Becket was fully satisfied with his life as chancellor is another matter. Throughout his life Thomas gave with prodigality and acted with panache. The description of the procession of men, beasts, and carriages laden with objects of luxury that accompanied him as envoy to Paris in 1158 is one of the highlights of William FitzStephen's *Life of Thomas Becket*. This, and his customary splendour of clothing and furnishings, suited ill with his status as archdeacon. More serious in the eyes of contemporaries was his refusal to surrender his archdeaconry while neglecting its duties, and his extraction of scutage (payment in lieu of military service) at a high rate from ecclesiastical fiefs. Most serious to modern minds is his failure to visit the disapproving and dying Theobald when summoned. In general, there can be no doubt that in public affairs he was the King's man, even when Henry endeavoured to reassert what he claimed to be his ancestral rights.

Meanwhile, the great movement known as the Gregorian reform had spread from Italy to France and the Holy Roman Empire and had begun to influence English churchmen. In its program, free elections to clerical posts, inviolability of church property, freedom of appeal to Rome, and clerical immunity from lay tribunals were leading points. Under Henry I and Stephen, the archbishops had stood out for these reforms, sometimes with partial success. Henry II, however, undoubtedly aimed at a complete return to the practice of Henry I, who had strict control over the church. He had begun to press his claims, and his chancellor had aided him. With the death of Theobald in 1161, Henry hoped to appoint Thomas as archbishop and thus complete his program.

As archbishop. For almost a year after the death of Theobald the see of Canterbury was vacant. Thomas was aware of the King's intention and tried to dissuade him by warnings of what would happen. Henry persisted and Thomas was elected. Once consecrated, Thomas changed both his outlook and his way of life. He became devout and austere

and embraced the integral program of the papacy and its canon law. This spectacular change has baffled historians, and several explanations have been attempted: that Thomas was intoxicated by his ambition to dominate or that he threw himself, as before, into a part he had agreed to play. It is simpler to suppose that he accepted at last the spiritual obligations he had ignored as chancellor and turned into a new channel his mingled energy, force of character, impetuosity, and ostentation. Greatly to Henry's displeasure, he immediately resigned the chancellorship but clung to the archdeaconry until forced by the King to resign. Henry had been in Normandy since August 1158, and on his return in January 1163 Thomas began the struggle by opposing a tax proposal and excommunicating a leading baron. More serious was his attitude in the matter of "criminous clerks." In western Europe, accused clerics for long had enjoyed the privilege of standing trial before the bishop rather than secular courts and usually received milder punishments than lay courts would assess. In England before the Conquest this was still the custom. If found guilty in an ecclesiastical court, clerics could be degraded or exiled but were not liable to death or mutilation. For 60 years after the Norman Conquest little is heard of clerical crime or its punishment, while on the Continent, Gregorian reformers were tending to emphasize the sole right of the church to try and punish clerics in major orders. The position of Thomas, that a guilty clerk could be degraded and punished by the bishop but should not be punished again by lay authority—"not twice for the same fault"—was canonically arguable and ultimately prevailed. Henry's contention that clerical crime was rife and that it was encouraged by the absence of drastic penalties commends itself to modern readers as a fair one. But it must be remembered that the King's motives were authoritarian and administrative rather than enlightened. Nevertheless, it may be thought that Thomas was ill-advised in his rigid stand on this point. The issue was joined in a council at Westminster (October 1163), but the crisis came at Clarendon (Wiltshire, January 1164), when the King demanded a global assent to all traditional royal rights, reduced to writing under 16 heads and known as the Constitutions of Clarendon. These asserted the King's right to punish criminous clerks, forbade excommunication of royal officials and appeals to Rome, and gave the King the revenues of vacant sees and the power to influence episcopal elections. Henry was justified in saying that these rights had been exercised by Henry I, but Thomas also was justified in maintaining that they contravened church law. Thomas, after verbally accepting the constitutions, revoked his assent and appealed to the Pope, then in France, who supported him while deprecating precipitate action.

Quarrel with Henry. Good relations between Thomas and Henry were now at an end: the Archbishop was summoned to trial by the King on a point of feudal obligation. At the Council of Northampton (Oct. 6–13, 1164), it was clear that Henry intended to ruin and imprison or to force the resignation of the Archbishop. In this he was encouraged by some of the bishops, among them Gilbert Foliot, bishop of London. Thomas fled in disguise and took refuge with Louis VII of France. Pope Alexander III received him with honour but hesitated to act decisively in his favour in fear that he might throw Henry into the arms of the Holy Roman emperor Frederick I and his antipope, Paschal III.

Thomas's exile lasted for six years (Nov. 2, 1164–Dec. 2, 1170). He was joined by many of his distinguished household and lived ascetically, first at Pontigny Abbey and then,

when Henry threatened the monks, at an abbey near Sens. Henry meanwhile had seized the properties of the Archbishop and his supporters and had exiled all Thomas' close relatives. In the following years several abortive attempts were made at reconciliation, but new acts of hostility by the King and declarations of excommunication hurled by Thomas at his opponents embittered the struggles.

The bishops were divided, but a majority of them, led by Foliot, were either hostile to Thomas or hesitant in supporting him. Papal legates more than once endeavoured to mediate, and the King and the Archbishop came together at Montmirail in 1169, only to part in anger. Thomas distrusted the King and was, in turn, hated by him. In the same year, Henry put out additions to the Constitutions of Clarendon, virtually withdrawing England from papal obedience. Finally, in 1170, he had his eldest son crowned as co-king by the archbishop of York, Becket's old rival.

This was a flagrant breach of papal prohibition and of the immemorial right of Canterbury to crown the king. Thomas, followed by the Pope, excommunicated all responsible. Henry, fearing an interdict for England, met Thomas at Fréteval (July 22), and it was agreed that Thomas should return to Canterbury and receive back all the possessions of his see. Neither party withdrew from his position regarding the Constitutions of Clarendon, which on this occasion were not mentioned. This "open-ended" concordat has remained an inexplicable event. Thomas returned to Canterbury (December 2) and was received with enthusiasm, but further excommunications of the hostile royal servants, refusal to lift the excommunication of Roger of York and Foliot, as well as his ready acceptance of tumultuous acclaim by the crowds infuriated Henry in Normandy.

Martyrdom. Some violent words of Henry were taken literally by four leading knights of the court, who proceeded swiftly to Canterbury (December 29), forced themselves into the Archbishop's presence, and, on his refusal to absolve the bishops, followed him into the cathedral. There, at twilight, after further altercation, they cut him down with their swords. His last words were an acceptance of death in defense of the church of Christ.

Within a few days after Thomas' death, his tomb became a goal of pilgrimage, and he was canonized by Alexander III in 1173. In 1174 Henry did penance at Canterbury and was absolved. For almost four centuries, Becket's shrine was one of the most famous in Europe. Thomas was portrayed in illuminations and sculpture, and churches were dedicated to him throughout western Christendom.

Judgment on the character and actions of St. Thomas has been varied. From his martyrdom until the reign of Henry VIII, he was the "blisful martir" of Chaucer's pilgrims, who had heroically defied a tyrant. Henry VIII despoiled his shrine, burned his bones, and erased his name from all service books. Thenceforth Thomas was a hero to Catholics and a traitor to Protestants.

Many recent historians, impressed by the legal and administrative reforms of Henry II, have seen Thomas as an ambitious and fanatical nuisance. Certainly there is room for debate, for both Thomas and his king were remarkable men with complex characters. If Henry had moral failings and made private and political miscalculations, Thomas can rightly be accused, at various moments of his life, of worldly behaviour, ostentation, impetuosity, weakness, and violent language. If Henry was ill-advised in committing his claims to writing at Clarendon and in crowning his son, Thomas was equally ill-advised in needlessly opposing the King in 1163 and in wavering

between compliance and intransigence when careful diplomacy might have won out. But his courage and sincerity cannot be doubted, and in the quarrel between church and state he gave his life for what he took to be a vital issue. (M.D.K.)

Beckett, Sir Edmund: see Grimthorpe (of Grimthorpe), Edmund Beckett, 1st Baron.

Beckett, Samuel (Barclay) (b. April 13?, 1906, Foxrock, County Dublin, Ire.—d. Dec. 22, 1989, Paris, Fr.), author, critic, and playwright, winner of the Nobel Prize for Literature (1969). He wrote in both French and English and is perhaps best known for his plays, especially *En attendant Godot* (1952; *Waiting for Godot*).

Life. Samuel Beckett was born in a suburb of Dublin. Like his fellow Irish writers George Bernard Shaw, Oscar Wilde, and William Butler Yeats, he came from a Protestant, Anglo-Irish background. At the age of 14 he went to the Portora Royal School, in what became Northern Ireland, a school that catered to the Anglo-Irish middle classes.

From 1923 to 1927, he studied Romance languages at Trinity College, Dublin, where

Samuel Beckett, 1965

© Gisele Freund

he received his bachelor's degree. After a brief spell of teaching in Belfast, he became a reader in English at the Ecole Normale Supérieure in Paris in 1928. There he met the self-exiled Irish writer James Joyce, the author of the controversial and seminally modern novel *Ulysses*, and joined his circle. Contrary to often-repeated reports, however, he never served as Joyce's secretary. He returned to Ireland in 1930 to take up a post as lecturer in French at Trinity College, but after only four terms he resigned, in December 1931, and embarked upon a period of restless travel in London, France, Germany, and Italy.

In 1937 Beckett decided to settle in Paris. As a citizen of a country that was neutral in World War II, he was able to remain there even after the occupation of Paris by the Germans, but he joined an underground resistance group in 1941. When, in 1942, he received news that members of his group had been arrested by the Gestapo, he immediately went into hiding and eventually moved to the unoccupied zone of France. Until the liberation of the country, he supported himself as an agricultural labourer.

In 1945 he returned to Ireland but volunteered for the Irish Red Cross and was back in France as an interpreter in a military hospital in Saint-Lô, Normandy. In the winter of 1945, he finally returned to Paris.

Production of the major works. There followed a period of intense creativity, the most concentratedly fruitful period of Beckett's life. His relatively few prewar publications included two essays on Joyce and the French novelist Marcel Proust. The volume *More Pricks Than Kicks* (1934) contained 10 stories describing episodes in the life of a Dublin intellectual, Belacqua Shuah, and the novel *Murphy* (1938) concerns an Irishman in London who escapes from a girl he is about to marry to a life of contemplation as a male nurse in a mental institution. His two slim volumes of poetry were *Whoroscope* (1930), a poem on the French philosopher René Descartes, and the collection *Echo's Bones* (1935). A number of short stories and poems were scattered in various periodicals.

During his years in hiding in unoccupied France, Beckett also completed another novel, *Watt*, which was not published until 1953. After his return to Paris, between 1946 and 1949, Beckett produced a number of stories, the major prose narratives *Molloy* (1951), *Malone meurt* (1951; *Malone Dies*), and *L'Innommable* (1953; *The Unnamable*), and two plays, the unpublished three-act *Eleutheria* and *Waiting for Godot*.

It was not until 1951, however, that these works saw the light of day. After many refusals, Suzanne Deschevaux-Dumesnil (later Mme Beckett), Beckett's lifelong companion, finally succeeded in finding a publisher for *Molloy*. When this book not only proved a modest commercial success but also was received with enthusiasm by the French critics, the same publisher brought out the two other novels and *Waiting for Godot*. It was with the amazing success of *Waiting for Godot* at the small Théâtre de Babylone in Paris, in January 1953, that Beckett's rise to world fame began. Beckett continued writing, but more slowly than in the immediate postwar years. Plays for the stage and radio and a number of prose works occupied much of his attention.

Beckett continued to live in Paris, but most of his writing was done in a small house secluded in the Marne valley, a short drive from Paris. His total dedication to his art extended to his complete avoidance of all personal publicity, of appearances on radio or television, and of all journalistic interviews. When, in 1969, he received the Nobel Prize for Literature, he accepted the award but declined the trip to Stockholm to avoid the public speech at the ceremonies.

Continuity of his philosophical explorations. Beckett's writing reveals his own immense learning. It is full of subtle allusions to a multitude of literary sources as well as to a number of philosophical and theological writers. The dominating influences on Beckett's thought were undoubtedly the Italian poet Dante, the French philosopher René Descartes, the 17th-century Dutch philosopher Arnold Geulincx—a pupil of Descartes who dealt with the question of how the physical and the spiritual sides of man interact—and, finally, his fellow Irishman and revered friend, James Joyce. But it is by no means essential for the understanding of Beckett's work that one be aware of all the literary, philosophical, and theological allusions.

The widespread idea, fostered by the popular press, that Beckett's work is concerned primarily with the sordid side of human existence, with tramps and with cripples who inhabit trash cans, is a fundamental misconception. He dealt with human beings in such extreme situations not because he was interested in the sordid and diseased aspects of life but because he concentrated on the essential aspects of human experience. The subject matter of so much of the world's literature—the social relations between individuals, their manners and possessions, their struggles for rank and position, or the conquest of sexual objects—appeared to Beckett as mere external

trappings of existence, the accidental and superficial aspects that mask the basic problems and the basic anguish of the human condition. The basic questions for Beckett seemed to be these: How can we come to terms with the fact that, without ever having asked for it, we have been thrown into the world, into being? And who are we; what is the true nature of our self? What does a human being mean when he says "I"?

What appears to the superficial view as a concentration on the sordid thus emerges as an attempt to grapple with the most essential aspects of the human condition. The two heroes of *Waiting for Godot*, for instance, are frequently referred to by critics as tramps, yet they were never described as such by Beckett. They are merely two human beings in the most basic human situation of being in the world and not knowing what they are there for. Since man is a rational being and cannot imagine that his being thrown into any situation should or could be entirely pointless, the two vaguely assume that their presence in the world, represented by an empty stage with a solitary tree, must be due to the fact that they are waiting for someone. But they have no positive evidence that this person, whom they call Godot, ever made such an appointment—or, indeed, that he actually exists. Their patient and passive waiting is contrasted by Beckett with the mindless and equally purposeless journeyings that fill the existence of a second pair of characters. In most dramatic literature the characters pursue well-defined objectives, seeking power, wealth, marriage with a desirable partner, or something of the sort. Yet, once they have attained these objectives, are they or the audience any nearer answering the basic questions that Beckett poses? Does the hero, having won his lady, really live with her happily ever after? That is apparently why Beckett chose to discard what he regarded as the inessential questions and began where other writing left off.

This stripping of reality to its naked bones is the reason that Beckett's development as a writer was toward an ever greater concentration, sparseness, and brevity. His two earliest works of narrative fiction, *More Pricks Than Kicks* and *Murphy*, abound in descriptive detail. In *Watt*, the last of Beckett's novels written in English, the milieu is still recognizably Irish, but most of the action takes place in a highly abstract, unreal world. Watt, the hero, takes service with a mysterious employer, Mr. Knott, works for a time for this master without ever meeting him face to face, and then is dismissed. The allegory of man's life in the midst of mystery is plain.

Most of Beckett's plays also take place on a similar level of abstraction. *Fin de partie* (one-act, 1957; *Endgame*) describes the dissolution of the relation between a master, Hamm, and his servant, Clov. They inhabit a circular structure with two high windows—perhaps the image of the inside of a human skull. The action might be seen as a symbol of the dissolution of a human personality in the hour of death, the breaking of the bond between the spiritual and the physical sides of man. In *Krapp's Last Tape* (one-act, first performed 1958), an old man listens to the confessions he recorded in earlier and happier years. This becomes an image of the mystery of the self, for to the old Krapp the voice of the younger Krapp is that of a total stranger. In what sense, then, can the two Krapps be regarded as the same human being? In *Happy Days* (1961), a woman, literally sinking continually deeper into the ground, nonetheless continues to prattle about the trivialities of life. In other words, perhaps, as one gets nearer and nearer death, one still pretends that life will go on normally forever.

In his trilogy of narrative prose works—they are not, strictly speaking, novels as usually understood—*Molloy*, *Malone Dies*, and *The*

Unnamable, as well as in the collection *Stories and Texts for Nothing* (1967), Beckett raised the problem of the identity of the human self from, as it were, the inside. This basic problem, simply stated, is that when I say "I am writing," I am talking about myself, one part of me describing what another part of me is doing. I am both the observer and the object I observe. Which of the two is the real "I"? In his prose narratives, Beckett tried to pursue this elusive essence of the self, which, to him, manifested itself as a constant stream of thought and of observations about the self. One's entire existence, one's consciousness of oneself as being in the world, can be seen as a stream of thought. *Cogito ergo sum* is the starting point of Beckett's favourite philosopher, Descartes: "I think; therefore, I am." To catch the essence of being, therefore, Beckett tried to capture the essence of the stream of consciousness that is one's being. And what he found was a constantly receding chorus of observers, or storytellers, who, immediately on being observed, became, in turn, objects of observation by a new observer. Molloy and Moran, for example, the pursued and the pursuer in the first part of the trilogy, are just such a pair of observer and observed. Malone, in the second part, spends his time while dying in making up stories about people who clearly are aspects of himself. The third part reaches down to bedrock. The voice is that of someone who is unnamable, and it is not clear whether it is a voice that comes from beyond the grave or from a limbo before birth. As we cannot conceive of our consciousness not being there—"I cannot be conscious that I have ceased to exist"—therefore consciousness is at either side open-ended to infinity. This is the subject also of the play *Play* (first performed 1963), which shows the dying moments of consciousness of three characters, who have been linked in a trivial amorous triangle in life, lingering on into eternity.

The humour and mastery. In spite of Beckett's courageous tackling of the ultimate mystery and despair of human existence, he was essentially a comic writer. In a French farce, laughter will arise from seeing the frantic and usually unsuccessful pursuit of trivial sexual gratifications. In Beckett's work, as well, a recognition of the triviality and ultimate pointlessness of most human strivings, by freeing the viewer from his concern with senseless and futile objectives, should also have a liberating effect. The laughter will arise from a view of pompous and self-important preoccupation with illusory ambitions and futile desires. Far from being gloomy and depressing, the ultimate effect of seeing or reading Beckett is one of cathartic release, an objective as old as theatre itself.

Technically, Beckett was a master craftsman, and his sense of form is impeccable. *Molloy* and *Waiting for Godot*, for example, are constructed symmetrically, in two parts that are mirror images of one another. In his work for the mass media, Beckett also showed himself able to grasp intuitively and brilliantly the essential character of their techniques. His radio plays, such as *All That Fall* (1957), are models in the combined use of sound, music, and speech. The short television play *Eh Joe!* (1967) exploits the television camera's ability to move in on a face and the particular character of small-screen drama. Finally, his film script *Film* (1967) creates an unforgettable sequence of images of the observed self trying to escape the eye of its own observer.

Beckett's later works tended toward extreme concentration and brevity. *Come and Go* (1967), a playlet, or "dramaticule," as he called it, contains only 121 words that are spoken by the three characters. The prose fragment "Lessness" consists of but 60 sentences, each of which occurs twice. His series *Acts Without Words* are exactly what the title denotes, and one of his last plays, *Rockaby*, lasts for 15

minutes. Such brevity is merely an expression of Beckett's determination to pare his writing to essentials, to waste no words on trivia.

(M.J.E./Ed.)

BIBLIOGRAPHY. Raymond Federman and John Fleicher, *Samuel Beckett: His Works and His Critics: An Essay in Bibliography* (1970), is an exhaustive bibliography of the author's writings and writings about him. Both Vivian Mercier, *Beckett/Beckett* (1977); and Deirdre Bair, *Samuel Beckett: A Biography* (1978), are excellent biographical studies. Many critical studies have been devoted to Beckett; among these Hugh Kenner, *Samuel Beckett: A Critical Study*, new ed. (1968); Ruby Cohn, *Samuel Beckett: The Comic Gamut* (1962); John Fletcher, *The Novels of Samuel Beckett*, 2nd ed. (1970); Rubin Rabinowitz, *The Development of Samuel Beckett's Fiction* (1984); and on Beckett's plays, Martin Esslin, *The Theatre of the Absurd*, 3rd ed., rev. and enlarged (1980); and John Fletcher and John Spurling, *Beckett the Playwright*, 3rd expanded ed. (1985), can serve as a basis for an approach to Beckett. Three anthologies of important Beckett criticism are *Samuel Beckett: A Collection of Critical Essays*, ed. by Martin Esslin (1965); *Samuel Beckett Now*, ed. by Melvin J. Friedman, 2nd ed. (1975); and Lawrence Graver and Raymond Federman (eds.), *Samuel Beckett, the Critical Heritage* (1979). Beckett's early writings are the subject of Raymond Federman, *Journey to Chaos: Samuel Beckett's Early Fiction* (1965); and Lawrence E. Harvey, *Samuel Beckett: Poet & Critic* (1970). John Fletcher, *Samuel Beckett's Art* (1967), is a valuable study of Beckett's technique as a writer. Richard N. Coe, *Beckett* (1964), is a useful introduction.

Beckford, William (baptized Dec. 19, 1709, Jamaica, British West Indies—June 21, 1770, London, Eng.), gentleman merchant, member of Parliament, and lord mayor of London (1762–63, 1769–70) who was particularly noted as a pioneer of the radical movement.

Beckford was reared in Jamaica, first arriving in England (to complete his schooling) at the age of 14. Upon the death of his elder brother Peter, who died unmarried, he inherited the considerable wealth that had accrued from Jamaican sugar plantations over several generations. Elected to Parliament for Shaftesbury in 1747, Beckford became alderman of Billingsgate in 1752 and represented the City of London in Parliament from 1754 until his death. From 1756 he developed a close political connection with William Pitt the Elder, and, through him, important popular city interests, hitherto usually in opposition, were for the first time allied with the government. These interests resented the retirement of Pitt and the terms of the Peace of Paris, and in 1763 Beckford gave strong support to outspoken journalist John Wilkes. In 1761 Beckford had begun criticizing the system of parliamentary representation, and during the crisis of 1769 over Wilkes and the Middlesex election Beckford urged the abolition of pocket boroughs (election districts that were "in the pocket" of one family or person). While Wilkes won popularity for the Wilkite movement, it was Beckford who inspired its leaders and provided a program of reform—shorter Parliaments and a wider franchise.

Beckford, William (b. Sept. 29, 1760, London, Eng.—d. May 2, 1844, Bath, Somerset), eccentric English dilettante, author of the Gothic novel *Vathek* (1786). Such writers as George Gordon, Lord Byron, and Stéphane Mallarmé acknowledged his genius. He also is renowned for having built Fonthill Abbey, the most sensational building of the English Gothic revival.

Beckford was the only legitimate son of William Beckford the Elder, twice lord mayor of London, and was the heir to a vast fortune accumulated by three generations of his Beckford ancestors, who were sugar planters in Jamaica. His mother was descended from

Mary Stuart. He was a precocious child, and his natural talents were given every encouragement. At five he received piano lessons from the nine-year-old W.A. Mozart. He also received training in architecture and drawing from prominent teachers. He inherited his fortune in 1770, upon the death of his father.

In 1778, after a period of travel and study in Europe, Beckford returned to England, where he later met the 11-year-old son and heir of Viscount Courtenay, a boy for whom Beckford felt strong romantic (but probably not sexual) attraction. Following a lavish three-day Christmas party held in the boy's honour at Fonthill, Beckford conceived the story of the caliph Vathek, a monarch as impious as he is voluptuous, who builds a tower so high that from it he can survey all the kingdoms of the world. Vathek challenges Mohammed in the seventh heaven and so brings about his own damnation and his banishment to the subterranean kingdom ruled by Eblis, prince of darkness.

Completed in outline in three days and two nights, the tale was written in French during the first four months of 1782, in all the gaiety of a London society greeting the inheritor of a fortune. A protégé of Lord Chancellor Thurlow, with a seat in the House of Commons, and married to the beautiful Lady Margaret Gordon, Beckford was expecting to be elevated to the peerage in December 1784. In the autumn of that year, scandal broke when he was charged with sexual misconduct with young Courtenay. Reports of the scandal were quickly spread, and, though Beckford's guilt was never proved, in mid-1785 he, with his wife and baby daughter, was forced into exile. In May 1786, in Switzerland, his wife died of puerperal fever after giving birth to a

Beckford, detail from an oil painting by John Hoppner, c. 1800; in the Salford Museum and Art Gallery, London

By courtesy of the Salford Museum and Art Gallery, London

second daughter. About that time, Beckford also learned that *Vathek*, which he had given to the Reverend Samuel Henley for translation, would be published anonymously, with a preface in which Henley claimed that it had been taken directly from the Arabic. Beckford remained abroad for many years. From 1796, after his return to England, he devoted his energies to his Gothic "abbey" at Fonthill. His architect was James Wyatt, but Beckford himself supervised the planning and building of what became the most extraordinary house in England. He lived there as a recluse, collecting curios, costly furnishings and works of art and reading the library of Edward Gibbon, which he had purchased in its entirety. In 1807 the house's great central tower collapsed and was rebuilt. Beckford's extravagances forced him to sell his estate in 1822. The tower later collapsed again, destroying part of the building.

Beckford's literary reputation rests solely on *Vathek*. Though all agree that it is uneven and stylistically uncertain, the strength of its final image has sustained Beckford's reputa-

tion for more than two centuries. A classic among Gothic novels, the book is a masterpiece of fantastic invention and bizarre detail. Among Beckford's other published works are accounts of his travels, two parodies of Gothic and sentimental novels, and a journal, *Life at Fonthill, 1807-22*.

Beckley, city, seat (1850) of Raleigh county, southern West Virginia, U.S., 50 miles (80 km) southeast of Charleston. The first settlement was established by General Alfred Beckley in 1838, but the city's growth dates from 1890, when the first commercial smokeless coal shipment was made from local mines. After the rich Winding Gulf coalfield was opened in 1907, the population increased sharply. During the American Civil War, the city was occupied by both Union and Confederate troops. Beckley is now the commercial centre for the surrounding coal and agriculture areas and has light manufactures, including mining machinery and electronic devices. Beckley College was founded in 1933. Grandview and Twin Falls state parks and Lake Stephens are nearby. Beckley Exhibition Coal Mine is in New River City Park. Inc. 1858. Pop. (1990) 18,296.

Beckmann, Max (b. Feb. 12, 1884, Leipzig, Ger.—d. Dec. 27, 1950, New York, N.Y., U.S.), Expressionist painter and printmaker whose works are notable for the violence with which they reflect the tragic events of the 20th century.

Beckmann was trained from 1900 to 1903 at the conservative Weimar Academy, where he was influenced by the idealistic classicism of his master, Hans von Marées. In 1904 Beckmann moved to Berlin, where he adopted the lush brushwork of the German Impressionist Lovis Corinth. Two years later he joined the prestigious Berlin Sezession, an association of Art Nouveau artists that had abandoned its earlier progressive policies in favour of a conservative stance—an attitude Beckmann continued to share. But, in the same year, he met the Norwegian Expressionist painter Edvard Munch, whose morbid, curvilinear compositions influenced Beckmann to develop an Expressionistic style.

Beckmann served as a medical corpsman in World War I. The shock of exposure to dead and maimed soldiers changed his art, filling it with the sordid, often horrifying imagery that characterizes his mature work. The distorted figures of "The Descent from the Cross" (1917) and its pendant, "Christ and the Woman Taken in Adultery" (1917), illustrate

"The Night," oil on canvas by Max Beckmann, 1918-19; in the Kunstsammlung Nordrhein-Westfalen, Düsseldorf, Ger.

his new style. In "The Night" (1918-19), a scene of nightmarish sadism, the deliberately repulsive colours and the erratic forms convey Beckmann's horror of man's bestiality.

In 1932 the Nazis declared Beckmann's art "degenerate" and forced him to resign his professorship at the Städel School of Art in Frankfurt. He returned to Berlin, where he completed "Departure" (1932-33), the first of the large-scale allegorical triptychs that constitute his most important works.

Finding the conditions in Germany intolerable, he fled to Amsterdam in 1937. In 1947 he moved to the United States, settling ultimately in New York after teaching for three years at Washington University in St. Louis, Mo. Among the most important fruits of his years of exile are such triptychs as "The Actors" (1942), "Carnival" (1943), and "Blindman's Bluff" (1945). Although they retain many of his earlier violent themes, the late triptychs, especially his "Argonauts" (1950), completed on the day of his death, affirm Beckmann's belief in the ineradicable human spirit. His numerous self-portraits provide a moving record of the artist's spiritual experience.

BIBLIOGRAPHY. Peter Selz, *Max Beckmann* (1964, reprinted 1980), is an account of Beckmann's life. Friedhelm W. Fischer, *Max Beckmann* (1973), discusses the artist's symbolism and iconography. Stephan Lackner, *Max Beckmann* (1977), relates Beckmann's art to contemporary German sociopolitical developments.

Becknell, William (b. 1796?, Amherst county, Va., U.S.—d. April 30, 1865, Texas), trader of the American West who established the Santa Fe Trail.

Upon settling in Missouri, Becknell became involved in trade with the Southwest. At the time, the Spanish government prohibited U.S. traders from selling goods in New Mexico. But after Spanish control of the area was overthrown in 1821, Americans were more welcome there. Becknell was in the southern Rockies when he learned of the change in policy, and he immediately set out for Santa Fe with his goods.

He took the customary route, following the Arkansas River nearly to its source and then turning south, to Taos and then Santa Fe. He sold his goods at a sizable profit and resolved to return. In his venture from Missouri in 1822, Becknell pioneered a new route. After moving south from the Missouri River to the Arkansas, he followed the latter only to around the site of the present Dodge City, Kansas. There he trekked southwest to the Cimarron River, following its main fork into the Rockies, and descended through a mountain pass into Santa Fe.

Becknell's route became famous as the Santa Fe Trail. Pioneer caravans crossed it time and again, and merchants used it to convey their products to the Southwest. Becknell followed it at least one more time before he settled in Texas in about 1834. There he fought in the war for Texan independence from Mexico (1836) and later joined the Texas Rangers.

Beckwourth, Jim, byname of JAMES PIERSON BECKWITH (b. April 26, 1798, Virginia, U.S.—d. 1867?, Denver [Colorado, U.S.]), American mountain man who lived for an extended period among the Indians.

He was the son of a white man, Sir Jennings Beckwith, and a mulatto slave woman and legally was born a slave. His father took him to Louisiana Territory in 1810 and eventually to St. Louis and there apparently manumitted him, for he was thereafter regarded as a "free Negro." His features were said to have resembled those of an American Indian.

In 1823 Beckwourth signed on as a groom with a fur-trading expedition. The following year, he was hired to handle the horses on an expedition to the Rocky Mountains. While in the West, he married a series of Indian women and eventually settled down for about

six years to live among the Crow Indians. According to his own testimony, Beckwourth greatly impressed the Indians with his strength and skill. Other evidence supports this claim, although Beckwourth was universally considered to exaggerate wildly.

He returned to white settlements in 1833, apparently abandoning his Indian wives. He established a route through the Sierras for Easterners en route to California after gold was discovered there in 1848. There he encountered a wandering journalist, Thomas D. Bonner, who recorded many of the frontiersman's yarns and recollections in an 1856 book that made his subject famous for a time: *The Life and Adventures of James P. Beckwourth, Mountaineer, Scout, Pioneer and Chief of the Crow Nation of Indians*. After participating briefly in the Mexican War, he returned to Missouri but soon joined the flood of settlers bound for Colorado in 1859. He served, probably as a guide and interpreter for U.S. troops, in the Cheyenne War of 1864, then settled near Denver. His death during a visit to the Crow is variously described as occurring on a hunting trip or by poison at the hands of a former wife.

Becque, Henry-François (b. April 18, 1837, Neuilly, Fr.—d. May 12, 1899, Paris), dramatist and critic whose loosely structured plays, based on character and motivation rather than on closely knit plots, provided a healthy challenge to the “well-made plays” that held the

Becque, photograph by Nadar (Gaspard-Félix Tournachon), c. 1880
Archives Photographiques—J. P. Ziolo

stage in his day. Although Becque disliked literary theory and refused identification with any school, he has been remembered as a forerunner of the Naturalist movement, whose chief exponent was the novelist Émile Zola.

From 1867 Becque tried his hand at various types of drama, including vaudeville and a play on a socialist theme. *Les Corbeaux* (1882; *The Vultures*, 1913), his masterpiece, describes a bitter struggle for an inheritance. The unvaried egotism of the characters and the realistic dialogue were unfavourably received, except by the Naturalist critics, and the play had only three performances. *La Parisienne* (1885; *Parisienne*, 1943) scandalized the public by its treatment of the story of a married woman and her two lovers. Its importance, like that of *Les Corbeaux*, was not recognized until a decade after its appearance. In his last years, a withdrawn and somewhat misanthropic figure, Becque devoted himself to journalism and to a drama of the financial world that he never completed.

Bécquer, Gustavo Adolfo, original name GUSTAVO ADOLFO DOMÍNGUEZ BASTIDA (b. Feb. 17, 1836, Seville—d. Dec. 22, 1870, Madrid), poet and author of prose legends of the late Romantic period who is considered one of the first modern Spanish poets.

Orphaned by the age of 11, Bécquer was strongly influenced by his painter brother, Valeriano. He moved to Madrid at 17 in pursuit of a literary career and from 1861 to 1868 contributed to the newspaper *El Contemporáneo*.

Bécquer's major literary production consists of nearly 100 *Rimas*, a series of about 20 *Leyendas* (“Legends”) in prose, and the literary essays *Cartas desde mi celda* (“Letters From My Cell”). Although many of his poems and prose works were published individually in *El Contemporáneo*, they did not appear in book form until after his death, when his friends collected his writings and published them in *Obras*, 2 vol. (1871; “Works”). His *Rimas*, probably his best known works, are sensitive, retrained, and deeply subjective. Bécquer's poetry explores the themes of love—particularly in connection with disillusionment and loneliness—and the mysteries of life and poetry.

In sharp contrast to the rhetorical, dramatic style of the Romantic period, Bécquer's lyricism, in which assonance predominates, is simple and airy.

The prose pieces, *Leyendas*, are characterized by medieval settings, supernatural characters such as nymphs, and a mysterious, dreamlike atmosphere. Written in a lyrical style, the narratives are based upon the themes of love, death, and the world beyond. His spiritual autobiography, the series of letters *Desde mi celda*, was composed at the monastery of Veruela, in northern Spain.

Becquerel, (Antoine-)Henri (b. Dec. 15, 1852, Paris—d. Aug. 25, 1908, Le Croisic, Fr.), French physicist who discovered radioactivity through his investigations of uranium and other substances. In 1903 he shared the Nobel Prize for Physics with Pierre and Marie Curie.

He was a member of a scientific family extending through several generations, the most notable being his grandfather Antoine-César Becquerel (1788–1878), his father, Alexandre-Edmond Becquerel (1820–91), and his son Jean Becquerel (1878–1953).

Education and training. After his early schooling at the Lycée Louis-le-Grand, Henri received his formal scientific education at the École Polytechnique (1872–74) and engineering training at the École des Ponts et Chaussées (Bridges and Highways School; 1874–77). In addition to his teaching and research posts, Becquerel was for many years an engineer in the Department of Bridges and Highways, being appointed chief engineer in 1894. His first academic situation was in 1876 as assistant teacher at the École Polytechnique, where in 1895 he succeeded to the chair of physics. Concurrently, he was assistant naturalist to his father at the museum, where he also assumed the physics professorship upon his father's death.

Electricity, magnetism, optical phenomena, and energy were major areas of physical investigation during the 19th century. For several years the young man's research was concerned with the rotation of plane-polarized light by magnetic fields, a subject opened by Michael Faraday and to which Henri's father had also contributed. Henri then concerned himself with infrared radiation, examining, among

Becquerel
Archives Photographiques

other things, the spectra of different phosphorescent crystals under infrared stimulation. Of particular significance, he extended the work of his father by studying the relation between absorption of light and emission of phosphorescence in some uranium compounds.

By 1896 Henri was an accomplished and respected physicist—a member of the Académie des Sciences since 1889—but more important than his research thus far were his expertise with phosphorescent materials, his familiarity with uranium compounds, and his general skill in laboratory techniques, including photography. Together, these were to place the discovery of radioactivity within his reach.

Systematic study of radiation. At the end of 1895, Wilhelm Röntgen discovered X-rays. Becquerel learned that the X-rays issued from the area of a glass vacuum tube made fluorescent when struck by a beam of cathode rays. He undertook to investigate whether there was some fundamental connection between this invisible radiation and visible light such that all luminescent materials, however stimulated, would also yield X-rays. To test this hypothesis, he placed phosphorescent crystals upon a photographic plate that had been wrapped in opaque paper so that only a penetrating radiation could reach the emulsion. He exposed his experimental arrangement to sunlight for several hours, thereby exciting the crystals in the customary manner. Upon development, the photographic plate revealed silhouettes of the mineral samples, and, in subsequent experiments, the image of a coin or metal cutout interposed between the crystal and paper wrapping. Becquerel reported this discovery to the Académie des Sciences at its session on February 24, 1896, noting that certain salts of uranium were particularly active.

He thus confirmed his view that something very similar to X-rays was emitted by this luminescent substance at the same time it threw off visible radiation. But the following week Becquerel learned that his uranium salts continued to eject penetrating radiation even when they were not made to phosphoresce by the ultraviolet in sunlight. To account for this novelty he postulated a long-lived form of invisible phosphorescence; when he shortly traced the activity to uranium metal, he interpreted it as a unique case of metallic phosphorescence.

During 1896 Becquerel published seven papers on radioactivity, as Marie Curie later named the phenomenon; in 1897, only two papers; and in 1898, none. This was an index of both his and the scientific world's interest in the subject, for the period saw studies of numerous radiations (e.g., cathode rays, X-rays, Becquerel rays, “discharge rays,” canal rays, radio waves, the visible spectrum, rays from glowworms, fireflies, and other luminescent materials), and Becquerel rays seemed not especially significant. The far more popular X-rays could take sharper shadow photographs and faster. It required the extension in 1898 of radioactivity to another known element, thorium (by Gerhard Carl Schmidt and independently by Marie Curie), and the discovery of new radioactive materials, polonium and radium (by Pierre and Marie Curie and their colleague, Gustave Bémont), to awaken the world and Becquerel to the significance of his discovery.

Further contributions. Returning to the field he had created, Becquerel made three more important contributions. One was to measure, in 1899 and 1900, the deflection of beta particles, a constituent of the radiation, in both electric and magnetic fields. From the charge to mass value thus obtained, he showed that the beta particle was the same as Joseph John Thomson's recently identified electron. Another discovery was the circumstance that

the allegedly active substance in uranium, uranium X, lost its radiating ability in time, while the uranium, inactive when freshly prepared, regained its activity. When Ernest Rutherford and Frederick Soddy found similar decay and regeneration in thorium X and thorium, they were led to the transformation theory of radioactivity, which explained the phenomenon as a subatomic chemical change in which one element spontaneously transmutes into another. Becquerel's last major achievement concerned the physiological effect of the radiation. Others may have noticed this before him, but his report in 1901 of the burn caused when he carried an active sample of the Curies' radium in his vest pocket inspired investigation by physicians, leading ultimately to medical use.

For his discovery of radioactivity, Becquerel shared the 1903 Nobel Prize for Physics with the Curies; he was also honoured with other medals and memberships in foreign societies. His own Academy of Sciences elected him its president and one of its permanent secretaries. (L.Ba.)

BIBLIOGRAPHY. There is no full-length biography of Becquerel in English. The article on him by Alfred Romer in the *Dictionary of Scientific Biography*, vol. 1 (1970), pp. 558–561, provides further details.

bed, piece of furniture upon which a person may recline or sleep, for many centuries considered the most important piece of furniture in the house and a prized status symbol. In ancient civilizations (and, indeed, in Europe until the later Middle Ages), beds were used not merely for sleeping but also, except in Egypt, for reclining when taking meals. They were either solid constructions built into the wall or lighter objects made of wood or metal, or a combination of both consisting of a couch supported on four legs with a low headboard at one end.

As shown on early medieval ivories and miniatures, even the beds of princes were remarkably simple. In 12th-century manuscripts, much richer bedsteads appear,

Great Bed of Ware, carved, inlaid, and painted wood, English, late 16th century; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London. Crown copyright reserved

with inlay, carving, and painting and embroidered coverlets and mattresses. To keep out drafts the bed was enclosed with curtains suspended from the ceiling. At first curtains were used only for the bed of the lord and his lady, but later they were also used for the beds of those in their immediate entourage.

Fifteenth-century western European beds had a paneled back with carved columns at the front corners, supporting a canopy, or tester, from which hung curtains that enclosed the

four bedposts. A remarkable feature of these beds was their size, as large as 8 by 7 feet (240 by 210 cm); it has been supposed that several people slept in them.

During the 16th century, beds became more decorative, with much carved work on the bedhead and bedposts. A well-known English Elizabethan bed is the Great Bed of Ware (Victoria and Albert Museum, London), which is 10 feet 11 inches (3.33 m) square. In France the taste for such beds hardly survived the beginning of the 17th century, when they disappeared again behind precious fabrics; but in England the carved oak or walnut bedstead with paneled and inlaid bedhead and tester continued into the first half of the 17th century.

During the first half of the 17th century, two types of beds were made, one with a heavy carved frame and the other with a light framework and elaborate hangings; by the middle of the century the latter had become prevalent in England and Europe. The second half of the 17th through the early 18th century was a period of magnificent beds. No fewer than 413, some of great splendour, were described in the inventory of Louis XIV's palaces. In the 17th century the appearance of the bed was determined by its hangings, but in the 18th the frame became visible again, appropriately carved and gilded. The curtains became lighter, being made of taffeta or satin instead of the heavy brocades and velvets of the 17th century.

With the development of coiled springs, which were first fitted into mattresses in the 1820s, bed comfort was transformed. During the second half of the 19th century, metal bedsteads became common, first made of cast iron, subsequently of brass tubing. One of the main features of bed design in the 20th century was the tendency to abandon the traditional, standard-size double, or matrimonial, bed in favour of two smaller single, or twin-size, beds or a larger queen- or king-size. One popular form is the divan, or daybed, which can serve as a seat during the day and a bed at night, and another is the convertible sofa that unfolds to become a bed.

In the Middle East it was the custom to make beds simply by piling up rugs on the floor. In both Persian and Indian miniatures of the Mughal period, lovers are shown reclining on low divan beds, with carved legs at the corners and sometimes a low headboard as well. No difference is apparent in the representations of beds in miniatures dating from periods as far apart as the 15th and 19th centuries.

In China raised and canopied beds were used about 2,000 years ago. During the Ming dynasty (1368–1644), or perhaps earlier, it became the custom in some areas to enclose beds with gauze or netting; later the bed was made along the back wall of a small back room with a small antechamber cut off by sliding doors. These beds were covered with matting.

Traditional Japanese bedding, the use of which persisted in the late 20th century, consisted of quilted padding and coverlets called futons arranged directly on the floor, which was covered with tatami, or resilient mats of woven fibre. During the day the futons were stored in a cupboard, and the room was used for eating and general social gatherings. During the late 20th century futons became increasingly popular in the West.

Exotic innovations in bed design in the 1960s were the inflatable air mattress and the water bed, a mattress-sized plastic or vinyl bag filled with water and supported in a wooden frame. At first popular mainly as a novelty among the young, the water bed was later more widely accepted and has been used in hospitals, infant nurseries, and convalescent homes.

bed-wetting, urinary incontinence during sleep. It is the most prevalent form of enuresis (*q.v.*).

bedbug, any member of the approximately 75 species of nocturnal insects of the family Cimicidae (order Heteroptera) that feed by sucking the blood of humans and other warm-blooded animals. The reddish brown adult is broad and flat and 4 to 5 mm (less than 0.2 inch) long. The greatly atrophied, scalelike, vestigial wings are inconspicuous and nonfunctioning. The distinctive, oily odour of bedbugs results from a secretion of the scent, or stink, glands. Each female lays an average of 200 or more

Bedbug (*Cimex lectularius*) magnified 5 ×
William E. Ferguson

eggs during a single reproductive period, and three or more generations may be produced in a year.

Bedbugs are among the most cosmopolitan of human parasites. They are found in every kind of dwelling place, hiding during the day and coming out at night to feed; afterward, they retreat to their hiding place to digest the meal, which may require several days. Adult specimens have lived for at least a year without food. Although the bedbug has an irritating bite, it is not known to transmit diseases to humans.

Cimex lectularius, which occurs in temperate regions, and *C. hemipterus*, which is common in the tropics, attach to humans. The species *C. pilosellus* lives on bats; species of *Oeciacus*, on swallows and martins; *Cimexopsis nyctalis*, on chimney swifts; and *Haematosiphon inodora*, on poultry, although it has been known to feed on humans and pigs as well.

Bedde, traditional emirate, Yobe state, northern Nigeria. Although Bade (Bedde, Bede) peoples settled in the vicinity of Tagali village near Gashua as early as the 14th century, they shortly thereafter came under the jurisdiction of a *galadima* ("governor") of the Bornu kingdom based at nearby Nguru (see Kanem-Bornu). Not until the late 18th century did they come under the rule of the present Gidgid (from the name of a settlement 30 miles [48 km] south-southwest of Gashua) dynasty of Bedde. Dispersed about 1808 by warriors in the jihad (holy war) conducted by the Fulani, the Bade sought protection and again agreed to pay tribute in slaves to Bornu. About 1825, however, Lawan Babuje, the Bade *mai* ("ruler"), found the tribute too high, organized a pan-Bade federation, built the walled town of Gorgoram (27 miles southwest of Gashua) as his capital, and declared Bedde's independence from both the Fulani and the Kanuri. Mai Alhaji, his son and successor (reigned 1842–93), successfully defended Gorgoram from both Fulani (mostly from Hadejia town, 73 miles west-southwest) and Kanuri attacks. Although Gorgoram was captured during the reign of Mai Duna (1893–97) by the forces of Rabiḥ az-Zubayr, the Sudanese warrior who destroyed the power of Bornu, following the

advent of British rule in 1902, Mai Saleh (also Sale; reigned 1897–1919) was recognized as the emir of independent Bedde.

Bedde traditional emirate is mainly inhabited by the predominantly Muslim Bade, Ngizim, and Kanuri peoples. Its arid savanna climate supports only a sparse population, but its location in the drainage systems of the seasonal Hadejia and Katagum rivers, which join together within the emirate to form the Komadugu Yobe, allows fishing during the rainy season. Peanuts (groundnuts) and cotton are the chief cash crops; but sorghum, millet, cowpeas, tobacco, and gum arabic are also collected for sale in the local markets. Cattle, goats, and sheep are the principal livestock. Gashua, by far Bedde's largest town, is the headquarters of a local government council and a market centre as well as the seat of the Mai Bedde.

Beddoes, Thomas Lovell (b. June 30, 1803, Clifton, Somerset, Eng.—d. Jan. 26, 1849, Basel, Switz.), poet best known for his haunting dramatic poem *Death's Jest-Book; or, The Fool's Tragedy*.

The son of a distinguished scientist, Beddoes seems early to have acquired, from his father's

Beddoes, detail of a portrait by Nathan C. Branwhite, 1824

dissections and speculations on anatomy and the soul, an obsession with death that was to dominate his life and work. He was educated at Charterhouse, where his passion for the drama became evident and where he nourished his imagination on 18th-century Gothic romances. In 1820 he went to Oxford University, where he wrote his first considerable work, *The Bride's Tragedy* (1822), based on the story of a murder committed by an undergraduate. In 1825 he went to Göttingen, Ger., to study anatomy and medicine. There he continued work on *Death's Jest-Book*. Friends who read the first version advised revision, and Beddoes' acceptance of their advice hindered his poetic development: for the rest of his life he was unable to escape from the work or to complete it, and it was eventually published posthumously in 1850.

In *Death's Jest-Book* itself, which Beddoes described as an example of "the florid Gothic," he aimed to use Gothic material to discuss the problems of mortality and immortality.

After trouble with the university authorities, Beddoes left Göttingen, moved to Würzburg (where he received his M.D.), and there involved himself in radical politics. More trouble caused him to leave Germany for Zürich, where his interest in writing English verse waned. In 1840 he had to flee from Switzerland, probably for political reasons, and he never afterward settled in one place for very long. He visited England for the last time in 1846–47. Two years later he committed suicide. The standard biography of Beddoes is by H.W. Donner (1935).

Bede the VENERABLE, SAINT, Bede also spelled BAEDA, or BEDA (b. 672/673, traditionally Monkton in Jarrow, Northumbria—d. May 25, 735, Jarrow; canonized 1899; feast day May 25), Anglo-Saxon theologian, historian, and chronologist, best known today for his

Historia ecclesiastica gentis Anglorum ("Ecclesiastical History of the English People"), a source vital to the history of the conversion to Christianity of the Anglo-Saxon tribes. During his lifetime and throughout the Middle Ages Bede's reputation was based mainly on his scriptural commentaries, copies of which found their way to many of the monastic libraries of western Europe. His method of dating events from the time of the incarnation, or Christ's birth—i.e., AD—came into general use through the popularity of the *Historia ecclesiastica* and the two works on chronology. Bede's influence was perpetuated at home through the school founded at York by his pupil Archbishop Egbert of York and was transmitted to the Continent by Alcuin, who studied there before becoming master of Charlemagne's palace school at Aachen.

Nothing is known of Bede's parentage. At the age of seven he was taken to the Monastery of St. Peter, founded at Wearmouth (near Sunderland, Durham) by Abbot St. Benedict Biscop, to whose care he was entrusted. By 685 he was moved to Biscop's newer Monastery of St. Paul at Jarrow. Bede was ordained deacon when 19 years old and priest when 30. Apart from visits to Lindisfarne and York, he seems never to have left Wearmouth-Jarrow. Buried at Jarrow, his remains were removed to Durham and are now entombed in the Galilee Chapel of Durham Cathedral.

Bede's works fall into three groups: grammatical and "scientific," scriptural commentary, and historical and biographical. His earliest works include treatises on spelling, hymns, figures of speech, verse, and epigrams. His first treatise on chronology, *De temporibus* ("On Times"), with a brief chronicle attached, was written in 703. In 725 he completed a greatly amplified version, *De temporum ratione* ("On the Reckoning of Time"), with a much longer chronicle. Both these books were mainly concerned with the reckoning of Easter. His earliest biblical commentary was probably that on the Revelation to John (703?–709); in this and many similar works, his aim was to transmit and explain relevant passages from the Fathers of the Church. Although his interpretations were mainly allegorical, treating much of the biblical text as symbolic of deeper meanings, he used some critical judgment and attempted to rationalize discrepancies. Among his most notable are his verse (705–716) and prose (before 721) lives of St. Cuthbert, bishop of Lindisfarne. These works are uncritical and abound with accounts of miracles; a more exclusively historical work is *Historia abbatum* (c. 725; "Lives of the Abbots").

In 731/732 Bede completed his *Historia ecclesiastica*. Divided into five books, it recorded events in Britain from the raids by Julius Caesar (55–54 BC) to the arrival in Kent (AD 597) of St. Augustine. For his sources he claimed the authority of ancient letters, the "traditions of our forefathers," and his own knowledge of contemporary events. Bede's *Historia ecclesiastica* leaves gaps tantalizing to secular historians. Although overloaded with the miraculous, it is the work of a scholar anxious to assess the accuracy of his sources and to record only what he regarded as trustworthy evidence. It remains an indispensable source for some of the facts and much of the feel of early Anglo-Saxon history. A modern translation of Bede's history is *Bede Historical Works*, 2 vol. (1990–94), in English and Latin, translated by J.E. King. Contemporary sources on Bede's life include Benedicta Ward's *The Venerable Bede* (1990, reissued with additions, 1998).

Bedford, borough (district), administrative county of Bedfordshire, south-central England. The borough lies almost entirely within the historic county of Bedfordshire, except for a small area northwest of Pertenhall that be-

longs to the historic county of Huntingdonshire. The borough of Bedford includes the large town of Bedford, the district seat, within its otherwise rural landscape. It spans a section of the winding, broad valley of the River Ouse. The clay soils of Bedford borough are used for growing a variety of agricultural products. Limestone exposed in the Great Ouse valley northwest of the town of Bedford was formerly used as building stone in the small riverside villages. Brick making is important; centred on the town of Stewartby, southwest of Bedford town, it utilizes the local heavy Oxford clays. Kempston, immediately adjacent to Bedford town, is a light industrial centre manufacturing crayons. Area 184 square miles (476 square km). Pop. (1998 est.) 140,200.

Bedford, town, Bedford borough, administrative and historic county of Bedfordshire, England, in the fertile valley of the River Ouse. A Roman fording station and a Saxon town (cemetery of Kempston), it was recaptured by the Anglo-Saxon sovereign Edward the Elder (ruled 899–924) from the Danes in 914. The community became the capital of the nascent shire because of its commanding position. It received its first charter from Henry II (ruled 1154–89), and this was confirmed by successive monarchs to Charles II (ruled 1660–85).

St. Paul's church is mainly Decorated and Perpendicular in style. The Bunyan Meeting House (1850) stands on the site of a barn in which John Bunyan preached from 1656 onward, and the panels of the door (1876) depict scenes from his *Pilgrim's Progress*. Howard House, belonging to the prison reformer John Howard, is near the Howard Congregational Church, which he helped to found in 1772. The Cecil Higgins Art Gallery and Museum is nearby, as is the mound on which stood the Norman castle.

Bedford is well served by rail and road. It is the centre for a large agricultural area and one of commerce and local government, serving as the county town (seat). Industries include the making of pumps, diesel engines, and gas and steam turbines. Pop. (1991) 73,917.

Bedford, city, seat of Lawrence county, southern Indiana, U.S., 25 mi (40 km) south of Bloomington. Founded in 1825 as the county seat, and named by Joseph Rawlins for his home county of Bedford, Tenn., it developed with the discovery of oolitic limestone in the 1830s. Bedford limestone is a highly prized building material, used to great effect in such famous buildings as the Empire State Building in New York City and the Pentagon in Arlington, Va. Immense quarries and mills are characteristic of the area. Bedford is the headquarters for the nearby Hoosier National Forest; Spring Mill State Park, 10 mi (16 km) southeast, has a working grist mill and reconstructed pioneer village. Inc. 1889. Pop. (2000) 13,768.

Bedford, town (township), Middlesex county, northeastern Massachusetts, U.S. It lies near the Concord River, just northwest of Boston. Settled in 1642, it developed around an Algonquin Indian trading post called the Shawsheen House. It was incorporated in 1729 and named for Bedford, Eng. The Bedford flag, carried by the minutemen (people who took up arms at a "minute's notice") on April 19, 1775, against the British at Concord Bridge, is displayed in the town library; the house of the flag carrier, Cornet Nathaniel Page, is now a historic site. Other landmarks include the Old Burying Ground, with graves of Revolutionary War soldiers, the First Parish Church (1817), and Fitch Tavern (1731). Bedford's economy is based on research and engineering associated with high-technology development. Pop. (2000) 12,595.

Bedford, town, Westchester county, southeastern New York, U.S., north of White Plains, near the Connecticut state line. Bedford Village, the original settlement, was founded in 1680 by 22 farmers from Stamford, Conn., on a tract known as the hopp ground, purchased from Katonah and other Indian chiefs. Originally in Connecticut, the village was made part of New York in 1700 by royal boundary decree. During the American Revolution, it was burned (1779) by British troops led by Lieut. Col. Banastre Tarleton. The Town (township) of Bedford, officially established in 1682, covers an area of 43.6 sq mi (113 sq km) and includes the hamlets of Bedford Village, Bedford Hills, and Katonah, and shares the Village of Mount Kisco (incorporated 1874) with New Castle. The building of New York City reservoirs forced the removal of Katonah to its present site (1897), changed the town's landscape, and stimulated a residential trend. Pop. (1990) 16,906.

Bedford, borough, seat (1771) of Bedford county, southern Pennsylvania, U.S., on the Pennsylvania Turnpike and the Raystown branch of the Juniata River, in the Allegheny Mountains, 38 mi (61 km) south of Altoona. A settlement, made on the site about 1750 by Robert Ray, an Indian trader, was known as Raystown. Ft. Bedford (built 1758 and apparently named for the Duke of Bedford) was a

The Bedford Springs Hotel, used by President Buchanan as a summer White House, Bedford, Pa. Milt and Joan Mann from CameraMann

frontier rallying point and supply base for the British colonial campaign against the French Fort-Duquesne. The town of Bedford was platted in 1766. In 1794 George Washington paused there to review troops sent to quell the Whiskey Rebellion; Espy House, which he then occupied, has been preserved. Bedford formed the background for several of Hervey Allen's historical novels, notably *Bedford Village* (1944) and *The Forest and the Fort* (1943).

The nearby resort area of Bedford Springs with its medicinal waters was used by Pres. James Buchanan as a summer White House. The Blue Knob ski area, Coral Caverns, and the Shawnee State Park are nearby. Fort Bedford Park and Museum includes a replica of the original fort, and Old Bedford Village has reconstructed buildings of the 1750–1850 period. Bedford's manufactures include clothing, mining equipment, toys, and wood products. Inc. 1795. Pop. (1990) 3,137.

Bedford, EARLS AND DUKES OF, titled English nobility of several creations, in the families Plantagenet, Tudor, and Russell, grouped below chronologically and indicated by the symbol ●.

● **Bedford, John Plantagenet, duke of** (b. June 20, 1389—d. Sept. 14, 1435, Rouen, Fr.), general and statesman who commanded England's army during a critical period in the Hundred Years' War (1337–1453) with France. Despite his military and administra-

tive talent, England's position in France had irreversibly deteriorated by the time he died.

The third son of King Henry IV of England (ruled 1399–1413), he was made duke

John Plantagenet, duke of Bedford, praying to St. George, miniature from the *Bedford Book of Hours*, c. 1430; in the British Library (MS. 18850)

By courtesy of the trustees of the British Library

of Bedford by his brother King Henry V in 1414. Between 1415 and 1422 he served as lieutenant of the kingdom three times while Henry was campaigning in France. Bedford helped relieve the besieged city of Harfleur in 1416, and he and the King were both in France at the time of Henry's death in 1422. He then became regent for Henry's son, the infant King Henry VI, and it was agreed that during his absence from England his brother Humphrey, duke of Gloucester, was to take over his duties.

Bedford again turned his attention to the war. By allying with Philip the Good, duke of Burgundy, in 1423, he gained control over northwestern France, and he then opened an offensive against the French king, Charles VII. On Aug. 17, 1424, Bedford won an important victory at Verneuil. Nevertheless, throughout this period he had to struggle to maintain the crucial Anglo-Burgundian alliance, which was threatened by hostility between Gloucester and Duke Philip. Furthermore, Bedford was recalled to England in 1426 to arrange a reconciliation between the warring factions led by Gloucester on the one side and the chancellor, Henry Beaufort, on the other.

Returning to France in 1427, Bedford had continual success until he was forced, under pressure from a French army led by Joan of Arc, to raise his siege of Orléans in April 1429. This setback was the turning point of the war. Thereafter, all Bedford's energy and judgment could not keep England's hold on France from weakening. In addition, in 1433 he discovered that his country was rapidly becoming too insolvent to prosecute the conflict. Bedford's death came as Burgundy was in the process of abandoning the English cause and making a separate peace with France.

● **Bedford, Jasper Tudor, duke of**, EARL OF PEMBROKE, byname JASPER OF HATFIELD (b. c. 1430—d. Dec. 21/26, 1495), leader of the Lancastrians in Wales, uncle and guardian of Henry, earl of Richmond, afterward Henry VII of England.

The second son of Owen Tudor, founder of the family's fortunes, he was knighted in 1449 and created earl of Pembroke about 1452. Between 1456 and 1459 he worked hard to increase his influence in West Wales. He was with Henry VI when the Yorkists were forced to flee at Ludford (Shropshire) in 1459, and

in 1460 he besieged and captured the Duke of York's North Welsh stronghold of Denbigh Castle. He shared in the Lancastrian defeat at Mortimer's Cross (February 1461), where his father was taken and beheaded, but he made his escape to Ireland and later to Scotland.

In 1468 he landed in North Wales in an attempt to relieve Harlech Castle, which held out for King Henry VI; he was able to capture Denbigh Castle but was then defeated by William, lord Herbert, who was rewarded with his forfeited earldom of Pembroke. Landing with the Earl of Warwick in 1470, he was sent to Wales and arrived too late for the defeat of the Lancastrians at Tewkesbury (1471).

With his young nephew, Henry of Richmond, he escaped to Brittany, where Henry grew up under his guidance. He attempted a further invasion of England during the rebellion of 1483 but was prevented from landing. In August 1485 he landed with Henry in South Wales and fought at Bosworth Field. His unflinching loyalty was rewarded by Henry VII with the dukedom of Bedford (1485) and a grant of the lordship of Glamorgan (1486), and he was afterward lord lieutenant of Ireland (1486–94). Jasper played a leading part in the suppression of the rebellions of 1486 and 1487 and lived into an honoured old age. He had issue by his wife, Catherine Woodville, sister of Edward IV's queen, but the dukedom became extinct upon his death.

● **Bedford, John Russell, 1st earl of** (b. c. 1485—d. March 14, 1555, London), founder of the wealth and greatness of the house of Russell, who was a favourite of England's Henry VIII and was created earl of Bedford during the reign of Edward VI.

He was with Henry VIII at the Field of Cloth of Gold in 1520 and, returning to military service when the French war was renewed, lost his right eye at the siege of Morlaix in 1522. In 1523 he went secretly to France, where he negotiated a treaty between Henry and Charles, duke of Bourbon, who wished to betray the French king, Francis I. He visited Pope Clement VII in Rome in 1524 and, having eluded the French, who endeavoured to capture him, was present at the Battle of Pavia in February 1525, returning to England about the close of the year. From 1527 on,

John Russell, 1st earl of Bedford, chalk drawing by Hans Holbein the Younger; in Windsor Castle, England

Reproduced by gracious permission of Her Majesty Queen Elizabeth II

Russell's life was mainly spent in England. He entered the Reformation Parliament for Buckingham in 1529 and, although an opponent of the party of Anne Boleyn, retained the favour of Henry VIII. He received many high honours and offices and became Baron Russell in 1539. When Charles V and Francis I were threatening to invade England in 1539, he was sent into the west and crossed to France when Henry attacked Francis in 1544. He was in command of an army in the west of England in 1545 and, when Henry died in January 1547, was one of the executors of his will.

Under Edward VI, Russell was lord high steward and keeper of the privy seal. He was created earl of Bedford in January 1550 and was one of the commissioners appointed to make peace with France in that year. He opposed the proposal to seat Lady Jane Grey on the throne; supported Mary I, who reappointed him lord privy seal (November 1553); and helped to prevent Sir Thomas Wyatt's rising from spreading to Devonshire. He went to Spain to conclude the marriage treaty between Mary I and Philip II in 1554. He died in London, soon after his return.

• **Bedford, Francis Russell, 2nd earl of** (b. c. 1527—d. July 18, 1585, London), Protestant supporter of Queen Elizabeth I of England.

Only son of the 1st earl, he took his seat in the House of Lords as Lord Russell in 1552. Russell was in sympathy with the Protestant reformers, whose opinions he shared, and was imprisoned during the earlier part of Mary's reign. He inherited the earldom in 1555 and left for the Continent, where he met foreign reformers and fought at the Battle of Saint Quentin (1557). When Elizabeth I ascended the throne (November 1558) Bedford became an active figure in public life. He was made a privy councillor, had some influence in the religious settlement, and was sent on diplomatic errands to Charles IX of France and Mary Stuart. He was governor of Berwick and warden of the east marches of Scotland (February 1564–October 1567), in which capacity he conducted various negotiations between Elizabeth and Mary. When the northern insurrection broke out in 1569, Bedford was sent into Wales, and he sat in judgment upon the duke of Norfolk in 1572. He was president of the council of Wales in 1576 and, in 1581, was deputed to arrange a marriage between Elizabeth and the duke of Anjou. Bedford was succeeded by his grandson Edward Russell, the 3rd earl.

• **Bedford, Francis Russell, 4th earl of** (b. 1593—d. May 9, 1641, London), only son of William, Lord Russell of Thornhaugh, who became earl of Bedford by the death of his cousin Edward, the 3rd earl, in May 1627.

When the quarrel broke out between Charles I and Parliament in 1628, Bedford supported the demands of the House of Commons as embodied in the Petition of Right, and in 1629 he was arrested for his share in an opposition pamphlet but was quickly released. The Short Parliament meeting in April 1640 found Bedford as one of the king's leading opponents. In July 1640 he was among the peers who wrote to the Scottish leaders refusing to invite a Scottish army into England but promising to stand by the Scots in all legal and honourable ways; and his signature was afterward forged by Thomas, Viscount Savile, in order to encourage the Scots to invade England. In the following September he was among those peers who urged Charles to call a parliament, to make peace with the Scots, and to dismiss his obnoxious ministers; and he was one of the English commissioners appointed to conclude the treaty of Ripon. When the Long Parliament met in November 1640, Bedford was generally regarded as the leader of the Parliamentarians. In 1641 he became a privy councillor and was appointed treasurer but died in the middle of the Parliamentary struggle.

• **Bedford, William Russell, 1st duke and 5th earl of** (b. 1613—d. Sept. 7, 1700), eldest son of the 4th earl, who fought first on the side of Parliament and then on that of Charles I during the Civil War.

In general, he played a minor part in politics. His son Lord William Russell (1639–83) was involved in the opposition to Charles II, led by Lord Shaftesbury, and was executed for treason in 1683. It was partly because of his son's

fame as patriot martyr that the 5th earl was granted a dukedom in 1694. He was succeeded by his grandson Wriothesley Russell (1680–1711), 2nd duke, who was succeeded by his son Wriothesley Russell (1708–32), 3rd duke.

• **Bedford, John Russell, 4th duke of** (b. Sept. 30, 1710—d. Jan. 15, 1771, Woburn, Bedfordshire, Eng.), leader of the "Bedford Whigs," a major parliamentary force in the third quarter of the 18th century in England.

Brother of the 3rd duke (Wriothesley Russell), he joined the opposition to Sir Robert Walpole and in November 1744 became first lord of the Admiralty in the administration of Henry Pelham. He was subsequently lord privy seal in Lord Bute's cabinet of 1761. He wanted peace at any cost, was sent to France to negotiate in 1762, and signed the Peace of Paris in 1763. He was lord president of the council in George Grenville's cabinet in the same year.

Bedford was the leader of a political group which bore his name. The Bedford Whigs were a group built up on family connections and electoral influence. Lord Sandwich, Lord Gower, Lord Weymouth, and Richard Rigby were notable Bedfordites. Because of his failing eyesight, Bedford himself did not hold office after 1765, when the Grenville administration fell, but his party continued to hold office in successive ministries, and it remained a cohesive political group for more than a decade after Bedford's death.

• **Bedford, Francis Russell, 5th duke of** (b. July 23, 1765—d. March 2, 1802, Woburn, Bedford, Eng.), eldest son of Francis Russell (d. 1767), marquess of Tavistock, the eldest son of the 4th duke; he succeeded his grandfather as duke of Bedford in 1771.

Regarding Charles James Fox as his political leader, he joined the Whigs in the House of Lords and became a member of the circle of the prince of Wales, afterward George IV. Bedford was greatly interested in agriculture. He established a model farm at Woburn and made experiments in sheep breeding that were recorded by Arthur Young in the *Annals of Agriculture* (1795). He was a member of the original board of agriculture and was the first president of the Smithfield Club.

• **Bedford, John Robert Russell, 13th duke of** (b. May 24, 1917—d. Oct. 25, 2002, Sante Fe, N.M., U.S.), elder son of the 12th duke (Hastings William Sackville Russell), succeeding to the title in 1953.

Faced with paying heavy death duties on his father's estate, including Woburn Abbey, the 13th duke developed to the full the commercial possibilities inherent in opening a "stately home" to the public—adding to the show of magnificent collections of furniture and art treasures a number of popular attractions on the grounds, including a safari park that was initially administered by a famous circus family, the Chipperfields; the park became home to such animals as elephants, giraffes, and lions. The estate, which is situated on 3,000 acres (1,214 hectares), also features a unique collection of deer, which includes some 10 species. Bedford was a resourceful publicist, and both he and Woburn Abbey became well known to the British public and to foreign tourists. He wrote *A Silver-Plated Spoon* (1959), *Book of Snobs* (with G. Mikes; 1965), *The Flying Duchess* (1968), and *How To Run a Stately Home* (with G. Mikes; 1971).

Bedfordshire, administrative, geographic, and historic county of the southeastern Midlands of England. The county town (seat) is Bedford. The administrative county is divided into three districts: Mid Bedfordshire, South Bedfordshire, and the borough of Bedford. These districts cover largely rural areas centred, respectively, on the towns of Ampthill, Dunstable, and Bedford. The geographic

county of Bedfordshire also includes the unitary authority of Luton, which is administratively distinct.

Much of the county occupies the broad valley of the River Great Ouse and its tributaries, but at its southern extremity the chalk ridge known as the Chiltern Hills cuts across the county on a southwest–northeast alignment. Below the chalk scarp lies a clay vale. Apart from the easily flooded valley bottoms and a belt of light sands, the county is largely cultivated, and milk and vegetables for the London market, 40–50 miles (70–80 km) to the south, are the principal products.

Settlement in Bedfordshire is ancient. In the early Bronze Age (c. 1800 BC) the Beaker people, immigrants from the eastern Mediterranean with a highly developed culture, settled in the Ouse Valley. Roman settlement (1st–5th centuries AD) was concentrated in the south of the county around Dunstable (Roman Durocobrivae). After the Roman withdrawal the area was settled by invading Anglo-Saxons and Danes; Bedford itself was founded by Danes. The shire was first mentioned as a political unit in 1010.

The urbanized southern fringe of the county contains the town of Luton and Dunstable, once noted for the manufacture of straw hats but now for the production of a wide variety of industrial goods. Luton is on the outermost fringe of the London industrial region. Situated 30 miles (48 km) from central London, it is on a major rail route and beside the motorway to the north, and it possesses one of London's smaller airports. The county has long-standing connections with aerospace industries, and the College of Aeronautics is at Cranfield.

The outstanding architectural masterpiece of the county is Woburn Abbey, seat of the dukes of Bedford. The present structure dates from 1747 and is surrounded by a magnificent park. A second notable house is Luton Hoo, near Luton, designed by Robert Adam in 1762; both it and Woburn are open to the public. Area administrative county, 460 square miles (1,192 square km); geographic county, 477 square miles (1,236 square km). Pop. (2001) administrative county, 381,571.

Bédier, (Charles-Marie-) Joseph (b. Jan. 28, 1864, Paris, France—d. Aug. 29, 1938, Le Grand-Scrrc), scholar whose work on the Tristan and Isolde and the Roland epics made invaluable contributions to the study of medieval French literature.

He was appointed to the Collège de France in 1903. His reputation as a writer was established with the publication of *Le Roman de Tristan et Iseult* in 1900, and his scholarship was fully expressed in his epoch-making critical edition of *Le Roman de Tristan* by the

Bédier, drawing by Aaron Bilis, 1931
J.P. Ziolo

Anglo-Norman poet Thomas (1902–05). He proved that the earliest Tristan poem was the product of an individual genius, not of popular tradition.

Les Légendes épiques, 4 vol. (1908–21), presents his theory on the origins of the old French epic poems, the chansons de geste. He marshals convincing evidence in support of his belief that they were originally composed by the troubadours on themes provided by the monks traveling on the pilgrimage routes. In 1922 he published a critical edition of *La Chanson de Roland*. He was elected to the Académie Française in 1921.

Bedlam, byname of BETHLEHEM ROYAL HOSPITAL, the first asylum for the insane in England. The word *bedlam* came to be used generally for all insane asylums and is used colloquially for an uproar.

The asylum was founded by Simon Fitz-Mary, sheriff of London, in 1247, as a priory in Bishopsgate Street for the order of the Star of Bethlehem. Bedlam was mentioned as a hospital in 1330, and some permanent patients were accommodated there by 1403. In 1547 it was given by Henry VIII with all its revenues to the City of London as a hospital for the insane. It subsequently became infamous for the brutal ill-treatment meted out to the insane. In 1675 the hospital was moved to Moorfields; in 1815 to St. George's Fields in southeast London; and in 1930 to Shirley on the borders of Beckenham and Croydon. Now a part of the national health service, it is known as the Bethlehem Royal Hospital and the Maudsley Hospital.

Bedlington terrier, breed of dog developed in the 1800s in Northumberland, England, and named for Bedlingtonshire, a mining district in the area. The breed, which established itself locally as a fighting dog and a courageous hunter of badgers and other vermin, was later popular as a pet. Lamblike in appearance, the

Bedlington terrier
Sally Anne Thompson—EB Inc.

Bedlington terrier has an arched back, a topknot, and a thick, curly coat, linty in texture and blue-gray, deep reddish brown, or pale sandy, often with tan markings. It stands 15 to 16 inches (38 to 40.5 cm) and weighs 22 to 24 pounds (10 to 11 kg).

Bedlingtonshire, also called BEDLINGTON, locality, Wansbeck district, county of Northumberland, England, adjacent to the North Sea port of Blyth. Its population grew rapidly with the expansion of coal mining north of the Blyth River in the 19th century. Ironworks flourished until the 1860s. Since World War II mining has declined, but the local economy has been sustained by light industries established to offset the pit closures. Bedlington gives its name to a breed of terrier dogs. Pop. (1991) 26,707.

Bedloe's Island (New York, U.S.): see Liberty Island.

Bednorz, J(ohannes) Georg (b. May 16, 1950, West Germany). German physicist who, along with Karl Alex Müller (*q.v.*), was awarded the 1987 Nobel Prize for Physics for their joint discovery of superconductivity in certain substances at temperatures higher than had previously been thought attainable.

Bednorz graduated from the University of Münster in 1976 and earned his Ph.D. at the Swiss Federal Institute of Technology at Zürich in 1982. That same year he joined the IBM Zürich Research Laboratory, where he was recruited by Müller into the latter's studies of superconductivity.

In 1983 the two men began systematically testing newly developed ceramic materials known as oxides in the hope that such substances could act as superconductors. In their efforts Bednorz was the experimenter in charge of the actual making and testing of the oxides. In 1986 the two men succeeded in achieving superconductivity in a barium-lanthanum-copper oxide at a temperature of 35 kelvins (-238°C [-396°F]), 12 K higher than the highest temperature at which superconductivity had previously been achieved in any substance.

Bedny, Demyan, byname of YEFIM ALEKSEYEVICH PRIDVOROV (b. April 13 [April 1, Old Style], 1883, Gubovka, Ukraine, Russian Empire—d. May 25, 1945, Barvikha, near Moscow), Soviet poet known both for his verses glorifying the Revolution and for his satirical fables.

The natural son of a grand duke, Pridvorov began contributing to the socialist press before the Revolution, adopting the name Demyan Bedny ("Damian the Poor"). In 1912 his satires started to appear. His style was influenced by the 19th-century Russian fabulist Ivan Krylov; his verses often took the form of popular songs and "factory couplets" (a kind of workers' slogan or cheer). Between 1917 and 1930 Bedny was highly popular with the general public, and Lenin himself, while noting their crudeness, lauded their propaganda value. Many of his works, however, were topical, and time diminished their appeal.

In 1936 Bedny composed a new libretto for the comic opera *Bogatyri* ("Heroes"), by Aleksandr Borodin; and his verse text, in the spirit of the original music, satirized Russian history and its epic heroes. Although Bedny had been a longtime favourite of Stalin, the dictator now personally berated him for his cynicism and lack of respect. In 1938 he was expelled from the Communist Party. Even the patriotic verses he wrote during World War II, which were extremely popular among the soldiers, did not regain for him his former status. Only in the 1960s, well after his death, was official approval of Bedny's works revived, and he is now regarded as an outstanding communist poet, although his popularity with the public remains limited.

Bedouin, also spelled BEDUIN, Arabic BADAWI, plural BADW, Arabic-speaking nomadic peoples of the Middle Eastern deserts, especially of Arabia, Iraq, Syria, and Jordan.

The Bedouin constitute only a small part of the total population of the Middle East but inhabit or utilize a large part of the land area. Most of them are animal herders who migrate into the desert during the rainy winter season and move back toward the cultivated land in the dry summer months. Although the Bedouin, as a matter of caste, traditionally despise agricultural work and other manual labour, many of them have become sedentary as a result of political and economic developments, especially since World War II. In the 1950s, Saudi Arabia and Syria nationalized Bedouin range lands, and Jordan severely limited goat grazing. Conflicts over land use between Bedouin herders on the one hand and settled agriculturists on the other have increased since then.

Bedouin with a young goat in central Qatar

M. Ericson—Ostman Agency

The traditional Bedouin can be classified according to the animal species that are the basis of their livelihood. First in prestige are the camel nomads, who occupy huge territories and are organized into large tribes in the Sahara, Syrian, and Arabian deserts. Beneath them in rank are the sheep and goat nomads, who stay mainly near the cultivated regions of Jordan, Syria, and Iraq. Cattle nomads are found chiefly in South Arabia and in the Sudan, where they are called Baqqārah (Baggara).

Following World War I the Bedouin tribes had to submit to the control of the governments of the countries in which their wandering areas lay. This also meant that the Bedouins' internal feuding and the raiding of outlying villages had to be given up, to be replaced by more peaceful commercial relations. Service in armed forces and even labour in construction became more common, especially after World War II. The tribal character of Bedouin society continued, however, as did the patriarchal order in their extended, patrilineal, endogamous and polygynous families. Among the Arabic-speaking tribes, the head of the family, as well as of each successively larger social unit making up the tribal structure, is called sheikh; the sheikh is assisted by an informal tribal council of male elders.

In addition to the "noble" tribes who trace their ancestry to either Qaysi (northern Arabian) or Yamani (southern Arabian) origin, traditional Bedouin society comprises scattered, "ancestorless," vassal tribal splinter groups who shelter under the protection of the large noble tribes and make a living by serving them as blacksmiths, tinkers, artisans, entertainers, and other workers.

Bedraja (Siamese king): see Phetracha.

Bedreddin, byname of BADR AD-DĪN IBN QĀDĪ SAMĀWNĀ (b. Dec. 3, 1358, Samāwnā, Ottoman Empire [Turkey]—d. December 1416/20, Sérrai [Greece]), Ottoman theologian, jurist, and mystic whose social doctrines of communal ownership of property led to a large-scale popular uprising.

A convert to Şūfism (Islamic mysticism), in 1383 Bedreddin undertook the pilgrimage to Mecca, and, upon his return to Cairo, he was appointed tutor to the Mamlūk crown prince of Egypt. He then traveled as a Şūfi missionary throughout Asia Minor. His communalistic doctrines made him a popular preacher, and in 1410 he was appointed a military judge by Mūsa, a claimant to the Ottoman throne. On the defeat of Mūsa in 1413, Bedreddin was banished to the Ottoman city of İznik.

During his exile Bedreddin further refined his doctrines and maintained contact with a secret society that in 1416 staged a social uprising, of which he became the ideological head. Upon the collapse of the rebellion, he

was arrested, and, after a trial of dubious legality, he was convicted and hanged.

Bedřich (Czech personal name): *see under* Frederick.

bedsore, also called DECUBITUS ULCER, or PRESSURE SORE, an ulceration of skin and underlying tissue caused by pressure that limits the blood supply to the affected area. As the name indicates, bedsores are a particular affliction for persons who have been bedridden for a long time. The interference with normal blood flow is caused by the prolonged pressure of the body upon the bed and the friction against the bedclothes. Bedsores are more likely to affect the skin over the bony prominences of the body, such as the elbows, hips, and the back at the level of the hip bones. Prevention and treatment of bedsores include frequent changes of position of the bedridden person, daily bathing, and topical (local) medication.

bedspread, top cover of a bed, put on for tidiness or display rather than warmth. Use of a bedspread is an extremely ancient custom, referred to in the earliest written sources, for example, the Bible: "I have decked my bed with coverings of tapestry" (Proverbs 7:16). The first bedcovers were probably of fur. Later versions included every sort of refinement that weaving or needlework could produce. The Roman historian Livy wrote in the 1st century BC that luxury, including "valuable bed covers," was first brought to Rome by the armies of Asia. An English account of 1472 makes reference to a "counterpane cloth of

(Rubiaceae), containing about 300 species of low perennial herbs found in damp woods and swamps and along stream banks and shores throughout the world. The finely toothed, often needle-shaped leaves are borne in whorls of four to eight. The small flowers, borne in clusters, are green, yellow, or white. The fruit is composed of two rounded nuts that are joined together.

Bedstraw (*Galium*)
F. K. Anderson—EB Inc

Northern bedstraw (*G. boreale*), marsh bedstraw (*G. palustre*), and goosegrass (*G. aparine*) are common throughout Europe and have become naturalized in parts of North America. Sweet woodruff (*G. odoratum*, formerly *Asperula odorata*), or waldmeister, has an odour similar to that of freshly mown hay; its dried shoots are used in perfumes and sachets and for flavouring beverages. Lady's bedstraw, or yellow bedstraw (*G. verum*), is used in Europe to curdle milk and to colour cheese. The roots of several species of *Galium* yield a red dye.

Beduin (people): *see* Bedouin.

Bedworth, town, Nuneaton and Bedworth borough, administrative and historic county of Warwickshire, England. Coal mining, from two local pits, was important until it ceased at the end of the 20th century. Today the economy pivots on light engineering and the manufacturing of tapes, ribbons, and trimmings. Bedworth and neighbouring Nuneaton have merged. Corley Hall, to the west of Bedworth, is reputed to be the model for Hall Farm in George Eliot's *Adam Bede*. Pop. (1991) 31,932.

Będzin, city, Śląskie województwo (province), southern Poland, just northeast of Katowice, near the Czarna Przemsza River. Located on the trade route between Wrocław and Kraków, and one of the oldest towns in the Upper Silesia coal-mining region, it developed as a centre of mining and heavy industry.

A castle and surrounding settlement were there as early as the 13th century. In the 17th century Będzin was noted for its cloth and crafts, and in the 19th century zinc extraction and refining and coal mining provided its economic base. During World War II the Germans constructed a concentration camp there in which more than 10,000 people were exterminated. The 13th-century castle, rebuilt (1952–56) in the Gothic style, houses the Dąbrowskie Basin Museum. Pop. (2005 est.) 58,662.

bee, any member of some 20,000 species of insects of the superfamily Apoidea (order Hymenoptera). In addition to the familiar honeybee (*Apis*) and bumblebee (*Bombus* and *Psithyrus*), thousands of more wasplike and flylike bees are included in the Apoidea. Adults range in size from about 2 mm to 4 cm (about 0.08–1.6 inch).

Bees are closely related to certain types of wasps; the principal biological difference between bees and wasps is that bees (except for parasitic bees) provide their young with a mixture of pollen and honey, whereas wasps feed their young prepared animal food or provision their nests with insects or spiders. Associated with this difference in food preference are certain structural differences; whereas wasps are covered with unbranched hairs, bees have at least a few branched or feathered hairs to which pollen often clings.

Bees are entirely dependent on flowers for food, which consists of pollen and nectar, the latter sometimes modified and stored as honey. There is no doubt that bees and the flowers that they pollinate evolved simultaneously. As bees go from flower to flower gathering pollen, they lose small quantities of it, which often results in cross-pollination of plants. The practical value of bees as pollinators is enormously greater than the value of their honey and wax production.

Male bees are usually short-lived and never collect pollen, nor have they other responsibilities in connection with providing for the young. Female bees do all the work of nest making and provisioning and usually have special anatomical structures that assist them in carrying pollen. Most bees are polylectic; that is, they gather pollen from a wide variety of flowers. Some bees, however, collect pollen only from flowers of certain families, others from flowers of certain colours. Oligolectic bees gather pollen from only a few related

Leaf-cutting bee (*Anthidium*)
M.W.F. Tweedie from the Natural History Photographic Agency—EB Inc

kinds of flowers. The mouth parts of bees, like the pollen-collecting and pollen-carrying devices, seem to be adapted to different flowers.

Most of the Apoidea are solitary, or nonsocial, in habit—*i.e.*, they do not live in colonies; each female makes her own nest (usually a burrow in the ground) and provisions it. Among such bees there are no castes. Some solitary bees make chimneys or turrets at the nest entrance, others nest in wood or in the pith of twigs or canes. Most solitary bees are short-lived as adults. Some species may be in flight only a few weeks of the year, having spent the rest of the year in their cells as eggs, larvae, pupae, and young adults.

Solitary bees provide food for the larvae when the cells are sealed; social bees, such as the bumblebee and the honeybee, feed their young progressively. For the life cycle of social bees, *see* bumblebee; honeybee.

The Apoidea includes eight families: Colletidae, which are primitive wasplike bees consisting of five or six subfamilies, about 45 genera, and some 3,000 species; Andrenidae, which are medium-sized solitary mining bees, including some parasitic species; Halictidae (mining, or burrowing, bees), the best-known

Reproduction of early 18th-century chintz bedspread and hangings from India; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London

gold furred with ermine," and there are many similar descriptions of bed coverings in medieval inventories. Later knitted or crocheted bedspreads were often elaborately patterned.

The kind of bedspread called counterpane, from the old French word *contrepoinct*, meaning "stitched quilt," was probably made of patched or applied pieces, quilted together. Quilted bedspreads, in both appliqué and patchwork, that were made in the United States during the 18th and 19th centuries have come to be considered an important type of American folk art. The colourful stylized or geometric patterns that were used were identified by imaginative, evocative names like Duck's Foot in the Mud, Robbing Peter to Pay Paul, Broken Dishes, or Delectable Mountains. *See also* quilting.

bedstraw, also called CLEAVERS, any plant from the genus *Galium* of the madder family

of which is *Dialictus zephyrus*, one of many so-called sweat bees, which are attracted to perspiration; Oxacidae, large, fast-flying bees that bear some anatomical resemblance to Andrenidae; Melittidae, bees that mark a transitional form between the lower and the higher bees; Megachilidae (leaf-cutting and mason bees), noted for their elaborate nest structures; Anthophoridae (including carpenter bees and cuckoo bees), a large family of three subfamilies that were once considered to be subfamilies of Apidae; and Apidae (bumblebees, honeybees, and digger, or mining, bees).

The so-called killer bee is a subspecies of African honeybee that was accidentally released in Brazil in 1957 during an attempt to produce a productive tropical hybrid. Moving northward some 200 to 300 miles (320 to 480 km) per year, the bees had reached Mexico in the 1980s. They have been considered responsible for hundreds of deaths. The African honeybee is smaller and much less effective in pollination of plants than its European counterpart. Although it is not more venomous than the European form, it reacts much more quickly, attacks in number, pursues for a longer time, and takes longer to calm down.

bee-eater, any of about 25 species of brightly coloured birds of the family Meropidae (order Coraciiformes). Found throughout tropical and subtropical Eurasia, Africa, and Austral-

Bee-eater (*Merops apiaster*)

S C Porter—Bruce Coleman Ltd

asia (one species, *Merops apiaster*, occasionally reaches the British Isles), bee-eaters range in length from 15 to 35 cm (6 to 14 inches).

The bee-eater's bill is moderately long, slightly downcurved, and sharply pointed. Brilliant plumage is characteristic; green predominates, but many species are partially coloured with red, yellow, blue, or purple. Many have elongated central tail feathers. Bee-eaters feed on bees, wasps, and other insects.

bee fly, any insect of the family Bombyliidae (order Diptera). Many resemble bees, and most have long proboscises (feeding organs) that are used to obtain nectar from flowers. Their metallic brown, black, or yellow colour is attributable to a covering of dense hair; in many species the body and sometimes the wings bear patches of delicate and easily abraded scales. Some bee flies are quite small, and their immature stages are unknown. Many species, including the largest and most showy, are tropical; but some species with a length of more than 1 cm (0.4 inch) live in temperate regions. They are usually found on flowers around sunny, grassy places.

The larvae of *Bombylius major*, the large bee fly of the Northern Hemisphere and one of the earliest to appear in spring, are parasitic on solitary bees. Larvae of several species of *Villa* destroy grasshopper eggs; others are parasitic

Bee fly (*Spartopoliulus fulvus*)

J. Miller—De Wys Inc

on caterpillars. *Anthrax anale* is a parasite of tiger beetle larvae, and the European *A. trifasciata* is a parasite of the wall bee. Several African species of *Villa* and *Thyridanthrax* are parasitic on the covering of the pupa of tsetse flies. *Villa (Hemipenthes) morio* is parasitic on the beneficial ichneumonid, *Banchus femoralis*. Some bee mimics in the family Syrphidae are also known as bee flies.

bee plant, any of a number of fragrant, nectar-producing flowering plants attractive to bees. The name refers especially to two plants in the caper family (Capparaceae), *Cleome lutea*, or yellow bee plant, and *C. serrulata*, called mountain bee plant (also known as stinking clover) and once cultivated near apiaries.

Certain trees, for example lindens, with particularly fragrant flowers, are often called bee trees because bees set up their hives in them, close to the source of nectar.

Beebe, (Charles) William (b. July 29, 1877, Brooklyn, N.Y., U.S.—d. June 4, 1962, Simla Research Station, near Arima, Trinidad), American biologist, explorer, and writer on natural history who combined careful biological research with a rare literary skill. He was the coinventor of the bathysphere (*q.v.*).

Beebe was curator of ornithology at the New York Zoological Gardens from 1899 and director of the department of tropical research of the New York Zoological Society from 1919. He led numerous scientific expeditions abroad and in 1934 with Otis Barton descended in his bathysphere to a then record depth of 3,028 feet (923 m) in Bermuda waters. A noted lecturer, he received numerous prizes and honours for scientific research and for his books, both technical and popular. His books include *Jungle Days* (1925), *Pheasants, Their Lives and Homes* (1926), *Beneath Tropic Seas* (1928), *High Jungle* (1949), *The Edge of the Jungle* (1950), *Unseen Life of New York* (1953), and *Half Mile Down* (1951).

beech, any of several different types of trees, especially about 10 species of deciduous ornamental and timber trees constituting the genus *Fagus* in the family Fagaceae, native to temperate and subtropical regions of the Northern Hemisphere. About 40 species of superficially similar trees, known as false beech (*Nothofagus*), are native to cooler regions of the Southern Hemisphere. The term beech has been used with a variety of qualifying terms. Australian beech refers to both *Nothofagus moorei*, described hereafter, and red box, a tree of the family Myrtaceae; blue beech and water beech are other names for the American hornbeam (*see* hornbeam); Malay bush beech is a tree of the family Verbenaceae; red beech is a common name for *N. fusca* and *F. grandifolia*, described hereafter, as well as for the Australian maple of the family Meliaceae.

A beech of the family Fagaceae is tall, round-headed, and wide-spreading, with smooth,

steel-gray bark and alternate, toothed, parallel-veined, shiny green leaves. Yellow-green male flowers hang from threadlike stems; the female flowers, usually in pairs on short, hairy stems on the same tree, develop into prickly burs enclosing three-sided, sweet-flavoured nuts.

The American beech (*F. grandifolia*), native to eastern North America, and the European beech (*F. sylvatica*), distributed throughout England and Eurasia, are the most widely known species. Both are economically important timber trees, often planted as ornamentals in Europe and North America; they may grow to 30 m (100 feet). The narrow, coarsely saw-toothed, heavily veined, blue-green leaves of the American beech are about 13 cm (5 inches) long and turn yellow in autumn; the slightly shorter, egg-shaped, dark-green leaves of the European beech turn red-brown in autumn but, in mild climates, persist through the winter.

European beech (*Fagus sylvatica*)

Eric G. Carle—Shostal/EB Inc

An Asian species, the Chinese beech (*F. engleriana*), about 20 m (about 65 feet) tall, and the Japanese beech (*F. japonica*), up to 24 m (79 feet) tall, divide at the base into several stems. The Chinese and the Japanese, or Siebold's, beech (*F. sieboldii*) are grown as ornamentals in the Western Hemisphere. The Mexican beech, or haya (*F. mexicana*), a timber tree often 40 m (130 feet) tall, has wedge-shaped leaves. The Oriental beech (*F. orientalis*), a pyramidal Eurasian tree about 30 m (about 100 feet) tall, has a grayish-white trunk and wavy-margined, wedge-shaped leaves up to 15 cm (6 inches) long.

Pale, red-brown beech wood, durable under water, is valued for indoor use, tool handles, and shipping containers. The nuts provide forage for game animals, are used in fattening poultry, and yield an edible oil.

Beeches are often cultivated as ornamental and shade trees, especially varieties of the European beech, such as the copper, or purple, beech, with copper-coloured foliage; the Dawyck beech, a narrow, spirelike, glossy-leaved tree; the fernleaf, or cut-leaved, beech, with narrow, deeply lobed, fernlike leaves; the oak-leaved beech, with deeply toothed, wavy-margined, oaklike leaves; and the weeping beech, with long, pendulous branches and wide-spreading, horizontal limbs.

Beeches grow best in sandy loam. They are slow-growing but may live to 400 years or more. Propagation is usually by seed; the shallow, spreading root system often sends up suckers that may grow into thickets.

The wavy-leaved Antarctic beech, or nire (*Nothofagus antarctica*), and the roble beech (*N. obliqua*), both 30-m trees native to Chile and Argentina, differ from other species of false beech in being deciduous; they are planted as ornamentals on other continents. The pink-brown hardwood of the Antarctic beech is used in flooring and cabinetmaking. The remaining false beeches are evergreen

timber trees of the Australasian area. Among the best known are the Australian beech (*N. moorei*), a 46-m-tall tree with leaves seven centimetres long, found in New South Wales; the mountain beech (*N. cliffortioides*), a 12-m-tall New Zealand tree with glossy, toothless leaves about one centimetre long; the myrtle beech, Tasmanian myrtle, or Australian, or red, myrtle (*N. cunninghamii*), a 60-m-tall Tasmanian tree important for its fine-textured wood; the slender, columnar red beech (*N. fusca*) of New Zealand, about 30 m tall; and the silver, or southland, beech (*N. menziesii*), a 30-m-tall New Zealand tree with doubly and bluntly toothed leaves bearing small, hairy pits beneath.

Beecham, Sir Thomas, 2ND BARONET (b. April 29, 1879, St. Helens, Lancashire, Eng.—d. March 8, 1961, London), internationally acclaimed conductor who championed the music of Frederick Delius and used his personal fortune for the improvement of orchestral and operatic performances in England.

Beecham, 1959
Camera Press

He made his London debut as a conductor in 1905 and in 1906 began a series of concerts with his own New Symphony Orchestra. Four years later he initiated a series of opera seasons. He introduced London audiences to Diaghilev's *Ballets Russes* (1911) and to Fyodor Chaliapin in Russian opera (1913). He founded the British National Opera Company after World War I and the London Philharmonic Orchestra in 1932 and was appointed artistic director at Covent Garden in 1933.

During World War II Beecham toured Australia and Canada, conducted the Seattle Symphony (1941–43) and at the Metropolitan Opera (1942–44) in New York City. He founded the Royal Philharmonic Orchestra in London (1947) and at the age of 78 made a lengthy European tour. His repertory ranged from Handel to the mid-20th century, but he preferred the 18th century and was associated especially with the music of Mozart and Haydn. He also gave special attention to the music of Jean Sibelius.

He was admired generally for the verve and elegance of his interpretations, and he endeared himself to the public by his witty tirades against the insufficiencies of British musical standards. Opposing the introduction of women players in his orchestras, he said if they were pretty they would distract the male players, and if they were ugly they would distract him.

Knighthood in 1916, he succeeded to his father's baronetcy later that year. In 1957 he was created a Companion of Honour. His autobiography, *A Mingled Chime*, appeared in 1943; his biography, *Frederick Delius*, in 1959.

Beecher, Catharine Esther (b. Sept. 6, 1800, East Hampton, Long Island, N.Y., U.S.—d. May 12, 1878, Elmira, N.Y.), U.S. educator and author who popularized and shaped a conservative ideological movement to both elevate and entrench woman's place in the domestic sphere of American culture.

Catharine Beecher was a member of an unusually influential family. The daughter of the Presbyterian evangelical minister and temperance activist Lyman Beecher, she was the sister of the writer Harriet Beecher Stowe and of the minister Henry Ward Beecher. As a school teacher, Catherine Beecher urged the training of young women in domestic science and teaching. She founded, with her sister Mary, the Hartford Female Seminary in 1823 and later opened the Western Female Institute in Cincinnati, Ohio, in 1832. She also organized the American Woman's Educational Association in 1852 to establish teachers' colleges for women.

Beecher was most influential as a writer. Her major work, *A Treatise on Domestic Economy*, first published in 1841, went through 15 editions and was the first American work to deal with all facets of domestic life. The *Treatise* helped to standardize domestic practices and reinforce domestic values, arguing that woman's proper role was in the home, where she could powerfully affect American society. Beecher's other publications include "Female Education" (1827), *The Duty of American Women to Their Country* (1845), *Common Sense Applied to Religion* (1857), and, with Harriet Beecher Stowe, *The American Woman's Home* (1869). *Catharine Beecher: A Study in American Domesticity*, by Kathryn Kish Sklar, was published in 1973.

Beecher, Henry Ward (b. June 24, 1813, Litchfield, Conn., U.S.—d. March 8, 1887, Brooklyn, N.Y.), liberal U.S. Congregational minister whose oratorical skill and social concern made him one of the most influential Protestant spokesmen of his time.

He was the eighth of the Rev. Lyman Beecher's 13 children and showed little promise at various schools until he went to Amherst in 1830. Though never distinguished as a scholar, he became a superior speaker and popular leader.

After three postgraduate years in Cincinnati, Ohio, at Lane Theological Seminary, of which his father became president in 1832, Beecher in 1837 became minister to a small Presbyterian congregation at Lawrenceburg, Ind. He gradually cultivated his pulpit technique, there and in a pastorate at Indianapolis, Ind. (1839–47), and came to believe that a sermon succeeds by focussing on the single objective of effecting a moral change in the hearer. A highly successful preacher and lecturer, Beecher furthered his reputation through *Seven Lectures to Young Men* (1844), vivid exhortations on the vices and dangers in a frontier community.

In 1847 he accepted a call to Plymouth Church (Congregational), Brooklyn, N.Y., where he drew weekly crowds of 2,500 by the early 1850s. Though his influence upon public affairs was sometimes exaggerated, both his pronouncements and his personal life were regularly matters of national and even international interest. He gradually became more emphatic in opposing slavery, and his lectures of 1863 in England won over audiences ini-

Henry Beecher, photographed by Napoleon Sarony
The Granger Collection

tially hostile to him and to the Northern point of view. Increasingly outspoken after the Civil War, he supported a moderate Reconstruction policy for the South, favoured Grover Cleveland's candidacy in the 1884 presidential campaign, and advocated women's suffrage, evolutionary theory, and scientific biblical criticism. His outlets for these issues, in addition to Plymouth Church, were the *Independent*, a Congregational journal he edited in the early 1860s, and the nondenominational *Christian Union* (later *Outlook*), which he founded in 1870.

Beecher, always considered an emotional and sensual man, became in the 1870s the subject of rumours alleging immoral affairs, and he was sued in 1874 by his former friend and literary protégé Theodore Tilton, who charged him with adultery with his wife. Two ecclesiastical tribunals exonerated Beecher, though the jury in the civil suit failed to reach agreement, as have later students of the evidence. Despite the scandal, however, he remained active and influential until his death.

Besides his sermons, Beecher's many works include *Evolution and Religion* (1885); *Life of Jesus the Christ* (1871–91); *Yale Lectures on Preaching* (1872–74); and a novel, *Norwood: A Tale of Village Life in New England* (1867). Two studies of Beecher as an orator are L.G. Crocker, *Henry Ward Beecher's Art of Preaching* (1934) and *Henry Ward Beecher's Speaking Art* (1937). The Tilton episode is discussed in Robert Shaplen, *Free Love and Heavenly Sinners* (1954).

Beecher, Lyman (b. Oct. 12, 1775, New Haven, Conn.—d. Jan. 10, 1863, Brooklyn, N.Y., U.S.), U.S. Presbyterian clergyman in the revivalist tradition.

A graduate of Yale in 1797, he held pastorates at Litchfield, Conn., and at Boston, during which he opposed rationalism, Catholi-

Lyman Beecher, detail of an oil painting by Chester Harding; in the Yale University Art Gallery

cism, and the liquor traffic. Turning his attention to evangelizing the West, he became president of the newly founded Lane Theological Seminary in Cincinnati, Ohio (1832–50), and also assumed a new pastorate there (1832–42). His Calvinism, considered strict by Bostonians, proved so mild for western Presbyterians that he was tried for heresy, but his synod acquitted him.

Beecher was called by a contemporary "the father of more brains than any other man in America." Among the 13 children of his three marriages, Henry Ward Beecher and Harriet Beecher Stowe achieved fame. Five others well known in their day were Catharine (1800–78), a leader in the women's education movement; Edward (1803–95), a minister, college president, and anti-slavery writer; Charles (1815–1900), Florida's superintendent of public instruction; Isabella (1822–1907), a champion of legal rights for women; and Thomas (1824–1900), an early advocate of adapting church life to modern urban conditions.

Beechworth, town, northeastern Victoria, Australia, at the foot of the Victorian Alps. The original settlement (c. 1839), called Mayday Hills, was renamed for a place in England. During the mid-19th century it was a centre of the Ovens Valley goldfields; it was the site of some of the earliest hospital and mental health care facilities in Victoria. The valley now produces timber, hops, grapes, tobacco, and livestock. Alluvial deposits of precious and semiprecious gems occur in the vicinity. A rail line leads to Melbourne, 140 mi (225 km) to the southwest.

Beechworth has a mild climate, is a resort for anglers and hikers, and provides access to winter snow areas of the upper valley. It was proclaimed a town in 1856, a borough in 1863, and a shire in 1865. Pop. (1996) 2,953.

Consult the INDEX first

Beecroft, John (b. 1790, near Whitby, Yorkshire, Eng.—d. June 10, 1854, Clarence, West Coast of Africa), adventurer, trader, explorer, and as British consul (1849–54) for the Bights of Benin and Biafra (the coastal area from present-day Benin to Cameroon), a forerunner of British imperial expansion in West Africa, both in his personal enthusiasm and in his systematic intervention in local African politics.

Beecroft's career in Africa began as an official on Fernando Po in 1829 when that island was a temporary British anti-slavery base. He remained there after Britain abandoned the island in 1834, and, in 1843, when Spain reasserted its formal rights to Fernando Po, it appointed him official governor of the island. He also acted as an unofficial British consul in the mid-1840s, helping the British anti-slavery squadron make treaties and settle disputes. By that time he had become known and respected by almost all the coastal chiefs.

As consul for the Bight of Benin (1849–54), Beecroft was mainly expected to safeguard the interests of British merchants. In his time in office he was involved in dealings with several major African societies, including those of Dahomey, Lagos (where the issue of the abolition of the slave trade resulted in a de facto British protectorate), and the Nigerian coastal town of Bonny—a complex affair that resulted in the King's exile. These and other actions of Beecroft systematically eroded the old British African policy of *laissez-faire*.

beef, flesh of mature cattle, as distinguished from veal, the flesh of calves. The best beef is obtained from early maturing, special beef breeds. High-quality beef has firm, velvety, fine-grained lean, bright red in colour and well-marbled. The fat is smooth, creamy white, and well distributed. In young beef the bones are soft, porous, and red; the less desirable mature beef has hard white bones. Beef tenderness and flavour are improved by aging; in one common aging method the carcass is hung for about two weeks at approximately 36° F (2° C), encouraging physical changes in the muscle tissue that enhance the quality of the meat.

Grading standards are somewhat similar in various countries; there is a large international beef trade. In the United States, grades in order of quality are prime, choice, good, commercial, utility, cutter, and canner. Commercial grades are mainly from mature cattle, especially cows. Utility, cutter, and canner grades are used in processed meat products. Beef hide, used for leather manufacture, is a valuable by-product of beef.

The primary beef-consuming countries of the world (in per capita terms) are Uruguay, Argentina, New Zealand, Australia, and the United States. Beef is relatively scarce—and

not particularly popular—in most of South-east Asia, Africa, and the Indian subcontinent; the sanctity of the cow in the Hindu religion forbids the consumption of its meat by Hindu adherents. Beef is not unusual in the cuisines of Korea and Japan, however; in Kōbe, Japan, near Ōsaka, a highly prized beef is produced from cattle that are vigorously massaged and fed a liberal dietary supplement of beer.

Butchering practices differ among countries, resulting in a variety of names for the different cuts. In the United States, where beef is the most popular meat, steaks—cross-sections from the fleshier parts of the carcass—are among the most desirable cuts. The standing rib roast, called in Britain the best rib, is also a valued cut. Less desirable cuts may be pot-roasted, used in stews, or ground (*see* hamburger). Boiled beef is popular in some cuisines, as in the French dish known as *pot-au-feu*. Corned beef (or salt beef in Britain) is a brisket or rump cut that has been pickled in brine.

Beehive (stars): *see* Praesepe.

Beehive, The, French LA RUCHE, an artists' settlement on the outskirts of Montparnasse (Paris), which in the early 20th century was the centre of avant-garde activity. The Beehive housed the living quarters and studios of many painters and sculptors, among them Marc Chagall, Fernand Léger, Robert Delaunay, Chaim Soutine, Jacques Lipchitz, Henri Laurens, Alexander Archipenko, Albert Gleizes, Jean Metzinger, and André Lhote. In addition, this bohemian colony attracted the poets Guillaume Apollinaire, Max Jacob, Blaise Cendrars, and Pierre Reverdy.

beehive house, primitive type of residence designed by enlarging a simple stone hemisphere, constructed out of individual blocks, to provide greater height at the centre; the form resembles a straw beehive, hence, its name. The beehive house is typical of Celtic dwellings from 2000 BC in Scotland and Ire-

Milesian beehive house, near Ventry, on the Dingle peninsula, Ire.

Peter Baker

land. The tomb of Agamemnon at Mycenae, Greece, is also of beehive shape; but it was made of cut stone rather than of the rough unhewn stone of the Celts.

beehive tomb: *see* Atreus, Treasury of.

beekeeping, the care and manipulation of colonies of honeybees (*Apis* species) so as to enable them to produce and store a quantity of honey exceeding their own requirements.

A brief treatment of beekeeping follows. For full treatment, *see* MACROPAEDIA. Farming and Agricultural Technology.

Beekeeping is one of the oldest forms of animal husbandry. Man first domesticated honeybees by establishing colonies in cylinders made of such materials as bark, reed, straw, or mud; removal of the honeycombs frequently destroyed the colony. Early American settlers, observing that wild bees preferred hollow logs, developed the bee gum, a section of hollow

Cutaway view of a Langstroth hive, a type commonly used in the U.S.

By courtesy of Walter T. Kelly Co.

log providing for comb removal at one end. European beekeepers developed the skep, a woven-straw hive resembling an inverted basket; combs could be removed through the bottom. By the 17th century, European beekeepers were making a hole in the hive and placing a box of straw or wood over the hole; the bees also filled this box with honey.

Two developments in the United States during the mid-19th century led to modern beekeeping methods. A multiple-story beekeeping system, devised by Moses Quinby, employed boxes placed over holes in the tops of box hives. Removal of the boxes as they became filled with honey did not disturb the main chamber. In 1851 the Rev. L.L. Langstroth invented a movable-frame hive that provided a foundation on which the bees could build honeycombs and allowed for simple removal and replacement of the filled combs. With several improvements this hive and similar types are in wide use throughout the world. Such hives consist of a base; a hive body; one or more removable sections, or supers; and a weathertight cover. The hive body is a brood chamber, fitted with frames, where the queen lays eggs and the young are nurtured; the supers are also fitted with frames for the storage of honey. Hives frequently have queen excluders, barriers with small holes allowing passage between the brood chamber and supers to worker bees but not to the larger queen.

When a colony is at the peak of its activity during the summer months, completed honey supers must be replaced with empty ones to prevent overcrowding and, ultimately, swarming (the formation of a new colony). In preparation for swarming, the worker bees select several larvae to be cultivated as potential new queens. Fed copiously with a substance called royal jelly, the new queens emerge shortly after the old queen's evacuation and fight to the death for supremacy of the hive. Drones are produced for the sole purpose of mating with the queen, after which they die. Swarming is undesirable in cultivated hives, since after swarming a colony is too busy hatching new workers to make extra honey. To prevent swarming, the queen cells must be removed and the hive enlarged.

The specialized gear of the beekeeper consists of a veiled helmet, a hive tool for cutting comb, and a smoker for tranquillizing the bees. This device blows smoke into the hive before it is opened. The bees, anticipating fire, instinctively gorge themselves with honey in preparation for rebuilding. Thus engorged, they are easier to handle and less likely to sting.

In modern beekeeping, honey is removed from the completed super by means of an extractor, in which centrifugal force evacuates the cells without damaging them, so that the bees do not have to build new cells before resuming honey production. After extraction, the honey must be slightly heated so that extraneous wax may be removed by skimming. The wax from the comb itself may be rendered by placing the comb in water heated to just over 145° F (63° C); the melted wax rises to the surface and is easily collected.

In addition to maintenance of the hive, beekeeping also requires protection of the colony against disease and predators. Honeybees are

susceptible to a number of parasites, mites, and fungus infections. Other natural enemies include raccoons, lizards, birds, and mice.

Centres for the study of bees and beekeeping have been established throughout the United States and in many other countries. Specific apicultural techniques, such as hive configuration and extraction, may vary according to tradition and scale of operation. *See also* honeybee.

Beelzebub, also called **BAALZEBUB**, in the Bible, the prince of the devils. In the Old Testament, in the form Baalzebub, it is the name given to the god of the Philistine city of Ekron (II Kings 1:1–18). Neither name is found elsewhere in the Old Testament, and there is only one reference to it in other Jewish literature. *See* demon; devil.

beer, any of a variety of alcoholic beverages produced by the fermentation of starchy material derived from grains or other plant sources.

A brief treatment of beer and brewing follows. For full treatment, *see* MACROPAEDIA: Beverage Production.

Known to the Egyptians, Babylonians, and probably to earlier civilizations, beer became the common beverage in northern climates not conducive to grape cultivation. Although beer and wine are both fermented and undistilled, wine is made from basic materials rich in natural sugar, while beer is made from materials high in starch content. Starches must be converted to sugar before fermentation can occur.

Most of the world's beers are made from malted barley and flavoured with hops. They may be produced by employing a bottom-fermenting yeast strain, which falls to the bottom of the container when fermentation is completed, or a top-fermenting strain, which releases carbon dioxide and rises to the surface, forming a head.

Lager beers, preferred in the United States, are aged beers of German origin, taking their name from the German *lagern* ("to store"). Bottom-fermented, they are stored at a low temperature for several months, clearing, acquiring mellowness, and becoming charged with carbon dioxide. Most lagers are light in colour, with high carbonation, medium hop flavour, and alcohol content of 3–5 percent by volume. They include Pilsener, Dortmund, Munich, and California steam beer. Top-fermented beers, popular in Great Britain, include ale, stout, and a brew intermediate between the two, called porter. They have a sharper, more strongly hopped flavour than lagers and alcohol content ranging from 4 to 6.5 percent or more by volume.

Beers made from raw materials other than barley include hundreds of local African drinks made from millet, sorghum, and other available starch crops; Russian kvass, made from fermented rye bread; Chinese samshu, Korean *suk*, and Japanese sake, all brewed from rice; and *pulque*, an indigenous Mexican beer made from the fermented sap of the agave plant. The Mexicans and the Japanese also brew and export several brands of Western-style beer.

Beer, Sir Gavin (Rylands) de: *see* de Beer, Sir Gavin (Rylands).

Beer, Israel (b. 1912, Vienna, Austria—d. May 1, 1966, Shatta prison, Israel), Israeli military analyst who was convicted (1962) for treason as a Soviet agent.

Arriving in Palestine (1938), Beer joined the Haganah, attaining the rank of lieutenant colonel in the Israeli army. After retiring from military service (1949), he held the chair of military history at the University of Tel Aviv and was commissioned by David Ben-Gurion to prepare the official history of the 1948–49 Israeli War of Independence. Arrested in 1961 for spying, Beer was convicted and sentenced to 15 years in prison, where he died.

Beer, Wilhelm (b. Jan. 4, 1797, Berlin [Germany]—d. March 27, 1850, Berlin), German banker and amateur astronomer who (with Johann Heinrich von Mädler) constructed the most complete map of the Moon of his time, *Mappa Selenographica* (1836). The first lunar map to be divided into quadrants, it contained a detailed representation of the Moon's face and was accompanied, in 1837, by a volume providing micrometric measurements of the diameters of 148 craters and the elevations of 830 mountains.

The *Mappa Selenographica* remained unsurpassed until 1878, when J.F. Julius Schmidt's more detailed map appeared. Beer and Mädler also published (1830) a description and map of Mars that was the first to depict the light and dark areas.

Beer Hall Putsch, also called **MUNICH PUTSCH**, German **BIERKELLER PUTSCH**, **MÜNCHENER PUTSCH**, or **HITLERPUTSCH**, Adolf Hitler's attempt to start an insurrection in Germany against the Weimar Republic on Nov. 8–9, 1923. Hitler and his small Nazi Party associated themselves with General Erich Ludendorff, a right-wing German military leader of World War I. Forcing their way into a right-wing political meeting in a beer hall in Munich on the evening of November 8, Hitler and his men obtained agreement that the leaders there should join in carrying the "revolution" to Berlin (after the pattern of Benito Mussolini's march on Rome in the preceding year); but the next day, on a march toward the Marienplatz in the centre of Munich, the approximately 3,000 Nazis were met by a fusillade of gunfire from a police cordon; 16 Nazis and 3 policemen died. The rebels then abandoned the project on thus learning that the government was prepared to counteract forcibly. At the subsequent trial in a sympathetic Bavarian court, Ludendorff was released, and Hitler was given a minimum sentence for treason—five years' imprisonment. He actually served only eight months in the fortress of Landsberg, where he wrote much of his testamentary *Mein Kampf* ("My Struggle"). The abortive *putsch* gave Hitler worldwide fame but led him to decide to achieve power by legal means.

Beerbohm, Sir Max, original name **HENRY MAXIMILIAN BEERBOHM** (b. Aug. 24, 1872,

Beerbohm, 1951

Kaye Webb—Camera Press London from Franz E. Furst

London, Eng.—d. May 20, 1956, Rapallo, Italy), English caricaturist, writer, dandy, and wit whose sophisticated drawings and parodies were unique in capturing, usually without malice, whatever was pretentious, affected, or absurd in his famous and fashionable contemporaries. He was called by G.B. Shaw "the incomparable Max."

A younger half brother of the actor-producer Sir Herbert Beerbohm Tree, he was accustomed to fashionable society from his boyhood. While still an undergraduate at Merton College, Oxford, he published witty essays in

the famous *Yellow Book*. In 1895 he toured the United States as press agent for Beerbohm Tree's theatrical company. His first literary collection, *The Works of Max Beerbohm*, and his first book of drawings, *Caricatures of Twenty-five Gentlemen*, appeared in 1896. In 1898 he succeeded Shaw as drama critic of the *Saturday Review*. His charming fable *The Happy Hypocrite* appeared in 1897 and his only novel, *Zuleika Dobson*, a burlesque of Oxford life, in 1911. *The Christmas Garland* (1912) is a group of Christmas stories that mirror the stylistic faults of a number of well-known writers, notably Henry James. His collection of stories, *Seven Men* (1919), is a masterpiece.

In 1910 Beerbohm married the American-born British actress Florence Kahn, and they settled in Rapallo, Italy, where, except for a return to England for the duration of World Wars I and II, they made their home for the rest of their lives. He attracted to Rapallo a constant stream of distinguished visitors who were charmed by his conversation and found in him a living archive of amusing anecdotes of the literary, artistic, and social circles of late Victorian and Edwardian England. Though Beerbohm's caricatures hit home, they remained civilized criticism and seldom alienated their subjects. In spite of the fun he had caricaturing successive generations of the royal family, he was knighted in 1939. The only two targets he attacked with ferocity were British imperialism—in the persona of a blustering John Bull—and Rudyard Kipling. As a parodist, he is frequently held to be unsurpassed. After his wife's death in 1951, Beerbohm lived with his secretary-companion, Elizabeth Jungmann, whom he married a few weeks before his death at 84.

BIBLIOGRAPHY. David Cecil, *Max, a Biography* (1964, reissued 1983); John Felstiner, *The Lies of Art: Max Beerbohm's Parody and Caricature* (1972).

Bernaert, Auguste-Marie-François (b. July 26, 1829, Ostend, Belg.—d. Oct. 6, 1912, Lucerne, Switz.), Belgian-Flemish statesman, and cowinner (with Paul-H.-B. d'Estournelles de Constant) of the Nobel Prize for Peace in 1909.

A lawyer by profession, Bernaert was elected to the Belgian Chamber of Deputies in 1873 and later served as minister of public works. He was prime minister and minister of finance from 1884 to 1894. In 1895 he was elected president of the Chamber of Deputies.

He held the post of president of the International Law Association from 1903 to 1905. He was Belgium's first representative at the Hague peace conferences in 1899 and 1907. In 1909, when he was 80 years old, Bernaert was awarded the Nobel Peace Prize.

Beersheba, Hebrew **BE'ER SHEVA'**, biblical town of southern Israel, now a city and the main centre of the Negev (ha-Negev) region.

Beersheba is first mentioned as the site where Abraham, founder of the Jewish people, made a covenant with the Philistine king Abimelech of Gerar (Genesis 21). Isaac and Jacob, the other patriarchs, also lived there (Genesis 26, 28, 46). The name seems to be a Hebrew play on words—*be'er* "well"; *sheva'* "oath," or "seven" (referring to the seven lambs of Genesis 21)—though a Canaanite origin has also been suggested. Beersheba was at the southern edge of permanent agricultural cultivation in ancient Palestine and represented the southern extremity of the Israelite country—hence the phrase "from Dan to Beersheba" (first used in Judges 20; Dan is in far northern Israel).

Insignificant for centuries, Beersheba regained importance under Byzantine rule (4th–7th century), when it was a key point on the Limes Palaestinae, the fortified line built as a

defense against the desert tribes; however, it fell to the Arabs in the 7th century and to the Turks in the 16th. It long remained a watering place and small trade centre for the nomadic Bedouin tribes of the Negev, despite Turkish efforts at town planning and development around 1900. Its capture in 1917 by the British opened the way for their conquest of Palestine and Syria.

After being taken by Israeli troops in October 1948, Beersheba was rapidly settled by new immigrants and has since developed as the administrative, cultural, and industrial centre of the Negev. It is one of the largest cities in Israel outside of metropolitan Tel Aviv-Yafo, Jerusalem, and Haifa. Its principal manufactures are chemicals (including the processing of the mineral deposits of the Dead Sea).

Tower apartments, Beersheba, Israel

Ronald Sheridan

porcelain and tile products, and textiles. Beersheba is the site of the Ben-Gurion University of the Negev (1965) and of the Negev Institute for Arid Zone Research. The railway from northern and central Israel runs through the city. Pop. (1999 est.) 163,700.

Beery, Wallace (Fitzgerald) (b. April 1, 1885, Kansas City, Mo., U.S.—d. April 15, 1949, Los Angeles, Calif.), American actor who played in more than 250 motion pictures between 1913 and 1949.

Beery's first job in entertainment was as an elephant trainer for the Ringling Brothers Circus. He later joined his brother, the actor Noah Beery, Sr., in New York City, where they both worked in the choruses of theatrical productions. He was given the lead in the play *The Yankee Tourist* and subsequently worked for several years as a dramatic actor in touring and stock theatrical companies.

In 1913 Beery joined the Essanay Studios in Chicago and began his motion-picture career as a director as well as an actor. He worked as a comedian in the Keystone comedies but in 1917 switched to playing villains for several years. He returned to comedy in the 1930s, playing gruff but lovable characters. His most notable performances were in *The Champ* (1931), for which he won an Academy Award as best actor, and *Tugboat Annie* (1933).

Beeston, Christopher (b. 1570?—d. c. Oct. 15, 1638, London, Eng.), actor and theatrical manager who was one of the most influential figures in the English theatre in the early 17th century.

Nothing is known of Beeston's early life. In

1598 he appeared in *Every Man In His Humour* with William Shakespeare, Augustine Phillips, and Richard Burbage, and in 1602 he was with Worcester's Men. Beeston remained with them after they became Queen Anne's Men in 1603 and succeeded Thomas Greene as their business manager in 1612. In 1616 he established them at his theatre, the Cockpit (later the Phoenix), in Drury Lane, where he remained for the rest of his life as manager to the succeeding companies. Beeston held two-thirds of the shares, owned the costumes, and retained control of the plays he had bought, practices that brought him a reputation for shrewdness. In 1637 he collected together the King's and Queen's Young Company, more popularly known as Beeston's Boys, a company that was established by royal warrant. Beeston was a lifelong friend of Thomas Heywood and produced many of his plays and also contributed verses to the *Apology for Actors* (1612).

After his death, his son William (1606?–82) managed Beeston's Boys for short periods before the closing of the theatres in 1642 and after their reopening in 1660 at Salisbury Court and the Cockpit. Records of the period suggest he had considerable influence in injecting elements of Elizabethan acting styles into the early Restoration theatre.

Beeston and Stapleford, locality, Broxtowe district, county of Nottinghamshire, England. The community developed during the 19th century as a result of its proximity to the coal measures of western Nottinghamshire and the railways they attracted, in addition to the construction of the Beeston Canal. Beeston and Stapleford has pharmaceutical and telecommunications industries. Pop. (1991) 66,626.

beeswax, commercially useful animal wax secreted by the worker bee to make the cell walls of the honeycomb. Beeswax ranges from yellow to almost black in colour, depending on such factors as the age and diet of the bees, and it has a somewhat honeylike odour and a faint balsamic taste. It is soft to brittle, with a specific gravity of about 0.95 and a melting point of more than 140° F (60° C), and it consists mainly of free cerotic acid and myricin (myricyl palmitate), with some high-carbon paraffins. Although insoluble in water, it can be dissolved in such substances as carbon tetrachloride, chloroform, or warm ether. Wax obtained from bees of East Asia may be somewhat different from that of the common, or Western, honeybee.

It is estimated that a bee consumes 6 to 10 pounds (3 to 4.5 kg) of honey for each pound of the wax that it secretes in small flakes from glands on the underside of its abdomen. The beeswax is obtained, after removal of the honey, by melting the honeycomb, straining the wax to remove impurities, and pressing the residue to extract any remaining wax. The purified wax is then poured into molds to solidify. Colour and quality are preserved by melting the wax in water, avoiding direct heat; the wax may also be bleached.

Beeswax is used for candles (religious ordinances often specify its use for church ceremonial candles), for artificial fruit and flowers, and for modeling wax. It is also an ingredient in the manufacture of furniture and floor waxes, leather dressings, waxed paper, lithographic inks, cosmetics, and ointments.

beet, cultivated form of the plant *Beta vulgaris* of the goosefoot family (Chenopodiaceae), one of the most important vegetables. Four distinct types are cultivated for four different purposes: (1) the garden beet, or beet-root, or table beet, as a garden vegetable; (2) the sugar beet, a major source of sugar; (3) the mangel-wurzel, or mangold, a succulent feed for livestock; and (4) the leaf beet, or Swiss chard, for its leaves, which may be eaten or used as a seasoning.

Beet (*Beta*)

Grant Heilman

The garden beet is grown for the thick, fleshy taproot that forms during the first season. In the second season a tall, branched, leafy stem arises to bear clusters of minute green flowers that develop into brown, corky fruits commonly called seedballs. The taproot ranges in shape from flattened oblate, through globular and somewhat conical, to long tapered. Skin and flesh colours are usually dark to dark-purplish red, with some nearly white. On cooking the colour diffuses uniformly through the flesh. In the United States the garden beet is popularly eaten cooked or pickled; borscht is a classic beet soup of eastern Europe.

The sugar beet (*q.v.*), commercially the most important type, was developed in Germany in the 18th century; its European cultivation received important encouragement from Napoleon as a means of combating the British blockade of imported sugar. Today it accounts for about two-fifths of the world's sugar production; major producers are Ukraine, Russia, the United States, France, Poland, Germany, Turkey, Italy, Romania, and the United Kingdom.

Cultivation of the mangel-wurzel and the leaf beet, in common with most crop plants, dates from prehistoric times.

Beets grow best on deep, friable soils that are high in organic matter; they respond well to chemical fertilizers and manures. Grown extensively under irrigation, beets tolerate relatively high salt content of the soil but are sensitive to high acidity and to low content of boron. Boron deficiency retards growth and causes black lesions in the root flesh.

Beets are most extensively grown in temperate to cool regions or during the cooler seasons. The growing season varies from 8 to 10 weeks for garden beets in favourable climates to 30 weeks for some mangel-wurzels.

Beet greens, a source of riboflavin, iron, and vitamins A and C, are served cooked, or, if very young, in salads; they should be fresh and tender when selected. Beet roots should be smooth, firm, and unblemished; medium-sized specimens are the most tender. They are frequently canned, either whole or cut up, and often pickled, spiced, or served in a sweet-and-sour sauce.

Beethoven, Ludwig van (baptized Dec. 17, 1770, Bonn, archbishopric of Cologne [now in Germany]—d. March 26, 1827, Vienna, Austria), German composer of Flemish descent, the predominant musical figure in the transitional period between the Classical and Romantic eras.

A brief treatment of Beethoven follows. For full treatment, see MACROPAEDIA: Beethoven. Born into a musical family, Beethoven be-

came a professional musician at the age of 11. He was taught by Christian Gottlob Neefe, court organist to the archbishop elector of Cologne, and then successively by Wolfgang Amadeus Mozart (1787) and Joseph Haydn (1792–94) in Vienna, where he made his home. From other composers in Vienna he learned the techniques of counterpoint and vocal composition. In the Austrian capital he first attracted aristocratic patrons with his emotional piano playing rather than with his compositions, but the merit of these was soon recognized, and he received financial support from various private persons for the rest of his life. He is said to have been the first important composer to make a decent living without subsidies from court or church. Tormented by deafness and emotional problems, he composed relatively little in the 1820s.

Beethoven's career in Vienna from 1794 is customarily divided into three periods. Although the initial phase includes his first three piano concerti and is closed by his *Symphony No. 1 in C Major* (1800), most of his output during those years consisted of chamber music. The second period (1801–14) is marked by his *Sonata in C-sharp Minor* (1801; *Moonlight*) and *Sonata in F Minor* (1804; *Appassionata*); his fourth and fifth (*Emperor*) piano concerti; his second through eighth symphonies, especially *No. 3 in E-flat Major* (1804; *Eroica*); his programmatic *Battle Symphony* (1813; unnumbered); and his only opera, *Fidelio* (final version 1814). His increasing preoccupation with counterpoint is evident in the works of his final period (1815–27), among them the *Symphony No. 9* and several string quartets (1824–26).

beetle (order Coleoptera), any of at least 250,000 species of insects (the largest order in the animal kingdom), principally characterized by their special forewings, which are modified into hardened wing covers (elytra) that cover a second pair of functional wings. The order includes some of the largest and smallest insects and is the most widely distributed insect order. Most feed either upon other animals or upon plants, but some eat decaying matter.

Some beetles are of great economic importance; both adults and larvae may destroy crops, timber, and textiles and spread parasitic worms and diseases. Other beetles are valuable because they prey on insect pests. Although the name beetle applies to all coleopterans, some are known by other common names—e.g., weevil, borer, firefly, chafer, and curculio. *See also* coleopteran.

Beets, Nicolaas (b. Sept. 13, 1814, Haarlem, Neth.—d. March 13, 1903, Utrecht), Dutch pastor and writer whose *Camera obscura* is a classic of Dutch literature.

Beets, engraving by D.J. Sluyter
By courtesy of the Iconographisch Bureau, The Hague

As a student at Leiden, Beets was influenced by reading Byron and was one of the first to write Romantic poetry. His poems—*José* (1834), *Kuser* (1835), and *Guy de Vlaming* (1837)—played a part in the controversy between the Classicists and the Romantics. While still at Leiden, he also wrote

the sketches, tales, and essays collected as *Camera obscura* (edited under the pseudonym Hildebrand, 1839; 4th definitive ed. 1854). These works continued the Dutch tradition of presenting domestic scenes realistically but combined with it the whimsical humour he had learned from reading the English authors Laurence Sterne, Charles Lamb, and Charles Dickens. Beets was ordained in 1839 and held pastorates at Heemstede (1840–53) and Utrecht (1854–74). He was professor at the State University of Utrecht from 1874 to 1884. During his successful career in the church, he produced a great quantity of commonplace prose and verse.

Befana, in Italian tradition, the old woman who fills children's stockings with gifts on Epiphany (Twelfth Night). Too busy to see the

Three Wise Men on their journey to adore the Saviour, she said she would see them on their return. According to legend, they returned by another way, and she was doomed to look for them forever.

beg (title): *see* bey.

Beg-tse, in Tibetan Buddhism, one of the fierce protective deities, the *dharmapālas*. *See* dharmapāla.

Bega, town of the South Coast region, New South Wales, Australia, where the Bemboka and Brogo rivers unite to form the short Bega River. Settled in 1839 and gazetted a town in 1851, its name is derived from an Aboriginal word meaning either "big camping place" or "beautiful." On the Prince's Highway, Bega serves a district of dairying, mixed farming, pastoralism, and granite quarrying. Bega has a large milk-processing plant, fish canneries, sawmills, and furniture, plaster, tile, and agricultural machinery factories; high-quality cheese comes from area. Bega is 10 miles (16 km) from the small resort port of Tathra, noted for surfing facilities. Pop. (1986) 4,294.

Begas, Reinhold (b. July 15, 1831, Berlin, Prussia [Germany]—d. Aug. 3, 1911, Berlin), artist who dominated Prussian sculpture for a generation after 1870.

While studying in Italy from 1856 to 1858, Begas was strongly influenced by the work of Michelangelo and by the art of the Baroque period. The Baroque influence is apparent in his work in, for example, the agitation of draperies and the asymmetrical placement of his figures, in the "Schiller Memorial" (1871) and the "Bismarck Monument" (1901). Although Begas' preference was for mythological and decorative subjects ("Mercury and Psyche"; 1874), he was the most famous German sculptor of his time in portraiture, executing busts of many of his great contemporaries.

Begin, Menachem, in full MENACHEM WOLFOVITCH BEGIN (b. Aug. 16, 1913, Brest-Litovsk, Russia [now in Belarus]—d. March

9, 1992, Tel Aviv, Israel), Zionist leader and prime minister of Israel from 1977 to 1983.

Begin received a law degree from the University of Warsaw in 1935. Active in the Zionist movement throughout the 1930s, he became (1938) the leader of the Polish branch of the Betar youth movement, dedicated to the establishment of a Jewish state on both sides of the Jordan River. When the Germans invaded Warsaw in 1939, he escaped to Vilnius; his parents and a brother died in concentration camps. The Soviet authorities deported Begin to Siberia in 1940, but in 1941 he was released and joined the Polish army in exile, with which he went to Palestine in 1942.

Begin joined the militant Irgun Zvai Leumi and was its commander from 1943 to 1948. After Israel's independence in 1948 the Irgun formed the Herut ("Freedom") Party with Begin as its head and leader of the opposition in the Knesset (Parliament) until 1967. Begin joined the National Unity government (1967–70) as a minister without portfolio and in 1970 became joint chairman of the Likud ("Unity") coalition.

On May 17, 1977, the Likud Party won a national electoral victory and on June 21 Begin formed a government. He was perhaps best known for his uncompromising stand on the question of retaining the territories occupied by Israel during the Arab-Israeli War of 1967. Prodded by U.S. President Jimmy Carter, however, Begin negotiated with President Anwar el-Sadat of Egypt for peace in the Middle East, and a peace treaty between Israel and Egypt was signed on March 26, 1979. Begin and Sadat were jointly awarded the Nobel Prize for Peace in 1978.

Begin, 1987

Ralph Crane; Camera Press from Globe Photos

In the early 1980s, his opposition to the establishment of a Palestinian state remained resolute. His party failed to win a clear majority in a general election in 1980, but he was able to form a coalition. Two years later, Israel's invasion of Lebanon, causing well-publicized civilian casualties, turned world opinion against Israel. Begin resigned from office in 1983.

begonia (genus *Begonia*), any of about 1,000 species of mostly succulent (juicy-stemmed) plants, many with colourful flowers or leaves and used as pot plants indoors or as garden plants. They are from the tropics and subtropics. Prominent features are their usually four tepals (petals and sepals together) in two pairs of different sizes and the three wings on the bases of the female flowers. Flower colours are pink, red, yellow, or white, with the ovary below of the same colour. The usually lopsided, alternate leaves are variable in shape and in colour on different forms.

The more than 10,000 recorded types of be-

gonias present a bewildering array of cultivated varieties. They are divided into four large groups: fibrous-rooted, rhizomatous, tuberous-rooted, and odd and rare begonias.

Carmen, a horticultural variety of *Begonia*
John H. Gerard

Fibrous-rooted begonias can be further divided into the wax, or bedding, begonias (*Semperflorens-Cultorum* group), including the offshoots of *B. semperflorens* used most often as summer bedding plants; the so-called cane stem types (angelwing begonias), characterized by their tall stems; and the hairy begonias, which have feltlike leaves.

Rhizomatous begonias include the rex, or beefsteak, begonias (*Rex-Cultorum* group), including offshoots of *B. rex* and allied species, prized for their brightly coloured and patterned leaves.

Tuberous-rooted begonias include the *Tuberhybrida* group, grown outdoors for their large and colourful flowers from early summer to first frost, and the greenhouse begonias that bloom during the winter. The latter are subdivided into the *Cheimantha* group, from crosses between *B. socotrana* and *B. dregei*, and the *Elatior* group, from crosses between *B. socotrana* and tuberous Andean species.

The *Tuberhybrida* group includes the following types based on flower characteristics or growth habit: single (single-flowered); crisp, with frilled tepals; cristata, with crested tepals; narcissiflora (daffodil-flowered); camellia (camellia-flowered); ruffled camellia; rosebud, with a raised rosebudlike centre; fimbriata plena (carnation-flowered); picotee, camellia-form with tepals showing colour shading; marginata, tepals edged in colour different from the dominant; marmorata, camellia-form, rose-coloured, and blotched with white; pendula, hanging-basket plants; and multiflora, compact bushy plants with many small flowers.

Most begonias are tender plants, intolerant of dry conditions and requiring protection from strong sunlight.

Beguines, women in the cities of northern Europe who, beginning in the Middle Ages, led lives of religious devotion without joining an approved religious order.

So-called "holy women" (Latin: *mulieres sanctae*, or *mulieres religiosae*) first appeared in Liège toward the end of the 12th century. Use of the word "Begaine" (Latin: *beguina*) was established by the 1230s. Its etymology is uncertain; it seems to have originated as a pejorative term. By the mid-13th century the movement had spread throughout the Low Countries, Germany, and northern France.

The beguinal movement began among upper-class women and spread to the middle class. In addition to addressing the spiritual needs of its adherents, it responded to socioeconomic problems caused by a surplus of unattached women in urban areas. Most Beguines lived together in communities called *beguinages*. In Germany groups of up to 60 or 70 women lived together in houses; in the Low Countries they usually lived in individual houses within walled enclosures—"towns within towns." Most supported themselves, often by nursing or cloth- or lace-making, and they spent time in religious contemplation. Beguines promised to preserve chastity while they remained in the community, but they were free to leave it and marry.

Many beguinal communities were closely associated with Dominican and Franciscan friars, and some communities and individuals cultivated intense forms of mysticism. These circumstances led many people to suspect them of heretical tendencies. Throughout the 13th century they were the object of prejudice and of restrictive legislation, and in 1311, at the Council of Vienne, decrees were drawn up that ordered the dissolution of beguinal communities. Thereafter official policy varied until the 15th century, when a consistent policy of toleration was established. Meanwhile, however, the beguinal movement had declined; many of its members joined formal religious orders. Some communities still exist, mainly in Belgium; most operate charitable institutions.

One of the most remarkable Beguines was Marguerite Porete, who was burned for heresy in Paris in 1310. Her mystical work *Miroir des simples âmes* (c. 1300; *The Mirror of Simple Souls*) is thought to be the greatest religious tract written in Old French.

The male counterparts of Beguines were known as *Beghards*. They never achieved the same prominence, and the few communities that survived in Belgium were suppressed during the French Revolution.

Begusarai, city, north-central Bihār state, northeastern India. It is situated in the Middle Ganges Plain, just north of the Ganges River. The name Begusarai is derived from *serai* (Persian, meaning "travelers' lodge"), a building in the centre of the town. It is an important commercial centre on the North Eastern Railway.

The surrounding area is flat, has alluvial soil, and is traversed by numerous streams. The region's economy is dominated by subsistence agriculture: rice, pulse (legumes), wheat, barley, corn (maize), sugarcane, and oilseeds are grown. Industries produce textiles, canned fruit, dairy products, vegetable oil, chemicals, and paper. Pop. (1991 prelim.) city, 71,362; metropolitan area, 83,907.

Behaghel, Otto (b. May 3, 1854, Karlsruhe, Baden [Germany]—d. Oct. 9, 1936, Munich), language scholar who specialized in studies of the German language and whose *Deutsche Syntax*, 4 vol. (1923–32; "German Syntax"), is a massive compilation and classification of

Behaghel
Archiv für Kunst und Geschichte, Berlin

examples of German linguistic usage from the 8th to the 20th century.

Behaghel held professorships at Heidelberg, Ger., at Basel, Switz., and at Giessen, Ger.; edited two important journals of Germanic studies; and published two works that remain standard treatises, *Die Deutsche Sprache* (1886; "The German Language") and *Geschichte der Deutschen Sprache* (1901; "History of the German Language").

Behaim, Martin, Portuguese MARTIM BEHAIM, OF MARTINHO DE BOÉMIA (b. Oct. 6, 1459, Nürnberg [Germany]—d. July 29, 1507, Lisbon [Portugal]), navigator and geographer whose Nürnberg Terrestrial Globe is the earliest globe extant.

Behaim first visited Portugal about 1480 as a merchant in the Flemish trade and, claiming to have been a pupil of the astronomer Johann Müller (Regiomontanus) at Nürnberg, became an adviser on navigation to King John II. He may have introduced the astrolabe of brass to replace wooden models of this instrument, then used in navigation to ascertain the altitudes of the Sun, Moon, and stars in order to deduce time and latitude. He probably voyaged down the west coast of Africa (1485–86) with Diogo Cão.

Returning to Nürnberg (1490), Behaim began constructing his globe with the help of the painter Georg Glockendon and finished it in 1492. In view of the extent of Portuguese exploration, his depiction of the world was surprisingly inaccurate and out of date, especially in relation to the west coast of Africa. It is interesting, nevertheless, for the indication it provides of common geographic suppositions on the eve of the discovery of North America. His globe is in the collection of the German National Museum in Nürnberg.

Beham, Hans Sebald (b. 1500, Nürnberg [Germany]—d. Nov. 22, 1550, Frankfurt am Main), German engraver who was the most prolific of the Kleinmeister (German: "Little Masters") of engraving, so called because they produced small prints.

The Kleinmeister also included Beham's younger brother, Barthel Beham (1502–40), and Georg Pencz (c. 1500–50). All three artists, noted for their brilliant work on extremely small copper plates, grew up under the influence of Albrecht Dürer's late classical style. It is likely that they worked in Dürer's studio. In 1525 the trio was banned from Nürnberg for independent religious views, but not for long. Later Beham moved to Frankfurt am Main. His 252 engravings include biblical and mythological subjects, allegories, genre scenes, and ornaments. Of particular charm were the genre scenes, such as a set entitled "Peasant Festival" (1537).

Behan, Brendan (Francis) (b. Feb. 9, 1923, Dublin, Ire.—d. March 20, 1964, Dublin), anti-English rebel and author whose earthy satire and powerful political commentary made a significant contribution to the theatre of the absurd.

Reared in a family active in revolutionary and left-wing causes against the British, Behan at the age of eight began what became a lifelong battle with alcoholism. After leaving school in 1937, he learned the house-painter's trade while concurrently participating in the Irish Republican Army (IRA) as a courier.

Behan was arrested in England while on a sabotage mission and sentenced (February 1940) to three years in a reform school at Hollesley Bay, Suffolk. He wrote an autobiographical account of this detention in *Borstal Boy* (1958). He was deported to Dublin in 1942 and was soon involved in a shooting incident in which a policeman was wounded. He was captured, charged with attempted murder, convicted, and sentenced to 14 years. He served at Mountjoy Prison, Dublin, the setting of his first play, *The Quare Fellow* (1954), and

Behan
BSC Hulton Picture Library

later at the Curragh Military Camp, County Kildare, from which he was released under a general amnesty in 1946. While imprisoned, he perfected his Irish, the language he used for his delicately sensitive poetry and for *An Giall* (1957), the initial version of his second play, *The Hostage* (1958).

Subsequent arrests followed, either for revolutionary activities or for alcoholism, which also forced various hospitalizations. In 1948 Behan went to Paris to write. Returning to Dublin in 1950, he wrote short stories and scripts for Radio Telefís Éireann and sang on a continuing program, *Ballad Maker's Saturday Night*. In 1953 he began in the *Irish Press* a column about Dublin, later collected (1963) in *Hold Your Hour and Have Another*, with illustrations by his wife, Beatrice Salkeld, whom he had married in 1955.

The Quare Fellow opened at the small Pike Theatre, Dublin, in 1954 and was an instant success. A tragicomedy concerning the reactions of jailors and prisoners to the hanging of a condemned man (the "Quare Fellow"), it presents an explosive statement on capital punishment. The play was subsequently performed in London (1956) and in New York City (1958). *The Hostage*, however, is considered to be his masterwork, in which ballads, slapstick, and fantasies satirize social conditions and warfare with a personal gaiety that emerges from anguish. The play deals with the tragic situation of an English soldier whom the IRA holds as a hostage in a brothel to prevent the execution of one of their own men. A success in London, the play opened in 1960 off Broadway, New York City, where Behan became a celebrated personality.

Behan's last works, which he dictated on tape, were *Brendan Behan's Island* (1962), a book of Irish anecdotes; *The Scarperer* (1964), a novel about a smuggling adventure, first published serially in the *Irish Press*; *Brendan Behan's New York* (1964); and *Confessions of an Irish Rebel* (1965), further memoirs. Alan Simpson's *Beckett and Behan, and a Theatre in Dublin* appeared in 1962; Ulick O'Connor's *Brendan Behan* was published in 1970.

behavioral science, any of various disciplines dealing with the subject of human actions, usually including the fields of sociology, social and cultural anthropology, psychology, and behavioral aspects of biology, economics, geography, law, psychiatry, and political science. The term gained currency in the 1950s in the United States; it is often used synonymously with "social sciences," although some writers distinguish between them. The term behavioral sciences suggests an approach that is more experimental than that connoted by the older term social sciences.

behaviour, also spelled BEHAVIOR: see animal behaviour; human behaviour.

behaviour genetics, also called PSYCHOGENETICS, the study of the influence of an organism's genetic composition on its behaviour and the interaction of heredity and environment insofar as they affect behaviour. The question of the determinants of abilities

as shown through behaviour has commonly been referred to as the "nature-nurture" controversy.

The relationship between behaviour and genetics, or heredity, dates to the work of the English scientist Sir Francis Galton (1822–1911). Galton studied the families of outstanding men of his day and concluded, like his cousin Charles Darwin, that mental powers run in families. Galton became the first to use twins in genetic research and pioneered many of the statistical methods of analysis that are in use today. He was the first to recognize that acquired behavioral characteristics could not be transmitted genetically. In 1918 the Scot R.A. Fisher published a paper that attempted to prove that Mendel's laws of inheritance can be generalized to show that both genes and environmental factors affect an individual's behaviour.

For more than half a century scientists have been studying the relationship between IQ and genetics, and have arrived at no solid conclusions. In 1937, the U.S. psychogeneticists Horatio Newman, Frank Freeman, and Karl Holzinger studied monozygotic (MZ) or identical twins that were reared by different families to determine the effect of environment on intelligence. They found that, in general, the mental ability of identical twins was influenced far more by genetic factors than by environmental influences. In 1980 another U.S. geneticist Robert Plomin concluded, on the other hand, that genetic differences account for about half of IQ variance.

Methods of study. Any long-term genetic research involving human subjects is complicated by the lengthy period of human development and the need to locate and observe identical (MZ) twins for long periods of time. Animal studies are simpler to control and have provided important results. By mating related animals (e.g., siblings) for as many as twenty generations, scientists obtain a nearly pure strain in which all offspring are genetically highly similar. Through these inbreeding experiments, the U.S. geneticists J.C. DeFries and Robert Plomin reported in 1978 that there exists a genetic component in laboratory animals that affect such diverse behaviours as learning, sexual activity, alcohol preference, aggression, taste perception, and seizure susceptibility.

The geneticist interested in investigating a specific trait or characteristic mates animals that exhibit a high degree of the desired trait in an approach known as selective breeding. Genetic theory predicts that a selectively bred behaviour among groups will become far more separated as the groups become more genetically dissimilar despite the fact that all animals are maintained in a common environment.

Another technique, consanguinity studies, is based on the belief that as the degree of relationship among individuals increases, so should the frequency of the characteristic. Scientists in 1978, for example, used consanguinity studies to show that parents of schizophrenic patients exhibited a higher incidence of schizophrenia than the population at large. The possible hereditary nature of alcoholism, depression, and other mental disorders are being studied extensively. Other behavioral characteristics that are believed to be genetically influenced include introversion-extroversion and activity level.

Genetic controversy. One highly debatable point among behavioral geneticists is the question of genetic influence on racial and ethnic IQ differences. In 1969, for example, the U.S. educator Arthur Jensen concluded that differences in IQ scores of black and white populations may be due to genetic differences. Many scientists have refuted Jensen's arguments claiming that environmental factors and the use of "racially biased" IQ tests were not adequately considered by Jensen. See also intelligence.

behaviour therapy, the application of experimentally derived principles of learning to the treatment of psychological disorders. The concept derives primarily from work of the Russian psychologist Ivan Pavlov, who published extensively in the 1920s and 1930s on the application of conditioning techniques and theories to abnormal behaviour. Behaviour-therapy techniques differ from psychiatric methods, particularly psychoanalysis, in that they are predominately symptom (behaviour) oriented and show little or no concern for unconscious processes, achieving new insight, or effecting fundamental personality change.

Behaviour therapy was popularized by the U.S. psychologist B.F. Skinner, who worked with mental patients in a Massachusetts state hospital. From his work in animal learning, Skinner found that the establishment and extinction (elimination) of responses can be determined by the way reinforcers, or rewards, are given. The pattern of reward-giving, both in time and frequency, is known as a "schedule of reinforcement." The gradual change in behaviour in approximation of the desired result is known as "shaping." More recent developments in behaviour therapy emphasize the adaptive nature of cognitive processes.

One of the most prominent behaviour techniques, variously known as systematic desensitization, reciprocal inhibition, extinction, or counter-conditioning, has its experimental basis in work done with animals in the 1950s by psychologists Joseph Wolpe and Arnold Lazarus. In one such experiment, cats were conditioned with electric shock to refuse to eat in a confined space. Their conditioned fear was overcome by feeding them in remotely similar situations and gradually increasing the similarity until all signs of anxiety had disappeared. When the technique, known as desensitization, is applied to human problems, patients may be asked either to imagine anxiety-producing situations or to deal with actual feared objects or situations. The construction of hierarchies of fears is perhaps the most important part of the procedure; the patient's verbalized responses are the primary source of information, although the therapist may also rely on such other sources as diagnostic tests or interviews of family or friends of the patient. Often relaxation training is employed in the presence of the anxiety-producing stimuli. The theoretical question of whether these procedures involve reduction in the habit strength of anxiety responses or establishment of alternative, adaptive responses to the same stimuli remains unresolved.

Much evidence has been collected to demonstrate the effectiveness of structured learning and behaviour therapy in groups. Assertiveness training is the broad term for a structured group situation that facilitates the acquisition of emotionally expressive behaviour. Such training is based on the behavioral concept that once the appropriate overt expressions of emotions are learned, practiced, and reinforced, the correlated subjective feelings will be felt.

In 1975, the U.S. psychologist Robert P. Liberman introduced assertion or personal effectiveness training as a fundamental component of the clinical services offered by community health centres.

A number of other behavioral techniques have been used in therapy. Aversion therapy causes a patient to reduce or avoid an undesirable behaviour pattern by conditioning him to associate the behaviour with an undesirable stimulus. The chief stimuli used in the therapy are electrical and chemical. In the electrical therapy, the patient is given a lightly painful shock whenever the undesirable behaviour is aroused; this method has been used in the treatment of sexual deviations. In the

chemical therapy, the patient is given a drug that produces unpleasant effects, such as nausea, when combined with the undesirable behaviour; this method has been common in the treatment of alcoholism, the therapeutic drug and the alcohol together causing the nausea. Another approach reinforces desired responses with praise, food, or some other reward.

Behaviour-therapy techniques have been applied with some success to such disturbances as enuresis (bed-wetting), tics, phobias, stuttering, obsessive-compulsive behaviour, drug addiction, neurotic behaviours of "normal" persons, and some psychotic conditions. It has also been used in training the mentally retarded.

In addition, behavioral self-control has received great academic attention, particularly learning to control the functions of the autonomic nervous system (e.g., heart rate, blood pressure, and intestinal contractions) by methods such as biofeedback (*q.v.*). The theory and therapy of self-control represents a significant humanistic development within the area of behaviour modification, by enhancing personal responsibility. *See also* behaviourism; conditioning.

behaviourism, a highly influential academic school of psychology that dominated psychological theory between the two world wars. Classical behaviourism concerned itself exclusively with measurable and observable data and excluded ideas, emotions, and the consideration of inner mental experience and activity in general. The organism is seen as "responding" to conditions (stimuli) set by the outer environment and inner biological processes. The dominant school of thought at the time, structuralism, conceived of psychology as the science of consciousness, experience, or mind; while bodily activities were not excluded, their paramount interest was considered to lie in their relations to mental phenomena. The characteristic method of psychology was thus introspection—observing and reporting upon the working of one's own mind.

The early formulations of behaviourism were a reaction by the U.S. psychologist John B. Watson against the introspective psychologies. Watson wrote that "Behaviorism claims that 'consciousness' is neither a definable nor a usable concept; that it is merely another word for the 'soul' of more ancient times. The old psychology is thus dominated by a subtle kind of religious philosophy" (*Behaviorism*, 1924). Behaviourism "attempted to make a fresh, clean start in psychology, breaking both with current theories and with traditional concepts and terminology" (*Psychology from the Standpoint of a Behaviorist*, 3rd ed., 1929). Introspection was to be discarded; only such observations were to be considered admissible as could be made by independent observers upon the same object or event—exactly as in physics or chemistry. In this way psychology was to become "a purely objective, experimental branch of natural science." However abstract these proposals may seem, they have had a revolutionary influence on modern psychology and social science and on man's conception of himself.

Watson's objectivist leanings were presaged by many developments in the history of thought and were in fact symptomatic of strong trends that had been emerging in biology and psychology since the late 19th century. Thus, his desire to "bury subjective subject matter" enlisted widespread cooperation. Between the early 1920s and mid-century, behaviourism in the methodic sense dominated U.S. psychology and had wide international repercussions. Though the chief alternatives to behaviourism (e.g., Gestalt psychology and psychoanalysis) promulgated methods that use experiential

data, even these positions accommodated the objectivist emphasis by a steadily increasing stress on the need for objective validation of experientially based hypotheses.

The period 1912–30 (roughly) may be called that of classical behaviourism. Watson was then the dominant figure, but many others were soon at work giving their own systematic twists to the development of the program. Classical behaviourism was dedicated to proving that phenomena formerly believed to require introspective study (e.g., thinking, imagery, emotions, feeling) might be handled in terms of stimulus and response. Classical behaviourism was characterized by a strict determinism based on the belief that behind every response lies a stimulus that elicits it.

From 1930 through the late '40s the derivative form known as neobehaviourism may be distinguished, when psychologists attempted to translate the general methodic program prescribed by Watson into a detailed, experimentally based theory of adaptive behaviour. This era was dominated by learning theorists Clark L. Hull and B.F. Skinner; Skinner's thought was the direct descendant of Watson's intellectual heritage, and became dominant in the field after the mid-1950s. Other important behaviourists included Hull-influenced Kenneth W. Spence; Neal Miller, who felt that neuroscience is the most productive avenue in psychological research; Edward C. Tolman; and Edwin R. Guthrie. Beginning in this period, with people like cognitive theorist Tolman, a tendency toward a liberalization of strict behaviourist doctrine (both methodic and conceptual) occurred. The posture toward objectivism remained fundamentally the same, even while admitting the existence of intervening (i.e., mental) variables, accepting verbal reports, and branching into problem areas such as perception.

A natural outgrowth of behaviourist theory was behaviour therapy (*q.v.*), which rose to prominence after World War II and focussed on modifying observable behaviour, rather than on the thoughts and feelings of the patient (as in psychoanalysis). Emotional problems are considered the consequences of faulty acquired behaviour patterns or the failure to learn effective responses. The aim of behaviour therapy, also known as behaviour modification, is therefore to change behaviour patterns. *See also* conditioning.

Behbehān, chief town and county (*shahrestān*) in Khūzestān *ostān* (province), southwestern Iran, in the foothills of the Zagros Mountains near the Mārūn River. The largely mountainous county extends to Mt. Dinār and has tribal populations. The town prospers through development of the neighbouring oil fields. It lies on an ancient trade route and connects by road with Ahvāz and Kāzerūn. Nearby ruins include the Sāsānian city of Arajan and a bridge with a single arch. Pop. (1996) town, 88,213; county, 164,074.

Behdet (Egypt): *see* Idfū.

beheading, a mode of executing capital punishment. The ancient Greeks and Romans regarded it as a most honourable form of death. Before execution the criminal was tied to a stake and whipped with rods. In earlier years an ax was used; later a sword, which was considered a more honourable instrument of death, was used in the case of Roman citizens.

Beheading is said to have been introduced into England from Normandy by William the Conqueror in the 11th century. Although some early manuscripts record the beheading of ordinary felons, this punishment was usually reserved for offenders of high rank. Simon, Lord Lovat, was the last person beheaded in England (April 9, 1747). The petition (1760) of the 4th Earl Ferrers to be beheaded was refused, and he was hanged. One consequence of the French Revolution was the extension of

the privilege of beheading to criminals of ordinary birth, by means of the guillotine (*q.v.*).

Beheading was only a part of the common-law method of punishing male traitors, which was ferocious in the extreme, including also hanging, mutilation, disembowelling, and quartering. In 1814 the king of England was empowered by royal warrant to substitute hanging as the ordinary mode of executing criminals; but as late as 1820, after traitors were hanged, their heads were cut off by a masked man.

Beheading is now rare in European countries, most of which have abolished or limited capital punishment. It is still used occasionally in some Muslim countries. It was practiced extensively by the Chinese war lords, especially by Sun Ch'uan-fang in Shanghai. Beheading was the method of execution prescribed by the German penal code until the death penalty was virtually abolished after World War II; during the Nazi regime the penalty had been imposed in an extended range of cases.

Beheira (Egypt): *see* Buḥayrah, al-.

Behemoth, in the Old Testament, a powerful, grass-eating animal whose "bones are tubes of bronze, his limbs like bars of iron" (Job 40:18). Among various Jewish legends, one relates that the righteous will witness a spectacular battle between Behemoth and Leviathan in the messianic era and later feast upon their flesh. Some sources identify Behemoth, who dwells in the marsh and is not frightened by the turbulent river Jordan, as a hippopotamus and Leviathan as a crocodile, whale, or snake.

Behistun (Iran): *see* Bisitūn.

Behn, Aphra (b. July 1640—d. April 16, 1689, London), English dramatist, novelist, and poet, the first Englishwoman to earn her

Aphra Behn, frontispiece to *All the Histories and the Novels*, 1722

By courtesy of the trustees of the British Museum, photograph, J.R. Freeman & Co. Ltd

living by writing. Her novel *Oroonoko* (1688; reprinted 1933), a story of an enslaved African prince whom Aphra knew in South America, unquestionably influenced the development of the novel. Her poems, unequal in merit, have perhaps been underestimated, but in life she attained great popularity and was the centre of much scandal. Though she wrote mostly plays, her fiction is now considered more interesting.

Her origin remains a mystery; an unidentified child named Aphra travelled with a couple named Amis to Surinam (Dutch Guiana), then an English possession. Back in England by 1658, she married a London merchant named Behn, who died in 1666. Her wit and talent having brought her into high esteem, she was employed by Charles II in secret service in the Netherlands. Unrewarded and imprisoned for debt, she began to write to support herself.

In 1671 Behn's first play, *The Forc'd Marriage*, was produced; her witty and vivacious comedies, such as *The Rover* (two parts, pro-

duced 1677 and 1681), were highly successful. She was well read and often adapted work by older dramatists. Her versatility, like her output, was immense.

Behn, Sosthenes (b. Jan. 30, 1882, St. Thomas, Danish Virgin Islands—d. June 6, 1957, New York City), telephone executive, president and founder, with his brother Hernand, of the International Telephone and Telegraph Corporation (ITT), one of the largest communications companies in the world.

Educated on the island of Corsica and in Paris, Behn began his career in 1901 with a New York City bank. Five years later he and his brother Hernand took over the sugar business of their stepfather in Puerto Rico and, while living on that island, purchased the Puerto Rican Telephone Company; they later acquired the Cuban Telephone Company. The brothers' business activities were interrupted by World War I; Behn served in the United States Army Signal Corps.

In 1920 the Behns and a third partner organized ITT, into which they incorporated their Puerto Rican and Cuban holdings. They later obtained telephone concessions for Spain and Romania. The onset of the depression in 1931 brought financial difficulties, but Behn's skillful handling of the firm's indebtedness enabled ITT to survive and grow. Hernand died in 1933, leaving his brother in full control. World War II brought more problems when certain European holdings were seized by Adolf Hitler; nevertheless, the company was able to sell its Romanian holdings and in 1945–46 disposed successfully of properties in Spain and Argentina. Operations in Latin America were expanded both during and after the war. Behn retired in 1956.

Behrens, Peter (b. April 14, 1868, Hamburg—d. Feb. 27, 1940, Berlin), architect noted for his influential role in the development of modern architecture in Germany. In addition, he was a pioneer in the field of industrial design.

After attending the fine arts school at Hamburg, Behrens went to Munich in 1897 during the time of the renaissance of arts and crafts in Germany. In 1900 the Grand Duke of Hesse called him to his newly founded artists' colony at Darmstadt. There, Behrens built his own house (1901) with all its furnishings. In 1903 he became director of the arts and crafts school in Düsseldorf.

The most important event in Behrens' career occurred in 1907. Emil Rathenau, general director of the AEG (Allgemeine Elektrizitäts Gesellschaft—one of the largest manufactur-

ing concerns in the world), appointed him as artistic adviser for all AEG products. Rathenau was a farsighted industrialist who recognized the industry's need for the refining hand of an artist. Up to that time Behrens had been a mediocre painter, producing woodcuts, book covers, ceramics, interiors, fabrics, and carpets, but he began to concentrate intensely on creative work in the industrial sphere. His contributions included the hexagonal trademark of the AEG, its catalogs, and its office stationery, products such as electric fans and street lamps, and retail shops and factories. Between 1909 and 1912 he built the AEG factory complex. His turbine assembly works with its glass curtain wall was the most influential building in Germany at that time. During that period Walter Gropius, Ludwig Mies van der Rohe, and Le Corbusier worked in his office.

Behrens' later works included factory and administrative buildings: the Mannesmann-Werke in Düsseldorf (1911–12), Farbwerke at Höchst (1920–24), the classical German embassy at St. Petersburg (1911–12), and the factory for the Austrian Tobacco Administration at Linz (1930). From 1922 to 1927 he was professor at the Academy of Fine Arts in Vienna. His later buildings demonstrated his belief that a building complex must have a heavy massiveness.

Behring, Emil (Adolf) von (b. March 15, 1854, Hansdorf, Prussia—d. March 31, 1917, Marburg, Ger.), bacteriologist who is consid-

Behring, 1914
Archiv für Kunst und Geschichte, Berlin

ered the founder of the science of immunology; he received in 1901 the first Nobel Prize for Physiology or Medicine for his work on serum therapy, especially its application against diphtheria.

Behring served with the Army Medical Corps before becoming assistant (1889) at Robert Koch's Institute of Hygiene, Berlin. There, with the Japanese bacteriologist Kitasato Shibasaburo, he showed that it was possible to provide an animal with passive immunity against tetanus by injecting it with the blood serum of another animal infected with the disease. Behring then applied this technique of antitoxic immunity (a term which he and Kitasato originated) to prevent diphtheria. Administration of diphtheria antitoxin, successfully marketed in 1892, became a routine part of the treatment of the disease.

Behring taught at Halle (1894) and at Marburg (1895). He became financially involved with the Farbwerke Meister, Lucius und Brüning in Höchst, a dyeworks that provided laboratories for his researches, which included studies of tuberculosis. He devised a vaccine (bovovaccine) for immunization of calves against the disease. His writings include *Die praktischen Ziele der Blutserumtherapie* (1892; "The Practical Goals of Blood Serum Therapy") and *Ätiologie und ätiologische Therapie des Tetanus* (1904; "The Etiology and Etiological Therapy of Tetanus").

Behrman, S(amuel) N(athaniel) (b. June 9, 1893, Worcester, Mass., U.S.—d. Sept.

9, 1973, New York City), U.S. short-story writer and playwright best known for popular Broadway plays that commented on contemporary moral issues. Behrman wrote about the wealthy, intellectual sector of society, endowing his characters with eloquence and intelligence. He is distinguished among popular playwrights for introducing volatile and complicated issues into his plays and for refusing to create shallow characters.

As a young man, Behrman contributed to newspapers and magazines, including *New Republic* and *The New Yorker*, and studied drama at Harvard. His first play, *The Second Man* (1927), was an immediate success. Behrman followed it with a string of successes, including *Meteor* (1929), *Brief Moment* (1931), and *Biography* (1932). In the 1930s Behrman began to struggle with the incongruity of writing comedy in that grim wartime era. He tackled the subject of Fascism in *Rain from Heaven* (1934). But despite Behrman's increasing treatment of the serious political themes of the day, he was criticized for not making his personal viewpoint known, instead letting the characters speak for him. In response, Behrman wrote *No Time for Comedy* (1939), in which the protagonist, an author of light comedy, criticizes himself for his failure to address effectively serious contemporary problems.

Behrman wrote more than two dozen comedies during his 40-year career, and nearly every one of them was a hit. He also wrote many short stories, two biographies, and a number of screenplays.

Behzād, in full USTĀD KAMĀL AD-DĪN BEHZĀD (b. c. 1455?, Herāt, Khorāsān—d. c. 1536?, Tabriz, Azerbaijan), major Persian painter whose style as a miniaturist and work as a teacher were vital influences on Persian Islamic painting.

Orphaned at an early age, he was raised in the city of Herāt by the painter Mirak Naqqāsh, who enjoyed the patronage of the Timurid princes who ruled the city. Behzād studied under his guardian and in 1486 became head of the Herāt academy, a post he held until 1506. Under his direction the academy became a greater centre of art than ever.

In 1506 Shāh Esmā'īl I, founder of Iran's Šafavid dynasty, conquered the city. In 1514

"The Building of the Famous Castle of Khawarnaq," miniature by Behzād, c. 1494, from the *Khamseh* of Nezāmi; in the British Library (OR. MS. 6810 fol 154v)

Behrens, painting by Max Liebermann
Archiv für Kunst und Geschichte, Berlin

Esmā'il's son Ṭahmāsp was made governor of Herāt, and, when he returned to Tabriz in 1522, Behzād returned in his train. At Tabriz he continued to enjoy royal patronage and was named director of the royal library and placed in charge of the production of the elaborate illuminated and illustrated manuscripts. He held the post until his death.

Both as a teacher and painter Behzād was a leading force in the development of Tabriz as a centre of art. His students included the painters Qāsim 'Alī, Mīr Sayyid 'Alī, Āqā Mīrak, and Muzaffar 'Alī.

A major problem in assessing Behzād's work precisely is the difficulty in identifying specific works as coming from his hand. His pupils worked closely to imitate his style. In addition, he became the standard of excellence in his own age, and collectors of the time would identify works of excellence as being by Behzād with little or no supporting evidence. Behzād signed few of his paintings, and only 32 have been definitively attributed to him, all executed between 1486 and 1495.

While Behzād's work represents no radical departure from earlier styles, his technical skill, combined with his originality in composition and dramatic presentations and his superb knowledge of colour, made him the master painter of his time. In a style marked by harmony, humanism, and grace, he was able to free the miniature from stiffness in presentation and excessive concern with detail. Behzād injected new energy and realism into Persian painting.

Two of his earliest surviving works are signed illustrations for a manuscript of the Persian poet Sa'di's classic *Golestān* ("The Rose Garden"). Five miniatures he contributed to a manuscript of Sa'di's *Būstān*, copied in 1488 and now preserved in the Egyptian National Library at Cairo, are considered by many scholars to be the best surviving examples of his work. His painting of the building of the castle of Khawarnaq, done about 1494, clearly shows Behzād's ability to portray vividly a complex scene in a rich and fluid composition. The work shows careful observation and an ability to display significant detail while stripping away unimportant clutter.

Bei Dao, Wade-Giles romanization PEI TAO, also spelled BEIDAO, original name ZHAO ZHENKAI (b. Aug. 2, 1949, Peking [Beijing], China), Chinese poet and writer of fiction who was commonly considered the most influential poet in China during the 1980s. He went into exile in 1989.

The eruption of the Cultural Revolution in 1966 interrupted Zhao Zhenkai's formal education. A member of the Red Guards for a short time and then a construction worker, he began to write as a substitute for active political involvement and as a protest against contemporary official literature. Bei Dao ("North Island") was one of several noms de plume under which he wrote covertly in the 1970s. He was one of the originators of *menglongshi* ("shadows poetry"), which uses metaphor and cryptic language to express beauty and yearnings for freedom, while avoiding direct discussions of contemporary political and social issues. In 1978 he created, with some fellow poets, *Jintian* ("Today"), the first unofficial literary magazine in mainland China since the 1950s; it was censored by the authorities in 1980, after the first nine issues.

Bei Dao came to be considered the poetic voice of his generation, and his poetry gradually gained a hearing in official publications but was considered difficult and arcane. In 1986 *Bei Dao shixuan* ("Bei Dao's Collected Poems"; Eng. trans. *The August Sleepwalker*) was published. The collection contains the poems "The Answer," "An End or a Begin-

ning," and "Portrait of a Young Poet." In June 1989, when the Tiananmen Square incident occurred, Bei Dao was in Berlin. He did not return to China but traveled throughout the West, gaining an international audience for his poetry, which began to reflect his profound sorrow at separation from his family and homeland. English editions of his poetry include *Old Snow* (1991), *Forms of Distance* (1994), *Landscape over Zero* (1996), *Unlock* (2000), and *Midnight's Gate* (2005). His other works include *Bodong* (1985; *Waves*), which contains a novella and stories, and *Lanfanzhi* (1998; *Blue House*), a collection of prose. In 1990 the journal *Jintian* was revived in Sweden as a forum for Chinese writers abroad, with Bei Dao as chief editor.

Bei Wei DYNASTY: see Wei dynasty.

Beiderbecke, Bix, in full LEON BIX BEIDERBECKE (b. March 10, 1903, Davenport, Iowa, U.S.—d. Aug. 6, 1931, Long Island, N.Y.), American jazz cornetist who was an outstanding improviser and composer of the 1920s and whose style is characterized by lyricism and purity of tone. He was the first major white jazz soloist.

As a boy Beiderbecke was expelled from Lake Forest Academy in suburban Chicago. In 1923 he joined the Wolverines, a youthful group with whom he first recorded and toured to New York City, and in 1925 he worked in Chicago, where he first heard and played with the great black innovators Louis Armstrong, King Oliver, and Jimmy Noone. While in St. Louis, Mo., in 1926, Beiderbecke joined Frank Trumbauer, with whom he maintained a close friendship for most of the rest of his life. The two played in the Jean Goldkette band (1927) and in Paul Whiteman's outstanding pop music orchestra (1928–30), in which Beiderbecke was a featured soloist. Severe alcoholism disrupted his career and led to his death.

Beiderbecke emphasized the cornet's middle register, using simple rhythms and diatonic harmonies. His attack was precise, and his tone, often described as "golden" and "bell-like," was consistently pure. If the simplicity of his materials made Beiderbecke's playing seem delicate, the vitality of his lyric imagination—he had a rare ability to create melodies, embellishments, and melodic variations—demonstrated his strength. Such recordings as "I'm Coming, Virginia" and "Singin' the Blues," both recorded with Trumbauer's group in 1927, remain jazz classics. Beiderbecke's approach lived on in the playing of Jimmy McPartland and Bobby Hackett, as well as in that of the many lesser players who formed almost a cult of hero worshipers, possibly fueled by

Bix Beiderbecke
Brown Brothers

novels and films such as Dorothy Baker's *Young Man with a Horn*, a novel inspired by (but not based on) Beiderbecke's life. His compositions include several short piano pieces, most notably "In a Mist," written in an advanced, chromatic harmonic language that showed the influence of such composers as Maurice Ravel and Claude Debussy.

Beilstein, Friedrich Konrad (b. Feb. 17, 1838, St. Petersburg, Russia—d. Oct. 18, 1906, St. Petersburg), chemist who compiled the *Handbuch der organischen Chemie*, 2 vol. (1880–83; "Handbook of Organic Chemistry"), an indispensable tool for the organic chemist.

In 1866 Beilstein was appointed professor of chemistry at the Imperial Technological Institute, St. Petersburg. The first edition of his *Handbuch* gave a full account of the physical and chemical properties of 15,000 organic compounds. The second edition came out in three volumes from 1886 to 1889. Because of the rapid growth of organic chemistry, he turned the task over to the Deutsche Chemische Gesellschaft ("German Chemical Society") in 1900. The fourth edition (27 volumes) of the *Handbuch* (commonly known as *Beilstein*) appeared in 1937 and is kept up to date by periodic supplements.

Beinum, Eduard van, in full EDUARD ALEXANDER BEINUM (b. Sept. 3, 1901, Arnhem, Neth.—d. April 13, 1959, Amsterdam), Dutch conductor, pianist, and violist who led orchestras in Europe and the United States.

At 17 van Beinum entered the Amsterdam Conservatory after a year of playing in the string section of the Arnhem Philharmonic Orchestra. A series of minor appointments led to conductorships of the Haarlem Orchestra and Haarlem Roman Catholic Choir, posts that he held until 1931, the year he was made second conductor of the Amsterdam Concertgebouw Orchestra. In 1938 he was promoted to co-first conductor, sharing the position with Bruno Walter. When musical activity resumed after The Netherlands' liberation in 1944, he took over as that organization's conductor-in-chief, which he remained until his death. He also began touring extensively. He led the London Philharmonic from 1949 to 1951, encouraging and promoting the composer and first trumpet player Malcolm Arnold. Van Beinum's American debut occurred in 1954 with the Philadelphia Orchestra, followed by a U.S. tour with the Concertgebouw Orchestra. In 1956 he was named musical director of the Los Angeles Philharmonic.

Van Beinum conducted with economy, without using a baton or much gesticulation. Though conventional in his programming, his reputation was based on intelligent, uneccentric interpretations that paid careful attention to the score.

Beipiao (China): see Pei-p'iao.

Beira, port city, central Mozambique. Beira is situated on the Mozambique Channel (Indian Ocean) at the mouths of the Púngoè and Búzi rivers. It was founded in 1891 as the headquarters of the Companhia de Moçambique ("Mozambique Company") on the site of an old Muslim settlement. The city's administration passed from the trading company to the Portuguese government in 1942 and then to independent Mozambique in 1975. The port developed as a trade and transportation outlet

The railway station, Beira, Mozambique

J Allan Cash

for the products of Central Africa and as a transshipment point for coastal cargo. The city is the busy ocean terminus of railways from South Africa, Zimbabwe, Zambia, Congo (Kinshasa), and Malaŵi, and it serves as the main port for Zimbabwe and Malaŵi. Principal exports passing through Beira are ores, tobacco, food products, cotton, and hides and skins. The main imports are liquid fuels, fertilizers, wheat, heavy equipment, textiles, and beverages. A fishing harbour, which includes canneries, processing plants, and refrigerated stores, was constructed at Beira in the early 1980s. Pop. (1997) 412,588.

Beira, former principality and historical province, north-central Portugal, extending from the banks of the Douro River in the north to the upper course of the Tagus in the south-east and from the Spanish frontier in the east to the Atlantic Ocean in the west. The region was reconquered from the Moors in the 8th century, but Moorish attacks continued until the 15th. It was also contested during the Portuguese-Castilian wars. In 1835 Beira was divided into the districts of Aveiro, Coimbra, Viseu, Guarda, and Castelo Branco. In 1936 three new provinces were created from its area of 9,233 square miles (23,913 square km); and in 1959 the provinces were replaced with new *distritos* (districts), eight of which compose at least parts of Beira. Aquilino Ribeiro, a regional writer, depicted rustic life in Beira.

Beirut, Arabic BAYRŪT, French BEYROUTH, capital, chief port, and largest city of Lebanon. It lies along the Mediterranean Sea, at the foot of the Lebanon Mountains. In the decades after World War II, Beirut became the hub of the economic and cultural life of the Middle East. During that time it was the chief financial, commercial, and transit centre for the Arab countries of the eastern Mediterranean, but its character changed dramatically during the Lebanese Civil War (1975–90) as a result of sectarian warfare and foreign invasions.

A brief treatment of Beirut follows. For full treatment, see *MACROPAEDIA*: Beirut.

Beirut is built on two hills, Al-Ashrafīyah (in East Beirut) and Al-Muṣayṭibah (West Beirut), which extend into the sea as a roughly triangular peninsula. A narrow coastal plain (As-Sāhil) runs north-south in the adjacent hinterland. The climate is Mediterranean, with hot, humid summers and a short rainy season in winter.

Beirut first gained prominence under Roman rule in the 1st century BC. After many vicissitudes under Muslim Arabs, Christian crusaders, and the Ottoman Turks, it became the capital of the new state of Lebanon (under French mandate) in 1920 and the capital of a sovereign and independent Lebanon in 1941. Between 1952 and 1975 Beirut was an established banking centre for Arab wealth—largely invested in construction, commerce, and industry (food processing, textiles and shoes, and publishing)—and the city's economy flourished. International banking and business firms often based their Middle Eastern opera-

tions there, and the port's free zone served as a leading regional entrepôt. Beirut was also a major centre for tourism.

By the 1950s few traces of the old city remained because of haphazard development, and those scattered remains were largely destroyed during the Lebanese Civil War. Downtown Beirut (the old city) remained in ruins in the early 1990s—a squatter-occupied belt between East and West Beirut in which some of the heaviest fighting of the war took place. East Beirut emerged from the civil war with a monolithically Christian character, dominated by Christian militia, while West Beirut remained predominately Muslim, with Syrian support. The movement of Palestinian refugees from 1948, in and out of camps or urban enclaves at the edge of the city, compounded the divided nature of Beirut. Israel's invasion of Lebanon in 1982–83 further compounded the destruction, which only ended in 1990 with the cessation of the civil war. Since the end of the war, the city has undergone dramatic reconstruction and modernization.

The city's universities, notably the American University of Beirut (1866) and Beirut Arab University (1960), have traditionally enjoyed fine reputations.

Two principal highways link Beirut with points north and south along the coastline and with points east via Al-Biqā' (Bekaa Valley) to Damascus. Rail lines connect with points north, east, and south. Beirut International Airport, located in the southern suburb of Khaldah, handles passenger and freight traffic, as does the port. Major efforts have been made to repair and upgrade the city's devastated transport network. Pop. (2003 est.) 1,171,000.

Beirut, American University of, private, nondenominational, coeducational international and intercultural university in Beirut, Lebanon, chartered in 1863 by the state of New York, U.S., as the Syrian Protestant College. Classes started in 1866. Although founded by the American Protestant Mission to Lebanon, the school was set up as an autonomous organization and has no official relationship with any religious body. Its present name was adopted in 1920. The educational philosophy is similar to that of an American university, but its program is adapted to the educational needs of the Middle East; some 80 percent of its students come from the Arab countries of the Middle East and North Africa. A school of medicine was opened in 1867, a school of pharmacy in 1871, and a school of nursing and a hospital in 1905. All are important to the country, and the hospital was the main medical centre of Beirut in the early years of the Lebanese Civil War (1975–90).

beisa, African antelope, a race of the species *Oryx gazella*. See *oryx*.

Beisān (Israel): see *Bet She'an*.

Beissel, Conrad, in full JOHANN CONRAD BEISSEL (b. April 1690, Eberbach, Palatinate [now in Germany]—d. July 6, 1768, Ephrata, Pa., U.S.), hymn writer and founder of the Ephrata religious community (1732).

The posthumous son of a German baker, Beissel experienced a religious conversion at age 27 and migrated to America in 1720. He joined the Duncers in Pennsylvania (1724) but withdrew when he became convinced that the day of worship should be the seventh rather than the first day of the week. The community that he organized and led followed his view that celibacy was a primary requirement for the religious person. (The religious community declined after his death and disappeared in the course of the 19th century.) Beissel published several collections of hymns, including *Turtel Taube* (1747; "Turtle Dove"), which influenced American hymnology.

Beit Alpha, Alpha also spelled ALFA (Israel): see *Bet Alfa*.

Beja, Arabic BUJĀĪ, nomadic people grouped into tribes and occupying mountain country between the Red Sea and the Nile and 'Aṭbarah rivers from the latitude of Aswān

Beja nomad camp near the Red Sea, Egypt

F Closs—Shostal Assoc

southeastward to the Eritrean Plateau—that is, from southeastern Egypt through The Sudan and into Eritrea. Numbering more than 2,500,000 in the early 21st century, the Beja are descended from peoples who have lived in the area since 4000 BC or earlier.

Some of the Beja speak a Hamitic language called To Bedawi, and some speak Tigre; many also speak Arabic. They were Christian in the 6th century but have been Muslim since the 13th. Most of the Beja prefer to live apart from their neighbours, and many are said to be indifferent to trade and modernization.

Essentially pastoralists, the Beja wander over vast distances with their flocks and herds of cattle and camels on whose produce—milk, butter, and meat—they subsist almost entirely.

The Beja trace their ancestry through the father's line, and their kinship organization resembles that of the Arabs. Authority is vested in the heads of kin groups. Men are permitted under Muslim law to have two or more wives, but only the rich do so. A man is expected to marry his father's brother's daughter, and livestock is presented to the bride's family. Formal groups based on age are lacking.

Beja, city, southern Portugal, southeast of Lisbon. According to legend, Beja was founded by Ulysses, and it was named Pax Julia by Julius Caesar in 48 BC to commemorate the peace treaty signed in Beja by the Romans and Lusitanians. The city is partly enclosed by walls of Roman origin with two Roman gateways. Afonso I captured Beja in 1162 in his campaigns against the Muslims to extend his territories. The city's castle features four towers, among them a Gothic keep of white marble. The castle was built on Roman foundations by King Dinis and was completed in 1310. In the 1660s a young local nun, Mariana Alcoforado (1640–1723), wrote the *Lettres portugaises*, love letters later important in French literature, to a French officer who had seduced her. Grain and fruit are grown and cattle and pigs are raised on the plains near the city. Tourism plays an increasingly important part in the local economy, and in the 1990s Beja's 13th-century Franciscan monastery was converted into an upscale hotel. Pop. (2001 est.) 23,353.

Bejaia, formerly BOUGIE, town, Mediterranean port, northeastern Algeria. The town lies at the mouth of the Wadi Soummam. Sheltered by Mount Gouraya (2,165 feet [660 m]) and Cape Carbon, it receives an annual average rainfall of 40 inches (1,000 mm) and is surrounded by a fertile plain. The older town, built on the mountain slope, descends to the French-built sector spread along the road to Algiers and containing the business and industrial quarters.

Ruins remain of the small Roman veterans' town of Saldae and of the successive Berber

settlement of the Bejaïa tribe, which gained importance as a fortified Hammâdid capital in 1067. During the Middle Ages, Bougie was a pirate stronghold and was contested by various powers. It traded with Europe and introduced the wax candle (French: *bougie*). The Spanish occupation (1510–55), the town's subsequent capture by the Turks, and the predominance of Algiers relegated the port to minor importance until the French occupation (1833) and the improvement of its harbour (1905–09).

Bejaïa is a busy market town for the Kabylie area and exports minerals (iron ore, phosphates), foodstuffs (olive oil, wine), and cork. After 1959, with the arrival of the oil pipeline from Hassi Messaoud, it became a leading port for the shipment of Saharan oil. Pop. (1987) 114,534.

Béjart FAMILY, 17th-century French theatrical family closely associated with the playwright Molière. Its members include the brothers and sisters Joseph, Madeleine, Geneviève, Armande, and Louis.

Joseph Béjart (c. 1617–59) was a strolling player and later a member of Molière's first company (the *Illustre Théâtre*). Joseph accompanied Molière in his theatrical wanderings and was with him when he returned permanently to Paris, dying soon after. He created the parts of Léliu in *L'Etourdi* (1653; *The Blunderer*) and Eraste in *Le Dépit amoureux* (1654; *The Amorous Quarrel*).

His brother Louis Béjart (1630–78) was also in Molière's company during the last years of its travels and created many parts in Molière's plays—Valère in *Le Dépit amoureux*, Dubois in *Le Misanthrope* (1666), Alcator in *Le Mariage forcé* (1664; *The Forced Marriage*), and Don Luis in *Don Juan, ou le festin de Pierre* (1665; *Don John; or, The Libertine*). He was lamed in a brawl and retired with a pension in 1670.

The more famous members of the family were two sisters: Madeleine Béjart (1618–72) was at the head of the traveling company to which her sister Geneviève (c. 1622–75), who played under her mother's name (Hervé), and her brothers belonged, before they joined Molière in forming the *Illustre Théâtre* (1643). Madeleine remained with Molière until her death on Feb. 17, 1672. She was an excellent actress, particularly in soubrette parts, a number of which Molière wrote for her. Among her creations were Marotte in *Les Précieuses ridicules* (1659; *The Affected Young Ladies*), Lisette in *L'École des maris* (1661; *The School for Husbands*), and Dorine in *Tartuffe* (1664–69).

Madeleine's sister, or possibly daughter, Armande (Grésinde-Claire-Elisabeth) Béjart (1642–1700), seems first to have joined the company at Lyon in 1653. In 1662 Molière married her, he being then 40 and she 19. Neither was happy; the wife was a flirt, the husband jealous. They separated after the birth of a daughter in 1665 and met only at the theatre until 1671, when they were reconciled. Her portrait is given in Act iii, scene 9 of *Le Bourgeois gentilhomme* (1670; *The Bourgeois Gentleman*). Armande's first appearance on the stage was in 1663, as Élise in *La Critique de l'école des femmes* (*School for Wives*). She was out of the cast for a short time in 1664, when she bore Molière a son, but in the spring she started her long list of important roles. She was at her best as Celimène—really her own portrait—in *Le Misanthrope* and hardly less admirable as Angélique in *Le Malade imaginaire* (1674; *The Imaginary Invalid*). She was Elmire in the first performance of *Tartuffe*, and was Lucile in *Le Bourgeois gentilhomme*.

After Molière's death Armande leased the *Théâtre Guénégaud*, Paris, and by royal ordinance the residue of her company was com-

bined with the players from the failing *Théâtre du Marais*. The combination, known as the *Troupe du Roi*, at first was unfortunate, but in 1679 they secured the services of Marie Champmeslé, one of the leading tragediennes of her time, and absorbed the company of the *Hôtel de Bourgogne*, in Paris. The combined company became the *Comédie Française*. In 1677 Armande married the actor Isaac-François Guérin d'Estriché. She retired in 1694 and died six years later.

Béjart, Maurice, pseudonym of MAURICE-JEAN DE BERGER (b. Jan. 1, 1928, Marseille), French-born dancer, choreographer, and opera director known for his style of combining classic ballet and modern dance with jazz, acrobatics, and musique concrète (composition by tape recordings).

After studies in Paris, Béjart toured with the Ballets de Paris de Roland Petit (1947–49), the International Ballet (1949–50), and the Royal Swedish Ballet (1951–52). In 1954 he founded Les Ballets de l'Étoile (later Ballet Théâtre de Maurice Béjart), for which he choreographed his masterwork, *Symphonie pour un Homme Seul*. His other ballets include *Voilà l'homme*, *Prométhée*, and *Sonate à trois*. In 1960, following his successful ballet version of Igor Stravinsky's masterpiece *Le Sacre du printemps* (1959), he became director of ballet at Brussels' Théâtre Royal de la Monnaie, and that same year he became artistic director of the Ballet du XX^e Siècle (Ballet of the Twentieth Century), which became one of the foremost dance companies in the world. Béjart's productions with the Twentieth Century troupe were notable for their flamboyant theatricality and their innovative reworking of traditional music and dance materials, often in an unusual and controversial fashion.

In 1961 Béjart launched his career as an opera director with Offenbach's *Tales of Hoffmann*, followed, in 1964, by Berlioz's *Dannation of Faust*. His original works include a musical, *The Green Queen* (1963), and such ballets as *Bolero* (1960), *Ninth Symphony* (1964), *Firebird* (1970), *Nijinsky*, *Clown of God* (1971), and *Notre Faust* (1975).

bejel, form of endemic (nonvenereal) syphilis occurring among Bedouin tribes and elsewhere in the Middle East.

Although endemic syphilis differs clinically from sporadic (venereal) syphilis, both are diagnosed by the same tests, treated by the same drugs, and caused by the same parasite (*Treponema pallidum*); both cause the same fundamental pathological changes in the tissues. Bejel, however, is rarely transmitted congenitally or through sexual contact; it spreads by contact from child to child in an unhygienic environment. The infection appears first as an eruption on the mouth and skin. The profuse rash, extremely contagious and persisting for a year or more, eventually fades into latency; the blood test remains positive. Later, the early stage may relapse or latency may be terminated by the late stage of the disease, which is characterized by soft, gummy ulcers of the skin, the bones, and the centre of the face, a patchy loss of skin pigment, and other conditions. Involvement of the central nervous system is uncommon.

Bekaa (Lebanon): see Biqā', al-.

Bekabad, city, Tashkent *oblast* (province), eastern Uzbekistan. It lies along both banks of the Syr River at the extreme southern tip of the *oblast*. The town arose originally in connection with a cement plant and until World War II was known as a cement and cotton centre. During World War II a small steel plant was constructed in Bekabad. It uses scrap and some pig iron brought from Karaganda and Novokuznetsk to produce steel and rolled products. An important early source of power was the small Farkhad hydroelectric station completed in 1948 (126 megawatts),

later augmented by hydroelectric and thermal power stations nearby at Shirin. Pop. (1991 est.) 82,800.

Beke, Charles Tilstone (b. Oct. 10, 1800, Stepney [now in Greater London]—d. July 31, 1874, Bromley, Kent [now in Greater London]), English biblical scholar, geographer, and businessman who played an important role in the final phase of the discovery of the sources of the Nile River.

After beginning a business career (1820), Beke turned to the study of law. His interest in ancient and biblical history led him to publish *Origines Biblicae, or Researches in Primeval History* (1834), which examined history in the light of geological principles. In 1840 Beke went to Ethiopia to explore the area, establish commercial relations with the inhabitants, and help abolish the slave trade. His commercial venture was unsuccessful, but he ascertained the approximate course of the Blue Nile, mapped about 70,000 square miles (180,000 square km) of the country, and also compiled vocabularies of 14 Ethiopian dialects. In 1845 he sponsored an expedition that tried to explore the sources of the White Nile from the East African coast. This venture, though uncompleted, may have inspired the Nile explorations of John Hanning Speke of England in the 1850s.

Beke traveled through Syria, Palestine, and Egypt (1861–62) and returned to Ethiopia in 1865, where his knowledge of the interior proved valuable to the British mission of 1868, which had been sent to secure release of the imprisoned consul and other British subjects. In 1873 he went in search of the true Mount Sinai, which he thought to be at the head of the Gulf of Aqaba. Among his writings were *An Essay on the Nile and Its Tributaries* (1847) and *The Sources of the Nile* (1860).

Békés, megye (county), southeastern Hungary, occupying 2,175 square miles (5,632 square km) of agricultural flatland on the Great Hungarian Plain. It has hot summers, severe winters, light rainfall, and a sparse natural vegetation. In the northern part of the *megye*, broad areas along the Körös and Berettyó rivers are irrigated. In addition to cereals, specialty crops of poppy seeds and sour cherries are produced. Cattle, pigs, and poultry are raised. Békéscsaba (*q.v.*), the *megye* seat, is a market centre. At Gyula, meat (notably sausage), vegetable, and dairy products are packaged. In the vicinity of Orosháza are several government experimental farms, where hybrid cereal strains have been tested and produced. Békés *megye* is known in Hungarian history as "stormy corner" because of continual agitation by its peasants for land reforms. Pop. (1990 prelim.) 411,959.

Békéscsaba, town, seat of Békés *megye* (county), southeastern Hungary. A central point for road and rail communications, it is also connected by canal with the Körös River and serves as an agricultural and industrial centre for a large fertile countryside. A 13th-century Roman Catholic church (rebuilt in the 18th century) is evidence of the town's long occupation. The settlement in the 18th century grew into a giant village with extensive territory. Two marked characteristics have been the relatively large size of the Slovak population (more than 50 percent) in the early 20th century and a strong tradition of Lutheranism. In 1950 the surrounding agricultural area was separated from the town in the major administrative restructuring that took place under the People's Republic. To its traditional industries (flour milling, warehousing of foods, tobacco production, and the making of the local *Csabai kolbász* [sausage]) have been added poultry packaging, clothing manufacture, and production of machine tools and bricks. Békéscsaba is a long-established cultural centre for the

large Slovak population in the district. Pop. (1990 prelim.) 67,621.

Békésy, Georg von (b. June 3, 1899, Budapest, Hungary—d. June 13, 1972, Honolulu, Hawaii, U.S.), American physicist and physiologist who received the 1961 Nobel Prize for Physiology or Medicine for his discovery of the physical means by which sound is analyzed and communicated in the cochlea, a portion of the inner ear.

As director of the Hungarian Telephone System Research Laboratory (1923–46), Békésy worked on problems of long-distance communication and became interested in the mechanics of human hearing. At the telephone laboratory, the University of Budapest (1939–46), the Karolinska Institute, Stockholm (1946–47), and Harvard University (1947–66) he conducted intensive research that led to the construction of two cochlea models and highly sensitive instruments that made it possible to understand the hearing process, differentiate between certain forms of deafness, and select proper treatment more accurately.

Since the mid-19th century, it had been known that the vibratory tissue most important for hearing is the basilar membrane, stretching the length of the snail-shaped cochlea and dividing it into two interior canals. Békésy found that sound travels along the basilar membrane in a series of waves, and he demonstrated that these waves peak at different places on the membrane: low frequencies toward the end of the cochlea and high frequencies near its entrance, or base. He discovered that the location of the nerve receptors and the number of receptors involved are the most important factors in determining pitch and loudness. Békésy became professor of sensory sciences at the University of Hawaii in 1966. His books include *Experiments in Hearing* (1960) and *Sensory Inhibition* (1967).

Bekhterev, Vladimir, in full VLADIMIR MIKHAYLOVICH BEKHTEREV (b. Jan. 20 [Feb 1, New Style], 1857, Sorali, Vyatka, Russia—d. Dec. 24, 1927, Moscow, Russia, U.S.S.R.), Russian neurophysiologist and psychiatrist who studied the formations of the brain and investigated conditioned reflexes.

Bekhterev received a doctorate from the Medical-Surgical Academy of St. Petersburg in 1881 and then studied abroad for four years. He returned to Russia in 1885 to become professor of psychiatric diseases at the University of Kazan, where he established the first laboratory of experimental psychology in Russia the next year. He became professor of psychiatry at the Military Medical Academy in St. Petersburg in 1893 and founded a psychoneurological institute there in 1907, though he was forced to resign his professorship in 1913. He was restored following the Russian Revolution of 1917 and chaired the department of psychology and reflexology at the University of Petrograd (i.e. St. Petersburg) from 1918 until his death.

A competitor of Ivan Pavlov, Bekhterev independently developed a theory of conditioned reflexes, studying both inherited and acquired reflexes in the laboratory. Bekhterev's most lasting work was his research on brain morphology and his original description of several nervous symptoms and illnesses. He discovered the superior vestibular nucleus (Bekhterev nucleus), as well as several other previously unknown brain formations. He also described numbness of the spine (Bekhterev's disease) and new forms of spondylitis and other diseases.

Bekhterev founded the *Nevrologicheskoy Vestnik* ("Neurology Journal"), the first Russian journal on nervous diseases, in 1896. His insistence on a purely objective approach to the study of behaviour and his conviction that complex behaviours could be explained through the study of reflexes influenced the growing behaviourist movement of psychol-

ogy in the United States. Among his more significant writings are *Conduction Paths in the Brain and Spinal Cord* (1882; 2nd ed., 1896) and *Objective Psychology* (1907).

Bektashi, Turkish BEKTAŞI, any member of an order of Muslim mystics founded, according to their own traditions, by Hājji Bektāsh Wali of Khorāsān, Iran. It acquired definitive form in the 16th century in Anatolia (Turkey) and spread to the Ottoman Balkans, particularly Albania.

Originally one of many Sūfi orders within orthodox Sunnite Islām, the Bektashi order in the 16th century adopted tenets of the Shī'ite sect, including a veneration of 'Alī, the fourth successor of the prophet Muḥammad, as a member of a trinity with Allāh and the Prophet himself. Like many Sūfis, the Bektashi were quite lax in observing daily Muslim laws, and women as well as men took part in ritual wine drinking and dancing during devotional ceremonies. The Bektashi in the Balkans adapted such Christian practices as the ritual sharing of bread and the confession of sins. Bektashi mystical writings made a rich contribution to Sūfi poetry.

The Bektashi acquired political importance in the 15th century, when the order dominated the Janissaries, an elite Ottoman military corps recruited from Christian lands. Their influence waned after 1826, when the Janissaries were disbanded, but the order underwent a revival later in the century, with the rebuilding of the monasteries and a flowering of literary activity in Turkey and Albania. After 1925, when all Sūfi orders were dissolved in Turkey, the Bektashi leadership shifted to Albania. With the banning of religion in Albania in 1967, Bektashi devotions were carried on by communities in Turkey, Albanian regions of the Balkans, and the United States.

Bel (Akkadian), Sumerian ENLIL, Mesopotamian god of the atmosphere and a member of the triad of gods completed by Anu (Sumerian: An) and Ea (Enki). Enlil meant Lord Wind; both the hurricane and the gentle winds of spring were thought of as the breath issuing from his mouth, and eventually as his word or command. He was sometimes called Lord of the Air.

Although An was the highest god in the Sumerian pantheon, Enlil had a more important role: he embodied energy and force but not authority. Enlil's cult centre was Nippur. Enlil was also the god of agriculture: the Myth of the Creation of the Hoe describes how he separated heaven and earth to make room for seeds to grow. He then invented the hoe and broke the hard crust of earth: men sprang forth from the hole. Another myth relates Enlil's rape of his consort Ninlil (Akkadian: Belit), a grain goddess, and his subsequent banishment to the underworld. This myth reflects the agricultural cycle of fertilization, ripening, and winter inactivity.

The name of his Akkadian counterpart, Bel, is derived from the Semitic word *baal*, or "lord." Bel had all the attributes of Enlil, and his status and cult were much the same. Bel, however, gradually came to be thought of as the god of order and destiny. In Greek writings references to Bel indicate this Babylonian deity and not the Syrian god of Palmyra of the same name.

Bel and the Dragon, in full THE HISTORY OF THE DESTRUCTION OF BEL AND THE DRAGON, Greek apocryphal addition to the biblical Book of Daniel. It is a deutero-canonical work in that it is accepted in the Roman canon but not by Jews or Protestants. It tells of the Jewish hero Daniel, who refuses to worship the god Bel and kills the dragon, thus being forced into a den of lions, which he is allowed to leave after seven days because he is unharmed. His enemies, advocates of idolatry, are later cast into the lions' den and devoured.

bel canto (Italian: "beautiful singing"), style of operatic singing that originated in Italian singing of polyphonic (multipart) music and Italian courtly solo singing during the late 16th century and that was developed in Italian opera in the 17th, 18th, and early 19th centuries. Using a relatively small dynamic range, bel canto singing was based on an exact control of the intensity of vocal tone, a recognition of the distinction between the "diapason tone" (produced when the larynx is in a relatively low position) and the "flute tone" (when the larynx is in a higher position), and a demand for vocal agility and clear articulation of notes and enunciation of words.

Among the masters of bel canto in the 18th and 19th centuries were the male soprano Farinelli, the tenor Manuel del Popolo Garcia, his daughter, the dramatic soprano Maria Malibran, and the soprano Jenny Lind. The technique of bel canto had died out by the turn of the 20th century, partly as a result of the demand for louder operatic singing as orchestras became larger.

bel fruit, bel also spelled BAEL, also called BENGAL QUINCE (species *Aegle marmelos*), fruit of the bel tree of the family Rutaceae, found wild or cultivated throughout India. The trees bear strong spines; alternate, compound leaves, each with three leaflets; and panicles of sweet-scented white flowers. The tree is valued for its fruit, which is oblong to pyriform in shape and 50–250 mm (2–10 inches) in

Bel fruit (*Aegle marmelos*)

Walter Dawn

diameter. The fruit has a gray or yellow rind and a sweet, thick, orange-coloured pulp. The unripe fruit, sliced and sun dried, is traditionally used as a remedy for dysentery; the ripe fruit is sweet, aromatic, and cooling. The bel tree's wood is yellowish white and hard but not durable.

Bel-usur: see Berosus.

Béla III (d. 1196), king of Hungary (1173–96) under whom Hungary became the leading power of south-central Europe.

Béla was educated at the Byzantine court and placed on the throne by force of arms by the Byzantine emperor Manuel I Comnenus in 1173. He made the Hungarian monarchy hereditary by naming his infant son, Imre, his successor. He also made his court among the most brilliant in Europe. Béla adopted Roman Catholicism, sought the assistance of Rome, and established close ties with France. Upon the death of his first wife, Anne of Châtillon, he married Margaret, sister of Philip II Augustus of France. Many leading Hungarian diplomats were educated in Paris during his reign, and the Cistercian and Premonstratensian monks he invited to Hungary introduced advanced agricultural methods there.

Internationally, Béla was only partly successful in his attempts to recover Dalmatia in two bloody wars with Venice (1181–88 and 1190–91), but he did help the Raskan Serbs gain independence from the Greeks and establish a native monarchy. He tried to make Galicia an appanage of his younger son Andrew, and he aided the Byzantine emperor Isaac II Angelus against the Bulgars. Béla III was one of the stronger rulers from the house of Árpád.

Béla IV (b. 1206—d. May 3, 1270), king of Hungary (1235–70) during whose reign the Mongol invasions left three-quarters of Hungary in ruins. He was the son of Andrew II.

Routed on the banks of the Sajó River in 1241 by Mongols under Batu Khan, Béla fled to Dalmatia, and for a year the kingdom of Hungary did not exist. So nearly complete was the country's destruction that Hungarians, when referring to total calamity, use the word *tátárjárás*, meaning Tatar invasion.

When the Mongols withdrew because of dynastic troubles, Béla began to reconstruct his realm, a task that occupied the rest of his reign. Particularly difficult was the recovery of western portions of the kingdom seized by Frederick of Austria as the price of the aid he promised against the Mongols but never delivered. Béla defeated Frederick, who died in the battle near the Leitha River on June 15, 1246. Three years earlier Béla had been forced to cede Zadar to Venice, but he retained Split and other Dalmatian provinces. Because of his policy of religious toleration in Bosnia, that province remained quiet for years.

Béla fought wars with the new Serbian kingdom, founded by the Nemanja dynasty, and was frequently in conflict with Otakar II over Styria, which ultimately fell to the Bohemians. Béla turned back a second Mongol invasion of Hungary, in 1261, and he resisted the Přemyslid dynasty, which had constructed a new Bohemian empire, absorbing territories of the Austrian Babenbergs and threatening Hungary itself. Béla had two sons and seven daughters by his consort, Maria, daughter of the Byzantine emperor of Niceaea, Theodore II Lascaris. Of these children, St. Margaret of Hungary became the best known.

Bélaín, Pierre, SIEUR D'ESNAMBUC (b. 1585, Alouville, France—d. 1637), French trader who in 1635 established the first colony for the Compagnie des Îles d'Amérique on the Caribbean island of Martinique, the first permanent French colony in the West Indies.

Born in Normandy, Bélaín founded (1625 or 1627) a short-lived French colony on St. Kitts, which was then occupied by the British. He landed on the site of Saint-Pierre, Martinique, on Sept. 1, 1635, and on September 17 he formally took possession of Martinique for King Louis XIII and the Compagnie (the island of Guadeloupe was seized by other French trader-explorers the same year). In the year of Bélaín's death his nephew Dizel du Parquet became captain general of Martinique.

Belalcázar, Sebastián de, Belalcázar also spelled BENALCÁZAR, or BELAICÁZAR, also called SEBASTIÁN MOYANO (b. c. 1495, Belalcázar, Spain—d. 1551, Cartagena, New Granada [now in Colombia]), Spanish conqueror of Nicaragua, Ecuador, and southwestern Colombia. He captured Quito and founded the cities of Guayaquil in Ecuador and Popayán in Colombia.

Going to the New World in 1519, Belalcázar became an officer in the forces of Pedro Arias Dávila and in 1524 conquered Nicaragua. Joining Francisco Pizarro's expedition to Peru in 1531, he was given command of the supporting base at Piura. In 1533 he set out to conquer what is now Ecuador. Defeating the Inca chief Rumiñahui, Belalcázar occupied the

Indian city of Quito on Dec. 6, 1534. In 1535 he founded a settlement that was later moved to a more healthful site and developed into the modern Guayaquil. Leading an expedition in search of Eldorado (a legendary city abounding in gold), he entered the Popayán region of Colombia, founded the city of Popayán in 1537, and became governor of the district.

The close of Belalcázar's life was embittered by disputes with other Spanish leaders. He died while under indictment for the killing of one of them, Jorge Robledo.

Belarus, also spelled BYELARUS, formerly BELORUSSIA, or BYELORUSSIA, officially REPUBLIC OF BELARUS, Belarusian RESPUBLIKA BYELARUS', also called WHITE RUSSIA, country of eastern Europe, the smallest of the three Slavic republics that formerly belonged to the Soviet Union. Belarus is bounded on the west by Poland, on the northwest by Latvia and Lithuania, on the north and east by Russia, and on the south by Ukraine. The capital is Minsk. Area 80,200 square miles (207,600 square km). Pop. (1995 est.) 10,332,000.

Belarus

A brief treatment of Belarus follows. For full treatment, see MACROPAEDIA: Belarus.

For current history and for statistics on society and economy, see BRITANNICA BOOK OF THE YEAR.

Physical and human geography. Much of Belarus consists of flat lowlands separated by low hills and uplands. The highest point, Dzerzhinskaya, is only 1,135 feet (345 m) in elevation. Forests cover about one-third of the country's area. The Belovezhskaya Forest, which straddles the Belarusian-Polish border, is home to the rare European bison, or wisent. The Pripyet Marshes occupy much of southern Belarus.

South and central Belarus are drained by the southward-flowing Dnieper River and two of its tributaries, the Berezina and Pripyet rivers. The northward-flowing Western Dvina River drains northern Belarus. Belarus' continental climate is moderated by maritime influences from the Atlantic Ocean and is characterized by cold winters, mild summers, and moderate rainfall.

Ethnic Belarusians, who speak an East Slavic language closely related to Russian and Ukrainian, make up more than three-quarters of the population. Ethnic Russians are the largest minority group, followed distantly by Ukrainians and Poles. Owing to industrialization, the urban proportion of the total population increased from one-fifth at the end of World War II to two-thirds by the 1990s, leading to the depopulation of some rural areas. The republic's chief city, Minsk, was one of the fastest-growing cities of the Soviet Union in the period from World War II until independence (1991).

Much of Belarus' land is suited to crop production, especially fodder crops. The main crops are grains (rye and oats), flax, potatoes,

and sugar beets. Cattle and pig raising are also important. Dairying and truck farming are important in the vicinity of Minsk. Belarus is generally poor in mineral resources, but it does have sizable deposits of potassium salts at Soligorsk, south of Minsk, which provide potash fertilizer for export to other European countries.

More than half the republic's income is provided by industry, much of which processes imported raw materials and hydrocarbon fuels to produce chemical fertilizers, refined petroleum, and petrochemicals. The republic's heavy-industrial sector is relatively small and produces heavy-duty trucks, tractors, and dump trucks. Other industries produce machine tools and such consumer goods as television sets, radios, watches, bicycles, and computers. Electricity is generated using oil and natural gas supplied by pipeline mostly from Russia.

Belarus' political system went through a transition in the early 1990s following the collapse of communist rule, the breakup of the Soviet Union, and the attainment of Belarusian independence in 1991. Under the constitution that was adopted in 1994, the president is the head of state and of the executive branch; he is directly elected for a term of five years. The unicameral parliament, called the Supreme Soviet, is also directly elected and sits for five years.

Primary and secondary education is free and compulsory in Belarus, and there are some 30 institutions of higher learning. Belarus was devastated by fighting during World War II, which destroyed three-quarters of the republic's urban housing and almost all industrial buildings. Although postwar reconstruction was speeded by the extensive use of prefabricated units, a shortage of housing in Belarus continues.

History. Belarus has yielded evidence of early prehistoric settlement. Between the 6th and 8th century AD, Slavic tribes moved into the region, eventually forming local principalities that came under the suzerainty of Kievan Rus in the mid-9th century. The Mongols overthrew Kiev in 1240, and most of the Belarusian lands passed to Lithuania, though the Belarusians retained substantial autonomy. Poland was united with Lithuania under the Jagiellon dynasty in 1386, and Belarus developed a largely Polish-speaking, Roman Catholic class of landowners. The peasantry remained mostly Russian Orthodox and were reduced to serfdom in the 16th century.

By the three partitions of Poland in the late 18th century, Russia acquired all of what became known under its rule as Belorussia (Russian: "White Russia"). The region did not begin to develop economically until the beginning of the 19th century, and even then its slow growth resulted in considerable emigration. In 1918–21 Belorussia was fought over by the Germans, the Bolshevik government of Russia, and a reconstituted Poland, with the result that western Belorussia was yielded by the Bolsheviks to Poland. In the meantime, the Bolsheviks had in 1919 proclaimed a Belorussian Soviet Socialist Republic (Belorussian S.S.R.) in the areas they held, and this became part of the Soviet Union in 1922.

The Belorussian S.S.R. industrialized rapidly under Soviet rule in the 1930s and '40s. At the end of World War II, during which the Belorussian S.S.R. experienced great losses of life and property, the Soviet government regained western parts that had been lost to Poland in 1921. The Belorussian S.S.R. underwent massive reconstruction after the war, and industrialization proceeded even more quickly, making the city of Minsk the industrial hub of the westernmost Soviet Union.

As central authority in the Soviet Union weakened in the late 1980s, the Belorussian S.S.R. declared its sovereignty (July 1990) and subsequently its independence (August 1991).

With the dissolution of the Soviet Union in December 1991, the republic gained its full independence and changed its name to Belarus. A new constitution establishing a presidential republic was adopted in 1994. Later that year, Alyaksandr Lukashenka, a supporter of closer ties with Russia, was elected president. In 1996 Lukashenka signed a union treaty with Russia that provided for closer military, economic, and political relations between the two countries. Throughout the 1990s and into the 21st century, there was extensive political conflict and confrontation between the president and the opposition.

Belarusian language, Belarusian also spelled BELARUSAN, formerly spelled BELORUSSIAN and BYELORUSSIAN, formerly called WHITE RUTHENIAN or WHITE RUSSIAN, Belarusian BELORUSSKAYA MOVA, East Slavic language that is historically the native language of most Belarusians. Many 20th-century governments of Belarus had policies favouring the Russian language, and, as a result, Russian is more widely used in education and public life than Belarusian. Belarusian forms a link between the Russian and Ukrainian languages on the respective borders. The central dialects, among several large dialect zones, form the basis for Standard Belarusian. The language contains many Polish loanwords and is written in a form of the Cyrillic alphabet. An older form of Belarusian was used as the official language of administration in the 14th and 16th centuries in the Grand Duchy of Lithuania, which included present-day Belarus as well as Lithuania and Ukraine.

Belarusian Ridge, Belarusian also spelled BELORUSSIAN, or BYELORUSSIAN, Russian BELORUSSKAYA GR'ADA, or BELORUSSKAJA GR'ADA, upland region in Belarus. From northeastern Poland the ridge runs southeast into western Belarus and then swings northeast. Its total length is 320 miles (520 km). The ridge, covered by marine sands and clays, is in reality a series of separate uplands, of which the highest point is Dzerzhinskaya Mountain, at 1,132 feet (345 m), in the Minsk Upland. To the south of the ridge lie the extensive Pripet Marshes.

Belasco, David (b. July 25, 1853, San Francisco, Calif., U.S.—d. May 14, 1931, New York, N.Y.), American theatrical producer and playwright whose important innovations in the techniques and standards of staging and design were in contrast to the quality of the plays he produced.

As a child actor, Belasco appeared with Charles Kean in *Richard III* and later played in stock companies touring the mining camps. During this period he served also as secretary to the playwright Dion Boucicault. From 1873 to 1879 he worked in several San Francisco theatres as actor, manager, and play adapter and in the latter year toured in *Hearts of Oak*, which he cowrote with James A. Herne. Belasco moved to New York City in 1880, becoming associated with the Frohmans as manager of the Madison Square Theatre and later of the

Belasco
By courtesy of the Library of Congress, Washington, D.C.

Lyceum. In 1890 he leased a theatre and became an independent producer. Feeling the pressure of the monopolistic Theatrical Syndicate, he built his own theatre in 1906.

Belasco was the first American producer whose name, regardless of star actor or play, attracted patrons to the theatre. He chose unknown actors and elevated them to stardom. He also preferred playwrights whose success depended upon his collaboration. He gained a reputation for minute attention to detail, sensational realism, lavish settings, astonishing mechanical effects, and experiments in lighting. He maintained a large permanent staff that worked constantly to perfect surprising effects. This work led to the virtual elimination of footlights and to the first lensed spotlights.

As a result, he brought a new standard of production to the American stage. Many critics, however, deplored his theatricalism, his lack of artistic judgment, and his failure to encourage the better dramatists who were then emerging in the United States and Europe.

His better-known productions include *The Heart of Maryland* (1895); *Madame Butterfly* (1900) and *The Girl of the Golden West* (1905), both turned into the operas by Giacomo Puccini; *Du Barry* (1901); *The Music Master* (1904); and *Lulu Belle* (1926). He also wrote the autobiographical *The Theatre Through Its Stage Door* (1919). Because of his clericlike dress and personal manner, he came to be known as the "bishop of Broadway."

Belaúnde Terry, Fernando (b. Oct. 7, 1912, Lima, Peru—d. June 4, 2002, Lima), statesman, architect, and president of Peru (1963–68, 1980–85), known for his efforts at democratic reform and his pro-American stance.

Belaúnde
Flash Press

Belaúnde, a member of a distinguished aristocratic Peruvian family, studied architecture in the United States and France in 1924–35 and practiced briefly in Mexico before returning in 1936 to Peru, where he became a noted architect and founded the architectural magazine *Arquitecto Peruano* ("Peruvian Architect"). He served in the Chamber of Deputies (1945–48) while his father, Rafael Belaúnde Diez Canseco, was prime minister. After a military coup in 1948 overthrew the government, the younger Belaúnde returned to his post as dean of the School of Architecture in the National University of Engineering.

Belaúnde helped establish the National Democratic Front and was its representative to parliament in Lima in 1945–48. With the restoration of free elections in 1956, he ran for president on behalf of the newly formed Democratic Youth Front; he was defeated but made a surprisingly strong showing. Shortly thereafter this party was renamed Popular Action (Acción Popular). In the new election of June 1963, Belaúnde received 39 percent of the vote and set about forming a reformist coalition. His program of land reform and road building to open the Amazon River valley to settlement progressed, but he was frustrated in much of the rest of his domestic policy by a Congress under opposition control. His administration sought to maintain close

relations with the United States, supporting its Alliance for Progress program for development of Latin America.

Public outcry over an agreement with an American corporation, the International Petroleum Company, on the development of oil fields in northern Peru led to Belaúnde's deposal by a military junta in October 1968. He fled to the United States, returned to Peru in December 1970, and was again exiled from January 1971 until his return in January 1976. In May 1980, in the first presidential elections since his deposal, he defeated 14 other candidates. Although he returned freedom of the press to Peru, Belaúnde was baffled by a high inflation rate, a huge foreign debt, and violent attacks by the Shining Path terrorist group. Resentment over his austerity measures and his inability to control the military in its fight against terrorists led to his crushing electoral defeat in May 1985. Belaúnde, a prolific writer, was the author of *La conquista del Perú por los Peruanos* (1959; *Peru's Own Conquest*).

Belawan, also called BELEWAN DELI, the most important port in northeastern Sumatra, Indonesia, located on Belawan Island. It is situated at the estuary of the Deli and Belawan rivers in Sumatera Utara provinsi ("province"). The port was originally dredged and constructed by the Dutch in the first two decades of the 20th century. It exports tobacco, rubber, tea, resin, copra, spices, palm oil, and sisal, and it imports foodstuffs and manufactured goods. Belawan is situated 12 miles (19 km) north of Medan city, which it serves as a port, and is the terminus of a railway that crosses the channel south of the island by bridge. Pop. (1990) 83,666.

Belaya River, river in Bashkortostan republic, west-central Russia. The Belaya is the largest tributary of the Kama River, which is itself an important tributary of the Volga. The Belaya rises in the southern Urals at the foot of Mount Iremel, and after flowing southwestward through a narrow mountain valley, the river turns sharply north and its valley becomes broad and terraced. After a course of 882 miles (1,420 km), the Belaya joins the Kama above Derbeshinsky. The Belaya's major tributary is the Ufa River.

Belchatów, city, Łódzkie województwo (province), south-central Poland, forming part of the industrial triangle of Belchatów, Szczerców, and Kamień. Belchatów is 30 miles (50 km) south-southwest of Łódź, the provincial capital. Lincn is the city's major product, and the surrounding farmlands produce rye and potatoes.

A major lignite deposit was discovered in 1960 near Belchatów, and work on a mining and power-generating project was begun there in 1975 as part of the development of an industrial complex. Belchatów's population has grown rapidly since then. Pop. (2002) 63,122.

Belcher Islands, archipelago in southeastern Hudson Bay, north of the mouth of James Bay, Baffin region, Nunavut territory, Canada. The islands, low-lying and striated, cover an area of about 5,000 square miles (13,000 square km), of which 1,118 square miles (2,896 square km) is land. The group, first sighted by the English navigator Henry Hudson in 1610 and named for Sir Edward Belcher, who commanded an Arctic expedition in search of Sir John Franklin, was not explored and mapped until 1915. Large deposits of iron ore underlie the Belcher and neighbouring Nastapoka islands. The sparse population is served by the trading post of Sanikiluaq (pop. [2001] 684), which has an airstrip.

Belcredi, Richard, Count (Graf) (b. Feb. 12, 1823, Ingrowitz, near Svitavy [Zwittau],

Moravia—d. Dec. 2, 1902, Gmunden, Austria), statesman of the Austrian Empire who worked for a federal constitution under the Habsburg monarchy, taking the Swiss consti-

Belcredi, engraving from a drawing by Fritz Kriehuber

By courtesy of Bild-Archiv, Österreichische Nationalbibliothek, Vienna

tuition as his model. His "Ministry of Counts" (July 27, 1865–Feb. 3, 1867) advocated conservative federalism under which the Slavs' historic rights would be recognized instead of subsumed by those of the Germans and Magyars.

Born into a Moravian landowning family, Belcredi entered the civil service (1842) and became governor of Silesia (1860) and *Statthalter* (imperial representative) at Prague (1864). After succeeding Anton von Schmerling as prime minister, he revoked (Sept. 20, 1865) the "February Patent" of 1861 (intended to constitute Austria as a centralized, German-speaking state) as a concession to the Slavic groups, especially the Czechs. He also established Czech as a language of instruction in the Bohemian schools, where only German had been permitted. These measures angered the Germans who had the confidence of the emperor Francis Joseph I.

The success of Belcredi's Slav policy in conciliating the Czechs to rule from Vienna was obscured by Austria's defeat in the Seven Weeks' War with Prussia and Italy (1866). The postwar settlement between Austria and Hungary which precluded Slav autonomy, caused Belcredi to resign. Fearing Belcredi's influence among the Slavs, the Emperor forbade him to return to his home in Moravia. Later (1881–95) he served as president of the Austrian administrative court.

Belcy (Moldova): see Belts.

Belém, also called PARÁ, city and port, capital of Pará state, northern Brazil, on the Baía

The cathedral at Belém, Braz.

Art Resource

do Guajará (Guajará Bay), part of the vast Amazon Delta, near the mouth of the Rio Guamá, about 80 mi (130 km) up the Rio Pará from the Atlantic. Its climate is equatorial, with an average annual temperature of 80° F (27° C) and an annual rainfall of 86 in. (2,175 mm).

In 1616 the fortified settlement of Feliz Lusitânia, later called Nossa Senhora de Belém do Grão Pará (Our Lady of Bethlehem of the Great Para River) and Santa Maria de Belém (St. Mary of Bethlehem), was established, consolidating Portuguese supremacy over the French in what is now northern Brazil. Belém was given city status in 1655 and was made the state capital when Pará state was separated from Maranhão in 1772. The early decades of the 19th century were marked by political instability. Uprisings and internecine strife were finally ended in 1836, after considerable loss of life.

The sugar trade was important in the Belém region until the end of the 17th century. Thereafter the city's economic importance alternately rose and fell. Cattle ranching supplanted sugar until the 18th century, when cultivation of rice, cotton, and coffee became profitable. With the settlement of southern Brazil, where such crops could be produced more reasonably, Belém declined again. The city subsequently became the main exporting centre of the Amazon rubber industry, and by 1866 its position was further enhanced by the opening of the Amazon, Tocantins, and Tapajós rivers to navigation. The rubber era terminated after the boom of 1910–12, but Belém continued to be the main commercial centre of northern Brazil and the entrepôt for the Amazon Valley.

The most valuable products now exported from the Amazon by way of Belém are nuts (chiefly Brazil nuts), black pepper, cassava, jute, wood veneers, and aluminum. Japanese immigration after the 1930s was an important factor in developing jute and black pepper, notably at Tomé-Açu, just south of Belém, and near Santarém. Marajó Island, the largest fluvial island in the world, which lies just across the Rio Pará from Belém, has some livestock grazing.

Belém has a modern appearance with tree-lined streets, several plazas and public gardens, and many noteworthy buildings. The north's leading educational and cultural centre, it is the seat of a bishopric, and its cathedral, founded in 1917, is one of Brazil's largest. Santo Alexandre, the oldest of Belém's churches, was built in 1616. The Museu (museum) Paraense Emilio Goeldi, the Teatro da Paz (a classical theatre), and the public library and archives are other notable institutions. The Universidade Federal do Pará (1957) is in the city, which also has a teachers' training school, an agricultural institute, and an institute for research on tropical diseases.

Belém is the main port for Amazon River craft and is served by international and coastal shipping and by inland vessels south to Brasília. Paved roads extend to Piavi and Goiás states. A railway leads 145 mi east-northeast to Bragança, and Belém's international airport is northern Brazil's largest. Pop. (2000 prelim.) 1,279,861.

Belém, also called SANTA MARIA DE BELÉM, *freguesia* (parish) within the western limits of the city of Lisbon. A former royal residence, Belém (Bethlehem) is known for its Manueline (early 16th-century) architecture, notably the Jerónimos monastery, founded by Manuel I in 1499 in honour of the explorer Vasco da Gama's discovery of a sea route to India, and the white Tower of Belém, built in 1515–21 to protect the entrance of the Tagus. Also notable are the Paço de Ajuda (begun 1802, never completed), a former royal palace, and the Paço de Belém (1770), the official residence of the president of Portugal. The latter

Tower of Belém, Lisbon

Porterfield/Chickering—Photo Researchers

contains the National Coach Museum, and there is also a museum of popular art. Pop. (1991) 11,820.

belemnoid, also called BELEMNITE, member of an extinct group of cephalopods, animals related to the modern squid and octopus but possessing a large internal shell, that first appeared about 345 million years ago, during the Early Carboniferous Period, and became

Reconstruction of squidlike belemnoid cephalopods from the Cretaceous System, southern Tennessee

By courtesy of the American Museum of Natural History, New York

extinct during the Eocene Epoch, which ended about 36.6 million years ago. The internal shell was straight in most species but was loosely coiled in some. The shell was complex in structure and served for support and muscle attachment and as a hydrostatic device enabling the animal to compensate for depth and its own body weight.

During the Jurassic and following Cretaceous periods, the belemnites reached their greatest diversity and abundance. It is probable that the belemnoids originated from the more primitive simple-shelled nautiloid cephalopods, animals related to the modern pearly nautilus. Many distinctive and easily recognized belemnoids are known. Some are of widespread occurrence and allow correlation of widely separated rocks.

Belenus (Celtic; possibly, Bright One), one of the most ancient and most widely worshipped of the pagan Celtic deities; he was associated with pastoralism. A great fire festival, called Beltane (or Beltine), was held on May 1 and was probably originally connected with his cult. On that day the cattle were purified and protected by fire before being put out to the open pastures for the summer. Despite associations of his name with fire or the sun, Belenus was not a sun god; in fact, there is no Celtic evidence for the worship of the sun as such, even though it was often used in religious imagery.

There are about 31 extant dedications to Belenus, an unusually high number for a religion that specialized in the number and diversity of its divine names and epithets. The cult of Belenus was practiced in northern Italy, Noricum in the eastern Alps, southern Gaul, and probably Britain.

Bélep, Îles, coral island group in the French overseas territory of New Caledonia, southwestern Pacific Ocean. Comprising Île Pott and Île Art (the largest, 10 mi [16 km] by 3 mi) and several islets, they lie within the northern continuation of the barrier reef that surrounds the main island of New Caledonia. Their total land area is 26 sq mi (67 sq km). Pop. (1996) 923.

Belesme, Robert of: *see* Robert of Belesme.

Belfast, Irish **BÉAL FEIRSTE**, city, district, and capital of Northern Ireland, on the River Lagan, at its entrance to Belfast Lough (inlet of the sea). It became a city by royal charter in 1888. After the passing of the Government of Ireland Act, 1920, it became the seat of the government of Northern Ireland. The district of Belfast has an area of 44 sq mi (115 sq km).

The site of Belfast was occupied during both the Stone and Bronze ages, and the remains of Iron Age forts are discernible on the slopes near the city centre. A castle, probably built there about 1177 by John de Courci, the Norman conqueror of Ulster, seems to have survived until the beginning of the 17th century. The city's name is derived from the Gaelic *Béal Feirste* (Mouth of the Sandbank [or Crossing of the River]). Belfast's modern history began in 1611 when Baron Arthur Chichester built a new castle there. He did much to encourage the growth of the town, which received a charter of incorporation in 1613. Belfast survived the Irish insurrection of 1641, and by 1685 it had a population of about 2,000, largely engaged in brick, rope, net, and sailcloth making. By the late 1730s the castle had been destroyed, but Belfast was beginning to acquire economic importance, superseding both Lisburn as the chief bridge town and Carrickfergus as a port. It became the market centre of the Ulster linen industry, developed by French Huguenot refugees under the patronage of William III of Great Britain at the end of the 17th century. Attempts to establish a cotton industry there were short-lived, but following mechanization of the spinning and weaving of linen, Belfast became one of the greatest linen centres in the world. By the 17th century, the town was a busy port with small shipbuilding interests, which became firmly established after William Ritchie founded a shipyard (1791) and a graving (dry) dock (1796). Since the Industrial Revolution, the chief shipbuilding firm has been Harland and Wolff (builders of the ill-fated "Titanic"). The city was severely damaged by air raids in 1941. Beginning in the 1970s, Belfast's traditional manufacturing specialties, linen and shipbuilding, began a long decline. These sectors are now overshadowed by service activities, food processing, and aircraft and machinery manufacture.

A Roman Catholic civil rights campaign was inaugurated in Ulster in 1968, and from 1969 street riots and increasing violence took place in Belfast. After British troops were called in to police Catholic-Protestant disorders, the riots were marked by an increased use of firearms and bombs by both Catholic and Protestant extremists and by the slaying of civilians, police, and soldiers. Unremitting violence continued into the 1990s, but a tentative cease-fire in 1994 and the Belfast Agreement of 1998 brought an end to the fighting. Since the conclusion of the peace accord, Belfast has attracted considerable investment, and its economy has improved. In 2000, Northern Ireland's new regional legislature and government took office in suburban Stormont (*q.v.*).

The city is the shopping, retail, educational, commercial, entertainment, and service centre for Northern Ireland and the seat of many of its largest businesses and hospitals. Educational institutions in Belfast include Queen's University at Belfast (founded in 1845 as the Queen's College), the University of Ulster at Belfast (1849), and Union Theological College

(1853). From the city's airport at Aldergrove, 13 mi (21 km) northwest, services are maintained with some principal international cities. Belfast is Northern Ireland's chief port, and there are ferry services to Liverpool in England, Stranraer in Scotland, and Douglas on the Isle of Man. Belfast suffered a pronounced population decline during the 1970s and '80s as a result of the sectarian violence and a loss of manufacturing jobs; however, its population began to stabilize during the 1990s. Pop. (1998 est.) city and district, 297,200.

Belfast, city, seat (1827) of Waldo county, southern Maine, U.S., on the Passagawakeag River where it empties into Penobscot Bay on the Atlantic coast, opposite Castine, 34 mi (55 km) south-southwest of Bangor. First settled in 1770 and named for Belfast, Ire., it early developed as a seaport and became a port of entry. Distinguished architecture of the sailing era remains. Its harbour is now used mainly by tugboats and pleasure craft. Tourism, the sardine and poultry industries, ski apparel, and shoe factories are its main economic assets. Fort Knox and Lake St. George state parks are nearby. Inc. town, 1773; city, 1853. Pop. (2000) 6,381.

Belfast Lough, inlet of the North Channel that connects the Irish Sea with the Atlantic, 12 mi (20 km) long and 3 to 5 mi (4.8 to 8 km) wide, indenting the northeastern coast of Ireland. Its sheltered harbour facilitated the growth of Belfast as a city and port, and its shores were sites of early settlements, including those at Whiteabbey, Carrickfergus, and Bangor. To the north is the elevated basaltic Antrim Mountains, and to the south are the older Ordovician and Silurian rocks.

Belfort, town, capital of the Territoire de Belfort, Franche-Comté region, eastern France, on the Savoureuse River, southwest of Mulhouse. Inhabited in Gallo-Roman times, Belfort was first recorded in the 13th century as a possession of the counts of Montbéliard, who granted it a charter in 1307. Passing later to the archdukes of Austria, it was ceded by the Treaty of Aix-la-Chapelle (1648) to Louis XIV, who gave it to Cardinal Mazarin. Because it controlled the strategic Trouée de Belfort, between the Vosges and the Jura, the town was often besieged. In World War I it was successfully defended by the French, but it was occupied by the Germans in World War II. Its fortified old quarter, on the east bank of the Savoureuse, contains the castle and public buildings. In front of the Hôtel de Ville (1721–24) is F.A. Bartholdi's majestic statue, the "Lion of Belfort" (36 ft [11 m] high, 72 ft [22 m] long), which commemorates the 104-day siege of the Franco-German War (1870–71). Belfort has electrical, metallurgical,

and textile industries, and trades in Alsatian wines, brandy, and cereals. Pop. (1999) 50,406.

Belfort, Territoire de, département, Franche-Comté region, Alsace-Lorraine, eastern France, formed from the southern portion of the Haut-Rhin *département*, bounded on the south by Switzerland and on the north by the Vosges. To the north, the south face of the Vosges rises to 4,094 ft (1,248 m) in the Ballon d'Alsace, and to the south are the wooded hills around Delle that comprise the northernmost part of the Jura. Between the two is the Trouée (depression) de Belfort known as the Belfort Gap or Burgundy Gate, 15–20 mi (24–32 km) wide, a strategic passageway connecting the Rhine Valley with the Paris Basin, which carries the link canal as well as important roads and railroads. A third of the territory's 236 sq mi (610 sq km); one of the smallest administrative units in France—it received its departmental status in 1922) is arable land, forest, and pasture. Industry is centred at the towns of Belfort, Delle, and Beaucourt. The territory comes under the court of appeal, the *académie*, and the bishopric of Besançon. From early times the historic gap has been commanded by the fortress town of Belfort. When the rest of Alsace was ceded to Germany (1871–1919), the territory was retained by France. Pop. (1999) 137,408.

To make the best use of the Britannica, consult the INDEX first

belfry, bell tower, either attached to a structure or freestanding. More specifically, it is the section of such a tower where bells hang, and even more particularly the timberwork that supports the bells.

Etymologically, bellfries have nothing to do with bells. The word is derived from the Old French *befrei* or a similar word used in the Middle Ages to denote a wooden tower employed in besieging fortifications. The word assumed its current use through a popular association of it with "bell."

The belfry, called by that name, is a prominent feature of Belgian Gothic architecture, especially in Flanders where a flat countryside heightens the dramatic impact of towers. The Halles (Market Hall) and belfry at Brugge (late 13th century) is typical. Medieval England's best example is the church of St. Andrew, Heckington, Lincolnshire, which displays the familiar attached steeple. This belfry has louver windows allowing the bells to be heard clearly while being sheltered from the weather.

The "Lion of Belfort," built of Vosgian sandstone, in front of the castle and Hôtel de Ville (town hall), Belfort, Fr.

Éditions "La Cigogne"—Hachette

A bell cote, or cot, is a bell gable, or turret, a framework for hanging bells when there is no belfry. It may be attached to a roof ridge, as an extension of the gable, or supported by brackets against a wall.

Belgae, any of the inhabitants of Gaul north of the Sequana and Matrona (Seine and Marne) rivers. The term was apparently first applied by Julius Caesar. Evidence suggests that the Romans penetrated into those areas about 150 BC.

The Belgae of Gaul formed a coalition against Caesar after his first Gallic campaign but were subdued the following year (57 BC). One northern tribe, the Eburones, revolted in 53 and slaughtered 15 Roman cohorts; in revenge they were virtually exterminated, and new tribes crossed the Rhine River to replace them.

During the first half of the 1st century BC, Belgae from the Marne district had crossed to Britain and had formed the kingdom that in 55 BC was ruled by Cassivellaunus (*q.v.*). After further Gallic victories (54–51 BC) by Caesar, other settlers took refuge across the Channel, and Belgic culture spread to most of lowland Britain. The three most important Belgic kingdoms, identified by their coinage, were centred at Colchester, St. Albans, and Silchester. The chief Belgic contribution to southern Britain was the introduction of the heavy plow, which was used to clear many lands previously untillable.

Belgaum, city, northwestern Karnāṭaka (formerly Mysore) state, southern India. It is located in the Western Ghāts at an elevation of 2,500 feet (760 m) above sea level. The city dates from the 12th century. It later exercised strategic control over the plateau routes to Goa and the western coast. Its early name, Venugrama, is said to be derived from the bamboos characteristic of the region. A melting pot for the Kannaḍa, Koṅkaṇi, Marāṭhī, and Goan cultures, modern Belgaum includes the original cantonment, site of an oval stone fortress with a 16th-century mosque and of two Jaina temples, and the suburbs of Shāhpur and Mādhavpur.

The city is a busy trading centre on the National Highway, with rail connections north to Pune (Poona) and south to Bangalore. Belgaum has cotton-weaving, leather, clay, soap, pottery, and metal-utensil industries. Shāhpur is known for goldwork and silverwork, and nearby Sambre has an airport. There are colleges of medicine, commerce, science, education, and law affiliated with Karnāṭak University in Hubli-Dhārṅwad, which lies to the southeast. Pop. (1991) city, 326,399; metropolitan area, 402,412.

Belgian Congo, French CONGO BELGE, former colony (coextensive with modern Zaire) in Africa, ruled by Belgium from 1908 until 1960. It was established by the Belgian parliament to replace the previous, privately owned Congo Free State (*q.v.*), after international outrage over abuses there brought pressure for supervision and accountability. The official Belgian attitude was paternalism: the Africans were to be cared for and trained as if they were children. They had no role in legislation, but traditional rulers were used as agents to collect taxes and recruit labour. Uncooperative rulers were deposed. In the late 1950s, when France and the United Kingdom worked with their colonies to prepare for independence, Belgium still portrayed the Congo as an idyllic example of parent-child relationships between Europeans and Africans.

Private European and American corporations invested heavily in the Belgian Congo after World War I. Large plantations (growing cotton, oil palms, coffee, cacao, and rubber) and

livestock farms were developed. In the interior, gold, diamonds, copper, tin, cobalt, and zinc were mined; the colony became an important source of uranium for the United States during World War II. Africans worked the mines and plantations as indentured labourers on four- to seven-year contracts, in accordance with a law passed in Belgium in 1922. Roads, railroads, electric stations, and public buildings were constructed by forced labour.

Native resistance challenged the colonial regime from the beginning. A rebellion that broke out in several eastern districts in 1919 was not suppressed until 1923. Anti-European religious groups active by the 1920s included Kibangism and the Negro Mission in the west and Kitawala in the southeast. Unrest increased in the depression years (1931–36) and during World War II. Because political associations were prohibited, reformers organized into cultural clubs such as Abako, a Bakongo association formed in 1950. The Congo National Movement was founded in 1958 by Patrice Lumumba, and riots broke out in Leopoldville (now Kinshasa) in January 1959. Belgium suddenly capitulated and arranged for the Congo to become an independent republic on June 30, 1960. *See also* Zaire.

Belgian Congo dog: *see* basenji.

Belgian horse, breed of heavy draft horse descended from the Flemish "great horse," the medieval battle horse native to the Low Countries. An old breed, Belgians were considerably improved after 1880. In 1866 the first Belgian was taken to the United States, where the breed was well accepted but was never as popular as the Percheron (*q.v.*).

Docile and patient in nature, Belgians have thick muscles, heavy bodies, and short legs. They average 16 to 17 hands (64 to 68 inches, or 163 to 173 cm) tall and weigh 1,800 to 2,200 pounds (820 to 1,000 kg). Although the Flemish horse was black, Belgians are usually bay, chestnut, sorrel, or roan in colour. The organization preceding the Belgian Draft Horse Corporation of America was established in 1887.

Belgian literature, the body of written works produced by Belgians and written in Flemish (the Netherlandic language as spoken in Belgium, and equivalent to Dutch), in French, or in Walloon dialects. Culturally speaking, Flemish-language literature in Belgium forms an integral part of Dutch literature, while French-language literature in Belgium is part of French literature.

A brief treatment of Belgian literature follows. For full treatment, *see* MACROPAEDIA: Belgian Literature.

Flemish-language literature in Belgium. The Belgian Territories, where Flemish was spoken, were loosely united with the Netherlands until 1579, when the northern (Reformed) provinces seceded from the Roman Catholic south and from the rule of Spain. Thus until the early 17th century the literatures of Flanders and Holland are considered as a whole (*see* Dutch literature).

As the northern provinces became the independent Dutch Republic, the south remained in Spanish (subsequently Austrian) hands and stagnated economically and culturally, although many Flemish authors still produced works of merit. The revival did not come until the early 19th century, with the Flemish Movement. While Karel Lodewijk Ledeganck was a Romantic poet, the prolific Hendrik Conscience wrote historical and social novels. The Realist novel found able exponents in Anton Bergmann and Virginie Loveling. The outstanding poetic talent of the century was the West Fleming Guido Gezelle. Around the turn of the century the periodical *Van Nu en Straks* ("Of Now and Later") brought together the critic August Vermeylen, the poet Karel

van de Woestijne, and the novelists Stijn Steuvels and Herman Teirlinck. During and after World War I the regionalist novel flourished and the radical innovator Paul van Ostaïen introduced the poetry of European Modernism. On the whole the novel dominated the interwar period, with the major practitioners being Maurice Roelants, Gerard Walschap, and especially Willem Elsschot and the consummate stylist Maurice Gilliams. After World War II the traditional novel was represented by Marnix Gijsen and Piet van Aken. Traditionalists tended to be overshadowed by more experimental writers such as Louis-Paul Boon and the versatile Hugo Claus; the latter is also a playwright and, with Hugues Pernath and Paul Snoek, one of the major postwar poets. Other writers of formally experimental fiction include Ivo Michiels, Walter van den Broeck, and Monika van Paemel. Among the poets of the new generation, Leonard Nolens was the outstanding talent.

French-language literature in Belgium. French literary writings are found early on in Flanders, Picardy, and Wallonia; the 9th-century *Cantilène de Sainte Eulalie* may have originated in what is now Belgium. Among the early texts are the 12th-century novella *Aucassin et Nicolette*, part prose and part verse, and probably from Hainaut; the *Farce du garçon et de l'aveugle* from Tournai; the Liège *Poème moral*; the rhymed chronicles of Philippe Mousket; and the epic works of Jean de Thuin. The satirical *Roman de Renart* went through several versions, of which *Le couronnement de Renart* is the most interesting. The 13th-century Brabant poet Adenet le Roi wrote love lyrics and epic works, such as *Cléomadès*. In the 14th century Jean le Bel's chronicles provided Jean Froissart with a model. It was at the 15th-century Burgundian court that the lively *Cent nouvelles nouvelles* came into being and that the chroniclers Georges Chastellain and Philippe de Commines wrote. The Reformation found a strong apologist in the bilingual Philips van Marnix.

In contrast to France, however, the 17th and 18th centuries were barren, with the exception of Charles Joseph, prince de Ligne. While André van Hasselt was the poet of Romanticism, the latter half of the 19th century was overshadowed by two novelists, the Naturalist Camille Lemonnier and Charles de Coster. The turn of the century was dominated by the writers who contributed to the reviews *La Jeune Belgique* and *La Wallonie* and by the poets and dramatists of the Symbolist movement such as Georges Rodenbach, Émile Verhaeren, Maurice Maeterlinck, Charles van Lerberghe, and Max Elskamp. In the 20th century the major dramatists are Fernand Crommelynck and Michel de Ghelderode. The novel is represented by Franz Hellens, Charles Plisnier, Marie Gevers, and the popular and prolific Georges Simenon. Among the most noted poets are Marcel Thiry, Jean de Bosschère, Maurice Carême, and the Surrealist Henri Michaux.

Walloon literature. Local dialects of French and Latin gave rise to a distinct literature in the provinces of Hainaut, Liège, Namur, Luxembourg, and southern Brabant, which formerly were known as Wallonia. The earliest of these vernacular writings date from the 12th century, and for the next three centuries Walloon writers mainly produced local chronicles and religious dramas.

In the 17th century the city of Liège became a centre of Walloon literary activity, and a Walloon theatre company was formed there in the 18th century. The founding in 1856 of the Société Liégeoise de Littérature Wallonne encouraged the use of the Walloon dialects in literature, and local poets and playwrights in particular reflected the major trends in European literature.

In the 20th century, dialect studies under-

taken by scholars renewed interest in Walloon dialects, and literary possibilities were expanded by the standardizing of rules of spelling and grammar.

Belgian sheepdog, also called GROENENDAEL, working dog developed in the village of Groenendaal, Belg., in 1885. A long-haired black dog, the Belgian sheepdog has a relatively pointed muzzle and erect, triangular ears. It is valued for intelligence and for working ability; in addition to herding sheep, it has been useful as a military dog, guard, and guide for the blind. Typically strong and agile, it stands 56 to 66 cm (22 to 26 inches) and

Belgian sheepdog
Walter Chandoha

weighs 23 to 27 kg (50 to 60 pounds). The Belgian sheepdog is one of several shepherd dogs developed in Belgium. As a result of breeding for ability rather than appearance, there were about seven varieties of sheepherding dogs in Belgium in the late 1800s, when attempts were begun to standardize the appearance of the animals. In addition to the black-haired form, the American Kennel Club also recognizes as distinct breeds the Belgian Tervuren and the Belgian Malinois.

Belgic Confession, Latin *CONFESSIO BELGICA*, statement of the Reformed faith in 37 articles written by Guido de Brès, a Reformer in the southern Low Countries (now Belgium) and northern France. First printed in 1561 at Rouen, it was revised at a synod in Antwerp in 1566, was printed that same year in Geneva, and was subsequently translated into Dutch, German, and Latin. It was accepted by synods at Wesel (1568), Emden (1571), Dort (1574), and Middelburg (1581) and was further revised and given final acceptance at the Synod of Dort in 1619. Originally written in French, the Belgic Confession closely followed the French, or Gallican, Confession of 1559; it is somewhat less elaborate than that creed, however, especially in treating the doctrines of the Trinity, the Incarnation, the church, and the sacraments. It became the standard creed of the Reformed Church of the Netherlands and of Reformed churches of Dutch background in the United States, which adopted a translation of a Latin version prepared for the Synod of Dort. *Compare* Gallican Confession.

Belgica, in full *GALLIA BELGICA*, one of the four provinces of Gaul under the Roman Empire. As established by Augustus (27 BC), Belgica stretched from the Seine River eastward to the Rhine and included the Low Countries in the north and the Helvetian territory in the south. Its capital was *Durocortorum Remorum* (now Reims, France). Under the Roman emperor Domitian (AD 81–96), the northern and southernmost parts of Belgica were made into the separate provinces of *Germania Inferior* and *Germania Superior*, respectively. Under Diocletian (c. AD 300), the remainder was divided into *Belgica Prima* (capital, Augusta Treverorum [modern Trier, Ger.]) and *Belgica Secunda* (capital, *Durocortorum Remorum*). In the 5th century, Belgica was absorbed into

the kingdoms of the Salian and Ripuarian Franks.

Belgioso, town, Pavia *provincia*, Lombardia (Lombardy) *regione*, northern Italy. It lies on the left bank of the Po River. Situated in an area of well-irrigated plateaus, the town is the agricultural and commercial centre for an area producing grain, cheese, and pigs. A medieval castle faces the town and an aqueduct constructed during the 14th century by Galeazzo II Visconti of Milan. During the period preceding the unification of Italy, Belgioso was the seat of a secret political society. Pop. (1993 est.) 5,242.

Belgioso, Baltazarini di (composer and choreographer): *see* Beaujoyeux, Balthazar de.

Belgium, officially KINGDOM OF BELGIUM, Dutch *KONINKRIJK BELGIË*, French *ROYAUME DE BELGIQUE*, nation located in the northwestern part of Europe. Belgium extends about 120 miles (193 km) from north to south and about 150 miles (240 km) at its widest from east to west. It is bounded by The Netherlands on the north and northeast, Germany on the east, Luxembourg on the southeast, France on the southwest and west, and a 41-mile- (66-kilometre-) long stretch of the North Sea on the northwest. The capital is Brussels. Area 11,787 square miles (30,528 square km). Pop. (1996 est.) 10,185,000.

A brief treatment of Belgium follows. For full treatment, *see* MACROPAEDIA: Belgium.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

Belgium

The land. Belgium can be divided into several geographic regions from southeast to northwest. Upper, or High, Belgium (in the southeast) consists of the densely forested Ardennes highland, which extends south of the Meuse (Maas) River valley and includes Mount Botrange (2,277 feet [694 m] above sea level), Belgium's highest point. The area south of the Ardennes, called *Côtes Lorraines* (Belgian Lorraine) and consisting of hills with north-facing scarps, is sometimes considered a separate region. Middle Belgium, lying 150 to 650 feet (45 to 200 m) above sea level, comprises the undulating loess plains of the Central (Bas) Plateaus and is a fertile region dissected by tributaries of the Schelde (Escaut) River. Lower Belgium, part of the great European Plain, comprises the flat, low-lying (up to 300 feet [100 m] above sea level) plain of Flanders (*Vlaanderen*) in the northwest and Kempenland (*Campine*) plateaus in the northeast. This occasionally marshy and wooded region is crisscrossed by a network of shipping canals and waterways.

The Maritime Flanders region borders the North Sea and is a continuous 5–10-mile- (8–16-kilometre-) wide band of sand dunes and polders (newly formed land reclaimed from the sea and protected by dikes); it is

agriculturally prosperous. The Meuse and the Schelde, Belgium's principal rivers, are important commercial arteries; they have large drainage basins in the southeast (Upper Belgium) and the north (Lower Belgium), respectively.

Belgium's temperate, maritime climate has relatively mild summers and cool winters and is characterized by wet westerly and southwesterly winds. The average winter temperature varies from 37° F (3° C) in the coastal areas to 32° F (0° C) in the centre and to 30° F (−1° C) in the Ardennes; the corresponding summer temperatures in those areas are 61° F (16° C), 66° F (19° C), and 57° F (14° C). The country's annual average precipitation is about 30 to 40 inches (750 to 1,000 mm). The climate in Belgium is favourable for abundant growth of grass and for cultivation. Approximately one-fourth of the total land area is used for agriculture; forest and pasture each cover an additional one-fifth.

Belgium is only moderately endowed with natural mineral resources, and most essential raw materials are purchased abroad. Its remaining coal deposits, of which the easily extractable reserves have been exhausted, are located in the Sambre-Meuse valley and in the Kempenland region. By 1992, however, coal mining had ceased in Belgium. The country does have considerable supplies of chalk and limestone and of building stone, including granite, sandstone, and marble.

The people. Belgium's population consists mostly of Flemings and Walloons. The Flemings (more than half of the population) speak Netherlandic—which, as spoken in Belgium and The Netherlands, is known by speakers of English as Flemish and Dutch, respectively—and live in the northern half of the country. The Walloons (about one-third of the population) speak French and inhabit the southern half of the country. Approximately one-tenth of Belgium's population is completely bilingual, but most Belgians have some knowledge of both French and Flemish. A tiny minority, most of whom live near the eastern border with Germany, speaks German. About 90 percent of the population is Roman Catholic, the remainder being predominantly Protestant or Muslim.

Because Belgium's birth and death rates are nearly identical and in- and out-migration fairly balanced, the growth rate is extremely low. Flemish Belgium had a moderate growth rate, whereas French-speaking Belgium had a very low rate of natural increase; the growth rate in both regions had become nearly equivalent by the end of the 20th century. Since World War II the growth rate of the foreign population has exceeded that of the native Belgians. Belgium's population older than 60 years is larger than its population younger than 15 years. Life expectancy is 73 years for males and 80 for females. Although the population density is among the highest in Europe, it varies from about 140 persons per square mile (54 per square km) on the Ardennes plateau to 15,300 per square mile in the Brussels-Capital region. Belgium is highly urban, with less than 4 percent of the population living in rural areas.

The economy. Belgium has a developed market economy largely based on services, light and heavy industries, and international trade. The manufacture of goods from imported raw materials plays a major role in the economy. Economic growth has favoured northern Belgium over the south, where mining and heavy industries are in decline. The *Société Générale de Belgique* dominates the banking sector. The gross national product (GNP) has grown more rapidly than the population, and the GNP per capita is about average among European Union (EU) countries.

The agricultural sector accounts for less than 2 percent of the gross domestic product (GDP) and employs about 2 percent of the workforce. Major crops include sugar beets, potatoes, wheat, barley, apples, tomatoes, oats, corn (maize), chicory (endive), and flax. Average yields of wheat, sugar beets, potatoes, and milk are among the highest of those of EU countries and are also among the highest in the world. Livestock breeding and raising (particularly of pigs and cattle) and milk production are highly developed, accounting for more than two-thirds of the total value of farm output.

The government has sponsored the consolidation of farms, which tend to be small and highly fragmented but also highly mechanized. Most farms are worked by tenant farmers who are protected by the government; the government and the EU have subsidized training and retirement programs for farmers.

Manufacturing industries account for about one-sixth of the GDP and employ about the same proportion of the workforce. Metalworking, in particular the production of steel, is the leading industry and largely produces for export. The steel industry, which relies on imported iron ore, was reorganized in the early 1980s and has been subsidized by the government. Other manufactures include processed foods, beverages, and tobacco; chemicals; paper, printing, and publishing; textiles; and building products.

Large quantities of petroleum are imported. Electricity is largely generated from nuclear power; only about two-fifths is generated from domestic and imported fossil fuels.

The Federation of Christian Trade Unions (Confédération des Syndicats Chrétiens; CSC) is the chief labour organization and is allied with the Christian People's Party. The CSC is particularly strong in Flemish areas, and most members are Roman Catholic. Increased expenditures for unemployment benefits, new jobs, and social services have forced the government to borrow from abroad; major industries were restructured and austerity measures in public spending were introduced by the government in the 1980s.

Belgium has one of the densest railway networks in the world, as well as an extensive network of inland waterways. Antwerp, on the Schelde River, is the country's chief port. Almost all of Belgium's roads are paved. The main international airport is at Brussels.

Belgium is heavily dependent on international trade. Other members of the EU account for a major portion of external trade; chief trading partners include Germany, The Netherlands, France, and the United Kingdom. The Benelux Economic Union is a customs and economic union encompassing Belgium, The Netherlands, and Luxembourg.

Government and social conditions. Belgium is a constitutional monarchy with a parliamentary form of government. In 1993 parliament voted to amend the constitution, adopted in 1831, to create a federal state of Belgium. The amendment provided for three largely autonomous regions: the Walloon Region (Wallonia), the Flemish Region (Flanders), and the bilingual Brussels-Capital Region; autonomy was also guaranteed for the Flemish-, French-, and German-speaking "communities." Under the new, coordinated constitution (1994) the central government retains responsibility for foreign policy, defense, taxation, and social security; the regional governments are responsible for transport, the environment, and trade promotion; the "community" governments oversee cultural and personal matters, including education. The constitution vests national executive power in the hereditary monarch and the monarch's ministers, whereas legislative power is shared by the monarch and the

bicameral Parliament, composed of the Chamber of Representatives and the Senate. All members of the Chamber of Representatives and more than half the senators are directly elected; some senators are elected by the community councils, and others by the rest of the Senate. Members of both houses serve a four-year term. The dominant political parties are the Christian People's, the Socialist, and the Liberal Reformation parties and the Flemish Liberals and Democrats. The major political parties have French- and Flemish-language wings. The independent judiciary is headed by the Supreme Court of Justice.

Social-welfare programs covering almost the entire population provide health insurance, pensions, family allowances, compensation for work injuries, unemployment relief, and aid for the old and indigent.

The population is almost entirely literate. A dual educational system is composed of state secular and private denominational, usually Roman Catholic, schools. The level of state subsidization of the school system was a traditional source of conflict until an agreement in 1958 provided more or less the same government financing for both state and private schools. Attendance is compulsory between the ages of 6 and 18. Belgium has several universities as well as other specialized institutions of higher education.

The print media remain largely privately owned. Radio and television broadcasting are organized into Flemish-language and French-language branches.

Cultural life. A basic cultural diversity exists between the Flemish and Walloon sectors. In music, avant-garde tendencies have become influential in Brussels, Liège, Ghent, and Antwerp, while Hainaut remains the centre of the classical and popular traditions. Literary works produced in Flanders have a style peculiar to the region, whereas in the Walloon area and in Brussels, most authors write for a larger French readership that is inclined especially toward Parisian tastes. Among the most notable contemporary Flemish writers are the novelist Felix Timmermans and the poet Hugo Claus. The Symbolist writers of the 20th century are exemplified by the poet Emile Verhaeven and the poet, playwright, and essayist Maurice Maeterlinck, both of whom have influenced many generations of French poets. The Surrealist René Magritte is probably the nation's best-known 20th-century painter.

History. Celtic and Germanic tribes inhabited the area of Belgium at the time of the Roman conquest (1st century BC). Roman rule lasted until the early 5th century AD and was followed by that of the Frankish Merovingians (mid-5th to late 7th century) and the Carolingians (early 8th to mid-9th century).

Several independent principalities emerged between the 10th and 14th century that basically correspond to Belgium's present-day provinces. It was during this period that the count of Flanders became a vassal of the king of France. Philip of Burgundy gained control of Flanders in the late 14th century. The houses of Burgundy and Habsburg were united by marriage in the late 15th century, and present-day Belgium came under Spanish Habsburg rule in 1504. During the Reformation the northern, Dutch-speaking parts of the Netherlands became Protestant, while the southern, Flemish parts remained Roman Catholic. In 1579 the southern provinces pledged allegiance to the Spanish king and Roman Catholicism. The Protestant northern provinces, which had successfully rebelled against Habsburg rule, formed the United Provinces of the Netherlands.

The Spanish Netherlands, as Flanders was now known, remained under Habsburg rule until 1700, when Philip V, grandson of Louis XIV of France, ascended the Spanish throne. In the War of the Spanish Succession (1701-14), which followed, the Spanish Netherlands

was ceded to the Austrian Habsburgs. After the Napoleonic Wars and a brief annexation by France, Belgium was reunited with the Netherlands into one country ruled by the house of Orange. Belgians revolted against Dutch rule in 1830, and in 1831 an independent Belgium was established. Prince Leopold of Saxe-Coburg was elected king and became Leopold I. Belgium's independence and neutrality were guaranteed by the major European states, and the country embarked on a long period of peaceful economic development. Leopold II (reigned 1865-1909) acquired a vast colonial domain in Africa's Congo River basin in the 1880s and granted universal male suffrage in 1893. The reign of Albert I (1909-34) was notable for his social reforms and his spirited resistance to the German invasion and occupation of Belgium (1914-18) in World War I. The Treaty of Versailles abolished Belgium's neutral status, and in 1920 the country signed a defense agreement with France. In 1930 the Belgian parliament transformed the country into two linguistic areas with different administrations. Leopold III became king in 1934; he attempted to reassert Belgium's neutrality but was unsuccessful.

In 1940 German troops occupied Belgium. A strong resistance movement existed during the four years of Nazi occupation. Following the war, Leopold abdicated in favour of his son Baudouin I in 1951. Divisions between Flemings and Walloons grew, and linguistic regionalization and mutual antagonism increased. Amelioration between the two groups began in the late 1960s through a process of federalization, which led in 1970 to the establishment of cultural autonomy in the Flemish and Walloon regions. Further autonomy in economic and educational sectors was advanced in the final decades of the 20th century; in 1993 Belgium became a federal state composed of three autonomous regions. In the same year, King Baudouin died and was succeeded by his brother, Albert II.

Belgorod, oblast (province), western Russia. It lies chiefly in the basins of the upper Vorskla, Donets, and Oskol rivers. The *oblast*, formed in 1954 and centred on Belgorod city, is situated in a forest-steppe with rich soils. The natural vegetation of deciduous forest and steppe has been almost wholly cleared for agriculture since intensive settlement began in the 17th century and now survives only as occasional oak groves along the rivers. Agriculture is highly developed, and the population is mostly rural. Grains—wheat, barley, millet, and corn (maize)—are the main crops, along with sugar beets and sunflowers. There are many orchards. Huge iron deposits of the Kursk Magnetic Anomaly were opened up in the 1950s and are now exploited at Gubkin, Lebedi, and Yakovleva. Area 10,500 square miles (27,100 square km). Pop. (2002) 1,512,400.

Belgorod, city and administrative centre of Belgorod *oblast* (province), western Russia. Belgorod lies along the upper Donets River where it is crossed by the Moscow-Kharkiv (Ukraine) and Sumy-Donets Basin railways. First mentioned in 1237, it was founded in 1593 as a fortress, becoming the key stronghold in the elaborate Belgorod defensive line set up in 1635-58 to protect Russia's southern frontier against Tatar attack. It maintained its military and administrative significance until the late 18th century. Modern Belgorod has a range of light-engineering, building-materials (chalk and slate), cement, and food-processing industries, as well as technical and pedagogical institutes. Pop. (2002 prelim.) 337,600.

Belgorod-Dnestrovsky (Ukraine): *see* Bilhorod-Dnistrovsky.

Belgrade, Serbo-Croatian BEOGRAD ("White Fortress"), city, administrative centre of Serbia and Montenegro and capital of the component republic of Serbia. It lies at the confluence of

the Danube and Sava rivers. Belgrade is located at the convergence of three historically important routes of travel between Europe and the Balkans: an east-west route along the Danube River valley from Vienna to the Black Sea; another that runs westward along the valley of the Sava River toward Trieste and northern Italy; and a third running southeast along the valleys of the Morava and Vardar rivers to the Aegean Sea. To the north and west of Belgrade lies the Pannonian Basin.

There is evidence of Stone Age settlements in the area. The city grew up around an ancient fortress on the Kalemegdan headland that was encamped on three sides by the Sava and the Danube. The first fortress was built by the Celts in the 4th century BC and was known by the Romans as Singidunum. It was destroyed by the Huns in 442 and changed hands among the Sarmatians, Goths, and Gepidae before it was recaptured by the Byzantine emperor Justinian. It was later held by the Franks and the Bulgars, and in the 11th century became a frontier town of Byzantium. In 1284 it came under Serbian rule, and in 1402 Stephen Lazarević made it the capital of Serbia. The Ottoman Turks besieged the city in 1440, and after 1521 it was in their hands except for three periods of occupation by the Austrians (1688–90, 1717–39, and 1789–91).

Old Belgrade on the Sava River, with the Orthodox cathedral in the background

Toni Schneiders

During the Turkish period Belgrade was a lively commercial centre where goods were traded from various parts of the Ottoman Empire. After the first Serbian uprising under Karageorge in 1804, Belgrade became the Serbian capital during 1807–13, but the Turks recaptured it. The Serbs were given control of the citadel in 1867, when Belgrade once more became the capital of Serbia.

From 1921 Belgrade was the capital of the three successive Yugoslav states, including the rump Yugoslavia (now Serbia and Montenegro). The city's rapid population growth since World War II resulted primarily from the migration from rural areas of Serbia as a consequence of industrialization. Most of the inhabitants are Serbs; the largest non-Serb groups are Croats and Montenegrins.

Since World War II Belgrade has become an industrial city that produces motors, tractors and combines, machine tools, electrical equipment, chemicals, textiles, and building materials. It is the largest commercial centre in Serbia and Montenegro. Three international railroad lines pass through Belgrade, which is also served by highways and by river vessels traveling up the Danube from the Black Sea or arriving from western Europe via the Main-Danube Canal. The airport is located west of the city at Surčin.

In the course of its growth, Belgrade spread southward and southeastward over a hilly terrain. Since World War II a new district called New Belgrade (Novi Beograd) has been built on the plain west of the old city, between the Sava and Danube rivers. The old fortress of Kalemegdan is now a historical monument; its former glacis has been rebuilt as a garden, from which is seen a famous view of the plain across the Sava and the Danube. Belgrade is the site of numerous government offices and is also home to various cultural and educational institutions, including the University of Belgrade, founded in 1863. There are many museums and galleries, of which the oldest, the National Museum (Narodni Muzej), was founded in 1844. Pop. (2002) 1,120,092.

Belgrade, Treaty of (September 1739), either of two peace settlements achieved by the Ottoman Empire that ended a four-year war with Russia and a two-year war with Austria.

Disputes arising from ill-defined frontiers between Russian-ruled Ukraine and the Ottoman-dominated Crimean Tatars provided the pretext in 1735 for a new Russian attempt to establish itself on the northern Black Sea. Austria entered the war as Russia's ally in 1737. Because of military failures, however, Austria made a separate peace in September 1739, ceding northern Serbia (with Belgrade) and Little Walachia (in southern Romania) to the Ottomans and thus renouncing the strong position in the Balkans it had obtained under the Treaty of Passarowitz (1718). With Austria's defection, the militarily successful Russians had to make a disappointing peace that same month: Azov, which they had captured, was to be demilitarized, Russia was to have no warships on the Sea of Azov or the Black Sea, and it was to depend entirely on Ottoman shipping for its commerce on the Black Sea.

The treaties, mediated and guaranteed by France, provided relatively stable conditions until 1768.

Belgrano, Manuel (b. June 3, 1770, Buenos Aires, Viceroyalty of Río de la Plata [now in Argentina]—d. June 20, 1820, Buenos Aires), military leader in the Argentine war for independence.

After studying law in Spain, Belgrano was appointed secretary of the Buenos Aires official merchants' guild (1794), a position in which he advocated liberal ideas, particularly in education and economic reform. He received his first military experience during the unsuccessful British invasion of the Viceroyalty of Río de la Plata in 1806–07. When Río de la Plata broke with Spain in 1810, Belgrano became a member of its ruling junta that tried to maintain its territorial integrity. After outlying portions of the country were lost, Belgrano was sent with a small army to bring what is now Paraguay under the authority of the junta but was unsuccessful. He later defeated pro-Spanish forces at Tucumán and Salta in the Argentine northwest, only to be defeated in Upper Peru (now Bolivia) in 1813. He was superseded in 1814 by José de San Martín as commander of the army.

Belgrano, like many other leaders of the South American independence movement, favoured the establishment of a monarchical type of government. To find a ruler, he went to Europe with Bernardino Rivadavia, who later became the first president of the Argentine republic. The European mission was unsuccessful.

Belice (Belize): see Belize City.

Belidor, Bernard Forest de (b. 1698, Catalonia, Spain—d. Sept. 8, 1761, Paris, France), military and civil engineer and author of a classic work on hydraulics.

After serving in the French army at an early age, he developed an interest in science and worked on the measurement of an arc of the Earth. The study of ballistics also attracted

him, and he became professor of artillery at the French military school at La Fère and eventually rose to become inspector of artillery. He wrote several notable books on engineering, artillery, ballistics, and fortifications, but his fame rests primarily on *Architecture hydraulique*, in four volumes (1737–53), covering engineering mechanics, mills and waterwheels, pumps, harbours, and sea works.

belief, a mental attitude of acceptance or assent toward a proposition without the full intellectual knowledge required to guarantee its truth. Believing is either an intellectual judgment or, as the 18th-century Scottish Skeptic David Hume maintained, a special sort of feeling with overtones that differ from those of disbelief. Beliefs have been distinguished according to their degree of certainty: a surmise or suspicion, an opinion, or a conviction. Belief becomes knowledge only when the truth of a proposition becomes evident to the believer. Belief in someone or something is basically different from belief that a proposition is true.

Belin, Édouard (b. March 5, 1876, Vesoul, France—d. March 4, 1963, Territet, Switz.), French engineer who in 1907 made the first telephoto transmission, from Paris to Lyon to Bordeaux and back to Paris, using an apparatus of his own invention. The first transatlantic transmission was made in 1921 between Annapolis, Md., and Belin's laboratories at La Malmaison, France. His equipment was adopted in Britain in 1928. It was used almost exclusively by European news media during the 1930s and '40s, when the term "Belino" came into general use for all kinds of picture transmission.

Belinsky, Vissarion Grigoryevich (b. May 30 [June 11, New Style], 1811, Sveaborg, Fin., Russian Empire—d. May 26 [June 7], 1848, St. Petersburg, Russia), eminent Russian literary critic, often called the "father" of the Russian radical intelligentsia.

Expelled from the University of Moscow (1832), Belinsky worked as a journalist. His first substantial critical articles, "Literaturnyye mechtaniya" ("Literary Reflections"), appeared in the newspaper *Molva* in 1834 and established his reputation. In them he expounded F.W.J. Schelling's Romantic view of national character, applying it to Russian culture, though Belinsky later embraced G.W.F. Hegel's philosophy of history. He obtained a permanent post (1839) with the journal *Otechestvennyye zapiski*. By 1840 he was showing signs of revolt against orthodox Hegelianism.

Some Soviet critics, taking his rare political utterances out of context, thought his almost

Belinsky, drawing by an unknown artist
Novosti Press Agency

accidental contribution to the Russian "national" type of socialism his principal achievement. In 1846 Belinsky joined the review *Sovremennik*, for which he wrote about literature's slow task of helping the still embryonic Russian nation to develop into an adult civilized society. In 1847 he wrote a famous letter to the author Nikolay Gogol, denouncing the latter's *Vybrannye mesta iz perepiski s druz'yami* ("Selected Passages from Correspondence with My Friends") as a betrayal of the Russian people because it preached submission to church and state.

His analyses of Aleksandr Pushkin, Mikhail Lermontov, Fyodor Dostoyevsky, and Gogol laid the foundation for much of modern Russian literary criticism.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Belisarius (b. c. 505, Germania, Illyria? [Greece]—d. March 565), Byzantine general, the leading military figure in the age of the Byzantine emperor Justinian I (527–565). As one of the last important figures in the Roman military tradition, he led imperial armies against the Sāsānian empire (Persia), the Vandal kingdom of North Africa, the Ostrogothic regime of Italy, and the barbarian tribes encroaching upon Constantinople.

Little is known of Belisarius' early years. Some traditions assign him an unlikely Slavic background, but his exact origins and the precise date of his birth are undocumented. As a member of Justinian's bodyguard, he came to the emperor's attention, and he was appointed to a command at about the age of 25. His public career thereafter is thoroughly described by the historian Procopius, who was a member of his personal staff for the first 15 years of his campaigns and who observed the general's activities personally.

Belisarius won his first laurels as commander on the Mesopotamian front against the empire's eastern neighbour and rival, Sāsānian Persia. He won a brilliant victory at Dara in 530; despite a subsequent defeat the following year at Sura (Callinicum), he emerged as the hero of the war by the time Justinian negotiated its end. Belisarius was in Constantinople, the capital, when the Nika Insurrection broke out there in January 532, and he further gained the emperor's confidence by commanding the troops that ended the episode by massacring the rioters. About this time, meanwhile, Belisarius married the widowed Antonina, who, as an old friend to the empress Theodora, had influence at court that was later to be of great importance to him.

Justinian next chose Belisarius to begin the reconquest of the western Roman territories occupied by Germanic peoples. In 533 he was sent with a small force to attack the Vandals in North Africa. In two stunning victories he shattered the Vandal kingdom within a few months. Returning to Constantinople, he was granted a triumphal celebration. The recovery of Italy from the Ostrogoths began in 535. Belisarius quickly took Sicily and moved steadily northward on the mainland, seizing Naples by storm and occupying Rome. Revitalized under their new king, Wittigis, the Goths besieged Rome in 537–538, but Belisarius held out there brilliantly. Hampered by conflicts within his command, his advance further northward was delayed, but by 540 the Goths, hard-pressed, offered to surrender if Belisarius would rule over them as emperor. Justinian had already come to fear that so popular a commander might win sufficient prestige to aim at his throne. Dissembling, Belisarius accepted the Goths' capitulation and then

refused the title, which would have proved dangerous, thus antagonizing the Goths without relieving Justinian's suspicions.

The emperor recalled him from Italy in temporary disfavour but sent him in the following year to fight again in Mesopotamia against the Sāsānians. Despite some successes, Belisarius had difficulties with his unruly soldiers, and then he was stripped of his command on charges of disloyalty. Only Theodora's intervention, out of friendship for Antonina, relieved his disgrace and ruin. Imperial rule had broken down in Italy under Belisarius' incompetent successors. He was reassigned there in 544, but Justinian, more suspicious and niggardly than ever, would not back him with sufficient men and money. Belisarius operated insecurely around the Italian coasts for the next few years, even briefly holding Rome once more, but effective opposition to the Ostrogoths was impossible. Theodora died in 548, and he was soon recalled. The Italian wars were left to be completed by other generals, notably the eunuch Narses, who would receive Justinian's fuller support.

Returning to Constantinople, Belisarius was allowed to retain his wealth and large household bodyguard. When marauding Hun tribes menaced the city in 559, the emperor summoned Belisarius back into service. Adding what men he could find to his private retinue, he frightened the Huns away by clever stratagems and then resumed his retirement. Three years later he was accused of involvement in a plot against Justinian's life and, though probably innocent, was disgraced. Partially restored to favour in 563, he was left in peace until his death, a few months before the death of the ungrateful emperor he had served so well.

Belisarius' character is elusive. Two primary impulses guided his life: loyalty to Justinian and passion for his wife, Antonina. Despite the treatment he often received from Justinian, Belisarius never wavered in his obedience, contributing one of the nobler dimensions to Justinian's era. Antonina seems to have utterly captivated him, but her reckless and immoral behaviour brought him embarrassment and humiliation.

In Procopius' *Secret History* (*Historia arcana*), Belisarius is given the least unfavourable treatment of the age's leading personalities. His reputation endured for centuries, and later legends, often mixed with stories about others, developed about him. The most famous had him actually blinded by Justinian and forced to beg in the streets in his old age. The 18th-century French writer Jean-François MarmonTEL used the story of Belisarius as a vehicle for an oblique attack on Louis XV and for a plea for tolerance and justice, in his philosophical novel *Bélisaire* (1767). Robert Graves's vivid novel *Count Belisarius* (1938) is the best fictionalized treatment of the general's life.

(J.W.Ba.)

Belit (Akkadian), Sumerian NINLIL, Mesopotamian goddess, the consort of the god Bel (Sumerian: Enlil) and a deity of destiny. She was worshiped especially at Nippur and Shuruppak and was the mother of the moon god, Sin (Sumerian: Nanna). In Assyrian documents Belit is sometimes identified with Ishtar (Sumerian: Inanna) of Nineveh and sometimes made the wife of either Ashur, the national god of Assyria, or of Enlil (Bel), god of the atmosphere.

The Sumerian Ninlil was a grain goddess, known as the Varicoloured Ear (of barley). She was the daughter of Haia, god of the stores, and Ninshegargu (or Nidaba). The myth recounting the rape of Ninlil by her consort, the wind god Enlil, reflects the life cycle of the grain: Enlil, who saw Ninlil bathing in a canal, raped and impregnated her. For his crime he was banished to the Underworld, but Ninlil followed. In the course of their journey

Enlil assumed three different guises, each one ravishing and impregnating Ninlil. The myth seems to represent the process of wind-pollination, ripening, and the eventual withering of the crops and their subsequent return to the earth (corresponding to Ninlil's sojourn in the Underworld).

Belit-ili (Mesopotamian goddess): see Nin-hursag.

Belitoeng, also spelled BELITONG, or BELITUNG (Indonesia): see Billiton.

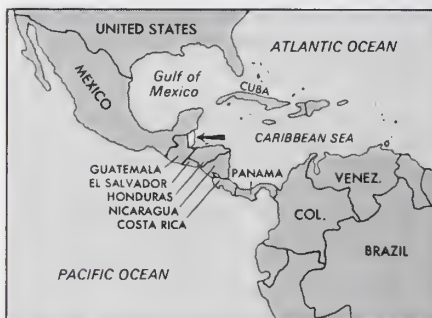

Beliveau, Jean (Marc A.), byname LE GROS BILL (b. Aug. 31, 1931, Trois Rivières, Que., Can.), professional ice hockey centre who was noted for scoring winning goals in Stanley Cup playoff games. He played his entire career (1953–71) with the Montreal Canadiens of the National Hockey League (NHL).

Beliveau attracted the attention of the Canadiens while playing in the Quebec Senior League, which they bought to get his services. Beliveau was team captain from 1961. His 507 career goals was a record for centres. He played in 17 Stanley Cup playoffs and was on 10 Stanley Cup winning teams. His career records of most points scored in Stanley Cup playoff games (162) and most assists (97) persisted into the 1980s. He was awarded the Art Ross Trophy as leading scorer (1956), the Hart Trophy as most valuable player (1956, 1964), and the Conn Smythe Trophy as most valuable player in the playoffs (1965). After his retirement as a player, he became a vice president of the Canadiens. He was a member of the Hockey Hall of Fame.

Belize, Spanish BELICE, country in the northeast of Central America, covering an area of 8,867 square miles (22,965 square km). The capital is Belmopan. It is bounded by Mexico to the north and northwest, by Guatemala to the south and west, and by the Caribbean Sea along its 174-mile (280-kilometre) coastline to the east. The population in 2002 was estimated to be 251,000.

A brief treatment of Belize follows. For full treatment, see MACROPAEDIA: Central America.

For current history and for statistics on society and economy, see BRITANNICA BOOK OF THE YEAR.

Belize

The land. Belize is a land of mountains, swamps, and tropical jungle. The northern half consists of largely swampy lowlands less than 200 feet (60 m) above sea level. They are drained by the navigable Belize River, the New River, and the Honda River; the latter forms the northern frontier with Mexico. The southern half of Belize is dominated by the Maya Mountains, a limestone (karst) plateau cut by erosion into hills and valleys extending northeastward from the Guatemalan boundary. The Cockscomb Mountains, a spur of the Maya Mountains, run toward the sea, rising to 3,681 feet (1,122 m) at Victoria Peak, the highest point in Belize. Off the coast lies the world's second largest barrier reef.

The climate is subtropical, with a distinct dry season from late February to May and a wet season from June to November; the latter

is interrupted from August to September by a shorter dry period. The average temperature at Belize City is 74° F (23° C) in December and 84° F (29° C) in July. The average annual rainfall increases sharply from 51 inches (1,295 mm) in the north to 175 inches (4,445 mm) in the south, but there are considerable yearly variations at all locations. Hurricanes, which are an annual threat from July through November, were largely responsible for the shift of the capital from Belize City, which was devastated by a hurricane in 1961, to Belmopan.

Roughly 45 percent of Belize is forested, with at least 50 different tree species. In the north the forest is deciduous, and sapodilla, mahogany, and ironwood predominate. In the south the forest is taller and is mainly oak, pine, and cedar. The rivers are largely bordered by swamp forests. On the coastal plain open savanna is interrupted by scattered oaks, pines, and palmetto palms. The coast is fringed with mangrove trees. The country's abundant wildlife includes the jaguar, tapir, a variety of deer, American crocodile, and manatee, as well as many species of turtles, birds, and fish.

Belize is poor in resources, with plentiful supplies only of limestone, sand, and gravel. Petroleum was discovered in northern Belize during exploratory drilling in 1981.

The people. Much of Belize's population is racially mixed. People of mixed African and European ancestry, who are called Creoles, predominate in the coastal regions, while Maya Indians and mestizos, who are of mixed Maya and European ancestry, predominate in the more sparsely inhabited interior. Black Caribs—descendants of Africans and the Carib Indians exiled from the British West Indies in the 18th century—live in settlements on the southern coast. There also are small numbers of Europeans, East Indians, and Salvadorans living in the coastal area. English is the official language, but a Creole patois is commonly spoken. Indians speak Spanish or one of several Indian languages. Roman Catholicism is the principal religion, but there are sizable minorities of Methodists and Anglicans; groups of Mennonites, who migrated from Mexico and Canada after 1958, have established settlements inland on the Belize River.

The country's birth and death rates remain relatively high; the annual rate of growth has been augmented by refugees from El Salvador and Guatemala.

The economy. Belize has a developing free-market economy with some government participation. The gross national product (GNP) has been increasing more rapidly than the population. The GNP per capita is higher than the average for Central American countries. Agriculture, trade, and manufacturing are principal components of the gross domestic product (GDP).

Agriculture generates one-fifth of the GDP. Less than 3 percent of the country's total land area is cultivated, but as much as one-fourth of the labour force is involved in farming. Cash crops grown include sugarcane, oranges, grapefruit, and bananas. Commercial cultivation of cacao, coconuts, and peanuts (groundnuts) was introduced in the early 1980s. Domestic crops include corn (maize), rice, kidney beans, sweet potatoes, yams, and vegetables.

Pastures occupy about 2 percent of the land; the principal livestock include cattle and pigs, and the Mennonite population has started a dairy industry.

A prolonged decline in timber production was reversed by the late 1970s; most of the wood cut annually is used for fuel. The government has introduced reforestation with fast-growing gmelina, eucalyptus, and pine and encourages cutting of nontraditional species for furniture and construction. Belize also produces chicle, extracted from sapodilla trees.

Fishing is carried out mainly by several co-

operatives; a large proportion of the catch—mostly lobster, shrimp, scale fish, and sea turtles—is frozen or canned for export.

Manufacturing generates about one-seventh of the GDP and produces some exports. The principal industries include food products, clothing, sawed wood and wood products, and fertilizer and animal feed. All of the country's electric energy is produced by thermal power plants.

Construction accounts for less than one-tenth of the GDP and is coordinated by the Ministry of Works, using its own workforce with private contractors.

The United General Workers Union is the largest labour federation. Cooperatives and credit unions are common in agriculture, fishing, marketing, and housing. With industrial development, shortages of skilled workers have become the principal labour problem.

Belize depends on foreign development aid, mainly from the United Kingdom, the United States, and Canada. By carefully regulating domestic policy, the government has generated annual surpluses in recurrent budgets while using foreign assistance for the capital budget, thereby keeping the public debt under control.

Only about one-seventh of Belize's roads are paved. Inland waterways, usable by shallow-draft vessels, total about 500 miles (800 km). Belize City has a deepwater port, and Commerce Bight has a pier for oceangoing vessels. An international airport is located near Belize City.

Belize's exports ordinarily fall far short of its imports. Sugar, clothing, lobster, molasses, and citrus fruits are the principal exports, while imports consist mostly of manufactured goods, machinery and transport equipment, and refined fuels. Belize's major trading partners are the United States, the United Kingdom, Mexico, Canada, and Jamaica. The trade deficit is partly reduced by remittances from Belizeans working abroad.

Government and social conditions. Belize is a constitutional monarchy. Its nominal head of state is the British monarch, represented in Belize by a governor-general. Belize's constitution of 1981 vests legislative responsibility in the bicameral National Assembly, which consists of a Senate and a House of Representatives. Executive power is held by the prime minister, who is normally appointed by the governor-general and is the leader of the majority party in the House. The cabinet is also appointed by the governor-general, on the advice of the prime minister. Representatives are elected by universal adult suffrage (age 18 and over), but senators are appointed by the governor-general on the advice of the prime minister, the leader of the opposition party in the House, and the Belize Advisory Council. The dominant political parties are the People's United Party and the United Democratic Party.

Social-security benefits are provided to sick, disabled, and unemployed workers and to survivors of deceased insured workers. Medical care is free for most Belizeans, and the government operates and staffs hospitals, dental clinics, and child-care facilities, as well as rural health centres and mobile clinics. Sanitary conditions, however, are poor; polluted water and gastrointestinal disease are major factors in the high infant mortality rate. Life expectancy is about 70 years.

Education is compulsory for children between the ages of 6 and 14. Most schools are church-operated and are jointly funded by the government and their respective church organizations. The literacy rate among citizens over 15 years of age is more than 90 percent.

The press in Belize is generally free from censorship. The nation has radio and television service.

Cultural life. Mayan antiquities are exhibited in the Baron Bliss Institute in Belize City.

Belize's most important indigenous festival is Dangriga's Settlement Day, which features Caribbean songs and dances. Belize associates itself culturally with the English-speaking Caribbean states.

History. Mayan civilization flourished in what is now Belize from about 300 BC to AD 900. The ruins of Mayan ceremonial centres can still be seen, particularly those of Caracol and Xunantunich. Sometime after the 6th century, Mayan settlement in the area reached its peak with an estimated population of 25,000.

The Spanish, though holding nominal sovereignty, never attempted to settle Belize.

Mayan ruins at Xunantunich, Belize, c. AD 650–890
—Doug Waugh/Peter Arnold, Inc.

but they always regarded as interlopers the British who did settle there. Sometime in the mid-17th century a group of English seamen, mostly pirates and adventurers, settled St. George's Cay and began cutting logwood, a material used for dyeing; it remained Belize's main export until it was surpassed by mahogany in the late 18th century.

British settlement of Belize was recognized in a number of treaties, and Spain's last attempt to take the settlement by force was defeated in 1798. British settlers began to penetrate the interior as coastal timber became exhausted. The Indians resisted this penetration, and the 19th century was punctuated by clashes between the two. Slavery was also a factor in the logging enterprises, but conditions were superior to those of the Caribbean sugar plantations, and emancipation was accomplished by 1838.

In 1862 British Honduras, as Belize was then called, became a crown colony, but an unfulfilled provision of a treaty made between Britain and Guatemala in 1859 led Guatemala to claim British Honduras. In 1981 Great Britain granted British Honduras its independence as Belize. The new nation's security remained threatened by Guatemala, which viewed Belize as a "lost province" to be regained by force. To counter that threat, Belize relied on a British military force stationed on its territory. With an improvement of relations between Belize and Guatemala in the early 1990s, however, the British troops were withdrawn in 1994.

Belize City, Spanish BELICE, former capital and chief seaport of Belize (formerly British Honduras). The city occupies both banks of the Haulover Creek, a delta mouth of the Belize River on the Caribbean coast. Its name was probably derived from an ancient Maya Indian word that refers to the Belize River, which was until the 10th century a heavily populated trade artery of the

Maya Empire. British adventurers apparently settled the area in the 17th century and engaged in logwood cutting. Belize City, built on ground only slightly above sea level and sur-

Supreme Court Building, Belize City

rounded by mangrove swamps, was severely damaged by Hurricane "Hattie" and the accompanying tidal wave on Oct. 31, 1961, and by Hurricane "Greta" in 1978. In May 1970 the capital was moved to Belmopan (*q.v.*), an inland site not liable to flooding.

Exports include sugar, mahogany, cedar, and other timbers (both mill wood and in the round), citrus fruits, coconuts, copra, bananas, and corn (maize). Furniture, boats, and wood products are manufactured, and livestock (hogs and cattle) are raised in the surrounding area. Fisheries and sawmilling are local activities. Water and sewage facilities for the city have been improved. The harbour is well sheltered, but large ships have had to anchor about a mile offshore because of sandbanks. The first phase of a deepwater port closer to Belize City was completed in 1980. The Belize International Airport is located northwest of the city.

Belize City has an institute for arts and drama and technical and teachers' training colleges. Notable landmarks include St. John's Anglican Cathedral (built 1812) and the Government House (1814). Pop. (1998 est.) city, 55,810; district, 70,355.

Belize River, also called OLD RIVER, river rising in northeastern Guatemala as the Río Mopán and flows about 180 mi (290 km) northeast past Benque Viejo, San Ignacio (El Cayo), and Roaring Creek (site of Belmopan, capital of Belize [formerly British Honduras]) into the Caribbean Sea at Belize City. During the pre-Columbian era, it served as one of the main trade arteries of the Maya Indians. It is navigable for small craft with enclosed propellers from Belize City as far as the Guatemalan border and is used to carry lumber for export and chicle to market areas.

Belkis (Turkey): *see* Apendus.

bell, hollow vessel usually of metal, but sometimes of horn, wood, glass, or clay, struck near the rim by an interior clapper or exterior hammer or mallet to produce a ringing sound. Bells may be categorized as idiophones, instruments sounding by the vibration of resonant solid material, and more broadly as percussion instruments. The shape of bells depends on cultural environment, intended use, and material of construction. The walls vary from straight to convex, concave, hemispherical, barrel shaped (as in East Asia), and tulip shaped with sound bow (the bulge near the rim), as are all tower bells in the West. In cross section they may be round, square, rectangular, elliptical, or many-sided. Chinese bells often have lotus-shaped rims.

The strongest sound-producing vibrations of bells occur near the rim (in Western bells, in the sound bow), in contrast to hollow gongs,

the vibrations of which are strongest in the centre. The acoustical structure of bell sound is complex and has been completely understood only in modern times. All bells contain an array of partials, or sound-wave frequencies of various pitches, but the tone of a musical bell consists of both harmonious partials and higher inharmonious partials. Western bells are invariably rung by a metal striker; Asian bells, except for metal-clappered hand and wind bells, are normally struck by a wooden hand mallet or swinging horizontal beam that engages the exterior wall. Asian bells are also devoid of the sound bow and never swing.

Bells are widely distributed geographically and usually possess a clearly defined cultural status. Legends surround them, and beliefs abound concerning their special powers—to induce rain or to dissolve storm clouds; to thwart demons when worn as amulets or when placed on animals, buildings, or conveyances; or to invoke curses and lift spells. The concept of their purifying action is ancient, as is their use in ritual, especially in the religions of eastern and southern Asia. The Chinese rang bells to communicate directly with spirits, and in Russian Orthodoxy, bells directly addressed the deity—hence, huge ones were cast by both peoples to lend greater authority. In both Buddhism and Christianity, bells are consecrated before being used liturgically, and in East Asia the fading tone of the bell is considered spiritually significant. In Roman Catholicism, bells have symbolized paradise and the voice of God.

Among the most basic and widespread uses of bells is signalling—marking significant points of ritual, calling to worship, tolling the hours, announcing events, rejoicing, warning, and mourning. In Christian and Asiatic Buddhist monasteries, bells regulate daily routine, and medieval and Christian bells were named according to purpose: *squilla* for the refectory, *nola* for the choir, and so forth.

Bells have also been treasured as patriotic symbols and war trophies, and invaders quickly silenced those of the conquered in order to eliminate the most vivid symbol of resistance. Most cultures have made bells into artistic objects, with respect to shape, material, and ornamentation, and both Eastern and Western religions have incorporated symbolic motifs in the ornamentation of bells.

The ancient Chinese were the first to employ sequences of bells musically; such sequences are termed chimes, or *pien chung*. In the West since the 9th century, small sets of bells (chimes) in stationary suspension and generally tuned diatonically (to the seven-note scale) have been common (*see* bell chime). Sets of tuned bells numbering at least 23 are termed carillons. Groups of two or more

free-swinging bells peal; a single stationary bell in slow repetition tolls. All today may be operated electrically. Change ringing is a British form of pealing whereby 5 to 12 bells are rung in mathematical permutations. The *zvон* ("chime") of the Russian Orthodox Church sounds repetitious rhythmic patterns. Sets of handbells ranging up to five octaves have been popular in England and the U.S. since the 19th century as a group method for producing melodies and simple harmonies. In the main the liturgical and utilitarian functions of bells have greatly diminished, whereas their musical usage has increased.

Forged and riveted metal bells antedate those of cast metal. The earliest bell founding (*i.e.*, the casting of bells from molten metal) is associated with the Bronze Age. The ancient Chinese were superb founders, their craft reaching an apex during the Chou dynasty (*c.* 1122–221 BC). Characteristic were elliptical temple bells with exquisite symbolic decorations cast onto their surfaces by the *cire perdue*, or lost wax, process.

European bell making was originally a monastic craft. The earliest Christian bells were of iron plates hammered square and riveted (resembling cowbells). Although bronze casting was practiced in pre-Christian Europe, it was not resumed to any extent until the 8th century.

In bell founding, molten metal (usually bronze) is poured into a mold consisting of an inner core and outer mold or cope contoured to a bell's profile. Most molds are faced with loam, those for handbells with sand. The liquid metal, heated to about 1,100° C (2,000° F) enters a hole at the top while being tamped (driven by a series of light blows) down through another. To avoid undesirable porosity, gases formed are allowed to escape. Cooling is carefully controlled to prevent the outer surface from cooling faster than the inner, thereby setting up a tension leading to later cracking. Large bells require a week or two to cool. When the mold is removed the rough casting of the bell is sandblasted and polished. If a certain pitch is required, small amounts of metal are ground from the bell's inner wall as it revolves. Bell metal, or bronze, is an alloy of copper and tin. Tin content may range from 13 percent in weight to 25 percent, rarely more. Tin increases brittleness, and large bells contain less than small ones do. Most carillon bells contain 20 percent.

Casting produced better toned bells by permitting greater wall thickness and more precise control of contour (now round). For centuries bells had a convex wall of uniform thickness, a shape termed a beehive or primitive bell. The wall was elongated for use in bell towers, and the rim was reinforced for more resonance and strength. Pitch was successfully controlled by the 9th century, when tuned sets of small bells (called *cymbala*) appeared.

By the 11th century, secular bell founders—often itinerant—were active, becoming dominant by the Renaissance. The lofty towers of Gothic architecture led to much larger, more resonant bells and gave rise to an archaic version of the present campaniform bell: tulip-shaped with a narrow, rounded top; a long, straight waist spreading outward at the bottom; and a flared mouth, or sound bow. By the 13th century this shape predominated. Until the 15th century, when a shape similar to the modern Western one emerged, it was slowly transformed, the waist becoming proportionately shorter and concave, the top broader, the shoulder squared, and the sound bow thickened.

Bell founding attained considerable prestige, and the introduction of gunpowder in the 14th century added cannon making to the founder's output. The founders of Belgium and the Netherlands surpassed all others, their stature growing as the carillon spread in that area in the 15th–18th century, their craft culminating

Chinese bell, cast bronze, Eastern Chou dynasty, about 5th century BC; in the Art Institute of Chicago

By courtesy of the Art Institute of Chicago

with the 17th-century Dutch founders François and Pierre Hémony. The craft declined in the 19th century, particularly in the ability to tune accurately, but regained its excellence by the 20th.

Russian bell founding dates from the 13th century, and by the 16th, bells weighing many tons were made. The world's largest bell, the Tsar Kolokol (Tsar Bell) in Moscow, was cast in 1733–35, weighing more than 400,000 pounds (180,000 kilograms); broken by fire in 1737, it never rang. English founders traditionally paid little attention to their bells' inner tuning of the partials, because their bell usages—change ringing and chimes—did not involve harmony. In the 20th century they adopted the partial tuning used in Belgium and The Netherlands.

The pellet bell, or crotaal (a term also having many other meanings), a spherical vessel with loose pellets, has been historically regarded as a type of bell, but modern authorities now classify it as a rattle; jingle and sleigh bells are familiar examples. Of great antiquity, it shares many of the ritual and magical functions of bells.

Bell, Adam Schall von: see Schall von Bell, Adam.

Bell, Alexander Graham (b. March 3, 1847, Edinburgh—d. Aug. 2, 1922, Beinn Bhreagh, Cape Breton Island, Nova Scotia, Can.), Scottish-born American audiologist best known as the inventor of the telephone (1876). For two generations his family had been recog-

tuberculosis, which had also struck down his younger brother, and the strain of his professional duties soon took their toll on young Bell. Concern for their only surviving son prompted the family's move to Canada in August 1870, where, after settling near Brantford, Ont., Bell's health rapidly improved.

In 1871 Bell spent several weeks in Boston, lecturing and demonstrating the system of his father's *Visible Speech*, published in 1866, as a means of teaching speech to the deaf. Each phonetic symbol indicated a definite position of the organs of speech such as lips, tongue, and soft palate and could be used by the deaf to imitate the sounds of speech in the usual way. Young A. Graham Bell, as he now preferred to be known, showed, using his father's system, that speech could be taught to the deaf. His astounding results soon led to further invitations to lecture.

Even while vacationing at his parents' home Bell continued his experiments with sound. In 1872 he opened his own school in Boston for training teachers of the deaf, edited his pamphlet *Visible Speech Pioneer*, and continued to study and tutor; in 1873 he became professor of vocal physiology at Boston University.

Never adept with his hands, Bell had the good fortune to discover and inspire Thomas Watson, a young repair mechanic and model maker, who assisted him enthusiastically in devising an apparatus for transmitting sound by electricity. Their long nightly sessions began to produce tangible results. The fathers of George Sanders and Mabel Hubbard, two deaf students whom he helped, were sufficiently impressed with the young teacher to assist him financially in his scientific pursuits. Nevertheless, during normal working hours Bell and Watson were still obliged to fulfill a busy schedule of professional demands. It is scarcely surprising that Bell's health again suffered. On April 6, 1875, he was granted the patent for his multiple telegraph; but after another exhausting six months of long nightly sessions in the workshop, while maintaining his daily professional schedule, Bell had to return to his parents' home in Canada to recuperate. In September 1875 he began to write the specifications for the telephone. On March 7, 1876, the United States Patent Office granted to Bell Patent Number 174,465 covering "The method of, and apparatus for, transmitting vocal or other sounds telegraphically . . . by causing electrical undulations, similar in form to the vibrations of the air accompanying the said vocal or other sounds."

Within a year followed the commercial application and, a few months later, the first of hundreds of legal suits. Ironically, the telephone—until then all too often regarded as a joke and its creator-prophet as, at best, an eccentric—was the subject of the most involved patent litigation in history. The two most celebrated of the early actions were the Dowd and Drawbaugh cases wherein the fledgling Bell Telephone Company successfully challenged two subsidiaries of the giant Western Union Telegraph Company for patent infringement. The charges and accusations were especially painful to Bell's Scottish integrity, but the outcome of all the litigation, which persisted throughout the life of his patents, was that Bell's claims were upheld as the first to conceive and apply the undulatory current. In 1877 Bell married Mabel Hubbard, 10 years his junior.

The Bell story does not end with the invention of the telephone; indeed, in many ways it was a beginning. A resident of Washington, D.C., Bell continued his experiments in communication, which culminated in the invention of the photophone—transmission of sound on a beam of light; in medical research; and in techniques for teaching speech to the deaf.

In 1880 France honoured Bell with the Volta Prize; and the 50,000 francs (roughly equiv-

alent to U.S. \$10,000) financed the Volta Laboratory, where, in association with Charles Sumner Tainter and his cousin, Chichester A. Bell, Bell invented the Graphophone. Employing an engraving stylus, controllable speeds, and wax cylinders and disks, the Graphophone presented a practical approach to sound recording. Bell's share of the royalties financed the Volta Bureau and the American Association to Promote the Teaching of Speech to the Deaf (since 1956 the Alexander Graham Bell Association for the Deaf). May 8, 1893, was one of Bell's happiest days; his 13-year-old prodigy, Helen Keller, participated in the ground-breaking ceremonies for the new Volta Bureau building—today an international information centre relating to the oral education of the deaf.

In 1885 Bell acquired land on Cape Breton Island in Nova Scotia. There, in surroundings reminiscent of his early years in Scotland, he established a summer home, Beinn Bhreagh, complete with research laboratories.

In 1898 Bell succeeded his father-in-law as president of the National Geographic Society. Convinced that geography could be taught through pictures, he sought to promote an understanding of life in distant lands in an age when travel was limited to a privileged few. Again he found the proper hands, Gilbert Grosvenor, his future son-in-law, who transformed a modest pamphlet into a unique educational journal reaching millions throughout the world.

As interest in the possibility of flight increased after the turn of the century, he experimented with giant man-carrying kites. Characteristically, Bell again found a group of four willing young enthusiasts to execute his theories. Always an inspiration, Mabel Hubbard Bell, wishing to maintain the stimulating influence of the group, soon founded the Aerial Experiment Association, the first research organization established and endowed by a woman. Deafness was no handicap to the wife of Professor Bell. At Beinn Bhreagh, Bell entered new subjects of investigation, such as sonar detection, solar distillation, the tetrahedron as a structural unit, and hydrofoil craft, one of which weighed more than 10,000 pounds and attained a speed record of 70 miles per hour in 1919.

Apart from his lifelong association with the cause of the deaf, Bell never lingered on one project. His research interests centred on basic principles rather than on refinements. The most cursory examination of his many notebooks shows marginal memos and jottings, often totally unrelated to the subject at hand—reminders of questions and ideas he wanted to investigate. It was impossible for him to carry each of his creative ideas through to a practical end. Many of his conceptions are only today seeing fruition; indeed, some undoubtedly have yet to be developed. The range of his inventive genius is represented only in part by the 18 patents granted in his name alone and the 12 he shared with his collaborators. These included 14 for the telephone and telegraph, 4 for the photophone, 1 for the phonograph, 5 for aerial vehicles, 4 for hydroairplanes, and 2 for a selenium cell.

Until a few days before his death Bell continued to make entries in his journal. During his last dictation he was reassured with "Don't hurry," to which he replied, "I have to."

(T.K.B.)

BIBLIOGRAPHY. Two general biographies are R.V. Bruce, *Alexander Graham Bell and the Conquest of Solitude* (1973), the best account of Bell and his work; and Catherine MacKenzie, *Alexander Graham Bell* (1928). The most detailed published account of Bell's telephonic work is his own last deposition (1892), published in 1908 by American Bell Telephone, *The Deposition of Alexander Gra-*

Alexander Graham Bell

nized as leading authorities in elocution and speech correction, with Alexander Melville Bell's *Standard Elocutionist* passing through nearly 200 editions in English. Young Bell and his two brothers were trained to continue the family profession. His early achievements on behalf of the deaf and his invention of the telephone before his 30th birthday bear testimony to the thoroughness of his training.

Alexander ("Graham" was not added until he was 11) was the second of the three sons of Alexander Melville Bell and Eliza Grace Symonds Bell. Apart from one year at a private school, two years at Edinburgh's Royal High School (from which he was graduated at 14), and attendance at a few lectures at Edinburgh University and at University College in London, Bell was largely family trained and self-taught. His first professional post was at Mr. Skinner's school in Elgin, County Moray, where he instructed the children in both music and elocution. In 1864 he became a resident master in Elgin's Weston House Academy, where he conducted his first studies in sound. Appropriately, Bell had begun professionally as he would continue through life—as a teacher-scientist.

In 1868 he became his father's assistant in London and assumed full charge while the senior Bell lectured in America. The shock of the sudden death of his older brother from

ham Bell; the original patents of 1876 and 1877 are printed in full. Thomas B. Costain, *Chord of Steel* (1960), is limited largely to the telephone.

Bell, Andrew (b. 1726, Edinburgh, Scot.—d. May 10, 1809, Edinburgh), Scottish engraver, and cofounder, with the printer Colin Macfarquhar, of the *Encyclopædia Britannica*.

Bell was born in Edinburgh and lived there all his life. He began work humbly by "engraving letters, names, and crests on gentlemen's plate, dog's collars and so forth." He was never greatly admired as an engraver, and many of his plates for the first, second, and third editions of the *Britannica*, and for William Smellie's translation of the Count de Buffon's *Natural History* (1781 et seq.), are more highly regarded today than in his own time. How the arrangement between Bell and Macfarquhar to produce an encyclopædia was made is not known; but it was Bell who wrote to William Smellie to engage his services as compiler of the first edition (1768–71), and his interest in the publication never flagged. He shared proprietorship with Macfarquhar, and in 1793, after Macfarquhar's death, he became sole proprietor.

Bell, Andrew (b. March 27, 1753, St. Andrews, Fife, Scot.—d. Jan. 27, 1832, Cheltenham, Eng.), Scottish clergyman who developed popular education by the method of supervised mutual teaching among students.

Bell graduated from St. Andrews and went as a tutor to Virginia, where he made a small fortune growing tobacco. After ordination in the Church of England, he went to Madras, where he introduced into an orphan school a "monitorial" plan that overcame shortage of teachers by having the better pupils instruct the slower ones. On his return to London in 1797 he published *An Experiment in Education*, which explained his system, but his ideas had little popularity in England until they were adapted by Joseph Lancaster in a school opened at Southwark in 1801 and by Robert Owen in New Lanark. Meanwhile, Bell was made rector of Swanage, Dorset, in 1801. In 1811 he became superintendent of the National Society for Promoting the Education of the Poor in the Principles of the Established Church, a society formed to put his ideas into effect. He was master of Sherburn Hospital, Durham (1809), canon of Hereford Cathedral (1818), and prebend of Westminster (1819). At his death he left a large endowment for Scottish educational schemes.

Bell, Sir Charles (b. November 1774, Edinburgh, Scot.—d. April 28, 1842, North Hallow, Worcestershire, Eng.), Scottish anatomist whose *New Idea of Anatomy of the Brain* (1811) has been called the "Magna Carta of neurology." A graduate of the University of Edinburgh, Bell went to London (1804), where he held surgical and teaching posts. In 1829 he received the first medal awarded by the

Sir Charles Bell, detail of a portrait by J. Stevens; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London.

Royal Society; he was knighted in 1831. He returned to Edinburgh in 1836 to accept the chair of surgery at the university.

Bell's later research on the anatomy of the brain resulted in an expanded version of his 1811 volume, entitled *The Nervous System of the Human Body* (1830). In these books Bell distinguished between sensory nerves that conduct impulses to the central nervous system and motor nerves that convey impulses from the brain or from other nerve centres to a peripheral organ of response. He announced that the anterior roots of the spinal nerves are motor in function, while the posterior roots are sensory—an observation that was confirmed and more fully elaborated 11 years later by François Magendie.

Bell, Charles Frederic Moberly (b. April 2, 1847, Alexandria, Egypt—d. April 5, 1911, London, Eng.), British journalist who played an outstanding part in the management of *The Times* (London) during a troubled period.

Educated privately in England, Bell returned to Alexandria in 1865 to work for a commercial firm but soon established an informal connection with *The Times*; in 1875 he became its official correspondent. In 1880 he helped to found the *Egyptian Gazette*.

It was after a visit to Egypt by A.F. Walter, chief proprietor of *The Times*, that Bell was invited, in 1890, to assist in the paper's management. *The Times* was then at a low ebb following its erroneous reporting about the Irish nationalist Charles Parnell. Although Bell was somewhat out of touch with technical developments, his strong will, courage, and industry enabled him to keep the paper alive. He reorganized the foreign department, writing personally to correspondents abroad, formed a publications department, and founded *The Times Literary Supplement* (1902) and *The Times Educational Supplement* (1910). He was associated with H.E. Hooper in the sale of the reprintings of the ninth (1898) and tenth (1902–03) editions of the *Encyclopædia Britannica*. He was also an enthusiastic supporter of Hooper in the formation of the Times Book club in 1905. In 1908, despite much opposition, he brought about the sale of *The Times* to Lord Northcliffe. He became managing director of the newly formed publishing company, a post he retained until his death.

Bell, Clive, full name ARTHUR CLIVE HEWARD BELL (b. Sept. 16, 1881, East Shefford, Berkshire, Eng.—d. Sept. 17, 1964, London), English art critic who helped gain popular acceptance in Great Britain for the art of the Post-Impressionists during the early 20th century.

Bell graduated from Trinity College, Cambridge, in 1902 and spent the next several years studying art in Paris and then back in London. In 1907 he married Vanessa Stephen, the sister of Virginia Stephen (Virginia Woolf after her marriage to Leonard Woolf), and these four personalities formed the nucleus of the circle of English writers and artists called the Bloomsbury group (*q.v.*). Clive Bell also formed an important friendship with the English art critic Roger Fry in 1910, and together they organized the landmark Second Post-Impressionist Exhibition that was held in London in 1912.

Bell's most important contribution to art criticism was the theory of "significant form" as described in his books *Art* (1914) and *Since Cézanne* (1922). He asserted that purely formal qualities, *i.e.*, the relationships and combinations of lines and colours, are the most important elements in works of art. The aesthetic emotion aroused in the viewer by a painting springs primarily from his apprehension of its significant form, rather than from his "reading" of its subject matter. Bell pointed to the works of Paul Cézanne as those in which formal properties were manifested most purely, and Bell also attacked the public's pre-

occupation with the anecdotal, narrative, and morally didactic functions of traditional realistic painting.

Bell's assertion that art appreciation involves an emotional response to purely formal properties proved widely influential for several decades, though he was later seriously criticized for his sweeping assertion of the primacy of form over content in art. Among Bell's other publications are *Landmarks in Nineteenth-Century French Painting* (1927) and a volume of reminiscences, *Old Friends: Personal Recollections* (1956).

Bell, Cool Papa, byname of JAMES THOMAS BELL (b. May 17, 1903, Starkville, Miss., U.S.—d. March 7, 1991, St. Louis, Mo.), American professional baseball player, reputedly the fastest baserunner of all time.

Bell began as a pitcher for the St. Louis Stars in the Negro National League at the age of 19 and earned the nickname Cool when he struck out legendary Oscar Charleston; Bell's manager added "Papa." He played centre field for the Stars (1922–28), for the Pittsburgh Crawfords (1933–37), in the Mexican League (1938–42), for the Homestead Grays in the Negro National League (1943–45), and as player-manager of the Kansas City Monarchs in that same league (1948–50). He also played in the California Winter League and in Cuba and the Dominican Republic, as well as on occasion with other Negro teams. A right-handed batter who later became a switch hitter, his average ranged from .308 to .480. He reputedly stole 175 bases in a 200-game season. (Statistics in Negro baseball were not carefully kept.) Playing against all the greats of Negro baseball and against white All-Star teams, Bell batted .391 over a five-year period. He was elected to the Baseball Hall of Fame in 1974.

Bell, Daniel (b. May 10, 1919, New York, N.Y., U.S.), American sociologist and journalist who used sociological theory to reconcile what he believed were the inherent contradictions of capitalistic societies.

Educated at City College of New York, where he received his B.S. (1939), Bell was a journalist for more than 20 years. As managing editor of *The New Leader* (1941–45) and labour editor for *Fortune* (1948–58), he wrote voluminously on various social subjects. After serving in Paris (1956–57) as director of the seminar program of the Congress for Cultural Freedom, he received his doctorate at Columbia University (1960), where he was appointed professor of sociology (1959–69). Bell became professor of sociology at Harvard University in 1969.

Bell's extensive output reflected his concern with political and economic institutions and the ways in which they shape the individual. Among his books are *Marxian Socialism in America* (1952; reprinted 1967), *The Radical Right* (1963), and *The Reforming of General Education* (1966). *The Coming of Post-Industrial Society* (1973) and *The Cultural Contradictions of Capitalism* (1976) attempt to define the relationship between science, technology, and capitalism in society. His views of the nonconforming individual in contemporary society are expressed in *The Winding Passage* (1980).

Bell, Eric Temple (b. Feb. 7, 1883, Aberdeen, Aberdeenshire, Scot.—d. Dec. 21, 1960, Watsonville, Calif., U.S.), Scottish-American mathematician, educator, and writer who discovered several important theorems in the field of number theory, a branch of mathematics dealing with the properties of integers.

Bell immigrated to the United States at the age of 19 and immediately enrolled at Stanford University, where, after only two years, he earned his bachelor's degree. He received his master's degree from the University of

Washington in 1908. Receiving his doctorate in mathematics from Columbia University in 1912, Bell immediately accepted a position at the University of Washington teaching mathematics. He held this position until 1926, when he was named professor of mathematics at the California Institute of Technology. Bell combined his teaching with mathematical research, developing and publishing his ideas on the theory of numbers. From 1931 to 1933 he served as president of the Mathematical Association of America.

Bell published approximately 250 scholarly articles, many dealing with the theory of numbers. For his work "Arithmetical Paraphrases" he received the Bôcher Prize in 1921. Two of his books, *Algebraic Arithmetic* (1927) and *The Development of Mathematics* (1940), became standards in the field, the latter outlining in clear, concise language what Bell believed to be the most significant trends in mathematics.

Bell's works for the layman include *Men of Mathematics* (1937), which related important mathematical discoveries to the men responsible, and *Mathematics, Queen and Servant of Science* (1951), which popularized mathematics as both a practical and an esoteric discipline. He also wrote *The Last Problem* (1961), which based the history of the theory of numbers around the accomplishments of the 17th-century mathematician Pierre Fermat. Under the pen name of John Taine, Bell wrote many books of science fiction, including *The Time Stream* (1946).

Bell, Sir Francis Henry Dillon (b. March 31, 1851, Nelson, N.Z.—d. March 13, 1936, Lowry Bay, near Wellington), New Zealand lawyer and statesman who had a leading role in the Cabinets of Prime Minister William Ferguson Massey (1912–25). He himself also served for a short time as prime minister of New Zealand (1925).

Bell was initially a successful lawyer, and upon entering politics he served three terms as mayor of Wellington, N.Z. During a term in the House of Representatives (1893–96), he formed a close attachment with W.F. Massey. When Massey became prime minister as head of the Reform Party in the general elections of 1912, he asked Bell to lead the Legislative Council. Bell proved an able administrator and legislator, particularly during the coalition government of World War I. He was knighted in 1915. After the war, Bell was effectively Massey's deputy, serving three times as acting prime minister. He also held several ministerial portfolios in Massey's postwar administration. Upon Massey's death in 1925, Bell served as prime minister only until the Reform Party chose a new leader.

Bell, George Kennedy Allen (b. Feb. 4, 1883, Hatling Island, South Hampshire, Eng.—d. Oct. 3, 1958, Canterbury, Kent), Anglican bishop of Chichester, outstanding ecumenicist, and leading British churchman during World War II.

George Bell, c. 1944
BBC Hulton Picture Library

Ordained in 1907, Bell was curate of Leeds (Yorkshire) parish church from 1907 to 1910. In 1914 he ceased studies at Christ Church and became chaplain to Archbishop Randall Davidson. He was made dean of Canterbury Cathedral in 1924 and bishop of Chichester in 1929. After Adolf Hitler came to power in Germany, Bell secured asylum in England for Jews and non-Aryan Christians fleeing from the Nazi regime. During the decade from 1929 to 1939 he was prominent in movements seeking church reunion, and he developed close relations with the German Confessing Church, which opposed Hitler's regime. During World War II, Bell was a well-known critic of saturation bombing.

After the war Bell traveled widely on behalf of the ecumenical movement and the World Council of Churches, which he served as chairman and president. He expressed his views in the House of Lords on numerous issues, including his opposition to Britain's decision to make nuclear weapons. Among his works are *Randall Davidson* (1935), *Christian Unity, The Anglican Position* (1948), and four volumes of *Documents on Christian Unity*.

Bell, Gertrude (Margaret Lowthian) (b. July 14, 1868, Washington Hall, Durham, Eng.—d. July 12, 1926, Baghdad), English traveler, administrator in Arabia, and writer who played a principal part in the establishment in Baghdad of the Hāshimite dynasty.

Gertrude Bell's brilliant career at Oxford, where she took a first in history in 1887, was followed by some time spent in Tehrān, where her uncle Sir Frank Lascelles was British minister. Returning to the political and intellectual salons in England and Europe for a decade, she did not until 1899 embark on the career of Arabian activities that made her famous. She visited Palestine and Syria in that year and was often back in the Middle East during the next decade, extending her travels to Asia Minor. But her heart was set on an Arabian journey, which she began in 1913, being the second woman (after Lady Anne Blunt) to visit Ha'il, where she was not favourably received, although she ever afterwards favoured Ibn Rashid as against the Ibn Sa'ūd dynasty. She never wrote a full account of this journey, though her literary output during the 20 years preceding World War I had been considerable, including *Safar Nameh* (1894), *Poems from the Divan of Hafiz* (1897), *The Desert and the Sown* (1907), *The Thousand and One Churches* (1909), and *Amrath to Amrath* (1911). Her vast correspondence was published in an edited form in two volumes by her stepmother in 1927.

Perhaps her greatest work was a masterly official report on the administration of Mesopotamia during the difficult period between the Armistice of 1918 and the Iraq rebellion of 1920. After a short period of war work in England and France, she plunged into the rough-and-tumble of Middle East politics, mainly in Mesopotamia, where she served in turn under Sir Percy Cox and Sir Arnold Wilson. She helped place the Hāshimite ruler Faysal I on the throne of Iraq in 1921. The last three years of her life were devoted to the creation of an archaeological museum in Baghdad. She insisted, for the first time, that antiquities excavated should stay in the country of their origin, thereby ensuring that the National Museum of Iraq, which is her monument in the land she loved, has a splendid collection of Iraq's own antiquities.

Bell, Henry (b. 1767, Torphichen, Linlithgowshire, Scot.—d. Nov. 14, 1830, Helensburgh, Dumbartonshire), Scottish engineer who launched the first commercially successful steamship in Europe.

After serving apprenticeships as a millwright and a ship modeler, he went to London, where he worked and studied under the Scottish engineer John Rennie. Bell returned to Scotland

in 1790, settled in Glasgow as a carpenter, and later moved to Helensburgh. In 1800 he submitted proposals to the British Admiralty for

Henry Bell, detail of an oil painting by James Tannock, 1840; in the Science Museum, London

By courtesy of the Science Museum, London

steam-propelled vessels. Bell's own steamship, the 28-ton *Comet*, was launched from Port Glasgow in 1812 and subsequently carried passengers and cargo along the Clyde River. The success of this vessel heralded the era of steam navigation in Europe.

Bell, John (b. 1691, Antermony, Stirlingshire, Scot.—d. July 1, 1780, Antermony), Scottish physician and traveler whose vivid account of his journeys did much to awaken Westerners to the way of life of the peoples of Russia and the East, particularly China.

In 1714 Bell set out for St. Petersburg, where he joined a Russian diplomatic mission departing for Persia. Returning to St. Petersburg in 1718, he spent the next four years on a diplomatic mission to China and passed through Siberia and Mongolia. In 1722 he accompanied Peter the Great on an expedition to the city of Derbent, on the western shore of the Caspian Sea. Sent on a mission to Istanbul in 1737, he remained there as a merchant before returning to Scotland in 1747. He was advised to use Jonathan Swift's *Gulliver's Travels* as a model for his *Travels from St. Petersburg in Russia to Various Parts of Asia* (1763), which went through a number of editions and was also translated into French.

Bell, John (b. 1745—d. 1831, Fulham, London), English publisher who was one of the first to organize a book-publishing company on a joint-stock basis. Beginning in 1777 he issued the 109 volumes of *The Poets of Great Britain complete from Chancer to Churchill* series. He influenced later publishing practice by introducing into his books illustrations prepared by competent artists and related to the text. In addition he founded a weekly newspaper, a monthly illustrated magazine, and various other periodicals.

Bell, John (b. Feb. 15, 1797, near Nashville, Tenn., U.S.—d. Sept. 10, 1869, Dover, Tenn.), American politician and nominee for president on the eve of the American Civil War.

Bell entered the U.S. House of Representatives in 1827 and served there as a Democrat until 1841. He broke with Pres. Andrew Jackson in 1834 and supported Hugh Lawson White for president in 1836. After White's defeat Bell became a Whig and, in March 1841, as a reward for party services, was made secretary of war in Pres. William Henry Harrison's Cabinet. A few months later, after the death of President Harrison, he resigned in opposition to Pres. John Tyler's break with the Whigs.

After six years' retirement from political life, Bell was elected as a U.S. senator for Tennessee in 1847, serving in the Senate until 1859. Although a large slaveholder, Bell opposed efforts to expand slavery to the U.S.

territories. He vigorously opposed Pres. James Knox Polk's Mexican War policy and voted against the Compromise of 1850, the Kansas-Nebraska bill (1854), and the attempt to admit Kansas as a slave state. Bell's temperate support of slavery combined with his vigorous defense of the Union brought him the presidential nomination on the Constitutional Union ticket in 1860, but he carried only Virginia, Kentucky, and Tennessee. He initially opposed secession; however, following Pres. Abraham Lincoln's call for troops, he openly advocated resistance and henceforth classed himself a rebel. Bell spent the war years in retirement in Georgia, returning to Tennessee in 1865.

Bell, Lawrence Dale (b. April 5, 1894, Mentone, Ind., U.S.—d. Oct. 20, 1956, Buffalo), U.S. aircraft designer whose experimental X-1 rocket-propelled airplane in 1947 was the first to break the sound barrier in level flight.

In 1912 Bell entered the aviation business as a mechanic for his brother, Grover. When his brother was killed in an airplane accident in 1913, Bell decided to quit, but the attraction of flying proved too great. He went to work

Lawrence Bell

By courtesy of the National Air and Space Museum, Smithsonian Institution, Washington, D.C.

for another aviation pioneer, Glenn L. Martin, remaining in the field for the rest of his life. He was actively running Bell Aircraft Corporation, Buffalo, at the time of his death. The Bell P-39 Airacobra and the P-63 Kingcobra fighters were widely used in World War II. Bell designed the first U.S. jet aircraft, the XP-59A Airacomet fighter. Originally powered by two British Whittle engines, it made its first flight on Oct. 1, 1942.

Bell Bay, port and site of a large aluminum-production facility, northern Tasmania, Australia, on the east bank of the River Tamar estuary in George Town municipality. Electric power is supplied from the Trevallyn station on the South Esk River, supplemented by an oil-fired thermal plant. The first metal was produced there in 1955, and operations combine the reduction of alumina from bauxite received from Weipa and Gladstone, Queen., and the production of aluminum. The capacity is more than 90,000 tons annually. Other activities include the manufacture of aluminum paint, as well as aluminum powder and paste for explosives. The port also has a ferromanganese plant and a bulk oil terminal. Large ore carriers approach Bell Bay via deep-water channels. Some processed materials are shipped through Launceston, 30 mi (50 km) south.

bell, book, and candle, in Roman Catholicism, a ceremony formerly used in pronouncing the "major excommunication" or "anathema" (see excommunication). Its origins are not clear, but it dates back certainly to the late 9th century. The bell represented the public

character of the act, the book the authority of the words spoken by the presiding bishop. The candle was believed to symbolize the possibility that the ban might be lifted by the repentance and amendment of its victim. The ceremony was performed in some conspicuous place, and, upon its termination, letters were written to bishops of other sees to report the fact. When the assemblage had been convoked, a bishop appeared with 12 priests, and all 13 held lighted candles. The bishop, wearing violet vestments, then recited the formula, ending thus: "We separate him, together with his accomplices and abettors, from the precious body and blood of the Lord and from the society of all Christians; we exclude him from our holy mother the church in heaven and on earth; we declare him excommunicate and anathema; we judge him damned, with the devil and his angels and all the reprobate, to eternal fire until he shall recover himself from the toils of the devil and return to amendment and to penitence." Those present answered, "So be it!" Then the bishop and the 12 priests extinguished their candles by dashing them to the ground, and (as a general rule) the ceremony then ended.

bell chime (from medieval Latin *cymbala*: "bells"), set of stationary bells tuned in a musical series, traditionally in diatonic sequence (seven-note scale) plus a few accidentals (sharps and flats). The bells generally number from 2 to 20 and, in the *voorslags* (automatic clock chimes) of Belgium and The Netherlands, can have a range of up to three octaves or more. The bell chime's primary function is the automatic play preceding the hour strike of a church or town-hall tower clock to alert to its imminence; it may also play on the half, quarter, and, sometimes, eighth hour. A secondary role is the human play of simple unharmonized melodies. From the 13th century this was done manually by pulling ropes attached to clappers ("clocking," now rare); from the late 18th century by a keyboard of levers and sometimes pedals, called a chime stand; and in the 20th century by an ivory keyboard with electric action, often in conjunction with automatic roll-play. To chime also refers to the clock's striking of the bells or chimes and to their music; in England, change-ringing bells swinging in a limited arc rather than a full-circle arc are said to chime.

The chime differs from a carillon in that its range is more limited and may not have a full 12-note (chromatic) scale. Until the 20th century its bells generally lacked an inner tuning, or fixed mathematical relationship of partials (component tones of a bell's complex sound) to permit use of harmony; it also lacks dynamic variation. But in Belgium and The Netherlands, automatic clock chimes produce fully harmonized music of considerable complexity, their bells having an inner tuning. Universally, the clock-chiming mechanism has been a drum pegged to trip levers wired to the bell hammers; rotated by a suspended weight, it is actuated by the clockworks.

The chime tune most commonly heard in English-speaking countries is the "Westminster Quarters" (originally "Cambridge Quarters"), consisting of the four notes E-D-C-G in various combination each quarter hour. Composed at Cambridge University by an organ student, William Crotch, for use with the new clock at Great St. Mary's Church, in 1793, its subsequent use in the clock tower of the Houses of Parliament, London (1859), resulted in its present name. Also frequently heard is the "ting-tang," or repeated alternation of two notes, adopted at St. Paul's Cathedral, London. Other chime tunes of note are the "Bells of Aberdovey," "Turn Again, Whittington," and "Holsworthy Tune."

The earliest chimes were Chinese stone chimes, sets of L-shaped marble slabs suspended in wooden frames and struck by mal-

lets. Chinese bell chimes appeared sometime before 2000 BC. From the Chou period (c. 1122–221 BC) both stone and bell chimes, suspended in two rows of eight, have been prominent in Chinese temple worship and in secular music. Later, bell chimes were used in Korea, India, and Japan.

In the 9th century, sequences of small beehive-shaped bells, numbering 4 to 15, were introduced in Western monasteries. Western chime bells, like the Chinese ones, were mounted on horizontal supports to be struck with mallets. The instrument itself, like the bells, was called a *cymbala*. In the 12th century, *cymbala* were wired to organ keys, thus forming the first organ chimes. The knowledge of tuning acquired with the *cymbala* resulted in the design of differently pitched bells placed in towers and struck by *jacquemarts*, or clock jacks (usually a pair of knights in armour), to mark the hours. The introduction of the weight-driven tower clock led to the invention of the pegged chiming barrel in the 14th; by the 17th century about 500 European chimes utilized this automatic action.

Late in the 18th century a chime of 10 to 20 bells playable from a wooden keyboard became fashionable in France and Great Britain. In the U.S. between about 1850 and 1930, hundreds of such chimes were installed in churches, town halls, and other towers.

The Russian *zvon* ("chimes") are sets of stationary bells rung by pulling ropes attached to clappers. They date from the 9th century but are rarely heard today. The *zvon* plays repetitious rhythmic patterns that form a part of the liturgy of the Orthodox Church. See also bell; carillon; change ringing.

Bell Island, island in southeastern Newfoundland, Canada; it lies in Conception Bay 3 mi (5 km) off the Avalon Peninsula. Bell Island is 6 mi long and 3 mi wide, and has an area of 11 sq mi (28 sq km). Named after a large bell-shaped rock off its west end, it was one of the world's major iron-ore producers from 1895 to 1966. Fishing and subsistence agriculture are now the main economic activities on the densely populated island. Regular ferry service connects Wabana, its largest town, with the Avalon Peninsula.

Bell Laboratories, formal title AT&T BELL LABORATORIES, INC., byname BELL LABS, research and development company, whose stock is owned by American Telephone and Telegraph Company (AT&T). It develops the telecommunications equipment manufactured by AT&T. It also does defense-related research and development under military contracts. Headquarters for the laboratories are in Murray Hill, N.J.

The company was incorporated in 1925 as Bell Telephone Laboratories, Inc., but its history can be traced at least to 1907, when the engineering departments of AT&T and Western Electric were centralized in New York City, or even to 1883, when AT&T's Mechanical Department was formed. Since its founding the organization has produced thousands of scientific and engineering innovations. In 1926, for example, it issued the first synchronous-sound motion-picture system. In 1937 it constructed the pioneer electrical-relay digital computer; in the same year, a Bell researcher, Clinton Davisson, shared the Nobel Prize for Physics for demonstrating the wave nature of matter. In 1947 the laboratories invented the transistor for which Bell researchers John Bardeen, Walter H. Brattain, and William B. Shockley were awarded the 1956 Nobel Prize for Physics. In 1978 two more Bell researchers, Arno Penzias and Robert W. Wilson, shared the Nobel Prize for the discovery of cosmic microwave background radiation. These and other achievements—together with the publication of technical and scientific papers by its staff—make Bell Labs one of the world's most prestigious research facilities.

bell-magpie, Australasian songbird belonging to the family Cracticidae (order Passeriformes), named for its loud, metallic voice and magpie-like black-and-white plumage. Most authorities consider the bell-magpies to represent a single widespread species, *Gymnorhina tibicen*; some recognize three species, the white-backed (*G. hypoleuca*), the western (*G. dorsalis*), and the black-backed (*G. tibicen*). Bell-magpies are 35–50 cm (14–20 inches) long and (unlike the true magpies) rather short-tailed. They feed on lizards, snakes, and large insects in open country. All are aggressive, especially during the breeding season, attacking larger birds and even humans. In rural areas the open nest may include large amounts of wire, as well as grass and sticks.

bell moth: see leaf roller moth.

bell pepper, any of various thick-fleshed, mild peppers of the genus *Capsicum*. See pepper.

Bell Rock, also called INCHCAPE ROCK, sandstone reef in the North Sea off the coast of Scotland, 12 miles (19 km) southeast of Arbroath. It is 2,000 feet (600 m) long and is exposed for a few feet at low tide but submerged at high tide. A peril to navigation, the rock lies in the fairway of vessels entering or leaving the rivers Tay and Forth as well as ports farther north. During a storm in 1779, 70 ships were wrecked on the reef. A lighthouse tower, designed by Robert Stevenson and built 1807–11, stands 100 feet high there.

According to tradition, an abbot of Arbroath had ordered a warning bell—whence the name of the rock—to be fastened to the reef so as to respond to movements of the waves. This was destroyed by the pirate Ralph the Rover, whose ship was later wrecked at the same spot. Robert Southey made the incident the subject of his ballad “The Inchcape Rock.”

Bell System, a former American telephone system, governed by American Telephone & Telegraph Company (*q.v.*; AT&T) and including Western Electric Company (*q.v.*), the system's manufacturer; Bell Laboratories (*q.v.*), the research and development facility; and other departments and 22 operating companies. The system was dismantled in 1983, when the 22 operating companies were divested by AT&T under court order.

Bell Trade Act, formally PHILIPPINE TRADE ACT OF 1946, an act passed by the U.S. Congress specifying the economic conditions governing the emergence of the Republic of the Philippines from U.S. rule.

When the Philippines became independent on July 4, 1946, its economy had been thoroughly devastated by World War II. Payment of war damage claims by the U.S. government and an influx of capital were both desperately needed. The Bell Act set quotas on Philippine exports to the U.S., pegged the Philippine peso to the U.S. dollar at a rate of 2:1, and provided for free trade between the two countries for 8 years, to be followed by gradual application of tariffs for the next 20 years. Many Filipinos objected to the so-called Parity Amendment, which required an amendment to the Philippine constitution allowing U.S. citizens equal rights with Filipinos in the exploitation of natural resources and operation of public utilities; nonetheless, some powerful Filipinos involved in these negotiations stood to benefit from the arrangement.

A strong incentive for Philippine acquiescence was the fact that American payment of \$800,000,000 in war damage claims was made contingent upon Filipino ratification of the Bell Act. The act remained extremely unpopular in the Philippines. It was later superseded by an agreement more favourable to Filipino interests, the Laurel-Langley Agreement, which took effect in 1956.

Bella, Stefano della (Italian), French ÉTIENNE DE LA BELLE (b. May 18, 1610, Florence [Italy]—d. July 12, 1664, Florence), Baroque printmaker noted for his engravings of military events, in the manner of Jacques Callot.

Stefano was initially apprenticed to a goldsmith but turned to engraving, studying under Remigio Cantagallina. Through Lorenzo de' Medici he was enabled to spend three years in study at Rome. In 1642 he went to Paris, where Cardinal de Richelieu engaged him to make drawings of the siege of Arras and the taking of that town by the French army. In 1647 he went to Amsterdam, where he was influenced by the Dutch school of landscape painting and the graphics of Rembrandt. His works after this period grew more atmospheric and delicate, often being executed in small formats. About 1650 he returned to Florence. His prints number more than 1,400 and include a wide variety of subjects.

Bella Coola, North Pacific Coast Indians whose villages were located in what is now the central British Columbia coast, along the upper Dean and Burke channels and the lower parts of the Bella Coola River valley. They spoke a Salishan language related to that of the Coast Salish (*q.v.*) to the south. Their ancestors probably separated from the main body of Salish and migrated northward. Although their material culture, ceremonials, and mythology resembled those of their Heiltsuk neighbours (see Kwakiutl), their social organization was similar to that of the more distant Salish. The Bella Coola probably numbered about 5,000 at the time of their first contacts with Europeans but were reduced by disease in the 19th century to less than 1,000, who lived in a single village. In the late 20th century the population was increasing.

The Bella Coola lived in permanent villages of large plank-built houses occupied by a number of families. They used wood for houses, canoes, and watertight boxes that served a variety of domestic purposes. Shredded cedar bark provided clothing, baskets were made of cedar and spruce, and alder and cedar were carved into masks and other ceremonial objects, including the spectacular totem poles of the 19th century. Fish was their basic food supply, supplemented by hunting and by collecting berries and roots. Salmon, taken in the summer, were eaten fresh or smoked; oil extracted from eulachon (candlefish) was used as a condiment. Life was essentially on a village basis, with status dependent both on hereditary rank and on wealth, measured by ostentatious giving at potlaches (*q.v.*). There was no formal tribal cohesion but rather a strong feeling of unity based on common language, common origin, and pride in respect to neighbouring tribes. Secret societies were important, with an unusually well-developed pantheon of deities and great dependence on numerous oral traditions.

belladonna, tall bushy herb, the deadly nightshade (*Atropa belladonna*), of the family Solanaceae (order Solanales), and the crude drug consisting of its dried leaves or roots. The plant, which grows to about 1.5 m (4–5 feet) tall, is a native of wooded or waste areas in central and southern Eurasia. It has dull green leaves, violet or greenish flowers in the axils of the leaves or in the forks of branches, shiny black berries about the size of cherries, and a large tapering root.

Belladonna is highly poisonous and is cultivated in France and elsewhere for the medicinal alkaloids hyoscyamine, hyoscyne, and atropine, which are derived from the crude drug and are used in sedatives, stimulants, and antispasmodics. Because of toxicity and undesirable side effects, these alkaloids are being superseded by synthetic drugs.

Bellamy, Edward (b. March 26, 1850, Chicopee Falls, Mass., U.S.—d. May 22, 1898,

Chicopee Falls), American writer known chiefly for his utopian novel *Looking Backward, 2000–1887*.

The son of a Baptist minister, Bellamy first realized the plight of the urban poor at 18 while studying for a year in Germany. He studied law, was admitted to the bar in 1871, but soon turned to journalism, first as an associate editor for the *Springfield* (Massachusetts) *Union* and then as an editorial writer for the *New York Evening Post*. Bellamy's early essays and stories sometimes indirectly criticized conventional American attitudes.

Bellamy

By courtesy of the Library of Congress, Washington, D.C.

In *Looking Backward* (1888), set in Boston in the year 2000, he described the United States under an ideal socialist system that featured cooperation, brotherhood, and an industry geared to human need. The novel, which sold more than 1,000,000 copies, appealed to a public still suffering the effects of the depression of 1883 and disturbed by such industrial clashes as the Haymarket Riot in Chicago (1886). Bellamy became an active propagandist for the nationalization of public services, and his ideas encouraged the foundation of Nationalist clubs. Political groups inspired by Bellamy's works also appeared in Europe, especially in The Netherlands. He influenced the Populist Party platform of 1892 through his magazine *The Nationalist* (1889–91), but its successor, the *New Nation* (1891–94), saw the movement in decline. Bellamy's *Equality* (1897), a sequel to *Looking Backward*, was less successful. Additional writings were published in *Edward Bellamy Speaks Again!* (1937) and as *Talks on Nationalism* (1938).

BIBLIOGRAPHY. Critical biographies include Arthur E. Morgan, *Edward Bellamy* (1944, reprinted 1974); and Sylvia E. Bowman, *The Year 2000* (1958, reprinted 1979). More recent studies are Bowman's *Edward Bellamy* (1986), a brief survey; and Daphne Patai (ed.), *Looking Backward, 1888–1888* (1988), centenary essays.

Bellanca, Giuseppe Mario (b. March 19, 1886, Sciacca, Italy—d. Dec. 26, 1960, New York, N.Y., U.S.), airplane designer and builder who created the first monoplane in the United States with an enclosed cabin.

Bellanca graduated with an engineering degree from the Milan Polytechnic and in 1911 came to the United States, where he thought the future was bright for aircraft design. He had experimented unsuccessfully with design and construction in his student days, but he built and learned to fly his first plane on Long Island, New York, where he had a flying school from 1912 through 1916. In 1917 he designed and built the first enclosed-cabin monoplane, which succeeded in air races. After World War I the premier flying circus pilot Clarence D. Chamberlin commissioned a plane from him and retained his friend, getting him a job at the Wright Aircraft Corporation (1924–26). In 1927 Chamberlin flew a Bellanca plane on the first transatlantic flight

with a passenger to set a new long-distance record, from New York City to Eisleben, Ger. Bellanca planes were favourites of long-distance flyers in the late 1920s and early 1930s. (A Bellanca had been Charles A. Lindbergh's first choice.) In 1931 a Bellanca plane made the first Japan-to-U.S. nonstop flight.

The Bellanca Aircraft Company (1927–54) specialized in making executive private planes. Bellanca became a naturalized U.S. citizen in 1929. After selling his company in 1954, he remained active in design and construction with Bellanca Aircraft Engineering, which he operated with his son.

Bellarmino, Saint Robert, Italian in full SAN ROBERTO FRANCESCO ROMOLO BELLARMINO (b. Oct. 4, 1542, Montepulciano, Tuscany [Italy]—d. Sept. 17, 1621, Rome; canonized 1930; feast day May 17), Italian cardinal and theologian, an opponent of the Protestant doctrines of the Reformation.

Bellarmino entered the Society of Jesus in 1560. After studying in Italy at Rome, Mondovì, and Padua, he was sent to Louvain in the Spanish Netherlands, where he was ordained in 1570 and began to teach theology. He was forced by the strength of Protestantism and the Augustinian doctrines of grace and free will prevailing in the Low Countries to define his theological principles. He returned to Rome, where he lectured at the new Jesuit College. Made a cardinal by Pope Clement VIII in 1599, he was subsequently appointed archbishop of Capua (1602). As a consultor of the Holy Office, he took a prominent part in the first examination of Galileo's writings. Bellarmine, somewhat sympathetic to Galileo's views, granted him an audience in which he warned him not to defend the Copernican theory but to regard it only as a hypothesis. Acting on the part of the Holy Office, and fearing scandal at a time when Roman Catholicism and Protestantism were embroiled, Bellarmine thought it best to have the Copernican theory declared "false and erroneous." The church so decreed in 1616.

Bellarmino took a personal interest in the poor, to whom he gave all his funds. He died a pauper. During his lifetime he gave impartial attention to Protestant works and was regarded as one of the most enlightened of theologians. He was named a doctor of the church by Pope Pius XI in 1931.

Bellarmino's most influential writings were the series of lectures published under the title *Disputationes de controversiis Christianae fidei adversus huius temporis haereticos* (1586–93; "Lectures Concerning the Controversies of the Christian Faith Against the Heretics of This Time"). They contained a lucid and uncompromising statement of Roman Catholic doctrine. He took part in the preparation of the Clementine edition (1591–92) of the Vulgate. His catechism of 1597 greatly influenced later works. In 1610 he published *De Potestate Summi Pontificis in Rebus Temporalibus* ("Concerning the Power of the Supreme Pontiff in Temporal Matters"), a reply to William Barclay of Aberdeen's *De Potestate Papae* (1609; "Concerning the Power of the Pope"), which denied all temporal power to the pope. Bellarmine's autobiography first appeared in 1675. A complete edition of his works was published in 12 volumes (1870–74).

BIBLIOGRAPHY. Works on Bellarmine include E.A. Ryan, *The Historical Scholarship of Saint Bellarmine* (1936); and James Brodrick, *Robert Bellarmine, Saint and Scholar* (1961).

Bellary, town, east-central Karnāṭaka (formerly Mysore) state, southern India. Of medieval origin, the town is dominated by a 16th-century fort on a granitic rock, 2 miles (3 km) in circumference, which rises abruptly from the surrounding plain to a height of 450 feet

(140 m). Haidar (Hyder) Ali, the 18th-century Muslim ruler of Mysore, reputedly expanded the fortifications with the aid of a French engineer, whom he later hanged for not building the fort on an adjacent, higher rock. A rail and road centre, Bellary processes cotton, the region's main cash crop, and has distillery and sugar-refining enterprises. Its colleges of medicine, law, and education are affiliated with Karnāṭak University in Dhārwar. Pop. (1991) 245,391.

Bellay, Guillaume du, SEIGNEUR (lord) DE LANGEY (b. 1491, Glatigny, Fr.—d. Jan. 9, 1543, Saint-Symphorien-de-Lay), French soldier and writer known for his diplomatic exploits during the reign of King Francis I of France.

The eldest of six brothers of a noble Angevin family, du Bellay was educated at the Sorbonne. He fought in Flanders and in Italy and was eventually, with Francis I, taken prisoner by the Holy Roman emperor Charles V's troops at the Battle of Pavia (1525). Afterward he was employed by Francis as a diplomat, at first concerned with the drawing up of the

Guillaume du Bellay, detail of an engraving, 16th century
Giraudon—Art Resource/EB Inc

Treaty of Cambrai (1529) between Francis and Charles V. From 1532 to 1536 he was employed principally in uniting the German princes against Charles V.

Without joining the Protestants, du Bellay defended them against their opponents. In 1534–35 he tried to bring about a meeting between Francis and Philip Melancthon, Luther's colleague; he was also the friend of many writers and scholars, some of whom were Protestants. Du Bellay himself wrote in the style of the Roman historian Livy. His most important work was the *Ogdoades*, a history of the rivalry between Francis I and Charles V. Only fragments remain: the first part, covering the years 1515–21, is written in Latin; the rest is in French and is incorporated in his brother Martin's *Mémoires* (1569). The first four books of a history covering the early years of France were published as *Épitome de l'antiquité des Gaules et de France* (1556; "Abridgment of the Early Times of Gaul and France").

Bellay, Jean du (b. 1492/98, Glatigny, Fr.—d. Feb. 16, 1560, Rome, Papal States [Italy]), French cardinal and diplomat, one of the chief counsellors of King Francis I of France and a protector of humanists and religious reformers.

Member of a prominent family and brother of Guillaume du Bellay, Jean du Bellay was made bishop of Bayonne in 1526, a privy counsellor in 1530, and bishop of Paris in 1532. Francis I also employed him as a diplomat, sending him on five missions to England between September 1527 and January 1534 and to Rome in 1534 to defend the English king Henry VIII's divorce. He was made a cardinal in May 1535. In February 1536 he was

appointed lieutenant general of the kingdom during the war of 1536–37 between Francis I and the Holy Roman emperor Charles V. During the last years of Francis' reign, du Bellay received many benefices.

Jean du Bellay, engraving by an unknown French artist, 16th century
Giraudon—Art Resource/EB Inc

On the accession of King Henry II (1547), du Bellay fell into disfavour. He retired to Rome (1553), where he became bishop of Ostia and dean of the Sacred College of Cardinals (1555).

Du Bellay helped his friend Guillaume Budé persuade Francis I to found the Collège de France. The writer François Rabelais was his secretary and doctor; and other men of letters, such as Étienne Dolet and the poet Salmon Macrin, were indebted to him for assistance. His own writings include three books of Latin poems and a defense of Francis I (1542). His correspondence is preserved in the Bibliothèque Nationale in Paris.

Bellay, Joachim du (b. c. 1522, Liré, Fr.—d. Jan. 1, 1560, Paris), French poet, leader with Pierre de Ronsard of the literary group known as La Pléiade. Du Bellay is the author of the Pléiade's manifesto, *La Défense et illustration de la langue française* (1549; *The Defence and Illustration of the French Language*), in which he asserts that French is capable of producing a modern literature at least equal to that of the Italians.

Du Bellay was born into a noble family of the Loire River valley. His cousin Jean du Bellay was a prominent cardinal and diplomat. Joachim studied law and the humanities in Poitiers and Paris, and in 1549–50 his first sonnets, inspired by those of the Italian poet Petrarch, were published. In 1553 he went with Jean on a mission to Rome. By this time he had started to write on religious themes, but his experience of court

Joachim du Bellay, pencil drawing, 16th century; in the Bibliothèque Nationale, Paris

By courtesy of the Bibliothèque Nationale, Paris

life in the Vatican seems to have disillusioned him. He turned instead to meditations on the vanished glories of ancient Rome in the *Antiquités de Rome* and to melancholy satire in his finest work, the *Regrets* (both published after his return to France in 1558).

Throughout his life du Bellay suffered ill health and intermittent deafness. His portraits show a withdrawn and austere figure and reinforce the impression of a man totally dedicated to his art. He had a sincere affection for his country and determined that it should have a literature to rival that of any other nation. He introduced new literary forms into French, with the first book of odes and the first of love sonnets in the language. Abroad, he influenced the English lyric poets of the 16th century, and some of his work was translated by Edmund Spenser as *Complaints*... (1591).

bellbird, any of several unrelated birds named for their ringing voices. All belong to the order Passeriformes.

Naked-throated bellbird (*Procnias nudicollis*)
Wolfgang Lummer

Procnias, four species of cotingas (family Cotingidae), chiefly of tropical South America, are more or less white; three wear fleshy ornaments. The white bellbird (*P. alba*) has a tapering black spike, sparsely feathered, on the forehead. The mossy-throated, bearded, or black-winged bellbird (*P. averano*) has many thin wattles hanging from the throat. The three-wattled bellbird (*P. tricarunculata*) confined to Central America, has three bill wattles. The naked-throated bellbird (*P. nudicollis*) has a green face and throat. These jaysized, fruit-eating birds produce calls that can be heard for surprising distances.

Anthornis melanura, of New Zealand, is a honeyeater (family Meliphagidae). Both sexes of this 23-centimetre (9-inch) dark-green species, which lives in virgin forest, sing in beautifully chiming choruses.

Manorina melanophrys, often called the bellminer, is an Australian honeyeater (family Meliphagidae).

Oreica gutturalis, also of Australia, usually called the crested bellbird, is a thickhead (subfamily Pachycephalinae of the family Muscipidae).

Certain shrike species are also known as bellbirds or bell-shrikes. See shrike.

Belle, Étienne de la: see Bella, Stefano della.

Belle Fourche, city, seat (1883) of Butte county, western South Dakota, U.S., at the confluence of Red Water Creek and Belle Fourche River, near the Wyoming border. The

site was selected by the Fremont, Elkhorn, and Missouri Valley Railroad; it was settled in 1878 and was named for the Belle Fourche (French: "beautiful fork") River. Since its early days the city has been an important market and shipping centre for livestock. Industries include beet-sugar refining, bentonite mining and processing, lumbering, and brick manufacturing. The Belle Fourche (Orman) Dam impounds a reservoir (10 mi [16 km] long and 2 mi wide) used for irrigation and recreation. The city is at the northern entrance to the Black Hills National Forest, and holds the Black Hills Roundup, an annual July rodeo. Inc. 1903. Pop. (1990) 4,335.

Belle Glade, city, Palm Beach county, southeastern Florida, U.S. It originated as the Hillsborough Canal Settlement on the southeast shores of Lake Okeechobee and in 1921 was renamed Belle Glade (from "Belle of the Glades"), selected from an informal poll. A hurricane (1928) caused widespread damage, but the community was rebuilt and incorporated as a town in the same year. It developed as a truck-farming centre, noted for winter vegetables grown on the surrounding rich Everglades muckland, which also supports citrus, sugarcane, and other tropical crops. Sugar processing is significant and a beef cattle industry has been established. Belle Glade became a city by referendum (1945). The Everglades Experiment Station is 3 mi (5 km) east. Pop. (1990) 16,177.

Belle-Île-en-Mer, Breton ENEZ AR GERVEUR, island (area 32 sq mi [83 sq km]) off the south coast of Brittany, France, 8 mi (13 km) southwest of Presqu'île de Quiberon and administratively part of Morbihan département, Bretagne region. As an outpost of the mainland ports of Saint-Nazaire and Lorient, a citadel on the island was strategically important to France from 1572 to the 19th century. Occupied by the British in 1761–63, it was returned to France by the same treaty that yielded Nova Scotia to Great Britain. It has several fishing settlements, the largest being Le

Belle-Île-en-Mer and its harbour, France
Éditions d'Art JOS Le Doaré

Palais. Its economic basis is agricultural, especially grains, supplemented by fishing. Pop. (1982) 4,191.

Belle-Isle, Charles (-Louis-Auguste) Fouquet, duc de (duke of), DUC DE GISORS (b. Sept. 24, 1684, Villefranche, Fr.—d. Jan. 26, 1761, Versailles), marshal of France and statesman chiefly important for his role in involving France in the War of the Austrian Succession.

A grandson of the notorious Nicolas Fouquet, finance minister under Louis XIV, Belle-Isle joined the army as a youth and fought in the War of the Spanish Succession and in the war of 1718–19 against Spain. He made his fortune by speculation in a financial system developed by John Law, Scottish monetary reformer and originator of the "Mississippi Scheme." He was disgraced and exiled to his estates by the Duc de Bourbon, head of the regency council. He recovered his position at

court under Cardinal Fleury and enhanced his military reputation by successes in the Rhineland during the War of the Polish Succession. Hoping to succeed Fleury as prime minister, Belle-Isle engaged in various court intrigues. He led an anti-Austrian faction at court that forced Fleury into offensive operations against Maria Theresa in the interest of Charles Albert, elector of Bavaria. France ended by repudiating Fleury's recognition of the Pragmatic Sanction and by forgoing a chance to concentrate on naval and colonial rivalry with Great Britain.

Belle-Isle was influential in securing the election of Charles Albert as emperor (Charles VII) on Jan. 24, 1742, for which he was created duc de Gisors in March. Later, as military commander, he skillfully led the withdrawal of French forces from Prague (1742) and successfully defended Provence against the Austrians and Sardinians (1746–47). In 1748 his duchy was made a peerage of France, and in 1749 he was elected to the Académie Française.

Belle-Isle served as minister of war (1758–60) during the Seven Years' War; he carried out minor administrative reforms but was criticized for his failure to reinforce the French troops at Quebec, thereby losing Canada.

Belle Isle, Strait of, northern entrance from the Atlantic Ocean to the Gulf of St. Lawrence.

Red Bay, fishing village on the Strait of Belle Isle, Labrador

eastern Canada. The strait, 90 mi (145 km) long, 10 to 17 mi wide, and lying between Newfoundland (east) and Labrador (west), is the most direct route from the St. Lawrence Seaway and Great Lakes ports to Europe. The cold Labrador Current flows through the strait, favouring an extended period of ice cover and limiting the shipping season to between June and late November.

Belleau, Rémy (b. 1528, Nogent-le-Rotrou, near Chartres, Fr.—d. March 6, 1577, Paris), Renaissance scholar and poet who wrote highly polished portraits known as miniatures. He was a member of the group called La Pléiade, a literary circle that sought to

Belleau, engraving by Radel
H Roger-Viollet

enrich French literature by reviving classical tradition.

A contemporary of the poet Pierre de Ronsard at the Collège de Coqueret, Belleau at first gained the patronage of the Abbé Chretophle de Choiseul and later of Charles IX and Henry III, who made him secretary of the king's chamber. He took part in a campaign against Naples in 1557 and from about 1563 lived at Joinville as tutor and counsellor to the Guises, a powerful Catholic family. Living at the Château de Guise inspired Belleau to write *La Bergerie* (1565–72), a collection of pastoral odes, sonnets, hymns, and amorous verse. Belleau's detailed descriptions of nature and works of art earned him a reputation as a miniaturist in poetry and prompted Ronsard to characterize him as a "painter of nature." His other poetic works include didactic verse; *Les Amours et nouveaux échanges des pierres précieuses* (1576), a commentary on exotic stones and their inherent secret virtues written in the tradition of the medieval lapidaries; and *La Reconnue* (1577), a comedy in verse based on Plautus' *Casina*. His erudite translations of Anacreon's *Odes* (1556) won him the seventh seat or "star" in the constellation of La Pléiade, a name the group adopted in imitation of a group of eminent Greek poets of c. 250 BC. Belleau's collected works were edited by A. Gouverneur and published in 1867.

Bellecour, original name JEAN-CLAUDE-GILLES COLSON (b. Jan. 16, 1725, Paris—d. Nov. 19, 1778, Paris), playwright who also was one of the leading comic actors of the Comédie-Française (q.v.).

The son of a portraitist, he was a painter in his youth, while concurrently appearing in various amateur theatrical productions. His success on stage caused him to set aside painting and become an actor. After playing in the provinces, he made his debut at the Comédie-Française on Dec. 21, 1750, as Achilles in Racine's *Iphigénie*. Bellecour established his reputation, however, in comic roles. He had entered the Comédie-Française concurrently with the famous French tragedian Lekain. Because of his superb stage presence, Bellecour was preferred. Upon Lekain's formal admission to the company, however, Bellecour forfeited the tragic roles and thus became an outstanding comedian, for which he was more suited. He wrote a successful play, *Les Fausses Apparences* ("The False Appearances"), in 1761.

Bellecour, Madame, original name ROSE-PERRINE LE ROY DE LA CORBINAYE, also called MADEMOISELLE BEAUMÉNARD (b. Dec. 20, 1730, Lamballe, Fr.—d. Aug. 5, 1799, Paris), French actress noted for her performances in works of Molière and Regnard.

The daughter of an aged artillery captain of noble ancestry, Rose-Perrine left home at the age of 13 and took up with an itinerant comedian called Beauménard. She decided to adopt both his name and his calling, and under his auspices she made her debut in 1743 at the Opéra-Comique of the fair at Saint-Germain. Beautiful and flirtatious she was immediately successful. She toured for several years with a variety of companies, entertained troops of the Marshal de Saxe—and, it is said, the Marshal himself—and had many amatory encounters. In 1749 she made her debut at the Comédie-Française, first appearing there as Dorine in Molière's *Tartuffe*; her success was immediate. She excelled in the role of soubrette, becoming extremely popular. She retired from the public eye in 1756 and did not reappear until 1761, by which time she had married Bellecour. She resumed a highly successful career as Madame Bellecour, appearing to wide acclaim in soubrette parts in the plays of Molière and Jean-François Regnard. She retired again in

1790. The French Revolution terminated her pension, forcing her to attempt a final comeback. Her failure was pathetic, and she died in poverty.

Belleek ware, porcelain from the factory at Belleek, in Fermanagh, Ire. (now Northern Ireland). Extensive local deposits of white feldspar and Cornish china clay and the use of skilled labour from England contributed to the early success of this factory, established by David McBinney and Robert Williams Armstrong in 1857. The white lustreware and the large Parian statuary associated with Belleek

Belleek porcelain shell ornamental dish probably modelled by Robert Williams Armstrong, c. 1868; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London

both appeared in that first year. Belleek ornate figures, busts in the classical style, were in natural forms (e.g., shells), and utilitarian ware were among the finest of Victorian eggshell porcelain. The factory became noted for its highly polished iridescent glaze (made under license from the patentee Jules-Joseph Brianchon of Paris) with a frostlike appearance; for a characteristic delicacy and subtlety, evident in the famous Belleek openwork baskets, which, in oval or round form, were hand modelled and embellished with flowers and foliage; and for ornamental motifs taken from marine life. Production continues to the present day, including traditional 19th-century designs.

American, or Lenox, Belleek, a successful imitation that developed its own warm and restrained perfection, was initiated by Walter Scott Lenox in about 1889 at the Ceramic Art Company and has been made by Lenox, Inc., since 1906.

Bellefontaine, city, seat (1820) of Logan county, west central Ohio, U.S., 45 mi (72 km) northwest of Columbus. The site was once occupied by a Shawnee village called Blue Jacket's Town (for a white youth [Marmaduke Swearingen] captured while wearing a blue jacket, who later became a Shawnee chief and was one of the tribal leaders at the Battle of Fallen Timbers [1794]). First settled by white men in 1806 and named Bellefontaine ("beautiful fountain") for the local natural springs, it became a service centre for a farming area, but its early importance as a railroad town has declined. Industries include the manufacture of power tools, circuit breakers, electric motors, machinery, and plating. The first concrete street in America was laid around the courthouse in 1891. The state's highest point, Campbell Hill (1,549 ft [472 m]), is 1 mi east. Also in the vicinity are Indian Lake State Park, the Ohio and Zane caverns, the Castle Piatt Mac-A-Cheek (1864, built in the style of a French chateau), and the Mac-O-Chee Castle (1879, modelled after a Flemish castle). Inc. village, 1835; city, 1895. Pop. (1990) 12,142.

Bellême, Robert II, seigneur de (lord of): see Robert of Belesme.

Bellenden, John, Bellenden also spelled BALLENDEN, BALLENTYNE, BALLANTYNE, OF BAN-

NATYNE (fl. 1533–87), Scottish writer whose translation of Hector Boece's *Scotorum historiae* had a profound influence on Scottish national feeling.

Educated at the universities of St. Andrews (Scotland) and Paris, he was in the service of James V as clerk of accounts from the King's earliest years and at his request translated the *Historiae*, which had just appeared in Paris (1526). It was published as *The History and Chronicles of Scotland* in 1536, prefaced by an original poem entitled *A Proheme to the Cosmographe* and later reprinted separately under the various titles of *Vertue and Vyce* and *An Allegory of Vertue and Delyte*. Written in a fluent and vivid style, the *History* is one of the earliest pieces of literary Scottish prose extant. Among other stories of interest, it made accessible the first account of Macbeth's meeting with the witches.

Also, at the King's request, Bellenden translated the first five books of Livy's *Roman History*, prefacing them with *The Proheme of the History*, another original poem. It was not publicly printed until 1822.

In 1533 Bellenden had become archdeacon of Moray and a canon of Ross. Later, however, he appears to have lost the King's favour, and his strenuous opposition to the Reformation caused him to go into exile. Some authorities say that he died in Rome in 1550, but others that he was still alive in 1587.

Bellenden Ker Range, granitic massif, in the Eastern Highlands, northeastern Queensland, Australia, extending for 40 mi (65 km) along the coast northeast from Nerada to Gordonvale, just south of Cairns. Bounded by the Mulgrave River (east), the Innisfail Downs (south), and the Atherton Plateau (west), the range was named after the Scottish botanist John Bellenden-Ker and culminates at Mt. Bartle Frere, 5,287 ft (1,611 m). In 1921 the area was made a national park, which encompasses 125 sq mi (325 sq km) and is accessible via the Bruce Highway from Brisbane (830 mi southeast). Features include Aboriginal *bora* (ringlike mounds of earth used for tribal rites), varied wildlife (including kangaroo), and vegetation ranging from tropical rain forests to scrub-covered peaks.

Bellerophon, also called BELLEROPHONTES, hero in Greek legend. In the *Iliad* he was

Bellerophon with his horse Pegasus, stone bas-relief; in the Palazzo Spada, Rome

Alinari—Art Resource/EB Inc

the son of Glaucus, who was the son of Sisyphus of Ephyre (traditionally Corinth). Anteia (or Stheneboea), wife of Proetus, the king of Argos, loved him; when her overtures were rejected, she falsely accused him to her husband. Proetus then sent Bellerophon to the king of Lycia with a message that he was to be slain. The king, repeatedly unsuccessful in his assassination attempts, finally recognized Bellerophon as more than human and married him to his daughter. Bellerophon lived in prosperity until he fell out of favour with the gods, lost two of his children, and wandered grief-stricken over the Aleian Plain.

Later authors added that, while still at Corinth, Bellerophon tamed the winged horse Pegasus (*q.v.*) with a bridle given to him by Athena and that he used Pegasus to fight the Chimera and afterward to punish Anteia. He supposedly earned the wrath of the gods by trying to fly up to heaven and was thrown from Pegasus and lamed.

Bellerophon's adventures were frequently represented in ancient art and formed the subject of the *Iobates* of Sophocles and of the *Bellerophontes* and *Stheneboea* of Euripides.

Bellerophon, extinct genus of gastropods (snails) found as fossils in rocks of Ordovician to Triassic age (between 208 and 505 million

Bellerophon

years old). *Bellerophon* is characteristic of the bellerophontids, a large group of snails. The shell of *Bellerophon* was primitive in that it was coiled with the midline in a single plane; the upper half of the shell was the mirror image of the lower half. In *Bellerophon*, growth lines angled away from a raised ridge along the midline of the shell. The anterior margins of the shell were flared outward, and they were separated by a narrow slit, called the selenizone.

Belleville, city, seat (1792) of Hastings county, southeastern Ontario, Canada, on the Bay of Quinte, an inlet of Lake Ontario, at the mouth of the Moira River.

The site was first visited by the French explorer Samuel de Champlain in 1615; it was settled after 1776 by Loyalists from the United States and named Meyers' Creek for John Meyers, an early gristmill operator. In 1816 the city was renamed Belleville in honour of Arabella Gore, wife of Francis Gore, lieutenant governor of Upper Canada. Reached by the railroad in 1855, it soon became an important terminal and service centre.

Economic activities include dairying (especially cheese making), meat-packing, and the manufacture of cement, conveyor machinery, plastics, and electronic equipment. Belleville is also a vacation resort and the site of Albert College (founded in 1854), the Loyalist College of Applied Arts and Technology, and a school for the deaf. Both national transcontinental railroads and the Macdonald-Cartier Freeway, which links Windsor, Toronto (113

miles [182 km] west), and Montreal (232 miles east), serve the city. Inc. town, 1850; city, 1877. Pop. (1991) 37,243.

Belleville, city, seat (1814) of St. Clair county, southwestern Illinois, U.S., adjoining East St. Louis.

Located on bluffs forming the eastern rim of a floodplain along the Mississippi River, it was founded in 1814 and given the French name for "beautiful town." Originally it was an agricultural centre, but by the mid-1850s, after the opening of coal mines in the vicinity and the resulting influx of German immigrants, its economy became diversified, with coal mining and manufacturing (beverages and cooking and heating equipment) as the main factors. Scott Air Force Base (1917) is just east. The National Shrine of Our Lady of the Snows (1958) is located nearby. Belleville Area (junior) College was established in 1946. Inc. town, 1819; city, 1850. Pop. (1991 est.) 43,205.

Bellevue, city, Sarpy county, eastern Nebraska, U.S., on the Missouri River, immediately southeast of Omaha.

Established in the early 1800s as a fur trading post, it is the state's oldest continuous settlement and was an important missionary centre and Indian agency. It became a river port but moved its site in 1835 to bluffs overlooking the river valley. The state's first newspaper, the *Nebraska Palladium*, was published there in 1854. It served as county seat (1857–75). The Old Settler's Home and the old city hall (1856) are preserved. The establishment nearby of the Martin bomber plant (1941) at Fort Crook and of Offutt Air Force Base (1948), site of the Strategic Aerospace Museum and Strategic Air Command headquarters, boosted residential growth. Bellevue College was founded in 1965. Fontenelle Forest Natural Landmark adjoins the city to the northeast. Inc. 1855. Pop. (1991 est.) 31,268.

bellflower, any of about 300 annual, perennial, and biennial herbs that compose the genus *Campanula* (family Campanulaceae). Bellflowers bear bell-shaped, usually blue flowers. They are native mainly to northern temperate regions, Mediterranean areas, and tropical mountains. Many are cultivated as garden ornamentals.

Tall bellflower (*Campanula americana*), native to moist woodlands of North America, has flowering spikes that may reach 2 m (6 feet) high and has saucer-shaped flowers with long, curved styles. Tussock bellflower, or Carpathian harebell (*C. carpatica*), with lavender to white, bowl-shaped, long-stalked flowers, several to the stem, has many forms. The plants, 15 to 25 cm (6 to 10 inches) tall, form clumps in eastern European meadows and woodlands. Fairy thimbles (*C. cochlearifolia*), named for its deep, nodding, blue to white bells, forms loosely open mats on alpine scree. Bethlehem stars (*C. isophylla*),

Bellflower (*Campanula*)

W.H. Hodge

a trailing Italian species often grown as a pot plant, bears sprays of star-shaped violet, blue, or white flowers. Canterbury bell (*C. medi-*

un), a southern European biennial, has large pink, blue, or white spikes of cup-shaped flowers. Peach-leaved bellflower (*C. persicifolia*), found in Eurasian woodlands and meadows, produces slender-stemmed spikes, 30 to 90 cm tall, of long-stalked, outward-facing bells. Rampion (*C. rapunculoides*), a Eurasian and North African biennial grown for its turnip-like roots and leaves, which are eaten in salads for their biting flavour, produces ascending clusters of long-stalked lilac bells. It has narrow stem leaves and untoothed, broadly oval basal leaves that form a rosette around the stalk. Rover, or creeping, bellflower (*C. rapunculoides*), a European plant named for its spreading rhizomes, has become naturalized in North America. Throatwort, or bats-in-the-belfry (*C. trachelium*), a coarse, erect, hairy Eurasian plant naturalized in North America, bears clusters of lilac-coloured, funnel-shaped flowers. Other common European plants of the genus *Campanula* that often are cultivated in gardens are Adria bellflower (*C. garganica*, sometimes classified as a variety of *C. elatines*); clustered bellflower (*C. glomerata*); milky bellflower (*C. lactiflora*); great bellflower (*C. latifolia*); and *C. zoyisii*. See also harebell.

Belli, Carlos Germán (b. Sept. 15, 1927, Lima, Peru), poet noted for the nihilistic outlook of his work and for the orderly precision of his language.

Belli was educated at the National University of San Marcos in Lima, receiving a doctorate in literature. He traveled widely in South America and lived at various times in Spain, Italy, and the United States. He was a professor of literature at San Marcos university and in the United States; in addition he worked as a translator and journalist.

Poemas (1958) and *Dentro y fuera* (1960; "Within and Without"), despite their Surrealist tone, have a syntax and diction that recall the orderly precision of the Spanish Golden Age. This language couched in the immediacy of the present strives to comprehend a basically inhuman world. *¡Oh hada cibernética!* (1961; "O Cybernetic Fairy") is a sarcastic and ironic denunciation of reality. Alienating and oppressive forces fragment the individual, leading to total disintegration. The sterile, dehumanizing language of technology with its "cybernetic fairy" has trapped humanity in a world from which there is no escape.

Belli's collections *El pie sobre el cuello* (1967; "The Foot on the Throat") and *Canciones y otros poemas* (1982; "Songs and Other Poems") continue to present a nihilistic vision of the world. Some critics have suggested that Belli's insistence on the negative aspects of life conceals his desire for communion, fraternity, and order. Later works include *En el restante tiempo terrenal* (1988; "In the Remaining Time on Earth").

Belli, Giuseppe Gioacchino (b. Sept. 10, 1791, Rome [Italy]—d. Dec. 21, 1863, Rome), poet whose satirical sonnets present a vivid picture of life in papal Rome in the early 19th century.

After an unhappy childhood Belli was a clerical worker until, in 1816, marriage to a rich widow enabled him to devote much time to poetry. His conservative political views as a papal civil servant were jolted by the Revolution of 1848 and the formation of the Roman republic of 1849. He stopped writing satirical verses and in his final hours asked that his sonnets be burned. Throughout his life he was troubled by moral and religious scruples.

His more than 2,000 sonnets in Roman dialect contrast with his conformist way of life. Composed mainly during 1830–39, they seem to have provided an outlet for his repressed feelings. Although he also wrote conventional

poems in Italian, his originality lies in the sonnets, which express his revolt against literary tradition, the academic mentality, and the social injustices of the papal system. The ritualism of the church and the accepted principles of commonplace morality were also objects of his derision. But just as when he wrote in his most erotic vein Belli was never obscene, so he was never really impious in his apparently most profane sonnets; in them, rather, he registered a passing mood of rebellion.

Belli's greatest gift was for observing and describing the people of Rome with the range of a major novelist. An edition of Belli's sonnets (introduction by G. Vigolo) appeared in three volumes in 1952. An English translation of 46 of the sonnets by Harold Norse appeared in 1960 and 1974.

Belli, Pierino (b. March 20, 1502, Alba, Montferrat [Italy]—d. Dec. 31, 1575, Turin, Savoy), Piedmontese soldier, jurist, and an authority on the law of war who is considered one of the founders of modern international law.

After serving as commander in chief of the army of the Holy Roman Empire in Piedmont, Belli was appointed (1560) a councillor of state by Emmanuel Philibert, Duke of Savoy. His book *De re militari et de bello* (1563) was for its time an unusually thorough treatment of military law and the rules for conducting war.

belligerency, the condition of being in fact engaged in war. A nation is deemed a belligerent even when resorting to war in order to withstand or punish an aggressor. A declaration of war is not necessary to create a state of belligerency. For example, the United States and the People's Republic of China were belligerents during the Korean conflict, though both parties avoided characterizing the hostilities as war.

The 1949 Geneva Convention Relative to the Treatment of Prisoners of War (Geneva Convention III) applies not only to declared war but to any armed conflict between parties to the Geneva conventions and to the occupation of the territory of a party even if unresisted. Under Geneva Convention III, lawful belligerents comprise members of the armed forces as well as the members of militias, voluntary corps, and organized resistance groups who are commanded by a person responsible for his subordinates, have a distinctive sign, carry arms openly, and conduct operations lawfully. A nation departing from strict neutrality by giving assistance to one of the contending factions in a war may still be considered a non-belligerent under certain circumstances. See also Geneva conventions; neutrality.

Bellingham, city, seat (1854) of Whatcom county, northwestern Washington, U.S. It is situated along Bellingham Bay (named in 1792 by Captain George Vancouver for Sir

Log storage pond, Bellingham, Wash.

Whitmore

William Bellingham). The site was settled in 1852, when Captain Henry Roeder built a sawmill at the lower Whatcom Falls. Coal-mining operations began in 1854, and the bay was a temporary "staging area" for the ill-fated Fraser River gold rush (1857–58). Four communities (Whatcom, New Whatcom, Schome, and Fairhaven) known as the Bellingham Bay Settlements were established by the 1880s. By 1903 they had merged to form the present city. With railroad connections and improved harbour facilities, Bellingham's timber-pulp operations, fish canneries, and pleasure-boat building industries developed. Mount Baker-Snoqualmie National Forest is near Bellingham, which is also a gateway to the San Juan

Islands. Western Washington University was founded in Bellingham in 1899 and Whatcom Community College in 1967. The Lummi Indian Reservation is 5 miles (8 km) northwest of the city. Pop. (1990) city, 52,179; Bellingham MSA, 127,780.

Bellingshausen, Fabian Gottlieb von, Russian FADDEY FADDEYEVICH BELLINGHAUZEN

Bellingshausen

Novosti Press Agency

(b. Aug. 18 [Aug. 9, Old Style], 1778, Ösel, Estonia, Russian Empire—d. Jan. 13 [Jan. 2], 1852, Kronshtadt, Russia), Russian explorer who led the second expedition to circumnavigate Antarctica (1819–21) and for whom was named the Bellingshausen Sea, an area of the Antarctic waters.

Bellingshausen entered the Russian navy at age 10 and was an admiral and the governor of Kronshtadt at the time of his death.

Commanding the *Vostok* and *Mirny*, sloops of about 500 tons each, on his Antarctic voyage, he discovered Peter I (Jan. 22, 1821) and Alexander I (January 29) islands in the South Sandwich Island group. These were the first sightings of land within the Antarctic Circle,

thought at first to be part of the mainland. His account of the voyage was translated into English in 1945.

Bellini, duct of: see renal collecting tubule.

Bellini, Gentile (b. c. 1429, Venice [Italy]—buried Feb. 23, 1507, Venice), painter, member of the founding family of the Venetian school of Renaissance painting, best known for his portraiture and his scenes of Venice.

Gentile was trained by his father, Jacopo Bellini, a painter who introduced the Renaissance style into Venice. Jacopo's influence may be seen in Gentile's early "Madonna." As an independent artist, he contracted with the officers of the San Marco School in 1466

to decorate the doors of their organ. These paintings represent four saints, colossal in size and designed with the harsh austerity and daring perspective that characterized the style of his brother-in-law, Andrea Mantegna, then the most prominent painter of the Paduan school. The same influence may be seen in his "Banner of Blessed Lorenzo Giustiniani" (1465), with its sharp, incisive outlines and stiff drapery.

In 1479 the doge ("duke") of Venice sent Gentile to Constantinople as a painter to Sultan Mehmed II. The most important of the extant works that Gentile painted there is the "Portrait of Mohammad II" (c. 1480), a masterful characterization of the shrewd, cultivated ruler. In his pen-and-gouache drawing "Portrait of a Turkish Boy" (1479–80), Gentile employs a flat patterned style similar to that of the Turkish miniatures that influenced such later works as his "Portrait of Doge Giovanni Mocenigo" (1478–85).

Among Gentile's best-known works are the scenes of Venice painted for the School of San Giovanni Evangelista, a religious fraternal organization. These works deal with episodes related to a relic of the Holy Cross that the school owned. Those events are all but lost in the panorama of "Procession in St. Mark's Square" (1496) and the "Recovery of the Holy Cross" (1500), huge canvases painted with fastidious attention to the smallest detail and crowded with small, rigid figures, including many portraits. A similar but lesser-known work is his "St. Mark Preaching in Alexandria" (1493–1507), which was finished after Gentile's death by his brother, Giovanni, one of the great Venetian painters of the Renaissance. These paintings are of interest today primarily as records of Venetian life and architecture during the 15th century.

Bellini, Giovanni (b. c. 1430, Venice [Italy]—d. 1516, Venice), Italian painter who made

Venice a centre of Renaissance art comparable to Florence and Rome. Although the paintings for the hall of the Great Council in Venice, considered his greatest works, were destroyed by fire in 1577, a large number of altarpieces (such as that in the church of SS. Giovanni e Paolo, Venice) and other extant works show a steady but adventurous evolution from purely religious, narrative emphasis to a new naturalism of setting and landscape.

Little is known about Bellini's family. His father, Jacopo, a painter, was a pupil of Gentile da Fabriano, one of the leading painters of the 15th-century Gothic revival, and may have followed him to Florence. In any case, Jacopo introduced the principles of the Florentine Renaissance to Venice before either of his sons. Apart from his sons Gentile and Giovanni, he had at least one daughter, Niccolosa, who married the painter Andrea Mantegna in 1453. Both sons probably began as assistants in their father's workshop.

Giovanni's earliest independent paintings were more strongly influenced by the severe manner of the Paduan school, and especially of his brother-in-law, Mantegna, than they were by the graceful style of Jacopo. This influence is evident even after Mantegna left for the court of Mantua in 1460. Giovanni's earliest works date from before this period. They include a "Crucifixion," a "Transfiguration," and a "Dead Christ Supported by Angels." Several pictures of the same or earlier date are in the United States and others at the Museo Civico Correr in Venice. Four triptychs, a set of three panels used as an altarpiece, are still in the Venice Accademia, and two "Pietàs," both in Milan, are all from this early period. His early work is well exemplified in two beautiful paintings now in the National Gallery of London, "The Blood of the Redeemer" and "The Agony in the Garden."

In all his early pictures he worked with tempera, combining the severity and rigidity of the Paduan school with a depth of religious feeling and human pathos all his own. His early Madonnas, following in his father's tradition, are mostly sweet in expression, but he substituted for a mainly decorative richness one drawn more from a sensuous observation of nature. Although the pronounced linear element—*i.e.*, the dominance of line rather than mass as a means of defining form, derived from the Florentine tradition and from the precocious Mantegna—is evident in the paintings, the line is less self-conscious than Mantegna's work, and, from the first, broadly sculptured planes offer their surfaces to the light from a dramatically brilliant sky. From the beginning Giovanni Bellini was a painter of natural light, as were Masaccio, the founder of Renaissance painting, and Piero della Francesca, its greatest practitioner at that time. In these earliest pictures the sky is apt to be reflected behind the figures in streaks of water making horizontal lines in a mere strip of landscape. In "The Agony in the Garden," the horizon moves up, and a deep, wide landscape encloses the figures, to play an equal part in expressing the drama of the scene. As with the *dramatis personae*, the elaborately linear structure of the landscape provides much of the expression, but an even greater part is played by the colours of the dawn, in their full brilliance and in the reflected light within the shadow. This is the first of a great series of Venetian landscape scenes that was to develop continuously for a century or more. To a city surrounded by water, the emotional value of landscape was now fully revealed.

The great composite altarpiece with St. Vincent Ferrer, which is still in the church of SS. Giovanni e Paolo in Venice, was painted perhaps 10 years later, toward the mid-1470s. But the principles of composition and the method of painting had not yet changed essentially; they had merely grown stronger in expression. It seems to have been during a voyage

down the Adriatic coast, made probably not long afterward, that Bellini encountered the influence that must have helped him most toward his full development: that of Piero della Francesca. Bellini's great "Coronation of the Virgin" at Pesaro, the first Venetian picture in the full style of the Renaissance, probably reflects and carries still further in composition the ideas expressed by Piero in an unrecorded "Coronation of the Virgin," the lost centre-piece of a polyptych originally in the church of S. Agostino at Borgo Sansepolcro. Christ's crowning of his Mother beneath the effulgence of the Holy Ghost is a solemn act of consecration, and the four saints who stand witness beside the throne are characterized by their deep humanity. Every quality of their forms is fully realized: every aspect of their bodies, the textures of their garments, and the objects that they hold. As with work by Masaccio and Piero della Francesca, the perspective and the polychrome of pavement and throne help to establish the group in space, and the space is enlarged by the great hills behind and rendered infinite by the luminosity of the sky, which envelops the scene and gathers all the forms together into one. Harmony is the aim of all art, but the significance of the harmony depends upon the significance of its parts, as well as upon the degree of its intensity. Here, Bellini has provided humanity with the full grandeur of nature, and it is nature endowed with all that is religious in man. The unity achieved has an emotional warmth that is uniquely his.

A new degree of technical achievement is implied. The fact that at this point Giovanni painted mainly in oil does not completely explain his greatness. Piero was one of many Italian painters who were already using the oil medium. A legend that Giovanni ceased to paint in tempera only after he was introduced to oils by Antonello da Messina, who was in Venice in 1475/76, is without point, for much the same effects can be produced in either medium.

It is the way of using the medium that makes the difference—and that depends upon the painter's intentions and upon his vision. It was Bellini's richer and wider vision that determined his future development. Oil paint is inclined to be the more transparent and fusible and therefore lends itself to richer colour and tone by allowing a further degree of glazing, the laying of one translucent layer of colour over another. It is this technique and the unprecedented variety with which he handled the oil paint that gives his fully mature painting the richness associated with the Venetian school.

Giovanni's brother Gentile was chosen by the government to continue the painting of great historical scenes in the hall of the Great Council in Venice; but in 1479, when Gentile was sent on a mission to Constantinople, Giovanni took his place. From that time to 1480 much of Giovanni's time and energy was devoted to fulfilling his duties as conservator of the paintings in the hall, as well as painting six or seven new canvases himself. These were his greatest works, but they were destroyed when the huge hall was gutted by fire in 1577. We can now only gain an approximate idea of their design from "The Martyrdom of St. Mark" in the Scuola di S. Marco in Venice, finished and signed by one of Giovanni's assistants, and of their execution from Giovanni's completion of Gentile's "St. Mark Preaching in Alexandria" after his brother's death in Venice in 1507.

Yet a surprisingly large number of big altarpieces and comparatively portable works have survived and show the steady but adventurous evolution of his work. The principles and the technique of the Pesaro altarpiece find their full development in the still larger Madonna altarpiece from S. Giobbe in the Venice Ac-

cademia, where the Virgin enthroned in a great apse and the saints beside her seem ready to melt into the reflected light. This seems to have been painted before the earliest of his dated pictures, the half-length "Madonna degli Alberetti," also in the Venice Accademia, of 1487.

While for the first 20 years of Giovanni's career the subject matter was limited mainly to Madonnas, Pietàs, and Crucifixions, toward the end of the century it began to be greatly enriched not so much by the wider choice of subjects, which were still mainly religious, as by the development of the *mise-en-scène*, the physical setting of the picture. He became one of the greatest of landscape painters. His study of outdoor light was such that one can deduce not only the season depicted but almost the hour of the day.

Bellini also excelled as a painter of ideal scenes; *i.e.*, scenes of primeval as opposed to individualized images. For the "St. Francis in Ecstasy" of the Frick Collection or the "St. Jerome at His Meditations," painted for the high altar of Sta. Maria dei Miracoli in Venice, the anatomy of the earth is studied as carefully as those of human figures; but the purpose of this naturalism is to convey idealism through the realistic portrayal of detail. In the landscape "Sacred Allegory," now in the Uffizi, he created the first of the dreamy enigmatic scenes for which Giorgione, his pupil, was to become famous. The same quality of idealism is to be found in his portraiture. His "Doge Leonardo Loredan" in the National Gallery, London, has all the wise and kindly firmness of the perfect head of state, and his "Pietro Bembo" (?) in the British royal collection portrays all the sensitivity of a poet.

Both artistically and personally the career of Giovanni Bellini seems to have been serene and prosperous. He lived to see his own school of painting achieve dominance and acclaim. He saw his influence propagated by a host of pupils, two of whom surpassed their master in

"Enthroned Madonna from S. Giobbe," panel painting by Giovanni Bellini, 1480s; in the Accademia, Venice
SCALA—Art Resource/EB Inc

world fame: Giorgione, whom he outlived by six years, and Titian.

The only personal description extant of Giovanni is from the hand of Albrecht Dürer, who wrote to the German humanist Willibald Pirckheimer from Venice in 1506 "... everyone tells me what an upright man he is, so that I am really fond of him. He is very old, and still he is the best painter of them all."

(P.He.)

MAJOR WORKS. "Annunciation" (1450s; Thyssen-Bornemisza Collection, Castagnola, Switz.); "Transfiguration" (1450s; Museo Civico Correr, Venice); "Christ Blessing" (1450s; Louvre, Paris); "Virgin and Child" (1450s; Philadelphia Museum of Art, Philadelphia); "Pietà" (1460s; Museo Poldi Pezzoli, Milan); "The Agony in the Garden" (1460s; National Gallery, London); "The Blood of the Redeemer" (1460s; National Gallery, London); "Pietà with Virgin and St. John" (1460s; Brera, Milan); "St. Vincent Ferrer Polyptych" (mid-1470s; SS. Giovanni e Paolo, Venice); "Madonna with Sleeping Child" (1470s; Accademia, Venice); "Coronation of the Virgin" (1470s; Museo Civico, Pesaro); "St. Jerome" (1470s; Contini Bonacossi Collection, Florence); "Madonna with the Greek Inscription" (1470s; Museo di Castelvecchio, Verona); "Madonna and Child" (1470s; National Gallery of Art, Washington, D.C.); "Madonna with Standing Child" (1470s; Accademia, Venice); "Portrait of Georg Fugger" (1474; formerly Contini Bonacossi Collection, Florence); "St. Francis in Ecstasy" (c. 1480; Frick Collection, New York City); "Enthroned Madonna from S. Giobbe" (1480s; Accademia, Venice); "Transfiguration" (1480s; Museo e Gallerie Nazionali di Capodimonte, Naples); "Resurrection" (1480s; Staatliche Museen Preussischer Kulturbesitz, Berlin); "Madonna degli Alberetti" (1487; Accademia, Venice); "Madonna and Child with Saints" (1488; Sta. Maria dei Frari, Venice); "Madonna with Doge Agostino Barbarigo" (1488; S. Pietro Martire, Murano); "Madonna of the Pomegranate" (c. 1490; National Gallery, London); "Madonna and Child with St. Paul and St. George" (c. 1490; Accademia, Venice); "The Allegory of the Souls in Purgatory" (1490s; Uffizi, Florence); "Portrait of a Young Man" (1490s; National Gallery of Art, Washington, D.C.); "Doge Leonardo Loredan" (c. 1501; National Gallery, London); "Enthroned Madonna with Four Saints" (1505; S. Zaccaria, Venice); "The Madonna of the Meadow" (c. 1505; National Gallery, London); "Madonna" (1510; Brera, Milan); "St. Jerome with St. Christopher and St. Augustine" (1513; S. Giovanni Crisostomo, Venice); "The Feast of the Gods" (landscape overpainted by Titian, 1500s; National Gallery of Art).

BIBLIOGRAPHY. The earliest biography of Bellini is by Giorgio Vasari in *The Lives of the Painters*. . . (1568; Eng. trans. by E.H. and E.W. Bashfield and A.A. Hopkins, 4 vol., 1913). By the end of the 19th century, notable studies in English, more concerned with his painting than his life, had appeared in J.A. Crowe and G.B. Cavalcaselle, *A History of Painting in North Italy*. . . vol. 1 (1871); Bernhard Berenson, *The Venetian Painters of the Renaissance* (1894); and Roger Fry, *Giovanni Bellini* (1899). In the 20th century the study of Bellini's work has been extensive—the contributions of the Italian art historians Adolfo Venturi and, later, Roberto Longhi and of the German G. Gronau marking advances in knowledge—and it received special impetus from the 1949 Bellini exhibition in Venice. Rodolfo Pallucchini, who prepared the catalog for that exhibition, has written a standard work, *Giovanni Bellini* (1959; Eng. trans. 1962), tracing the development of Bellini's painting, with notes relating to the 285 plates and with a bibliography. Fritz Heinemann, *Giovanni Bellini e i Belliniani*, 2 vol. (trans. into Italian, 1962), is an annotated catalog of 1,902 works by Bellini and his followers, including copies of lost works and works once wrongly attributed to Bellini, with 910 illustrations. Philip Hendy and Ludwig Goldscheider, *Giovanni Bellini* (1945), is an introductory essay. A later important work is Giles Robertson, *Giovanni Bellini* (1968), an account of Bellini's career and oeuvre.

Bellini, Jacopo (b. c. 1400, Venice—d. c. 1470, Venice), painter who introduced the principles of Florentine early Renaissance art into Venice.

He was trained under the Umbrian artist Gentile da Fabriano, the most influential International Gothic painter in Italy. By 1423 he had accompanied his master to Florence. There the progress made in fidelity to nature and in mastery of classic grace by such masters as Donatello and Ghiberti, Masaccio and Paolo Uccello offered Jacopo further instruction.

By 1429 Jacopo was settled at Venice and had established himself as the city's most important painter. The use of gold pigment in highlights of such works as his "Madonna" (c. 1438; Accademia, Venice) shows that Jacopo long retained elements derived from Byzantine art, while the Child's rich robes and the patterned background of angels reveal his continued interest in the decorative International Gothic style. The modelling of the figures, the

"The Nativity," leadpoint by Jacopo Bellini, c. 1450; in the Louvre, Paris

Giraudon—Art Resource/EB Inc

confident rendering of folds of cloth, and the accurate perspective, however, indicate an excellent understanding of the progressive art of 15th-century Florence. In the life-sized "Crucifixion" (Museo di Castelvecchio, Verona), the spare and sombre scene strictly conforms to the Florentine Renaissance style of Masaccio and repudiates the rich colouring and courtly grace of Bellini's earlier known works.

More important than his paintings are his two books of drawings (c. 1450). The Louvre in Paris and the British Museum in London each own one of these sketchbooks. The drawings depict a great variety of scenes, and artists used them as models for compositions well into the 16th century. In such drawings as the "Nativity," the "Flagellation," and "St. John the Baptist Preaching," Jacopo experimented with linear perspective and was among the first to make figures diminish in space using rules of perspective formerly applied only to depictions of architecture. The "Crucifixion" (British Museum, London) is among Jacopo's boldest compositional experiments. Possibly for the first time in art, the three crosses are viewed at an angle instead of frontally, and the soldiers' backs are turned to the viewer, lending a spontaneity and immediacy rare in Italian art of the time. Jacopo's great influence upon Venetian art was heightened through the work of his sons, Gentile and Giovanni, and his son-in-law, Andrea Mantegna, all of whom were prominent painters in the vicinity of Venice.

Bellini, Lorenzo (b. Sept. 3, 1643, Florence—d. Jan. 8, 1704, Florence), physician and anatomist who described the collecting, or excretory, tubules of the kidney, known as Bellini's ducts (tubules).

In *Exercitatio anatomica de structura et usu renum* (1662; "Anatomical Exercise on the Structure and Function of the Kidney"), published when he was a 19-year-old student at the University of Pisa, Bellini showed for the first time that the kidney consists of an im-

Alinari—Art Resource/EB Inc

mense number of tiny canals. A professor at Pisa for 30 years, Bellini described the taste organs (1665) and stressed the value of urinalysis as an aid to diagnosis (1683). After retiring from the university to Florence (1693 or 1694), he became physician to Duke Cosimo III and Pope Clement XI.

Bellini, Vincenzo (b. Nov. 3, 1801, Catania, Sicily—d. Sept. 23, 1835, Puteaux, near Paris), operatic composer with a gift for creating vocal melody at once pure in style and sensuous in expression; his influence is reflected not only in later operatic composers, including the early works of Richard Wagner, but also in the instrumental music of Chopin and Liszt.

Born into a family of musicians, Bellini produced his first works while still a student at the Naples Conservatory, where he had been sent by his father, an organist. Bellini gained the patronage of an important impresario, who commissioned *Bianca e Fernando* for the Naples opera. The success of this early work led to other commissions. *Il pirata* (1827), written for La Scala, the opera house at Milan, earned

Vincenzo Bellini, portrait by an unknown artist; in the Museo Teatrale alla Scala, Milan

By courtesy of the Museo Teatrale alla Scala, Milan

Bellini an international reputation. He was fortunate in having as librettist the best Italian theatre poet of the day, Felice Romani, with whom he collaborated in his next six operas. The most important of these were *I Capuleti ed i Montecchi* (1830), based on Shakespeare's *Romeo and Juliet*; *La sonnambula* (1831; *The Sleepwalker*); and *Norma* (1831). *La sonnambula*, an opera semiseria (serious but with a happy ending), became very popular, even in England, where an English version appeared. His masterpiece, *Norma*, a tragedy set in ancient Gaul, achieved lasting success despite an initial failure.

Bellini lived briefly in London in 1833, then went to Paris, where the composer Gioacchino Rossini's influence secured for him a commission to write an opera for the Théâtre-Italien. The result was *I puritani di Scozia* (1835), the last of Bellini's nine operas; although handi-

capped by an inept libretto, it is in many ways his most ambitious and beautiful work.

Bellini's fame was closely bound up with the bel canto style of the great singers of his day. He was not a reformer; his ideals were those of Haydn and Mozart, and he strove for clarity, elegance of form and melody, and a close union of words and music. Yet with perseverance he corrected some of the grosser abuses of opera then current. While he subordinates the orchestra accompaniment to the singers and places upon their voices the responsibility for dramatic expression, his harmony is more enterprising than that of his contemporary Gaetano Donizetti, and his handling of the orchestra in introductions and interludes is far from perfunctory. It is, however, for the individual charm and elegance of his luminous vocal melody that Bellini is remembered.

Bellinzona, capital of Ticino canton, southern Switzerland, on the Ticino River, at the junction of roads to the St. Gotthard, Lukmanier, and San Bernardino passes, east of Locarno. Possibly of Roman origin, it was first mentioned in AD 590 and played a considerable part in the early history of Lombardy because of its strategic location. A possession of the bishops of Como in the 8th century, it was the object of continuous conflict between the Lombardian cities of Como and Milan in the 14th and 15th centuries. Occupied by the French (with the other Milanese lands) in 1499, it was taken by Uri canton in 1500, and the French king ceded it to Uri, Schwyz, and Unterwalden cantons in 1503. It became the capital of the Bellinzona canton of the Helvetic Republic in 1798 and in 1803 became the joint capital, with Locarno and Lugano, of the newly formed Ticino canton. It has been the permanent political capital of the canton since 1878.

The town is dominated by three 15th-century castles of the dukes of Milan. There are also remains of the great wall (*murata*) that barred the Ticino Valley c. 1500, and it is the location of several 16th-century churches. Tourism, which increased rapidly after the opening of the St. Gotthard railway line (1882), is the most important economic factor, but there are small industries. The population is Italian speaking and Roman Catholic. Pop. (1998 est.) 44,248.

Bellman, Carl Michael (b. Feb. 4, 1740, Stockholm—d. Feb. 11, 1795, Stockholm), outstanding poet-musician of 18th-century Sweden, whose songs have remained popular in Scandinavia, though he is little known elsewhere.

The son of a wealthy civil servant, he studied at Uppsala University and entered the government service, but his salary and a stipend from King Gustav III hardly allowed him to support himself and his family. In early youth he published religious and satirical works and translations from German and French. By the 1760s, his popular drinking songs and biblical parodies were being sung throughout Scandi-

navia, circulated by word of mouth, handwritten copies, and printed sheets. He borrowed the music for his songs from the works of others, revising the tunes when necessary. He performed them to his own accompaniment on the zither. About 1765, Bellman began to write a cycle of songs, *Fredmans epistlar*, the title alluding to the Pauline Epistles, which were parodied in the early songs. Fredman was modelled after a respected clockmaker who took to drinking and died in poverty. Following the mocking, parodic style of Jean-Joseph Vadé and other French writers, Bellman began by adapting minuets, contredanses, and arias from French musical comedies in a highly original manner, though several songs in this collection were entirely of his own composition.

Fredmans epistlar was not published until 1790, when it appeared with an introduction by the famous critic J.H. Kellgren. During this time Bellman had strengthened the narrative and dramatic elements in his work and had added many new figures to his gallery of middle-class Stockholmers. The 82 songs in the final collection reflect his poetic and personal development. The feeling for nature and vivid characterizations in the *epistlar* make it unique in Swedish poetry. It was followed in 1791 by *Fredmans sänger*, also a varied collection, but containing mainly drinking songs. *Bacchi tempel* (1783), a poem in alexandrines, also contained some songs and engravings. Bellman's other works, including plays and occasional poems, were published posthumously.

Bello, city, Antioquia department, northwestern Colombia, on the Río Porce between the Cordilleras (mountains) Occidental and Central of the Andes at 4,905 ft (1,495 m) above sea level. Formerly a commercial and manufacturing centre for a fertile agricultural region, Bello is now part of the industrial complex centring on Medellín, 6 mi (10 km) south by highway and railroad. The principal industry is textile milling; brushes are also produced. Pop. (1999 est.) mun., 340,910.

Bello, Andrés (b. Nov. 29, 1781, Caracas—d. Oct. 15, 1865, Santiago, Chile), poet and scholar, regarded as the intellectual father of South America.

His early reading in the classics, particularly Virgil, influenced his style and theories. At the University of Venezuela in Caracas he studied philosophy, jurisprudence, and medicine. Acquaintance with the German naturalist and traveller Alexander von Humboldt (1799) led to the interest in geography so apparent in his later writings. He was a friend and teacher of the South American liberator, Simón Bolívar, with whom he was sent to London in 1810 on a political mission for the Venezuelan revolutionary junta. Bello elected to stay there for 19 years, acting as secretary to the legations of Chile and Colombia and spending his free time in study, teaching, and journalism.

Bello's position in literature is secured by his *Silvas americanas*, two poems, written during his residence in England, which convey the majestic impression of the South American landscape. These were published in London (1826–27) and were originally projected as part of a long, never-finished epic poem, *América*. The second of the two, *Silva a la agricultura de la zona tórrida*, is a poetic description of the products of tropical America, extolling the virtues of country life in a manner reminiscent of Virgil. It is one of the best known poems in 19th-century Spanish-American letters. In 1829 he accepted a post in the Chilean Ministry of Foreign Affairs, settled in Santiago, and took a prominent part in the intellectual and political life of the city. He was named senator of his adopted country and founded the University of Chile (1843), of which he was rector until his death. Bello was mainly responsible for the Chilean Civil

Code, promulgated in 1855, which was also adopted by Colombia and Ecuador and had

Bello, detail of an oil painting by Raymond-Auguste Quinsac Monvoisin, c. 1845; in the Biblioteca Nacional, Caracas

By courtesy of Organization of American States

much the same influence throughout South America as the Code Napoléon in Europe.

Bello's prose works deal with such varied subjects as law, philosophy, literary criticism, and philology. Of the last, the most important is his *Gramática de la lengua castellana* (1847; "Grammar of the Spanish Language"), long the leading authority in its field.

Belloc, (Joseph-Pierre) Hilaire (b. July 27, 1870, La Celle-Saint-Cloud, Fr.—d. July 16, 1953, Guildford, Surrey, Eng.), French-born poet, historian, and essayist who was among the most versatile English writers of the first quarter of the 20th century. He is most re-

Belloc, detail of a pencil drawing by B. Partridge from the "Mr Punch's Personalities" collection, 1926–29, in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery London

membered for his light verse, particularly for children, and for the lucidity and easy grace of his essays, which could be delightfully about nothing or decisively about some of the key controversies of the Edwardian era.

Belloc was educated at the Oratory School, Birmingham, and then worked as a journalist. After military service, as a French citizen, he entered Balliol College, Oxford, in 1894. He graduated with first-class honours in history, was president of the Union (debating society), and in 1896 married Elodie Hogan (1870–1914) of Napa, Calif. He became a naturalized British subject in 1902 and sat as a member of Parliament for Salford (1906–10), first as a Liberal and then as an Independent.

Verses and Sonnets (1895) and *The Bad Child's Book of Beasts* (1896) launched Belloc on his literary career. *Cautionary Tales*, another book of humorous verse for children, which parodied some Victorian compositions, appeared in 1907. His *Danton* (1899) and *Robespierre* (1901) proved his lively historical sense and powerful prose style. *Lambkin's Re-*

Bellman, detail of an oil painting by P. Krafft, 1779; in Gripsholm Castle, Sweden

mains (1900) and *Mr. Burden* (1904) showed his mastery of satire and irony. In *The Path to Rome* (1902) he interspersed his account of a pilgrimage on foot from Toul to Rome with comments on the nature and history of Europe. Born and brought up a Roman Catholic, he showed in almost everything he wrote an ardent profession of his faith. This coloured with occasional inaccuracy and overemphasis most of his historical writing, which includes *Europe and the Faith* (1920), *History of England*, 4 vol. (1925–31), and a series of biographies ranging in period from *James II* (1928) to *Wolsey* (1930). But he had the power of bringing history to life.

The Four Men (1912) described a walk through Sussex, the county where he made his home, and his love of sailing was vividly illustrated in *The Cruise of the "Nona"* (1925). In political and economic matters Belloc was a follower of William Cobbett, English author, journalist, and radical influential in the early 19th century. Among Belloc's volumes of lighter verse are *The Modern Traveller* (1898) and the *Heroic Poem in Praise of Wine* (1932). He also wrote a number of satiric novels, which were illustrated by his close friend, the novelist G.K. Chesterton.

Belloc engaged in much heated controversy, particularly with H.G. Wells, whose *Outline of History* he vigorously attacked, and with the Protestant scholar and historian G.C. Coulton. Belloc is one of the masters of modern English prose, a good poet, and a deeply interesting literary personality.

Bellotto, Bernardo, also called CANALETTO BELOTTO, or CANALETTO THE YOUNGER (b. Jan. 30, 1720, Venice [Italy]—d. Oct. 17, 1780, Warsaw, Pol.), *vedute* ("view") painter of the Venetian school known for his carefully drawn topographical paintings of central Italian and eastern European cities.

Bellotto studied under his uncle, Canaletto, and was himself known by that name when painting outside Italy. Bellotto's urban scenes have the same carefully drawn realism as his uncle's Venetian views but are marked by heavy shadows and are darker and colder in tone and colour. The fidelity of his views are in part attributable to the use of the camera obscura.

"View of Dresden," oil on canvas by Bernardo Bellotto, last half of the 18th century; in the National Gallery of Ireland, Dublin

By courtesy of the National Gallery of Ireland, Dublin

He painted scenes of Venice until 1742, when he left for Rome, and, after traveling in northern Italy for a time, he permanently left the country and went to Munich in 1747. He became court painter to the elector Frederick Augustus II and lived mostly in Dresden from 1747 to 1766. In 1767 he went to St. Petersburg and was invited by Stanislaw II of Poland to come to Warsaw and become his court painter. Bellotto's accurately detailed views of the Polish capital were used after World War II to restore the historic sections of the city.

Bellow, Saul (b. June 10, 1915, Lachine, near Montreal, Que., Can.—d. April 5, 2005, Brookline, Mass., U.S.), American novelist

whose characterizations of modern urban man, disaffected by society but not destroyed in spirit, earned him the Nobel Prize for Literature in 1976. Brought up in a Jewish household and fluent in Yiddish—which influenced his energetic English style—he was representative of the Jewish American writers whose works became central to American literature after World War II.

Bellow, 1971

Jill Kremenitz

Bellow's parents emigrated in 1913 from Russia to Montreal. When he was nine they moved to Chicago. He attended the University of Chicago and Northwestern University (B.S., 1937) and afterward combined writing with a teaching career at various universities, including the University of Minnesota, Princeton University, New York University, the University of Chicago, and Boston University.

He won a reputation among a small group of readers with his first two novels, *Dangling Man* (1944), a story in diary form of a man waiting to be inducted into the army, and *The Victim* (1947), a subtle study of the relationship between a Jew and a Gentile, each of whom becomes the other's victim. *The Adventures of Augie March* (1953) brought wider acclaim and won the National Book Award (1954). It is a picaresque story of a poor Jewish youth from Chicago, his progress, sometimes highly comic, through the world of the 20th century, and his attempts to make sense of it. In this novel Bellow employed for the first time a loose, breezy style in conscious revolt against the preoccupation of writers of that time with perfection of form. *Henderson the Rain King* (1959) continued the picaresque approach in its tale of an eccentric American millionaire on a quest in Africa. *Seize the Day* (1956), a novella, is a unique treatment of a failure in a society where the only success is success. He also wrote a volume of short stories, *Mosby's Memoirs* (1968), and *To Jerusalem and Back* (1976) about a trip to Israel.

In his later novels and novellas—*Herzog* (1964; National Book Award, 1965), *Mr. Sammler's Planet* (1970; National Book Award, 1971), *Humboldt's Gift* (1975; Pulitzer Prize, 1976), *The Dean's December* (1982), *More Die of Heartbreak* (1987), *A Theft* (1989), *The Bellarosa Connection* (1989), and *The Actual* (1997)—Bellow arrived at his most characteristic vein. The heroes of these works are often Jewish intellectuals whose interior monologues range from the sublime to the absurd. At the same time, their surrounding world, peopled by energetic and incorrigible realists, acts as a corrective to their intellectual speculations. It is this combination of cultural sophistication and the wisdom of the streets that constitutes Bellow's greatest originality. In *Ravelstein* (2000) he presented a fictional version of the life of teacher and philosopher Allan Bloom.

BIBLIOGRAPHY. Bellow's life and works are discussed in Robert R. Dutton, *Saul Bellow*, rev. ed. (1982); and Ruth Miller, *Saul Bellow: A Biography of the Imagination* (1991). Critical studies include Daniel Fuchs, *Saul Bellow: Vision and Revision* (1984); Ellen Pifer, *Saul Bellow Against the Grain* (1990); Peter Hyland, *Saul Bellow* (1992); and Marianne M. Friedrich, *Character and Narration in the Short Fiction of Saul Bellow* (1995).

bellows, mechanical contrivance for creating a jet of air, consisting usually of a hinged box with flexible sides, which expands to draw in air through an inward opening valve and contracts to expel the air through a nozzle. The bellows was invented in the European Middle Ages and was commonly used to speed combustion, as in a blacksmith's or ironworker's forge, or to operate reed or pipe organs.

In its simplest form, a hand bellows consists of two flat boards of rectangular, circular, or pear shape, hinged at one end and connected around their edges by a wide band of flexible leather to form an airtight joint. Wire rings keep the leather from collapsing when the boards are separated suddenly and the pressure in the chamber is less than atmospheric. One of the boards has a hole in the centre, covered inside by a leather flap or valve that can open only inward. The outlet nozzle has a relatively small opening.

Bellows inlaid with mother-of-pearl and pewter, Dutch, 17th century; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London

When the boards are separated, the partial vacuum created causes the air to rush into the chamber through the valve; when the boards are brought together, the valve closes, and the air in the chamber is discharged through the open nozzle.

Bellows, George Wesley (b. Aug. 12, 1882, Columbus, Ohio, U.S.—d. Jan. 8, 1925, New York, N.Y.), American painter and lithographer noted for his paintings of action scenes and for his expressive portraits and seascapes.

Bellows attended Ohio State University before moving to New York City, where he studied at the New York School of Art under Robert Henri, leader of the group of American realist painters called *The Eight* (q.v.). Bellows' early works show the influence of Henri in their dark, tonal palette, vigorous brushwork, and urban subject matter; typical of this period is "Forty-Two Kids" (1907), a painting of slum children swimming and diving in the East River. Bellows' dramatic, evocative paintings of prizefights, such as "Stag at Sharkey's" and "Both Members of This Club" (both 1909), date from this period as well; they remain among his most famous works.

In 1909 Bellows was elected an associate member of the National Academy of Design; full membership followed in 1913. From 1910 he taught at the Art Students League in New York City. Between 1912 and 1917 he contributed illustrations to the socialist magazine *The Masses*.

Bellows was one of the organizers of the Armory Show of 1913, which introduced Eu-

"Stag at Sharkey's," oil painting by George Bellows, 1909; in the Cleveland Museum of Art, Ohio

European modernist art to American artists and critics. The show had a marked influence on Bellows; although he remained a realist painter, his later works reveal an intensified interest in theory. He began to use a greater range of colour and to experiment with various compositional systems. The subject matter of his work also changed: many of the best works from this later period are intimate portraits of friends and family members. He also turned increasingly to painting seascapes—notably at Monhegan Island, Maine—and rural landscapes.

From 1916 Bellows experimented with lithography, producing nearly 200 prints. Among the best known is "Dempsey and Firpo" (1924; he also produced a painting with this title), a boxing scene; the solid modeling of form and geometric approach to design characteristic of Bellows' later paintings are also apparent in this work.

bells of Ireland: see shell flower.

Belluno, city, capital of Belluno provincia, in the Veneto regione of northeastern Italy. The city lies at the confluence of the Piave and Ardo rivers, in the Dolomite Alps, north of Venice. Of pre-Roman origin and known to the Romans as Bellunum, it was a medieval free commune before voluntarily joining Venice in 1404. Taken by the French in 1797, it passed to Austria in 1813 and to the Italian kingdom in 1866. Notable buildings include the 16th-century cathedral, partly rebuilt after an earthquake in 1873; the Renaissance-style Palazzo dei Rettori (1491–96), housing the prefecture; the Church of San Stefano (1980–86); and the Palazzo dei Giuristi (1664), housing the civic museum with a fine art gallery. Agriculture and tourism are the main sources of income. Pop. (1993 est.) mun., 35,497.

Belluschi, Pietro (b. Aug. 18, 1899, Ancona, Italy—d. Feb. 14, 1994, Portland, Ore., U.S.). Modernist architect identified first with regional architecture of the American Northwest, from which his influence spread throughout the world. He was noted for his use of indigenous materials, especially woods for residential buildings and aluminum for tall office buildings, following his own dictum of "eloquent simplicity."

Graduating in 1922 as a civil engineer from the University of Rome, Belluschi went to the United States on a scholarship and continued civil engineering studies at Cornell University. He practiced architecture until 1950, and the following year he became dean of the School of Architecture and Planning at the Massachusetts Institute of Technology. After retirement in 1965 he continued to lecture

and served as adviser to the U.S. State Department in South Korea and the Philippines. Among his works in Portland, Ore., are the Sutor House (1938), the Equitable Building (1948), considered to be the first glass curtain-wall structure in the United States, and Zion Lutheran Church (1950). His other well-

Belluschi, 1972
Paul Connell

known buildings (some in association with other architects) include the Portland Art Museum (1931); the Boston and Keystone buildings, Boston; the Bank of America World Headquarters, San Francisco (1969); and the Juilliard School, Lincoln Center, New York City (1969).

Bellville, town, Western Cape province, South Africa. It lies east of Cape Town within the Cape Peninsula urban area. Originally a village called Twelfth Mile Stone, Bellville was established by proclamation in 1861 and named after Charles D. Bell, surveyor general of the Cape. It became a town in 1940. The town is built on the slopes of the Tygerberg (1,362 feet [415 m]).

The Elsie River runs through Bellville, and there is a park in the river's valley. Bellville South, an industrial zone of Bellville, produces paper and food products, bricks and tiles, and fertilizers. Bellville is located on the main railway from Cape Town to Johannesburg, and Bellville South has the largest marshaling yard in the Cape provinces. The University of the Western Cape was founded in Bellville in 1960. D.F. Malan (international) Airport is 5 miles (8 km) southwest. Pop. (1985) 68,915.

bellwort, any of five species of woodland plants comprising the genus *Uvularia* of the

lily family (Liliaceae) and native to eastern North America. They are all low perennials with slender, creeping rootstocks that send up leafy stems from 6 to 20 inches (15 to 50 cm) high. The stems bear large pale yellow flowers, usually solitary and drooping at the ends of the branches, that bloom from April to June. The most conspicuous species is the large-flowered bellwort (*U. grandiflora*). It bears ovate leaves and narrowly bell-shaped, lemon-yellow, six-petaled flowers that are about 1.5 inches (4 cm) long. It is found from Quebec westward to Minnesota and southward to Georgia and Kansas. The somewhat smaller perfoliate bellwort (*U. perfoliata*), with more pointed leaves, occurs from Quebec and Ontario south to Florida and Mississippi. In these two species, the leaves appear as if impaled upon the stem (i.e., perfoliate). The other three species of bellworts are much smaller and have sessile leaves.

belly (musical instrument): see soundboard.

Belmondo, Jean-Paul (b. April 9, 1933, Neuilly-sur-Seine, near Paris, France), French motion-picture actor noted for his portrayals of charismatic antiheroes.

Belmondo was the son of the sculptor Paul Belmondo and studied acting at the National Conservatory of Dramatic Art after a brief career as an amateur boxer. His performance as the defiant, impulsive criminal in Jean-Luc Godard's *A bout de souffle* (1959; *Breathless*), a seminal film in the French New Wave movement, gained him international recognition. Belmondo's character in *Breathless* inspired a cult following known as "le Belmondisme" among European youth. His subsequent films, *La Ciociara* (1960; *Two Women*), *Léon Morin—prêtre* (1961; *Léon Morin, Priest*), and *L'Homme de Rio* (1964; *That Man from Rio*), showed his versatility.

Among Belmondo's other films were Godard's *Pierrot le fou* (1965; "Pierrre the Mad"), Louis Malle's *Le Voleur* (1967; *The Thief of Paris*), *Borsalino* (1970), and *Stavisky* (1974). He gradually withdrew from working with New Wave directors and concentrated on commercially oriented action films that proved popular with European audiences. His autobiography, *Trente ans et vingt-cinq films* ("Thirty Years and Twenty-five Films"), was published in 1963.

Belmont, city, San Mateo county, western California, U.S., near San Mateo. Settled in 1850 as a stagecoach station, it was known for its association with William C. Ralston, Bank of California magnate, who in 1866 transformed Count Lussetti Cipriani's hillside villa into an ornate, rambling mansion—now the main building of the College of Notre Dame (founded 1851 in San Jose, moved 1923). Belmont became a shipping point for flowers. Several sanitariums, including a neuropsychiatric centre, were built there, and after 1950 the community grew as a southeastern residential suburb of San Francisco. Nearby is the tourist attraction Marine World/Africa U.S.A. Inc. 1926. Pop. (1993 est.) 24,857.

Belmont, village, Lafayette county, southwestern Wisconsin, U.S. It lies 50 miles (80 km) southwest of Madison. The original village (Old Belmont) was the first seat of the Territory of Wisconsin (created 1836), and the first legislature met there for 42 days in one of four hastily constructed frame buildings (a Council House, Supreme Court building, governor's residence, and boarding house for the legislators). The old village of Belmont (now called Leslie) died after it was bypassed by the Platteville branch of the Mineral Point Railroad, and the legislature moved to Burlington, Iowa (then in the Territory of Wisconsin) and later (1838) to Madison.

The present agricultural village of Belmont was established on the railroad line and was incorporated in 1894. In the First Capitol State Park, 3 miles (5 km) northwest on the old village site, are the restored (1924) Council House and Supreme Court building. Mineral Point (now restored), a centre of lead-mining activities in the mid-19th century, is a few miles northeast. Pop. (2000) 871.

Belmont FAMILY, family prominent in American banking and finance, politics, and patronage of the arts.

The family's founder in the United States was August Belmont (b. Dec. 8, 1816, Alzey, Rhenish Prussia [Germany]—d. Nov. 24, 1890, New York, N.Y., U.S.), a German-born

August Belmont

By courtesy of the Library of Congress, Washington, D.C.

banker and diplomat. The son of a wealthy Jewish landowner, August Belmont entered the banking house of the Rothschilds at Frankfurt am Main at age 14. His remarkable abilities won him a transfer to a more important post in the Rothschilds' Naples office three years later. In 1837 he moved to New York City and opened a small office on Wall Street, where he served as American agent for the Rothschilds and laid the foundation for his own banking house, August Belmont & Company. Though he started with practically no capital, within a few years Belmont had built his firm into one of the largest banking houses in the country. He also began taking an active interest in politics as a Democrat. From 1853 to 1855 he was chargé d'affaires for the United States at The Hague, and from 1855 to 1857 he served as resident minister there. Belmont was strongly opposed to slavery; although he initially supported Stephen A. Douglas, after the American Civil War began he became a loyal supporter of President Abraham Lincoln. He exerted a strong influence upon merchants and financiers in England and France in favour of the Union during the war. He also served as chairman of the national committee of the Democratic Party from 1860 to 1872. In his later years Belmont was a noted art collector and sportsman. He introduced Thoroughbred horse racing into the United States and was a long-time president of the American Jockey Club.

August Belmont married Caroline Slidell Perry, the daughter of Commodore Matthew C. Perry, in 1849. They had three sons and one daughter. Perry Belmont (b. Dec. 20, 1850, New York, N.Y., U.S.—d. May 25, 1947, Newport, R.I.) was their eldest son. He attended Harvard University (A.B., 1872) and Columbia Law School, where he earned a law degree in 1876. He practiced law from then until 1881, when he was elected to the U.S. House of Representatives as a Democrat from New York. He served four consecutive terms and chaired the House Committee on Foreign Affairs from 1885 to 1888, after which he was U.S. minister to Spain until 1889.

August Belmont, Jr. (b. Feb. 18, 1853, New

York, N.Y., U.S.—d. Dec. 10, 1924, New York), another son of August Belmont, graduated from Harvard in 1874 and then entered his father's firm, August Belmont & Company. He took full control of the banking house upon his father's death in 1890, and under his guidance it remained one of the largest and most powerful banking firms in the country. The younger August became deeply involved in financing public transportation, and in 1900 he organized the Rapid Transit Construction Company to finance and build the New York City subway.

Oliver Hazard Perry Belmont (b. Nov. 12, 1858, New York, N.Y., U.S.—d. June 10, 1908), another son of August Belmont, joined the Belmont banking house and in 1896 married the prominent socialite Alva Vanderbilt (née Smith).

Eleanor Belmont, née Robson (b. Dec. 13, 1879, Wigan, Lancashire, Eng.—d. Oct. 24, 1979, New York, N.Y., U.S.), was the wife of August Belmont, Jr. She took a special interest in opera, and in 1935 she organized the Metropolitan Opera Guild to oversee the troubled financing of New York City's Metropolitan Opera.

Belmont, Alva, also called (1875–96) ALVA VANDERBILT, in full ALVA ERTSKIN SMITH VANDERBILT BELMONT, née ALVA ERTSKIN SMITH (b. Jan. 17, 1853, Mobile, Ala., U.S.—d. Jan. 26, 1933, Paris, France), prominent socialite of New York City and Newport, R.I., who, in her later years, became an outspoken suffragist.

Daughter of a well-to-do Southern cotton planter and merchant, Alva Smith spent much of her youth in France. She married the New York tycoon William K. Vanderbilt in 1875. Their grandiose mansion at 660 Fifth Avenue in New York City, designed by Richard Morris Hunt and modeled after the French Château de Blois, was completed in 1881. Hunt subsequently built her Newport summer mansion, Marble House. There and in New York City and on the private yacht *Alva* she entertained often and grandly, making her a historical exemplar of conspicuous consumption.

In 1895 Alva divorced William for adultery and, after arranging her daughter Consuelo's marriage to the 9th duke of Marlborough, married the wealthy banker Oliver Hazard Perry Belmont in 1896. After the latter's death in 1908, Alva gave up most of her social activity, made an about-face, and became a militant suffragist and feminist. She opened her houses in New York and Newport to suffrage meetings, donated large sums to the suffrage cause, supported the National American Woman Suffrage Association, and founded the Political Equity League, a New York suffrage organization. In 1913 she joined the more militant Congressional Union—later the National Woman's Party—and became its president in 1921.

Belmont Stakes, oldest of the three classic American horse races (with the Kentucky Derby and the Preakness) that constitute the Triple Crown of United States horse racing; it originated in 1867 and is named after the financier, diplomat, and sportsman August Belmont. The Belmont has been run at various distances and tracks in its history. Since 1905, however, it has been held at Belmont Park, near New York City; and the course has been 1.5 miles (about 2,400 m) in length since 1926. The race is held early in June. For winners since 1947, see *Sporting Record: Horse racing*.

Belmonte, Juan, in full JUAN BELMONTE Y GARCÍA (b. April 14, 1892, Triana, near Seville, Spain—d. April 8, 1962, Utrera), Spanish bullfighter, one of the greatest toreros and the most revolutionary in his style.

About 1914, early in his career (which extended from 1910 to 1935), Belmonte intro-

duced the technique of standing erect, nearly motionless, and much closer to the bull's horns than earlier matadors had dared. Rather than using footwork to escape injury (accepted as the standard procedure before his time, but considered a sign of cowardice afterward), he diverted the bull with skillful capework so that the horns would barely miss him.

In 1919 Belmonte set a Spanish bullfighting record (unbroken at his death 43 years later) for a single season by appearing in 109 corridas (bullfights). After his retirement he reared fighting bulls on his *ganadería* (ranch) at Utrera. His autobiography, *Juan Belmonte, su vida y sus hazañas*, as told to Manuel Chaves Nogales, was translated into English as *Juan Belmonte, Killer of Bulls* (1937) by the novelist Leslie Charteris.

Belmopan, capital of Belize. It is located near the town of Roaring Creek, in the Belize River valley, 50 miles (80 km) inland from Belize City, the former capital on the Caribbean coast. The new capital was conceived after Hurricane Hattie and an associated tidal wave did extensive damage to Belize City in 1961. The site was chosen to be far enough inland to avoid a recurrence of disastrous flooding. Construction was begun in 1966, with funds from a United Kingdom grant. In 1970 government offices were moved to the new capital; housing construction went on through the 1970s. Most of the residents of Belmopan are government employees and their families. Pop. (2000) 8,130.

Belo, Carlos Filipe Ximenes (b. Feb. 3, 1948, Wailacama, East Timor), Roman Catholic bishop of Dili who, with José Ramos-Horta, received the 1996 Nobel Prize for Peace for their efforts to bring peace to East Timor (Timor Timur), which has been under Indonesian control since 1975.

Belo was ordained a bishop in 1983. As spiritual leader of a territory that is overwhelmingly Catholic, he became one of the primary spokesmen of the Timorese people. He denounced the brutal tactics and oppressive policies of the Indonesian government despite at least two attempts on his life, in 1989 and 1991. Following a massacre of peaceful demonstrators in Dili in 1991, Belo successfully campaigned for reforms in the military and the dismissal of two generals. A strong believer in nonviolent resistance, Belo sought peaceful means to settle the troubles in his homeland. In an open letter written in July 1994, he outlined his concern for the people of East Timor and proposed that the Indonesian government reduce its military presence, expand the civil rights of citizens, and allow East Timor to hold a democratic referendum on self-determination, or, barring that, grant East Timor special territorial status.

Belo Horizonte, city, southern Minas Gerais estado ("state"), southeastern Brazil. It lies on the western slope of the Serra do Espinhaço, at an elevation of 2,720 feet (830 m). The first of Brazil's planned cities, Belo Horizonte occupies a wide plateau encircled by the Serra do Curral del Rey, a hilly ridge forming the

Chapel of São Francisco, designed by Oscar Niemeyer, in Belo Horizonte, Braz.

Loren McIntyre—Woodfin Camp

"beautiful horizon" for which the city was named. Belo Horizonte lies on the eastern edge of the *sertão*, or dry interior, of Brazil. The site was chosen in the late 19th century after the city of Ouro Preto, enclosed within a narrow valley 50 miles (80 km) southeast, was abandoned as the state capital because it could not accommodate the necessary expansions. Belo Horizonte was laid out on a grid, modeled after Washington, D.C., in the United States and La Plata in Argentina. The city was inaugurated as the capital of Minas Gerais in 1897 under the name Cidade de Minas, adopting its present name in 1901. Originally designed with an area of 8 square miles (20 square km), Belo Horizonte is now many times that size, having surpassed a target population of 200,000 people by 1925.

Belo Horizonte is the hub of a large agricultural region growing mainly sugarcane and cotton, and it is the centre for extensive mining and livestock activity conducted throughout the *sertão* west of the city. It is the regional commercial centre as well, with vigorous activity in banking, commerce, and administration. The city's older, longer-established industries include publishing, textiles, furniture, and food processing. The steady growth of heavy industry since 1950, however, has made Belo Horizonte one of the largest industrial centres in Brazil. Electrical generating facilities and plants manufacturing and working iron and steel have been established, primarily in the industrial suburb of Contagem, and a large oil refinery and an automobile factory have been constructed in nearby Betim.

Tourists are attracted by the impressive buildings and the wide, tree-lined avenues radiating from the city centre. Pampulha, a garden suburb, is noted for its bold architecture, exemplified by Oscar Niemeyer's Chapel of São Francisco, decorated by Cândido Portinari.

Belo Horizonte is an important cultural centre, having several museums, including the Palace of the Arts and the Mineiro Museum, as well as a music conservatory, a ballet school, a technical college, and a wide range of secondary and primary schools. The Federal University of Minas Gerais (1927) and the Catholic University of Minas Gerais (1958) are situated in Belo Horizonte. The Mineirão stadium, also located in the city, is one of the largest football (soccer) stadiums in the nation. Major highways and railroads extend from the city in all directions, linking it to communities in the *sertão* as well as to the main population centres of Brazil's Atlantic coast. A domestic airport in Pampulha serves the Belo Horizonte metropolitan area, and there is an international airport at Confins. Pop. (2005 est.) city, 2,375,300; metropolitan area, 5,391,284.

Beloil, village, Hainaut province, Wallonia région, Belgium, situated between Mons and Tournai. It has been known since the 14th century as the seat of the princely family of Ligne, the most famous member of which was the writer and field marshal Charles-Joseph (1735–1814). The family's collections of tapestries, portraits, and precious artifacts are maintained in the castle, which is open to the public. Much of the present castle is of 20th-century construction, rebuilt on its old foundations after a fire in 1900; the old (1682–95) wings and entryway, however, are intact. Extensive grounds form a grandiose park, with a lake and fountains. Laid out by Charles-Joseph's father, Prince Claude Lamorel, and later adapted to 18th-century taste by the French architect Jean-Michel Chevotet, these grounds are sometimes compared to the gardens of Versailles. Pop. (2004 est.) 13,395.

Beloil, town, Montréal region, southern Quebec province, Canada. It lies on the west (left) bank of the Richelieu River. First settled in 1694, Beloil, the name of which means "beautiful view" in French, is now a popular

summer resort and suburb of Montreal city, 18 miles (29 km) to the west, to which it is joined by the Trans-Canada Highway, the Sir Wilfrid Laurier Boulevard, and a railway. The town also serves as a market centre for a fruit- and potato-growing, dairying, and cattle-raising region. Beloil's manufactures include explosives, agricultural chemicals, and ceramics. Pop. (2005 est.) 19,303.

Belogorsk, formerly (1860–1935) ALEKSANDROVKA, or (1935–57) KUYBYSHEVKA-VOSTOCHNAYA, city, Amur oblast (province), far eastern Russia. Situated in the Zeya-Bureya Plain and on the Tom River, it was founded in 1860 and became a city in 1926. It is a rail junction and an agricultural centre in a wheat-producing area with food-processing industries. Pop. (2002) 67,422.

Beloit, city, Rock county, southern Wisconsin, U.S. It lies along the Illinois state line at the confluence of the Rock River and Turtle Creek. The area was inhabited by Ho-Chunk Nation (Winnebago) Indians prior to the arrival of settlers from New Hampshire in 1836–37, calling themselves the New England Emigrating Company. The village pledged land, labour, and money for a college, and Beloit College was founded there in 1846. The centre of a rich agricultural area and the focal point of area commerce, the city also has manufacturing and food processing. Inc. 1857. Pop. (2004 est.) city, 35,803; Janesville MSA, 156,512.

Belon, Pierre (b. 1517, near Le Mans, France—d. April 1564, Paris), French naturalist whose discussion of dolphin embryos and systematic comparisons of the skeletons of birds and humans mark the beginnings of modern embryology and comparative anatomy.

Belon, detail from an engraving
By courtesy of the Ashmolean Museum, Oxford

Belon studied botany at the University of Wittenberg (1540) and, under the patronage of François, Cardinal de Tournon, embarked on a tour of eastern Mediterranean countries (1546–48) in order to identify animals, plants, places, and objects described by ancient writers. In the resulting work, *Les Observations de plusieurs singularitez et choses mémorables . . .* (1553; "Observations of Several Curiosities and Memorable Objects . . ."), he described many animals, plants, drugs, customs, arts, and ruins previously unknown to Europeans and established an itinerary followed by scientific travelers for nearly three centuries afterward.

Although based on the taxonomy of Aristotle, Belon's *L'histoire naturelle des estranges poissons marins* (1551; "Natural History of Unusual Marine Fishes"), much of which is devoted to a discussion of the dolphin, and *L'histoire de la nature des oyseaux* (1555; "Natural History of Birds"), illustrating, classifying, and describing about 200 species, include original observations and concepts that made a deep impression on contemporary and later science. Belon was murdered by unknown assailants in the Bois de Boulogne.

Beloretsk, city, Bashkortostan, west-central Russia. It lies near the headwaters of the Belaya River, a tributary of the Kama. It was founded as a mining settlement in 1762 when a metallurgical factory was constructed nearby. Beloretsk remains a metallurgical centre and has medical and teachers colleges. It became a city in 1923. Pop. (1994 est.) 73,700.

Belousov, Vladimir Vladimirovich (b. Oct. 17 [Oct. 30, New Style], 1907, Moscow, Russia—d. Dec. 25, 1990), Soviet geologist and geophysicist who in 1942 advanced the theory that the Earth's material has gradually differentiated according to its density to produce

Belousov
Novosti Press Agency

the present internal structure of the Earth and that this gradual movement is the basic cause of movements of the Earth's crust.

Belousov assumed direction of the department of geodynamics at the Academy of Sciences of the U.S.S.R., Moscow, in 1942 and served as chairman of the Soviet Joint Geophysical Committee from 1961. He was also vice chairman of the International Geophysics Committee (1960–64) and president of the International Committee for Upper Mantle of the Earth Projects (1964–70).

Belovezhskaya Forest, also called BELOVEZH FOREST, Belarusian BELOVEZH-SKAYA PUSHCHA, Polish PUSZCZA BIAŁOWIE-SKA, forest in western Belarus and eastern Poland. It is one of the largest surviving areas of primeval mixed forest (pine, beech, oak, alder, and spruce) remaining in Europe and occupies about 460 square miles (1,200 square km). The Belovezhskaya Forest is located in Brest and Hrodna (Grodno) *oblasti* (provinces) of Belarus and in Podlaskie *wjewództwo* (province) of eastern Poland near the headwaters of the Narev (Polish: Narew) and Lesnaya (Lesna) rivers, tributaries of the Bug. The forest contains elk, deer, lynx, and wild boar. Hunted into extinction in the wild after World War I, the European bison, or wisent, was reintroduced to the Belovezhskaya with zoo-bred animals. The forest remains the European bison's most notable home, though the animals are now also found again in other parts of Europe, including Lithuania, Russia, and Ukraine. Once the hunting grounds of kings and tsars, the Belovezhskaya is the oldest nature preserve in Europe. Both the Polish and Belarusian portions of the forest have become national parks and World Heritage sites.

Belovo, city, Kemerovo oblast (province), south-central Russia, on the small Bachat River. Incorporated in 1930, it is an important coal-mining town of the Kuznetsk Basin. A large zinc works, built in 1931, uses concen-

trated ore from eastern Siberia. Sulfuric acid and cinema devices are manufactured. Pop. (2000 est.) 89,000.

Belper, town ("parish"), Amber Valley district, county of Derbyshire, England. It lies on the east bank of the River Derwent. Jedediah Strutt, inventor of an important ribbing machine, built the town's first cotton mills about 1780. The production of nails was formerly the staple industry of the parish, but it has given way to cotton and hosiery manufacture, with some engineering. Pop. (1991) 18,213.

Belsen (German Nazi concentration camp): see Bergen-Belsen.

Belsen, Beast of: see Kramer, Josef.

Belshazzar, Neo-Babylonian BEL-SHAR-USUR, Greek BALTASAR, or BALTHASAR (d. c. 539 BC), coregent of Babylon who was killed at the capture of the city by the Persians.

Belshazzar had been known only from the biblical Book of Daniel (chapters 5, 7–8) and from Xenophon's *Cyropaedia* until 1854, when references to him were found in Babylonian cuneiform inscriptions. Though he is referred to in the Book of Daniel as the son of Nebuchadrezzar, the Babylonian inscriptions indicate that he was in fact the eldest son of Nabonidus, who was king of Babylon from 555 to 539, and of Nitocris, who was perhaps a daughter of Nebuchadrezzar. When Nabonidus went into exile (550), he entrusted Belshazzar with the throne and the major part of his army.

During his coregency Belshazzar administered the government, his own estates, and those of his father, though, according to the Book of Daniel, famine and economic setbacks occurred late in his rule. According to the accounts in the Bible and Xenophon, Belshazzar held a last great feast at which he saw a hand writing on a wall the following words in Aramaic: "mene, mene, tekel, upharsin." The prophet Daniel, interpreting the handwriting on the wall as God's judgment on the king, foretold the imminent destruction of the city. Belshazzar died after Babylon fell to the Persian general Gobyras without resistance on Oct. 12, 539, and probably before the Persian king Cyrus II entered the city 17 days later.

belt drive, in machinery, a pair of pulleys attached to usually parallel shafts and connected by an encircling flexible belt (band) that can serve to transmit and modify rotary motion from one shaft to the other. Most belt drives consist of flat leather, rubber, or fabric belts running on cylindrical pulleys or of belts with a V-shaped cross section running on grooved pulleys. To create an effective frictional grip on the pulleys, belts must be installed with a substantial tension. Because of the wedging action of the belts in the grooves, V belts require less tension than do flat belts and are particularly suitable for connecting shafts that are close together. Flat and V belts slip when overloaded, and in some applications this condition may be more desirable than a rigid drive because it limits the transmitted torque and may prevent breakage of parts.

When flat belts are used to connect non-parallel shafts, the pulleys are located in such a way that the belt does not run off the pulleys; in some cases it may be necessary to use additional, or idler, pulleys to guide the belt. With an open flat belt, both shafts rotate in the same direction; with a crossed belt they rotate in opposite directions.

Another type of belt used on some internal-combustion engines for connecting the crankshaft and camshafts is the toothed, or timing, belt. This is a flat belt with evenly spaced transverse teeth that fit in matching grooves on the periphery of the pulley. The

Belt drive

positive drive these belts provide has many advantages but lacks overload protection.

Belt Series, major division of late Precambrian rocks in North America (the Precambrian lasted from 3.8 billion to 540 million years ago). The series was named for prominent exposures in the Belt Range in southwestern Montana. The thickness of Beltian rocks, which extend northward into Canada, ranges from more than 11,000 m (about 36,000 feet) on the west to about 4,000 m in the east. The upper portions of the Belt Series grade into undoubted Cambrian rocks without apparent interruption, whereas the lower portions are at least 1.5 billion years old, as determined by radiometric-dating techniques.

Four divisions of the Belt Series are recognized. The uppermost, or youngest, of these is the Missoula Group, which is underlain in turn by the Piegan Group and the Ravalli Group; older Beltian rocks are termed Pre-Ravalli. Beltian rocks rest on a basement of gneisses and consist of thick deposits of sandstones, shales, sandy shales, and limestones. Although mud-cracked reddish shales occur, gray shales predominate. Limestones and shales are dominant in the east, whereas to the west sandstones and shales are dominant; it is probable that this coarsening of sediment types to the west indicates the presence in Beltian time of a major landmass still farther to the west, perhaps in the region of what is today the state of Washington or British Columbia. Ripple marks in the gray shales show that most Beltian rocks were deposited in shallow water; the reddish shales were probably deposited on low-lying floodplains, but their origin is disputed. The remains of Precambrian organisms have been found in the Belt Series and include stromatolites (carbonate-secreting algal mats) and the burrows of wormlike creatures; more advanced fossils attributed to the Beltian are probably of Cambrian age.

Beltane, also spelled BELTINE, Irish BELTAINNE or BELLTAINNE, also known as CÉTAMAIN, festival held on the first day of May in Gaelic-speaking lands, celebrating the beginning of summer and open pasturing. Beltane is first mentioned in a glossary attributed to Cormac, bishop of Cashel and king of Munster, who was killed in 908. Cormac describes how cattle were driven between two bonfires on Beltane as a magical means of protecting them from disease before they were led into summer pastures—a custom still observed in Ireland in the 19th century. In early Irish lore a number of significant events took place on Beltane, which long remained the focus of folk traditions and tales in Ireland, Scotland, and the Isle of Man. As did other pre-Christian Celtic peoples, the Irish divided the year into two main seasons. Winter and the beginning of the year fell on November 1 (Irish: Samain) and midyear and summer on May 1 (Irish:

Beltaine). These two junctures were thought to be critical periods when the bounds between the human and supernatural worlds were temporarily erased; on May Eve, witches and fairies roamed freely, and measures had to be taken against their enchantments.

Belter, John Henry, original name JOHANN HEINRICH BELTER (b. 1804, Germany—d. 1863, New York, N.Y., U.S.), cabinetmaker and designer considered to have created superb Victorian Rococo pieces.

Belter served as a cabinetmaker's apprentice in Württemberg (now in Germany), where he was trained in the Black Forest tradition of rich carving so admired during the 19th century. Settling in New York City in 1844, he married and opened a fashionable shop on Broadway. Although he also worked in walnut and mahogany, his favourite medium was rosewood (then popular in the United States), with which he experimented. In 1856 he patented his invention of processing laminated rosewood in many layers to achieve thin panels that, once shaped in molds through steam heating, were finely carved. This rather personal Louis XV revival style, a somewhat heavy, florid Rococo called *zweites Rokoko*, succeeded the uniquely Neoclassical and functional Biedermeier period created in his homeland and reflected the more nostalgic tastes then evolving in Europe.

Marble-top rosewood parlour table by Belter, 1856–61; in the Museum of the City of New York
By courtesy of the Museum of the City of New York

The large factory Belter opened in New York City in 1858 employed many apprentices; and his furniture became known for its rich carving, handsome brocades, and bold asymmetry. Competitive French imports that were esteemed by the elite, together with economic problems attending the American Civil War (1861–65), impaired his business; production continued for a while after his death, but the firm failed completely in 1867.

Beltrami, Eugenio (b. Nov. 16, 1835, Cremona, Lombardy, Austrian Empire [now in Italy]—d. Feb. 18, 1900, Rome, Italy), Italian mathematician known for his concepts of non-Euclidean geometry, especially his theories of surfaces of constant curvature.

Following his studies at the University of Pavia (1853–56) and later in Milan, Beltrami was invited to join the faculty at the University of Bologna in 1862 as a visiting professor of algebra and analytic geometry; four years later he was appointed professor of rational mechanics. He also held professorships at universities in Pisa, Rome, and Pavia.

Influenced by N.I. Lobachevsky, C.F. Gauss, and Bernhard Riemann, Beltrami's work on the differential geometry of curves and surfaces removed any doubts about the validity of non-Euclidean geometry, and his method was soon followed by the German mathematician Felix Klein. Beltrami's four-volume work, *Opere Matematiche* (1902–20), published posthumously, contains his comments on a broad range of physical and mathemat-

ical subjects, including thermodynamics, elasticity, magnetism, optics, and electricity. Beltrami was a member of the Accademia dei Lincei, serving as president in 1898; he was elected senator a year before his death.

Beltrán, Pedro Gerado (b. Feb. 17, 1897, Lima, Peru—d. Feb. 16, 1979, Lima), Peruvian economist, diplomat, and publisher whose brief term as prime minister and minister of finance (1959–61) stabilized the Peruvian economy.

A graduate of the London School of Economics (1918), Beltrán was the longtime owner (1934–74) and publisher of the influential Lima newspaper *La Prensa* ("The Press"). An ultraconservative in social and economic matters, he helped organize in 1936 the National Party, whose candidate lost the presidential election that year. After returning from his post as the ambassador to the United States (1944–45), he used his newspaper to lead a campaign to outlaw the American Popular Revolutionary Alliance (APRA), a reformist political party. In 1956, during the autocratic regime of President Manuel Odría (1948–56), Beltrán was jailed for one month on the island prison of El Frontón, for advocating a relaxation of Odría's repressive rule.

In 1959 President Manuel Prado Ugarteche appointed Beltrán prime minister and minister of finance. He repaid Peru's debt to the International Monetary Fund, cut inflation, and strengthened the country's foreign reserves and its balance of trade. He dropped plans to run for president in 1962 after his initial campaign rally attracted only a handful of supporters. Beltrán returned to editing *La Prensa* until the newspaper was expropriated (1974) by President Juan Velasco Alvarado.

Beluchi (group of tribes): see Balochi.

Beluchi rug: see Balochi rug.

beluga, also called WHITE WHALE (*Delphinapterus leucas*), widely distributed whale of the family Monodontidae, found in the Arctic Ocean and adjacent seas, in both deep offshore and coastal waters. It may also enter rivers that empty into far north seas. A medium-sized toothed whale with a rounded forehead and no dorsal fin, the beluga is about 4 m (13 feet) long. Born dark blue-gray or blackish,

Beluga, or white whale (*Delphinapterus leucas*)
E.R. Degginger

it fades to white or cream at four or five years of age. The beluga feeds on fish, cephalopods, and crustaceans and usually lives in groups of 5 to 10. It is taken commercially for its oil, hide, and flesh and is used in the Arctic as food for humans and dogs.

beluga, also called HAUSEN, large species of sturgeon (*q.v.*).

Belukha, Mount, also spelled BELUCHA, Russian GORA BELUKHA, one of the Katun Mountains, a series of snowcapped peaks in Russia. The highest mountain in the Russian portion of the Altai Mountains, Belukha reaches a height of 14,783 feet (4,506 m) in one of its twin peaks. Glaciers cover some 27 square miles (70 square km) of its surface; the largest, Berel, ascends to a height of 6,396 feet

(1,950 m). The mountain lies in a region of year-round snows.

belvedere (Italian: "beautiful view"), architectural structure built in an elevated position to provide lighting and ventilation and to command a fine view. Roofed but open on one or more sides, a belvedere may be located in the upper part of a building or may stand as a separate structure. It often assumes the form of a loggia, or open gallery.

The belvedere has been used in Italy since the Renaissance; in the colder climate of northern Europe it is largely an architectural ornamentation. The term is sometimes applied

Twin-towered belvedere atop the Villa Medici, Rome, by Annibale Lippi, 1574–80
H. Roger-Vollet

to an entire building with a planned view, as the Belvedere gallery in the Vatican or the Belvedere palace in Vienna. The gazebo (*q.v.*) is a freestanding belvedere, usually open on all sides but often enclosed by wire screening.

Belvedere Torso, Hellenistic sculpture fragment of a male nude (5 feet 2⁵/₈ inches [1.59 m] high) in the Vatican Museum; the work is signed by the Athenian sculptor Apollonius the son of Nestor and was long thought to be a 1st-century-BC original. It is now believed that Apollonius copied a 2nd-century original. The dynamic pose of the torso influenced the development of the energetic figure style of Michelangelo and was subsequently much studied by artists of the Mannerist or Late Renaissance and Baroque periods.

Belvidere, city, seat (1837) of Boone county, northern Illinois, U.S., on the Kishwaukee River. Founded in 1836 by settlers from the state of New York, it was important as a stopping place on the Chicago-Galena stage route and developed as an agricultural trading centre, shipping milk and grain to Chicago. With the building of a large Chrysler Corporation automobile plant there in 1965, Belvidere became an important industrial community. Also in Belvidere are the Boone County Historical Museum and the grave of the Potawatomi Indian chief Big Thunder. Inc. 1852. Pop. (1991 est.) 16,114.

Bely, Andrey, pseudonym of BORIS NIKOLAYEVICH BUGAYEV, or BUGAEV (b. Oct. 14 [Oct. 26, New Style], 1880, Moscow, Russia—d. Jan. 7, 1934, Moscow), leading theorist and poet of Russian Symbolism, a literary school deriving from the modernist movement in western European art and literature and indigenous Eastern Orthodox spirituality, expressing mystical and abstract ideals through allegories from life and nature.

Reared in an academic environment as the son of a mathematics professor, Bely was closely associated with Moscow's literary elite, including the late 19th-century philosopher-mystic Vladimir Solovyov, whose eschatological thought (concerning the world's purpose and final resolution) he absorbed. Carried by his idealism from harsh reality to speculative thought, Bely completed in 1901 his

first major work, *Severnaya simfoniya* (1902; "The Northern Symphony"), a prose poem that represented an attempt to combine prose, poetry, music, and even, in part, painting. Three more "symphonies" in this new literary form followed. In other poetry he continued his innovative style and, by repeatedly using irregular metre (the "lame foot"), introduced Russian poetry to the formalistic revolution that was brought to fruition by his aesthetic colleague Aleksandr Blok.

Bely's first three books of verse, *Zoloto v lazuri* (1904; "Gold in Azure"), *Pepel* (1909; "Ashes"), and *Urna* (1909; "Urn"), are, like Blok's, diaries in poetry. In 1909 Bely completed his first novel, *Serebryany golub* (1910; *The Silver Dove*). His most celebrated composition, *Peterburg* (published serially 1913–14; *St. Petersburg*), is regarded as a Baroque extension of his earlier "symphonies." In 1913 he became an adherent of the Austrian social philosopher Rudolf Steiner and joined his anthroposophical colony in Basel, Switz., a group advocating a system of mystical beliefs derived from Buddhist contemplative religious experience. While in Switzerland Bely began writing his *Kotik Letayev* (1922; *Kotik Letayev*), a short autobiographical novel suggestive of the style of James Joyce.

Bely returned to Moscow in 1916, and, like other Symbolists, he at first greeted the 1917 Bolshevik Revolution ecstatically. His brief poem "Khristos voskresc" (1918; "Christ Has Prevalled") lauded the messianic promise of Russian socialism; however, after Blok's death and the execution by the Soviets of several of his literary colleagues, the dispirited Bely went abroad, although he returned to Russia in 1923. His development of new techniques of writing significantly affected later Russian verse and prose style.

*A list of the abbreviations used
in the MICROPAEDIA will be found
at the end of this volume*

Bely Gorod, also spelled BELYI GOROD (Russian: "White City"), fortress and settlement comprising the third defense belt around Moscow, which joined the Kremlin and Kitaygorod on the left bank of the Moskva River. Built between 1585 and 1593 of stone walls, the fortifications of Bely Gorod were important in providing defense for the Moscow settlement. In the 1770s and '80s its walls and defense towers were taken down and replaced by boulevards.

Belyayev, Pavel, in full PAVEL IVANOVICH BELYAYEV (b. June 26, 1925, Chlshchevo, Russia, U.S.S.R.—d. Jan. 10, 1970, Moscow), cosmonaut who served as the pilot of the Voskhod 2 spacecraft during the Soviet Union's eighth manned space mission,

Belyayev, 1965
Sovfoto

launched March 18, 1965, the flight on which Aleksey Leonov, Belyayev's copilot, became the first man to walk in space.

Belyayev began training as a fighter pilot in 1943 and saw combat against the Japanese late in World War II. After the war he remained in naval aviation. While attending the Soviet Air Force Academy, Moscow, in late 1959, he was selected for training as one of the original group of cosmonauts. For his part in the Voskhod 2 flight, he was proclaimed a Hero of the Soviet Union.

Belyi Gorod (Russia): see Bely Gorod.

Belzec, Polish *BEŁŻEC*, German Nazi system of concentration camps and extermination camp in and near the village of Belżec in Lublin province, Poland. The first forced-labour camp for Polish Jews was established at this site in early 1940, and by the autumn of the year there were three camps in the village itself and a number of satellite camps in surrounding areas, accommodating more than 11,000 prisoners at a time. Hundreds died from overwork, starvation, disease, and brutal living conditions. The camps were closed in December 1940, and the population dispersed.

In early 1942 an extermination camp was set up at Belżec, receiving Jews from Poland and later from Germany, Czechoslovakia, and Romania. Originally victims were exterminated in cells filled with diesel fumes; but, in August 1942, Zyklon-B, the quick-acting hydrogen cyanide gas, was first demonstrated at Belżec. The camp was closed in the spring of 1943, and traces of it were obliterated; a farm was established on the site. Probably more than 600,000 persons died at Belżec; only one known survivor was discovered at war's end. See also Holocaust.

Belzoni, Giovanni Battista (b. Nov. 5, 1778, Padua, Republic of Venice—d. Dec. 3, 1823, Gwato, Benin), excavator of Egyptian archaeological sites.

Originally planning to join a religious order, Belzoni went to England in 1803 where he turned his powerful six-foot seven-inch physique to earning a living as a circus strong man. He also exhibited models of hydraulic engines and in 1815 he went to Cairo to offer to Muhammad 'Ali Pasha, the founder of modern Egypt, hydraulic engines for use in irrigation. Two years later he had embarked on a new career, excavating Egyptian tombs and temples for their treasures with scant regard for incidental damage to less desirable items. Many of his archaeological feats might today be regarded as pillage.

Belzoni, oil painting by W. Brockedon; in the National Portrait Gallery, London. By courtesy of the National Portrait Gallery, London

At Thebes he obtained the colossal sculpture of the head of Ramses II ("the Young Memnon") for the British Museum; in the nearby Valley of the Tombs of Kings, he discovered the tomb of Seti I and removed the aragonite sarcophagus for the Sir John Soane's Museum,

London. Though he managed to make off with an obelisk from the Nile island of Philae (Jazīrat Filah), near Aswān, it was taken from him at gunpoint by agents working for French interests. He explored Elephantine (Jazīrat Aswān) and the temple of Edfu (Idfu), cleared the entrance to the great temple of Ramses II at Abu Simbel, was first to penetrate the pyramid of Khafre at Giza, and identified the ruins of the city of Berenice on the Red Sea. He returned to England in 1819 and published an account of his adventures, *Narrative of the Operations and Recent Discoveries Within the Pyramids, Temples, Tombs and Excavations, in Egypt and Nubia* . . . 2 vol. (1820). He died in western Africa as he began a journey to Timbuktu. In 1825 his widow exhibited in Paris and London his drawings and models of the royal tombs of Thebes. *Great Belzoni*, a biography written by Stanley Mayes, appeared in 1959.

B.E.M., recipient of the British Empire Medal. See British Empire, The Most Excellent Order of the.

Bem, Józef Zachariasz, also called **MURAD PASHA** (b. March 14, 1794, Tarnów, Galicia, Austrian Empire—d. Dec. 10, 1850, Aleppo,

Bem, detail from a portrait by an unknown Polish artist, 19th century; in the National Museum, Warsaw

By courtesy of the National Museum, Warsaw

Syria, Ottoman Empire), Polish army officer whose military feats in Transylvania and the region of Banat made him a hero of the Hungarian Revolution of 1848–49.

Educated at the Warsaw Military School, he distinguished himself with a Polish artillery regiment in Napoleon's Russian campaign (1812) and in the defense of Danzig (1813). He returned to Polish service in 1815 and fought with distinction in the rebellion against Russia (1830–31).

In 1848 he offered his services to the Hungarian leader Lajos Kossuth and was assigned the defense of Transylvania. With a small army he performed prodigiously against the Austrians, especially in his stand at the bridge of Piski (Feb. 9, 1849), where he repulsed superior forces. Bem occupied the Banat region but had to return to the defense of Transylvania when the Russians invaded. Finally, on July 31, overwhelming forces wiped out his army. Bem escaped only by feigning death.

On the collapse of the Hungarian rebellion he fled to Turkey, adopted Islām, and, as Murad Pasha, became governor of Aleppo, where, at the risk of his life, he saved the Christian population from being massacred.

bema (Greek *bēma*, "step"), raised platform: in antiquity it was probably made of stone, but in modern times it is usually a rectangular wooden platform approached by steps. Originally used in Athens as a tribunal from which orators addressed the citizens as well as the courts of law, the bema later became a standard fixture in Christian churches. In Early Christian basilicas it functioned as a stage for the seating of clergy, first in the chancel and later in the apse. The bema also appears in synagogues, and from it the Pentateuch and

Bema, S. Lorenzo Fuori le Mura, Rome, begun 4th century

Alinari—Art Resource

Torah are read. Rabbinical authorities disagree about its placement, however, and it has no fixed position.

Bemba, also called **BABEMBA**, or **AWEMBA**, Bantu-speaking people inhabiting the north-eastern plateau of Zambia and neighbouring areas of Zaire and Zimbabwe. The Bantu language of the Bemba has become the lingua franca of Zambia.

The people practice shifting cultivation, pollarding the forest trees and planting the staple, finger millet, in the ash derived from burning the branches. The poor soil and inadequate transportation have hindered cash crops, and in the 1960s and 1970s many men left the area to find work in the copper mines more than 400 miles to the south.

The Bemba claim to be an offshoot of the Luba empire (see Luba-Lunda states) and are thought to have left the Congo in the 18th or early 19th century. They achieved a centralized government under a supreme chief, the Chitimukulu, who was a member of a single, matrilineal, royal clan. The power of members of this clan rested on the sacredness of their persons and on their prayers to ancestral spirits at relic shrines, which were thought to have influence on the fertility of the land and on the general welfare of the people. Their burial and accession ceremonies are among the most elaborate found among the Bantu speakers.

The Bemba are divided into 40 matrilineal, exogamous clans, with members dispersed over the country. The local group is the village, which is largely composed of the matrilineal relatives of the headman. It contains about 30 huts and moves every four or five years when the soil is exhausted. Polygyny is practiced, the first wife enjoying special status, but each co-wife occupying a separate hut.

Bembo, Pietro (b. May 20, 1470, Venice—d. Jan. 18, 1547, Rome), Renaissance cardinal who wrote one of the earliest Italian grammars and assisted in establishing the Italian literary language.

Of an aristocratic family, Bembo was educated principally by his father, a man of great authority in the Venetian republic. In 1513 the son became secretary to Pope Leo X in Rome. On Leo's death (1521), he retired to Padua. He accepted the office of historiographer of Venice in 1529, and was shortly thereafter appointed librarian of St. Mark's Cathedral. Created a cardinal in 1539, Bembo returned to Rome, where he devoted himself to theology and classical history.

Bembo wrote Latin lyric poetry of formal excellence and then turned to the vernacular,

modeling his poetry on that of Petrarch. His way of making direct imitations of Petrarch was widely influential and became known as *bembismo*. A collected edition of his Italian poems, *Rime*, appeared in 1530. His other vernacular works include: *Gli Asolani* (1505), dialogues on platonic love, the systemization of which influenced Ludovico Ariosto, Baldassare Castiglione, and Torquato Tasso; a history of Venice; and *Prose della volgar lingua* (1525; "Discussions of the Vernacular Language"). In the *Prose*, Bembo codified Italian orthography and grammar, essential for the establishment of a standard language, and recommended 14th-century Tuscan as the model for Italian literary language. His view, opposed by those who wanted Latin and by others who wanted a more modern Italian as the model, had triumphed by the end of the 16th century.

Bemidji, city, seat of Beltrami county, north-central Minnesota, U.S., on Lake Bemidji. The city developed around a trading post established in 1888. The name, first applied to the lake, honours an Ojibwa Indian chief. In the 1890s large-scale lumbering operations were begun, and for 30 years Bemidji was a major logging and sawmilling centre. As the largest city within a radius of 100 miles (160 km), it is now an important trading centre. Its chief industries include creameries and wood-working plants. The surrounding scenic lake and forest region attracts a summer and winter resort trade. Bemidji State University was opened in 1919. Nearby is Lake Bemidji State Park, and Paul Bunyan State Forest is to the south. An 18-foot (5.5-metre) statue of the mythological lumberjack Paul Bunyan, with Babe, his blue ox, stands on the lake shore. Inc. village, 1896; city, 1905. Pop. (2002 est.) 12,374.

Bemmelen, Reinout Willem van (b. April 14, 1904, Batavia, Dutch East Indies [now Jakarta, Indon.]—d. 1983), Dutch geophysicist whose studies of the regional geology of Indonesia led to recognition of the importance of island areas in the development of the Earth's crust.

A member of the Geological Survey of Indonesia (1927–46), for which he served as chief of its volcanological survey (1940–46), he became a member of the staff at the Geological Institute of the State University of Utrecht, Neth., in 1949, retiring in 1969. He also conducted research on continental drift and determination of winds in the equatorial stratosphere. He wrote *The Geology of Indonesia* (1949), *Mountain Building* (1954), and *Geodynamic Models* (1972).

Ben Barka, Mehdi (b. 1920, Morocco—d. October 1965?, Paris, France?), Moroccan revolutionary politician exiled to Paris whose abduction and presumed murder in October 1965 caused a political crisis for the government of French President Charles de Gaulle and led to ruptured diplomatic relations between France and Morocco for almost four years.

Ben Barka, the son of a Moroccan policeman, taught mathematics before he entered political life. He joined the Istiqlal Party, becoming speaker of the National Consultative Assembly, and in 1959 left the party to found the left-wing National Union of Popular Forces (UNFP). He was widely considered as a likely president for a possible Republic of Morocco. When Morocco and Algeria had a brief war in 1963, Ben Barka sided with Algeria and went into exile. He was subsequently accused of high treason for an alleged plot against King Hassan II and was sentenced in absentia to death. He moved to Paris and became leader-in-exile of the opposition to Hassan.

On Oct. 29, 1965, Ben Barka disappeared. He was never found, and investigators concluded that gangsters were paid to kidnap and murder him. It was suggested several times that the plot was headed by General Muham-

mad Oufkir, Hassan's minister of the interior. A formal inquiry and trial in France showed that Morocco had violated French national sovereignty and, worse yet, that French police officers and members of French intelligence had been involved in the affair. France issued an international warrant for Oufkir's arrest, which was ignored. Relations between the two countries deteriorated steadily over the incident until January 1966, when diplomatic relations were severed.

Ben Bella, Ahmed (b. Dec. 25, 1918?, Maghnia [Marnia], Alg.), principal leader of the Algerian War of Independence against France, the first prime minister (1962–63) and first elected president (1963–65) of the Algerian republic, who steered his country toward a socialist economy.

Ben Bella was the son of a farmer and small businessman in Maghnia in the *département* of Oran. There, he successfully completed his early studies at the French school and continued his education in the neighbouring city of Tlemcen, where he first became aware of racial discrimination and also mingled with the fringes of the nationalist movement.

He was conscripted into the French army in 1937, served in World War II, and was awarded the Croix de Guerre (1940) and the Médaille Militaire (1944). On his return to Maghnia, Ben Bella resumed his nationalist activities, refusing to be intimidated by the French authorities' confiscation of his farm. He left Maghnia, joined Messali Hadj's underground movement, and soon became one of the "Young Turks" who, after the rigged election of Governor Marcel-Edmond Naegelen (1948), considered illusory any hope of achieving independence democratically. He founded with his friends in Messali Hadj's party, the Organisation Spéciale (OS), whose aim was to take up arms as quickly as possible.

After robbing the post office at Oran (1950) to obtain funds for the nationalist movement, Ben Bella was sentenced to prison, but he escaped after serving only two years. He went underground again and moved to Egypt, where he was promised help by the revolutionary supporters of Gamal Abdel Nasser.

In November 1954 Ben Bella and the Algerian émigré leaders resident in Egypt, who had met secretly in Switzerland with those leaders who were still living in Algeria, came to two major decisions: to create the National Liberation Front (Front de Libération Nationale [FLN]) and to order an armed insurrection against the French colonists.

Ben Bella played an important political role in the leadership of the FLN, simultaneously organizing the shipment of foreign arms to Algeria. In 1956 he escaped two attempts on his life, one at Cairo and the other at Tripoli, Libya. In the same year, he was arrested in Algiers by the French military authorities while in the process of negotiating peace terms with the French premier, Guy Mollet.

His imprisonment (1956–62) kept him dissociated from those errors of military conduct committed by the FLN, and, when he was freed after the Évian agreements with France were signed in 1962, his reputation was intact.

The situation in independent Algeria was chaotic. The leaders of the FLN had formed a conservative provisional government (Provisional Government of the Algerian Republic), while the party's congress at Tripoli had elected a socialist-oriented government at the end of the war. It was this latter "Bureau Politique" that Ben Bella ran.

The intervention on his behalf by Colonel Houari Boumedienne, chief of the Army of National Liberation (Armée de Libération Nationale [ALN]), assured both the success of the Bureau Politique and of Ben Bella, who was elected unopposed and with an immense majority to the presidency of the Algerian republic in 1963.

Ben Bella reestablished order in a country disorganized both by the massive departure of French colonists and by the clashes of armed groups. He created a state out of nothing and set aside one-quarter of the budget for national education. Above all else, he inaugurated, under the title autogestion, a series of major agrarian reforms, including the nationalization—but not the direct state control—of the former colonists' huge farms.

Ben Bella allied himself with the anti-Zionist Arab states and developed cultural and economic relations with France. He also extricated the country from an important border dispute with Morocco.

Ben Bella's method of government pleased the Algerian people, but the effects of his policies were not always as beneficial as his generous intentions. Through lack of either *timé*, political lucidity, or planning, Ben Bella governed from day to day in a series of improvised acts, some of which—like his appeal to Algerian women to donate their jewelry to the state—were more spectacular than useful. Ben Bella was unable to restore the FLN, nor was he able to win for it that popular support that would have helped to keep Boumedienne in check.

On June 19, 1965, Ben Bella was deposed in a coup led by Boumedienne, who installed himself as president; Ben Bella was detained and had little contact with the outside world for 14 years. Following the death of Boumedienne in 1978, restrictions on Ben Bella were eased in July 1979, though he remained under house arrest. On Oct. 30, 1980, he was freed. He spent 10 years in exile, returning to Algeria in 1990.

Ben-Gurion, David, original name DAVID GRUEN (b. Oct. 16, 1886, Plońsk, Pol., Russian

Ben-Gurion
Horst Tappe - EB Inc

Empire [now in Poland]—d. Dec. 1, 1973, Tel Aviv-Yafo, Israel), Zionist statesman and political leader, the first prime minister (1948–53, 1955–63) and defense minister (1948–53; 1955–63) of Israel. It was Ben-Gurion who, on May 14, 1948, at Tel Aviv, delivered Israel's declaration of independence. His charismatic personality won him the adoration of the masses, and, after his retirement from the government and, later, from the Knesset (the Israeli house of representatives), he was revered as the "Father of the Nation."

Ben-Gurion, born David Gruen, was the son of Victor Gruen, one of the leaders in Plońsk of the "Lovers of Zion," a movement that was disseminating among the oppressed Jews of eastern Europe the idea of the return to their original homeland of Israel. Zionism fascinated the young David Gruen, and he became convinced that the first step for the Jews who wanted to revive Israel as a nation was to immigrate to Palestine and settle there as farmers. In 1906 the 20-year-old Gruen arrived in Palestine and for several years worked as a

farmer in the Jewish agricultural settlements in the coastal plain and in Galilee, the northern region of Palestine. There he adopted the ancient Hebrew name Ben-Gurion. Suffering the hardships of the early pioneers, including malaria and hunger, he never lost sight of his goal. It was owing to his efforts that the 1907 convention of his Zionist socialist party, Poale Zion ("Workers of Zion"), included the following declaration in its platform: "The party aspires to the political independence of the Jewish people in this land."

With the outbreak of World War I, the Turkish governors of Palestine, their suspicions aroused by his Zionist activity, arrested Ben-Gurion and expelled him from the Ottoman Empire. During the height of the war, he traveled to New York, where he met and eventually married the Russian-born Pauline Munweis. In the last stages of World War I, the British supplanted Turkish rule in the Middle East; and with this change the Jewish settlers and their friends and supporters abroad began to realize that Zionism could rely for future assistance on Britain as well as on the wealthy and influential segments of American Jewry. Following the British government's publication on Nov. 2, 1917, of the Balfour Declaration, which promised the Jews a "national home" in Palestine, Ben-Gurion enlisted in the British army's Jewish Legion and sailed back to the Middle East to join the war for the liberation of Palestine from Ottoman rule.

The British had already defeated the Turks when the Jewish Legion reached the battlefield, and, when Britain received the mandate over Palestine, the work of realizing the "Jewish national home" had begun. For Ben-Gurion, the "national home" was a step toward political independence. To implement it, he called for accelerated Jewish immigration to Palestine in the effort to create a Jewish nucleus that would serve as the foundation for the establishment of a Jewish state. That nucleus was the Histadrut—the confederation of Jewish workers in Palestine founded in 1920 by Ben-Gurion (who was elected its first secretary-general) and his colleagues. The Histadrut rapidly became a central force in social, economic, and even security affairs, attaining the position of a "state within a state." Ten years later, in 1930, a number of labour factions united and founded Mapai, the Israeli Workers Party, with Ben-Gurion at its head. In 1935 he was elected chairman of the Zionist Executive, the highest directing body of world Zionism, and head of the Jewish Agency, the movement's executive branch.

As the Jewish settlement strengthened and deepened its roots in Palestine, anxiety mounted among the Palestinian Arabs, resulting in violent clashes between the two communities. In 1939 Britain changed its Middle East policy, abandoning its sympathetic stand toward the Jews and adopting a sympathetic attitude toward the Arabs, leading to severe restrictions on Jewish immigration and settlement in Palestine. Ben-Gurion reacted by calling upon the Jewish community to rise against England, thus heralding the decade of "fighting Zionism." On May 12, 1942, he assembled an emergency conference of American Zionists in New York City; the convention decided upon the establishment of a Jewish commonwealth in Palestine after the war. At the end of World War II, Ben-Gurion again led the Jewish community in its successful struggle against the British mandate; and in May 1948, in accordance with a decision of the United Nations General Assembly, with the support of the United States and the Soviet Union, the State of Israel was established.

David Ben-Gurion became prime minister and minister of defense. Through internal po-

litical struggles that incensed both the right and the left, he succeeded in breaking up the underground armies that had fought the British and in fusing them into a national army, which became a model and symbol of the maturing Israeli nation and an effective force against the invading Arab armies from Syria, Jordan, Iraq, and Egypt. Although the fighting ended with an Israeli victory, the Arab leaders refused to enter into formal peace negotiations with the Jewish state.

Ben-Gurion viewed the newborn state as the direct continuation of Jewish history that, in his opinion, had been interrupted 2,000 years earlier when the Roman legions had crushed the Hebrew freedom fighters and banished the Jews from Palestine. He saw the Jews' period of exile as a prolonged interlude in the history of Israel and declared that they had now regained their rightful home. In order to strengthen and develop the young nation, Ben-Gurion presented the people of Israel with a series of challenges: the absorption of mass immigration from all over the world; the assimilation of newcomers of diverse communities and backgrounds; the creation of a unified public education system; the settlement of the desert lands. In his foreign policy, he adopted an independent and pragmatic course. He used to say: "What matters is not what the Gentiles will say, but what the Jews will do." His defense policy was firm, and he answered violations of the cease-fire agreements by neighbouring Arab states with military reprisals.

His stronghanded policy inspired little sympathy for him from the governments of the United States and Britain. They preferred more moderate leaders such as Chaim Weizmann, first president of Israel, and Moshe Sharett, who was elected prime minister for a brief term (1953–55) when Ben-Gurion temporarily retired from office. Striving to gain a foothold in the Middle East, the U.S.S.R. alienated Israel by providing the Arabs with vast quantities of arms. At that time, Ben-Gurion found an ally in France. During the war in Algeria, France encountered the opposition of the united Arab front, led by Egyptian President Gamal Abdel Nasser, and consequently drew closer to Israel, supplying it with considerable amounts of military equipment; when Nasser nationalized the Suez Canal in July 1956, French initiative brought Israel to join the Franco-British military campaign against Egypt. On Oct. 29, 1956, following a secret visit to France and a meeting with French and British leaders, Ben-Gurion ordered the army to take over the Sinai Peninsula, while France and Britain were making an abortive attempt to seize the canal. Israel subsequently withdrew from Sinai after having been assured freedom of navigation in the Strait of Tiran and de facto peace along the Egyptian-Israeli border, which was to be supervised by a special United Nations force.

Following the Sinai campaign, Israel entered a period of diplomatic and economic prosperity. Ben-Gurion was head of government until 1963. During his last years of office, he initiated several plans (which proved fruitless) for secret talks with Arab leaders with a view to establishing peace in the Middle East.

In June 1963 Ben-Gurion unexpectedly resigned from the government for unnamed "personal reasons." His move apparently resulted in part from the bitter internal controversy between his supporters and his rivals in the party, who rose against him for the first time because of the political implications of the 1954 "Lavon Affair," involving Israeli-inspired sabotage of U.S. and British property in Egypt. The affair led Ben-Gurion in 1965 to leave Mapai with a number of his supporters and to found a small opposition party, Rafi, at the head of which he fought, with little success, against his successor, Levi Eshkol.

In 1970 Ben-Gurion retired from the Knes-

set and from all political activity, devoting himself to the writing of his memoirs in Sede-Boqer, a kibbutz in the Negev. He published a number of books, mostly collections of speeches and essays. Through most of his life he had also engaged in researches into the history of the Jewish community in Palestine and in the study of the Bible. (M.Ba.)

Ben ha-Mizrah: see Oriental Jew.

Ben-hadad I, ASSYRIAN ADAD-IDRI (d. c. 841 BC), king of Damascus who led a coalition against the invading forces of the Assyrian king Shalmaneser III, repulsing them at Karkar in 853. In a battle with him King Ahab of Israel was killed (I Kings 22:29–36). Ben-hadad was murdered by the usurper Hazael.

Ben Jelloun, Tahar (b. Dec. 21, 1944, Fès, Mor.), Moroccan poet, novelist, and dramatist.

Ben Jelloun began his studies in philosophy and later earned a doctorate in social psychology. He taught and was a contributor to a number of magazines and newspapers, including *Souffles*, *Intégral*, *Les Lettres Nouvelles*, and *Le Monde*.

Ben Jelloun's first collection of poetry, *Hommes sous linceul de silence* (1971; "Men Under the Shroud of Silence"), was followed by *Cicatrices du soleil* (1972; "Scars of the Sun"). *Harrouda* (1973), an erotic, poetic evocation of infancy, youth, and coming to manhood in Fès and Tangier, was his first novel. It was followed by two more poetry collections, *Le Discours du chameau* (1974; "The Discourse of the Camel") and *Grains de peau* (1974; "Particles of Skin").

Les Amandiers sont morts de leurs blessures (1976; "The Almond Trees Are Dead from Their Wounds")—poems and stories on his grandmother's death, the Palestinian question, North African immigration to France, love, and eroticism—was awarded the Prix de l'Amitié Franco-Arabe. In the same year, *Chronique d'une solitude* ("Chronicle of Loneliness"), a play about the misery of the North African immigrant worker, was staged at the Avignon Festival and appeared as a novel, *La Réclusion solitaire* (1976; "Solitary Confinement"). A third novel, *Moha le fou, Moha le sage* (1978; "Moha the Fool, Moha the Wise"), a satire of the modern North African state, received the Prix des Bibliothécaires de France et de Radio Monte Carlo. *À l'insu du souvenir* (1980; "Unknown to Memory"), a later collection of poetry, and an essay on the intellectual in the Third World, "L'Écrivain public" (1983; "The Public Writer"), displayed his power for evoking reality through fantasy, lyric, and metaphor and his conviction that his art must express the struggle for human freedom—political, economic, and social.

Ben Lomond, mountain mass in northeastern Tasmania, Australia, comprising a plateau of 30 square miles (78 square km) made up of igneous rock. It mostly lies above 4,500 feet (1,400 m), making it the highest land in the state. The loftiest portion stretches 7 miles (11 km) from Legge Peak (Legges Tor; 5,161 feet [1,573 m]) southeast to Stacks Bluff (5,010 feet [1,527 m]). The surface is also covered with many small hills and lakes. Ben Lomond lies within a 62-square-mile (161-square-kilometre) national park, the major winter-sports resort for northern Tasmania. Tin and wolfram (tungsten) are mined on the southeastern slopes. It was named in 1804 by the explorer Lieutenant Colonel William Paterson for a mountain in Scotland.

Ben Nevis, highest mountain of the British Isles, in the district of Lochaber, Highland region, Scotland. Its summit, reaching 4,406 feet

(1,343 m), is a plateau of about 100 acres (40 hectares), with a slight slope to the south and a sheer face to the northeast. Snow lies in some

Ben Nevis from Loch Linnhe, Scotland
Colour Library International

parts all year, and permafrost conditions are almost reached. The mountain consists of a superstructure of volcanic rocks surmounting the ancient schists, with granites intruded, of the Highlands.

Ben Rinnes, mountain in the district of Moray, Grampian region, Scot., situated 15 miles (24 km) southwest of Keith and about 5 miles (8 km) east of the confluence of the Rivers Avon and Spey. One of the notable sights associated with Ben Rinnes is the Linn of Ruthie, a waterfall on one of the many streams descending from the mountain.

Ben Slimane, formerly BOULHAUT, town, north-central Morocco. The town, a local market centre, is situated 12 miles (20 km) inland from the Atlantic Ocean between the cities of Rabat and Casablanca. It lies at an elevation of 980 feet (299 m) above sea level, at the edge of the Ziada cork oak forest.

The town is situated in a region of low plateaus and valleys that are intensely cultivated near the ocean; cereals (mostly wheat), citrus fruits, and grapes are grown. Farther inland, forests of cork oak, Aleppo pine, eucalyptus, and mimosa predominate. Pop. (1982 est.) 24,125.

Ben Thuy, town, northern Vietnam, on the Ca River, just southeast of the urban centre of Vinh. Just upstream from where the Ca River enters the Gulf of Tonkin where it meets the South China Sea, Ben Thuy serves as the outport of Vinh, and much of the trade of the central part of the country is funneled through it.

Ben Tre, formerly TRUE GIANG, city on the flat Mekong River delta, southern Vietnam. Ben Tre is linked by highway and ferry boat to Ho Chi Minh City (formerly Saigon) 53 miles (85 km) to the northeast. It is served by a commercial airfield and functions as a link on the My Tho-Phu Vinh river-canal system.

The surrounding region is devoted largely to irrigated rice and coconuts. Other crops include dates, corn (maize), potatoes, cotton, tobacco, sugarcane, and pineapples.

Ben Wyvis, mountain in the Highlands, Ross and Cromarty district, Highland region, Scot., the summit of which rises some 9 miles (14 km) northwest of Dingwall on the Cromarty Firth, which itself is an inlet off the Moray Firth. The mountain has an elevation of 3,429 feet (1,045 m). On its heights can be found Castle Leod (1616), at its foot the 18th-century resort spa of Strathpeffer.

Ben-Zvi, Itzhak, original name ISAAC SHIMSHELEVICH (b. Nov. 24, 1884, Poltava, Ukraine—d. April 23, 1963, Jerusalem [Israel]), second president of Israel (1952–63) and an early Zionist leader in Palestine, who helped create the political, economic, and military institutions basic to the formation of the state of Israel.

A Zionist from his youth, Ben-Zvi in 1905 helped form the Russian Poale Zion, a so-

cialistically oriented Zionist group that set an important ideological precedent for later institutions in Palestine and elsewhere and led to the formation of the Poale Zion World Federation in 1907. He settled in Palestine and in 1908 helped found ha-Shomer, a self-defense organization for Jewish agricultural settlements. In 1909 he founded in Jerusalem the first Hebrew high school in Palestine.

Exiled from Palestine in 1915 by the Turks, Ben-Zvi traveled to the United States, where with David Ben-Gurion, later prime minister of Israel, he founded Hehalutz, a Zionist pioneer youth organization, and the Jewish Legion to fight alongside the British against the Germans and Turks in Palestine during World War I. He returned with the legion to Palestine in 1918 and two years later helped create the Histadrut, the General Federation of Labour, which became the dominant labour organization in Israel. He served as a member

Ben-Zvi, 1953
Central Zionist Archives

of Histadrut's secretariat from 1920 to 1929, when he and Ben-Gurion founded the Mapai Party, which became the leading political force in the country. One of the creators of Va'ad Le'umi, the Jewish National Council representing 90 percent of the Jewish community during the British mandate in Palestine (1920–48), Ben-Zvi served as the council's chairman from 1931 to 1944 and as its president from 1944 to 1949.

Ben-Zvi signed Israel's Declaration of Independence on May 14, 1948, and was elected to the Knesset the following year. He became president of the body in 1952, a position he held until his death. Also a noted scholar of Middle Eastern history and archaeology, he founded the Institute for Research of Jewish Middle Eastern Communities (now the Ben-Zvi Institute) in 1948 and directed it until 1960. He wrote a history of the Jews, *The Exiled and the Redeemed* (1958).

Benacerraf, Baruj (b. Oct. 29, 1920, Caracas, Venez.), immunologist whose contributions to an understanding of the mechanisms and genetic basis of the immunologic response and especially of its role in certain diseases known as the autoimmune diseases brought him a share (with George Snell and Jean Dausset) of the 1980 Nobel Prize for Physiology or Medicine.

From the age of five until the outbreak of World War II Benacerraf lived in Paris. In 1940 he entered Columbia University, from which he graduated in 1942. He became a naturalized U.S. citizen in 1943, while a student at the Medical College of Virginia. After receiving his M.D. in 1945 and interning at Queens General Hospital in New York City, he served in the U.S. Army in 1946–48. After a year of research at Columbia and six at the Hôpital Broussais in Paris, he joined the faculty of New York University School of Medicine in 1956, advancing to professor of pathology in 1960. In 1968–70 he was chief of the immunologic laboratory of the National

Institute of Allergy and Infectious Diseases, National Institutes of Health. From 1970 he held the Fabyan chair of comparative pathology at Harvard.

Benaco (lake, Italy): see Garda, Lake.

Benadir, traditional coastal region, southern Somalia, on the Horn of Africa. The name, from Persian *bandar*, "port," refers to the voyages of Persian and Arab traders to eastern Africa across the Arabian Sea during the European Middle Ages. Benadir passed to the sultan of Zanzibar in 1871; it was leased by Italy in 1895 and thereafter shared the political fate of the remainder of Somalia (until World War II, Italian Somaliland). Largely agricultural, Benadir has an area of about 17,000 square miles (45,000 square km).

Benalla, city, central Victoria, Australia, on the Broken River. Founded in 1848 on an overland stock route after Sir Thomas Mitchell's exploration of the area, its name is derived from an Aboriginal term meaning "crossing place." The city is a rail and highway junction and the commercial centre for a district of livestock, poultry, and grain farming. Local industries include flour milling and sawmilling, food processing, clothing manufacture, and railroad workshops. Close to Mount Buller (5,919 feet [1,804 m]) and other ski areas, Benalla also is a winter resort. It became a shire in 1869, a borough in 1948, and a city in 1965. Pop. (1988 est.) 9,020.

Bénard, Abraham-Joseph: see Fleury.

Benares (India): see Vārānasi.

Benaud, Richie, byname of RICHARD BENAUD (b. Oct. 6, 1930, Penrith, N.S.W., Australia), cricketer who is best remembered as one of Australia's most imaginative captains. Benaud made his debut in first-class cricket at the age of 18 and first appeared in Test (international) matches in 1951. He was appointed captain of the Australian national team in 1958. With his leadership and shrewd knowledge of the game, Benaud led Australia to victory in four successive Test series (1958–61) and did much to rekindle public interest in the sport.

Benavente y Martínez, Jacinto (b. Aug. 12, 1866, Madrid, Spain—d. July 14, 1954, Madrid), one of the foremost Spanish dramatists of the 20th century, who was awarded the Nobel Prize for Literature in 1922. He returned drama to reality by way of social criticism: declamatory verse giving way to prose, melodrama to comedy, formula to experience, impulsive action to dialogue and the play of minds. Benavente showed a preoccupation with aesthetics and later with ethics.

The extent to which he broadened the scope of the theatre is shown by the range of his plays, e.g., *Los intereses creados* (performed 1903, published 1907; *The Bonds of Interest*, performed 1919), his most celebrated work, based on the Italian commedia dell'arte; *Los malhechores del bien* (performed 1905; *The Evil Doers of Good*); *La noche del sábado* (performed 1903; *Saturday Night*, performed 1926); and *La malquerida* (1913; "The Passion Flower"), a rural tragedy with the theme of incest. *La malquerida* was his most successful play in Spain and in North and South America. *Señora Ama* (1908), said to be his own favourite play, is an idyllic comedy set among the people of Castile.

In 1928 his play *Para el cielo y los altares* ("Toward Heaven and the Altars"), prophesying the fall of the Spanish monarchy, was prohibited by the government. During the Spanish Civil War Benavente lived in Barcelona and Valencia and was for a time under arrest. In 1941 he reestablished himself in public

favour with *Lo increíble* ("The Incredible"). His extraordinary productivity as a dramatist (he wrote more than 150 plays) recalled Spain's Golden Age and the prolific writer Lope de Vega. With the exception, however, of the harsh tragedy *La infanzona* (1948; "The Ancient Noblewoman"), and *El lebr del cielo* (1952), inspired by Francis Thompson's "Hound of Heaven," Benavente's later works did not add much to his fame.

Benbecula, island of the Outer Hebrides, Western Isles area of Scotland. Benbecula ("Mountain of the Fords") lies between the islands of North Uist and South Uist and is connected over the fords by a causeway (1960) to the north and by O'Regan's Bridge (1943) to the south. The island has an area of about 7 square miles (18 square km) and has near its centre a solitary hill, Rueval, which rises to 409 feet (125 m). The eastern portion of the island is moorland, and the western side is fertile grazing and crofting land cut by numerous small lochs.

Benbow, John (b. March 10, 1653—d. Nov. 4, 1702, Port Royal, Jamaica), English admiral who became a popular hero through his exploits against the French and his death in active service.

The son of a tanner of Shrewsbury, Shropshire, Benbow served in the navy and merchant marine from 1678 and became captain of a naval vessel in 1689. As master of the fleet under Admiral Edward Russell, he helped destroy the French fleet in the Battle of La

Benbow, detail of an oil painting by Sir Godfrey Kneller, 1701; in the collection of the National Maritime Museum, Greenwich, Eng.

Hogue (May 1692), and in November 1693 he bombarded the French port of Saint-Malo.

After serving as commander of the English fleet in the West Indies from 1698 to 1700, Benbow returned there as vice admiral in 1701. On Aug. 19, 1702, his seven ships sighted nine French vessels off Santa-Marta (now in Colombia). He gave chase for five days, but the captains of four of his vessels lagged behind, refusing to engage the enemy. On August 24 Benbow's right leg was shattered by French fire. Nevertheless, he remained on deck until his captains compelled him to return to Jamaica. There he had two of them court-martialed for insubordination and shot. Benbow died of his wounds and was buried in Kingston.

bench, long seat that may be freestanding, fixed to the wall, or placed against the wall. Paneled benches were used by the Romans, and they were the most common form of seating in medieval halls at a time when a chair was a rare luxury. Benches were not only used as seats but were normally wide enough to be used for sleeping on or eating from; as the Frankish ecclesiastic and historian Gregory of Tours recorded, when King Chilperic I was

Oak bench, English, mid-17th century, in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London

sitting with Bishop Bertrand, he had before him a bench bearing food.

Benches retained their popularity as fitted seats in window alcoves, but in the 16th century they lost favour as freestanding pieces of furniture when chairs became more widely used. Upholstered versions were also made. Some of the most spectacular benches were made in the Spanish colonies in South America in the 17th century, notably in Cuzco, Peru, where benches bore enormous carved crests and balustraded backs that were painted and gilded.

Bench, Johnny (Lee) (b. Dec. 7, 1947, Oklahoma City, Okla., U.S.), American professional baseball player who, in 17 seasons with the Cincinnati Reds of the National League, established himself as one of the game's finest catchers.

Bench was signed to a contract with the Reds in 1965 and played with its minor league teams until he came up to the Reds late in the 1967 season. From 1968 he was the team's regular catcher, though in the early 1980s he caught less and finally switched to playing third base. Bench led the league in runs batted in (1970, 1972, 1974) and in home runs (1970, 1972). Together with Pete Rose and Joe Morgan, he helped lead the Reds to four World Series (1970, 1972, 1975, and 1976). His greatest performance was in the 1976 series, in which he batted .533. At his retirement in 1983, Bench held the record for the most home runs by a catcher, 324. He subsequently conducted a television sports interview show in Cincinnati.

Benchley, Robert (Charles) (b. Sept. 15, 1889, Worcester, Mass., U.S.—d. Nov. 21, 1945, New York, N.Y.), American drama critic, actor, and humorist.

A graduate of Harvard University (1912), Benchley joined the staff of the old *Life* magazine in 1920 as drama critic. His monologue "The Treasurer's Report," delivered as a skit in an amateur revue in 1922, was the basis for one of the first all-talking shorts. He subsequently wrote and acted in motion-picture short subjects, his *How to Sleep* winning an Academy Award in 1935. In all, he made 46 shorts and appeared in minor roles in about 50 feature pictures, often playing a confused, annoyed, and mildly sarcastic drunk.

Although films and radio brought him wide public acclaim, his writings constitute his most lasting achievement. Among his essays, collected in 15 books and illustrated by Gluyas Williams' caricatures, are *My Ten Years in a Quandary*, and *How They Grew* (1936) and *Benchley Beside Himself* (1943). Benchley's quiet, whimsical humour mainly depicted the struggles of an ordinary little man—himself—who was completely befuddled by the world; his humour often ascended by hardly noticeable steps into pure nonsense. Benchley was drama critic for *The New Yorker* (1929–40), for which he also wrote "The Wayward Press" column under the pseudonym Guy Fawkes. *The Benchley Roundup* (1954) was a selection from his writings edited by his son Nathaniel, who also wrote his biography (1955).

BIBLIOGRAPHY. Nathaniel Benchley, *Robert Benchley* (1955); Babette Rosmond, *Robert Benchley* (1970, reprinted 1989); Robert Redding, *Starring Robert Benchley* (1973).

Benckendorff, Aleksandr Khristoforovich, Count (Graf) (b. 1783, Tallinn, Russia [now in Estonia]—d. Sept. 23 [Oct. 5, New Style], 1844, St. Petersburg), general and statesman who played a prominent role in the Napoleonic Wars and later served as Tsar Nicholas I's chief of police.

Of Baltic-German origin, Benckendorff joined the Russian army and was one of the officers who assassinated Emperor Paul I in 1801. Between 1806 and 1815 he fought in numerous military campaigns, distinguishing himself particularly when he became commandant of Moscow, joined the pursuit of the French forces as they fled from Russia (1812), and engaged in many battles against the French in Germany and the Low Countries and Belgium.

Benckendorff then served as aide-de-camp to Tsar Alexander I (1819–21) and, having been promoted to lieutenant general, was given command of the cuirassier division of the guards (1821). In 1825, when the liberal Decembrists attempted to prevent the succession of Nicholas to the throne and to force the establishment of constitutional government in Russia, Benckendorff commanded the troops that suppressed their uprising; later, he played a leading role in prosecuting them. The relentless way in which he and fellow generals of German origin in Russia tracked down members of eminent Russian noble families who had been connected with the Decembrist movement aroused popular belief that the German generals were trying to liquidate their Slav rivals in the government.

In January 1826 he submitted a plan to Nicholas for organizing a department of political police. When Nicholas then created the third section of the imperial chancellery, Benckendorff was placed in charge of both the gendarmerie and the third section, with responsibility for the work of regular and secret police, posts he held until his death.

Bend, city, seat (1916) of Deschutes county, central Oregon, U.S. It lies along the Deschutes River, in the eastern foothills of the Cascade Range (west), and is bordered by Bear Creek Butte (east). Laid out in 1904, the community grew after the Deschutes Irrigation and Power Company opened farmland for settlement in 1909. Vast timber resources influenced a railroad boom (1911), sawmills were built, and wood industries developed. Bend is now the headquarters for the Deschutes National Forest and is a centre for tourist accommodations because of its proximity to lakes, lava beds, caves, and mountain and ski resorts. Central Oregon Community College was established there in 1949. Inc. 1904. Pop. (1991 est.) 21,042.

Benda, František, German FRANZ BENDA (b. Nov. 25, 1709, Staré Benátky, Bohemia [now in Czech Republic]—d. March 7, 1786, Potsdam, Prussia [Germany]), an outstanding violinist of 18th-century Germany.

The eldest son of Jan Jiří Benda and his wife Dorota Bixi, both talented musicians, Benda studied under J. Graun and joined the orchestra of Frederick II the Great (then crown prince). On Frederick's accession (1740) to the Prussian throne, Benda settled in Berlin, where the rest of his family joined him in 1742. He became concertmaster of the royal orchestra in 1771. His compositions include 80 violin solos, 15 concerti, symphonies, trio sonatas, and violin concerti and sonatas. His son Friedrich William Heinrich Benda (1745–1814) also became well known as a violinist and composer.

Benda, Georg (Anton), Czech JIŘÍ ANTONÍN BENDA (b. June 30, 1722, Staré Benátky, Bohemia [now in Czech Republic]—d. Nov. 6, 1795, Köstritz, Saxony [Germany]), composer widely admired during his lifetime for his stage works.

The third son of Jan Jiří Benda and his wife, Dorota Brixi, both musicians, and brother of the violinist František Benda, he went with his family to Berlin in 1742. He played violin in the royal orchestra (1742–49) and for nearly 30 years (from 1750) was chapelmaster to the Duke of Gotha.

Benda toured Italy (1765–66) and composed Italian operas and intermezzi, but the works that won him renown throughout Europe were his melodramas *Ariadne auf Naxos*, *Medea* (both 1775), and *Pygmalion* (1779), in which an orchestral accompaniment was provided for the action and spoken words. Benda also wrote several *Singspiele* ("song-plays"), of which the most famous were *Der Dorfjahrmarkt* (1775; "The Village Fair") and *Romeo und Julie* (1776). Benda's work influenced later composers, notably W.A. Mozart.

Benda's son Friedrich Ludwig Benda (1752–92) was a composer of theatrical music, cantatas, and instrumental works.

Benda, Julien (b. Dec. 26, 1867, Paris, France—d. June 7, 1956, Fontenay-aux-Roses, near Paris), novelist and philosopher, leader of the anti-Romantic movement in French criticism, persistent defender of reason and intellect against the philosophical intuitionism of Henri Bergson.

Benda graduated from the University of Paris in 1894. Among his first writings were articles (1898) on the Dreyfus affair. His lifelong assault on the philosophy of Bergson began with *Le Bergsonisme* in 1912. Literary fame came the same year with the publication of his first novel, *L'Ordination* (1911; *The Yolk of Pity*). In his most important work, *La Trahison des clercs* (1927; *The Treason of the Intellectuals*), Benda denounced as moral traitors those who

Julien Benda
H. Roger Viollet

betray truth and justice for racial and political considerations. The evolution of his thought can be traced in two autobiographical works: *La Jeunesse d'un clerc* (1937; "The Youth of an Intellectual") and *Un Régulier dans le siècle* (1938; "A Regular in His Century").

Benda, Wladyslaw Theodor (b. Jan. 15, 1873, Poznań, Pol.—d. Nov. 30, 1948, Newark, N.J., U.S.), Polish-American painter, illustrator, and designer.

Benda studied art in Kraków, Pol., and in Vienna before coming to the United States in 1899. He settled in New York City, becoming a U.S. citizen in 1911. Benda's illustrations were published in books and in a number of magazines. He is best remembered for his masks, which were used in theatre and dance performances throughout the world. Benda wrote the book *Masks* (1944).

bendahara, in the traditional Malay states, the chief minister, second only to the sultan in rank, power, and authority; the office of *bendahara* (a Sanskrit title) grew in importance during the Malacca sultanate after 1400. Its functions included executing the sultan's commands and acting as prime minister and commander in chief. The *bendahara* also supplied the sultan with a palace and with a bride from his own family, thus adding to

his independent power. Perhaps this official's most important duty came after a sultan's death, when he gathered the royal regalia and acted as regent during the interregnum until he handed the regalia to the heir. Frequently, the position was occupied by an older relative of the sultan. Befitting the close relationship between these two offices, the *bendahara* was the chief figure in the Council of Four, the administrators of the realm. The office of *bendahara*, often hereditary, existed in all Malay states with minor variation after the decline of Malacca.

Bender, Charles Albert, byname CHIEF BENDER (b. May 5, 1883, Brainerd, Minn., U.S.—d. May 22, 1954, Philadelphia, Pa.), American professional baseball player, a right-handed pitcher.

Bender pitching for the Philadelphia Athletics
Culver Pictures

Bender's mother was part Chippewa, and his childhood was spent on a reservation and at schools for native Americans. Between 1903 and 1914 he pitched for the Philadelphia Athletics, winning nearly 200 regular games and six World Series games; in 1910 and 1914 he led the American League in winning percentage. In addition to pitching, Bender occasionally played outfield or first base and pinch-hit. Bender joined the short-lived Federal League in 1915, playing for Baltimore, and in 1916 and 1917 he played for the Philadelphia Phillies in the National League.

After his career as a player ended Bender worked for various teams as a scout, manager, and coach. He was elected to the National Baseball Hall of Fame in 1953.

Bender-Ereğli (Turkey): see Ereğli.

Bendery (Moldova): see Tighina.

Bendigo, byname of WILLIAM THOMPSON (b. Oct. 11, 1811, Nottingham, Nottinghamshire, Eng.—d. Aug. 23, 1880, Beeston, Nottinghamshire), English pugilist and tavern keeper who became a noted Methodist evangelist and who is one of the very few athletes whose name is borne by a city—Bendigo, Vic., Australia.

His nickname apparently is a corruption of the Old Testament name Abednego; Thompson was one of triplets, the other two being nicknamed Shadrach and Meshach. In the course of his pugilistic career (1832–50) Bendigo lost only one fight, a defeat by Benjamin Caunt in 1838; Caunt, however, outweighed him by more than 40 pounds (18 kg). In 1839 Bendigo won the English championship by beating James ("Deaf") Burke. Bendigo retired and then rewon the honour from Caunt in 1845. His last fight, won by a foul, was in 1850.

Because fistfighting was a breach of the peace,

Bendigo was arrested after most of his fights; his religious activity was inspired by a prison chaplain's sermon. The language of his own sermons was described as quaint. He was so highly regarded in Nottingham that a monument to him was dedicated in 1891. The city of Bendigo is believed to have been named after an admirer of the pugilist who adopted the nickname to advertise his own pretensions as a boxer.

Bendigo, city, central Victoria, Australia, in the central upland area of the state; it is about 93 miles (150 km) northwest of Melbourne by road.

Founded as a sheep run in 1840, the city's official name was Sandhurst until 1891, when it was formally changed to honour a local prizefighter who compared his own prowess to that of the English pugilist known as Bendigo. An important gold discovery on Bendigo Creek (1851) brought rapid growth and created an impressive city with fine examples of Victorian architecture and tree-lined streets. Mining ceased in 1955.

Bendigo is now the commercial focus of a region that produces livestock, fruit, poultry, wheat, dairy products, vegetables, and wool. Its livestock market, one of the largest in Australia, handles more than 1,000,000 sheep each year. Diversified industries include iron, clothing, ceramics, armaments, hardboard manufacture, and food processing. Tourism is also important; the city's attractions include Rosalind Park and the Bendigo Art Gallery. The Bendigo Pottery, located northeast of Bendigo in Epsom, is the oldest pottery works in Australia. A rail centre, the city is also the junction of the Calder, Loddon Valley, Eppalock, and Midland highways. Declared a municipal district in 1855 and a shire in 1863, Bendigo became a city in 1871. Cultural resources include the Bendigo College of Advanced Education; the city also has two cathedrals. Pop. (1991 prelim.) 30,133.

Bendis, Thracian goddess of the moon; the Greeks usually identified her with the goddess Artemis. She is often represented holding two spears.

Apart from areas adjacent to Thrace, the cult of Bendis gained prominence only in Athens. At the outbreak of the Peloponnesian War, the Athenians allowed the founding of a sanctuary for the goddess and shortly afterward created a state festival, the Bendideia, for her. The first celebration was held on the 19th of Thargelion (May–June), 429 BC, at the Piraeus, the seaport of Athens. The festival included two processions, a torch race on horseback, and a vigil; it provided the dramatic setting for Plato's *Republic*.

Bendix, Vincent (b. Aug. 12, 1882, Moline, Ill., U.S.—d. March 27, 1945, New York, N.Y.), American inventor and industrialist who contributed to the development of automobiles and aircraft.

At the age of 16, Bendix ran away from home to New York City, where he studied engineering at night school. In 1907 he organized the Bendix Company of Chicago and produced more than 7,000 automobiles before the company failed in 1909. He developed the starter drive, which made the automobile self-starter practicable, and in 1913 sold manufacturing rights to the Eclipse Machine Company of Elmira, N.Y. The Bendix Corporation, founded in 1924 with a factory in South Bend, Ind., producing automobile brake systems, in 1929 became Bendix Aviation Corporation and eventually manufac-

tured a wide range of automotive, aviation, marine, radio, and radar equipment. More than 5,500 patents were held by Bendix or his company. Keenly interested in advancing aviation, he founded the Bendix Transcontinental Air Race in 1931. In 1942 he organized Bendix Helicopters, Inc.

Bendix Corporation, American company founded in 1924 to manufacture automobile brake systems. Over the years, Bendix became a leader in aerospace, automotive components, and construction materials. It was acquired by Allied Corporation (q.v.) in 1983, became part of AlliedSignal in 1985, and was merged into Honeywell International, Inc. (q.v.), in 1999.

The company's founder, Vincent Bendix, himself an inventor, joined with French inventor Henri Perrot to manufacture brake systems in South Bend, Ind., in 1924. By 1928 the Bendix Corporation was producing 3,600,000 brakes per year, chiefly for General Motors Corporation. In 1928 Bendix Corporation acquired control of Eclipse Machine Company, Elmira, N.Y., which had been manufacturing Vincent Bendix's automotive starter since 1914. In 1929 the company turned to aviation products and changed its name to Bendix Aviation Corporation (not reverting to the name Bendix Corporation until 1960). From 1928 to 1948 General Motors was a major stockholder, but in the latter year GM disposed of all its remaining shares. In 1982 a poorly planned takeover scheme caused Bendix to fail in its bid for rival conglomerate Martin Marietta Corporation. As a result, Allied swiftly purchased Bendix, causing 4,000 Bendix employees, including chairman Bill Agee, to lose their jobs.

bends (syndrome): see decompression sickness.

Bene Beraq, city, northeastern suburb of Tel Aviv-Yafo, west-central Israel, in the southern Plain of Sharon. In Assyrian texts, Bene Beraq is listed as a city that fell to Sennacherib, king of Assyria, in 701 BC. It is also mentioned in the Bible (Joshua 19) and was a well-known scholarly centre (c. 100 BC) during the time of the compilation of the Talmud. The Jewish sage Akiba ben Joseph established an academy there in the 1st century AD.

Near the presumed location of ancient Bene Beraq, a modern settlement was founded by Orthodox Polish-Jewish immigrants in 1924. At first chiefly agricultural (citrus groves), it later became industrialized. The city has preserved its Orthodox character: It is the home of a number of Talmudic schools, and Orthodox Jews hold a majority of elected municipal offices. Inc. 1950. Pop. (2000 est.) 136,895.

Bene Israel (Hebrew: "Sons of Israel"), largest and oldest of several groups of Jews of India. Believed by tradition to have been shipwrecked on the coast of western India more than 2,100 years ago, they were absorbed into Indian society, maintaining many Jewish observances while operating within the caste system. Of some 67,000 Bene Israel at the turn of the 21st century, less than 5,000 remain in India, the great majority having immigrated to Israel.

Bene Israel tradition itself varies on the group's presence in India. Some claim descent from the Ten Lost Tribes of Israel, who disappeared from history after the northern Kingdom of Israel was overrun by the Assyrians in 721 BC. Others believe that their ancestors fled by sea the persecution of Antiochus Epiphanes, a theory that explains the absence of a Hanukkah tradition in Bene Israel practice. Whatever the case, the survivors settled in Indian villages and adopted Hindu names (with surnames usually ending in *-kar*). They ab-

stained from work on the Jewish Sabbath and also practiced circumcision, recited the Shema (q.v.) on ceremonial occasions, celebrated several major festivals, and observed Jewish dietary laws.

When the existence of a Jewish community in India first attracted public attention—from David Rahabi, who, according to Bene Israel tradition, may have arrived as early as AD 1000 or who may have been David Ezekiel Rahabi (1694–1772), of Cochin on the Malabar Coast, south of Konkan—the group still followed these practices. Rahabi was instrumental in re-vivifying Judaism among the Bene Israel. The Cochin Jews acted as cantors, ritual slaughterers, and teachers for the Bene Israel. Many Bene Israel migrated toward Bombay (now Mumbai) during this period. The first of numerous Bene Israel synagogues, all following the Sefardic (Spanish) liturgy, was built in Bombay in 1796.

In the early 19th century, Christian missionaries introduced Marathi-language versions of the Hebrew Bible (their Old Testament) to the inhabitants of the Konkan coast and set up English-language schools. The revelation provided by this first encounter with the texts of Judaism—together with the model of normative Judaism provided in the last half of the 19th century by contact with Arabic-speaking Jews who had migrated to India from Baghdad in the late 18th century—finally broke their isolation from the rest of the Jewish world. When, in 1948, the State of Israel was established, many Bene Israel began to emigrate.

Like other far-flung Jewish groups, the Bene Israel over the centuries had become physically indistinguishable from the peoples they lived among, and their practices—much influenced by Hindu beliefs and practices—were somewhat at odds with those of mainstream Jews. As a result, their immigration to Israel was marked by conflict for a few decades; some rabbis objected to their marriage with other Jews on the grounds that the Bene Israel could not have properly observed rabbinic laws governing marriage and divorce. In 1964, however, the chief rabbinate declared the Bene Israel "full Jews in every respect" but reserved to itself the right to decide the legitimacy of individual marriages.

Beneden, Edouard (-Joseph-Louis-Marie) van (b. March 5, 1846, Louvain [Leuven], Belg.—d. April 28, 1910, Liège), Belgian embryologist and cytologist best known for his discoveries concerning fertilization and chromosome numbers in sex cells and body cells.

During his early years, van Beneden worked with his father, P.J. van Beneden, a professor of zoology at the Catholic University in Louvain, who was noted for his studies on protozoans, nematodes, and various other animal groups. The younger van Beneden extended this research to dicynemids, a group of wormlike organisms distinguished by their production of two types of embryo. In 1870 he was appointed to the faculty of the University of Liège, where he focused his research on comparative morphology. His work, for example, advanced the theory of the Russian zoologist Aleksandr O. Kovalovsky that marine organisms called tunicates were chordates. Van Beneden established the tunicates' phylogenetic relationship to other animals through an investigation of the segmentation of the embryo.

From 1883 van Beneden published a series of important papers on the egg of *Ascaris megalocephala*, an intestinal worm found in horses. In these studies he showed that fertilization consisted essentially in the union of two half-

nuclei—one male (from the sperm cell) and one female (from the egg cell)—each containing only half the number of chromosomes found in the body cells of the species. This union produced a cell containing the full number of chromosomes. Van Beneden revealed the individuality of single chromosomes in his study of a subspecies of *Ascaris* (*A. megalocephala univalens*) having only two chromosomes in its body cells. He further demonstrated that the chromosome number is constant for every body cell of a species. He also developed a theory of embryo formation in mammals that later became a standard scientific principle.

Beneden, Pierre-Joseph van (b. Dec. 19, 1809, Mechelen, Belg.—d. Jan. 8, 1894, Louvain [Leuven]), parasitologist and paleontologist best known for his discovery of the life cycle of tapeworms (Cestoda).

After an apprenticeship with the pharmacist Louis Stoffels, van Beneden studied medicine at the University of Louvain. In 1835 he was appointed professor of zoology at the Catholic University of Louvain, where he remained throughout his career. In 1842 he was elected to the Belgian Academy of Sciences, of which he became president in 1881.

Van Beneden's work on tapeworms began in 1845 and continued for about 15 years. Before his studies, certain life stages of tapeworms had been discovered and named, but their relationship was not suspected; some were even thought to represent aberrant tissues of the animals in which they were found. By studying the digestive tracts of many fishes, van Beneden was able to show that organisms known as cysticerci were larvae of intestinal worms then called taeniae (adult tapeworms). Van Beneden's work covered a wide range of parasites in diverse animals and culminated with his *Les Commensaux et les parasites dans le règne animal* (1875; "Commensals and Parasites in the Animal Kingdom"). About 1859 he began a study of fossil and recent whales, which resulted in a major work, written in collaboration with the Belgian anatomist Paul Gervais, *Ostéographie des cétacés, vivants et fossiles* (1868–80; "The Osteology of Cetaceans, Living and Fossil").

Bénédictte, Le: see Castiglione, Giovanni Benedetto.

Benedetti, Mario (b. Sept. 14, 1920, Paso de Los Toros, Tacuarembó, Uruguay), Latin-American novelist, short-story writer, poet, and essayist.

Most of Benedetti's early life was spent in Montevideo, where he held a number of bureaucratic positions that allowed him time to write. His first book of short stories, *Esta mañana* (1949; "This Morning"), deals with urban middle-class problems. His first novel, *Quién de nosotros* (1953; "Who of Us"), presents the frustration of three characters whose lives are intertwined. On three different occasions from 1954 to 1960 he directed one of Uruguay's most prestigious weekly journals, *Marcha*. Benedetti's *Poemas de la oficina* (1956; "Office Poems"), written simply and colloquially, was an instant success. In 1957 he visited Europe for the first time as a correspondent for *Marcha* and *El diario*.

With the publication of *Montevideanos* (1959), tragicomic tales of everyday city life, he won recognition as one of Uruguay's most perceptive writers. His second novel, *La tregua* (1960; *The Truce*), is written as the diary of a middle-aged man who becomes romantically involved with a much younger woman. *El país de la cola de paja* (1960; "The Country with the Tail of Straw") is a collection of essays on the decline of Uruguay. *Gracias por el fuego* (1965; "Thanks for the Fire") is a novel with an openly revolutionary message.

From 1967 to 1971 Benedetti lived in Cuba, where he was a member of Cuba's official

international cultural organization. Essays of his impressions of Cuban life appeared in *Cuaderno Cubano* (1969; "Cuban Notebook"), *El cumpleaños de Juan Angel* (1971; "The Birthday of Juan Angel"), an autobiographical novella published in Mexico, tells of the crisis of political consciousness of the author. He returned to Uruguay in 1971 to help establish a leftist coalition for future elections, but with the military takeover of 1973 Benedetti returned to his former post in Cuba. *Con y sin nostalgia* (1977; "With and Without Nostalgia") is a collection of short stories about violence and exile.

Benedetti, Vincent, Comte (Count) (b. April 29, 1817, Bastia, Corsica—d. March 28, 1900, Paris), French diplomat remembered chiefly for his rôle in the events leading up to the Franco-German War in 1870.

Benedetti studied law in Paris and in 1840 entered consular service. He served in several embassies in Europe and the Middle East between 1845 and 1864, when he was named ambassador to Prussia with instructions from Napoleon III to prevent an Austro-Prussian alliance. The six-year series of negotiations that followed resulted only in deadlock. In July 1870 a Hohenzollern prince became the candidate for the Spanish throne, and Benedetti was instructed to urge King William I's renunciation of the candidacy and to obtain a guarantee that it would not be renewed. This William would not promise. The record of the meeting's outcome was published in an edited form that made it appear as if Benedetti had been insulted as well as refused. France clamoured for war, and Benedetti was recalled. He retired to Corsica, where he practiced law. In *Ma Mission en Prusse* (1871) he defended his diplomatic actions.

Benedetto DA MAJANO, Majano also spelled MAIANO (b. 1442, Majano, Republic of Venice—d. May 24, 1497, Florence), early Renaissance sculptor whose work is characterized by its decorative elegance and realistic detail.

He was greatly influenced by the Florentine sculptors Desiderio da Settignano and Antonio Rossellino. His earliest surviving work is the shrine of S. Savino (1468–72) in the Faenza cathedral. Between 1470 and 1475 he was engaged on the altar of Sta. Fina in the Collegiata at S. Gimignano, in a chapel designed by his elder brother Giuliano (1468) and decorated with frescoes by Domenico Ghirlandajo. The connection between Benedetto da Majano and Ghirlandajo is reflected in the careful realism of the five narrative reliefs in Benedetto's masterpiece, the pulpit in Sta. Croce in Florence (1472–75). A bust of Pietro Mellini (1474; Bargello, Florence), by whom the pulpit was commissioned, reveals the same accumulation of naturalistic detail as is found in the male portraits of Ghirlandajo.

After this time, Benedetto was employed on two major works for the church of Monte Oliveto in Naples: the tomb of Mary of Aragon (d. 1470), begun by Rossellino, and an altarpiece of the Annunciation (1489). Concurrently, he was employed by the Florentine banker Filippo Strozzi, of whom he made a portrait bust (marble in the Louvre, Paris; terra-cotta in the Berlin-Dahlem Museum) and whose tomb in Sta. Maria Novella, Florence, he completed after 1491.

Benedetto's work depends for its effect less on invention and originality than on unflinching taste and an exceptionally high level of technical skill. The naturalism of his male portrait busts is in marked contrast to his delicate, idealized busts of women. But both types show his virtuosity in the handling of highly polished stone to achieve a jewel-like play of light on surfaces.

Benedict, Latin BENEDICTUS, name of Roman Catholic popes and antipopes, grouped

below chronologically and indicated by the symbol •.

• **Benedict I** (b. Rome—d. July 30, 579, Rome), pope from 574/575 to 579.

Little is known about his life. He was elected to succeed John III, probably just after the latter's death (July 574), but was not consecrated until June 575, so that the see of Rome was vacant for almost 11 months. He consecrated 21 bishops during his pontificate and granted the Massa Veneris, an estate near Minturnae (near modern Minturo, Italy), to Abbot Stephen of St. Mark's. He ruled the church during a period made calamitous by invasion and by famine. While working to solve these problems, he died during a siege of Rome by the Lombards.

• **Benedict II**, SAINT (b. Rome—d. May 8, 685, Rome; feast day May 8), pope from 684 to 685.

He was engaged in church government under popes SS. Agatho and Leo II, whom he was elected (683) to succeed. His consecration (June 26, 684) was delayed until the approval of the Byzantine emperor Constantine IV Pogonatus could be obtained, so that the see of Rome was vacant for almost a year. Benedict wanted to eliminate this time gap between the election by the clergy and Roman citizens and corroboration by the Christian emperor, and he persuaded Constantine to decree that future elections would not need imperial consent. Nevertheless, further imperial ratification occurred. Benedict confirmed Agatho's injunctions to restore Archbishop Wilfrid to the see of York. During his pontificate, Benedict restored several Roman churches.

• **Benedict III** (b. Rome—d. April 17, 858, Rome), pope from 855 to 858, who was chosen as successor to Leo IV in July 855. The election was not immediately confirmed by the Holy Roman emperor Louis II the Bavarian, who set up Anastasius the Librarian as antipope. Benedict was imprisoned, but the imperial government's opposition to Benedict was dropped, and he was consecrated pope. He reprimanded the Frankish bishops, whose inaction he blamed as the source of misery in their empire. Benedict also was responsible for the repair of Roman churches damaged by the Saracens in 846.

• **Benedict IV** (b. Rome—d. July 903, Rome), pope from 900 to 903. Benedict reigned during one of the darkest periods of papal history, and little is known of his life or acts. He excommunicated Baldwin II, count of Flanders, for causing the assassination of Fulk, archbishop of Reims, Fr. (June 17, 900); he crowned Louis III the Blind as Holy Roman emperor in February 901.

• **Benedict V**, byname BENEDICTUS THE GRAMMARIAN, Latin BENEDICTUS GRAMMATICUS (d. July 4, 966, Hamburg), pope, or antipope, from May 22, 964, to July 4, 966. His election by the Romans on the death of Pope John XII infuriated the Holy Roman emperor Otto I, who had already deposed John and designated Leo VIII as successor. Otto forced his way into Rome and convened a synod that deposed and degraded Benedict, reducing him to deacon. After reinstating Leo, Otto brought Benedict to Hamburg. Either Benedict or Leo may be considered an antipope.

• **Benedict VI** (b. Rome—d. July 974, Rome), pope from Jan. 19, 973, to July 974.

He was a cardinal deacon when elected to succeed John XIII the Good (d. Sept. 6, 972), but his consecration was delayed for the ratification of his protector, the Holy Roman emperor Otto I the Great. Otto's death in 973 put Benedict at the mercy of the powerful Roman Crescentii family, whose role in the history of the papacy was dramatized when Crescentius I led a resurgence of the Roman baronage. The Pope was imprisoned in June 974 and

replaced by the deacon Franco, later known as antipope Boniface VII, who purportedly, by order of Crescentius, strangled Benedict. Few documents of his pontificate survived.

• **Benedict VII** (b. Rome—d. July 10, 983, Rome), pope from 974 to 983. He furthered the cause of monasticism and acted against simony, specifically in an encyclical letter in 981 forbidding the exaction of money for the conferring of any holy order.

Formerly bishop of Sutri, Papal States, he was elected through the intervention of Count Sicco, representative of Otto II, Holy Roman emperor. Sicco expelled Antipope Boniface VII, who had been intruded on the papal throne by a Roman group that killed Benedict's predecessor, Benedict VI. Benedict's rule was peaceful. He is judged, however, to have been mistaken when, in an agreement with Otto, he dissolved the bishopric of Merseburg (981). The closing of this outpost among the Slavs is considered to have been a setback in the conversion of central Europe. Benedict and Otto worked harmoniously together and died in the same year.

• **Benedict VIII**, original name TEOFILATTO, Latin THEOPHYLACTUS (b. probably County of Tusculum [Italy]—d. April 9, 1024), pope from 1012 to 1024, the first of several pontiffs from the powerful Tusculani family.

The ascendancy of the Tusculani marked the fall of the rival Crescentii family of Rome, which had come to dominate the papacy in the latter half of the 10th century. Benedict's predecessor, Sergius IV, was the choice of the Crescentii, and Benedict ousted another of their candidates when he became pope.

During Benedict's pontificate his brother Romanus became the civil ruler of Rome and later succeeded him as Pope John XIX. Benedict's rule was acceptable to King Henry II of Germany, whom he crowned as Holy Roman emperor in 1014. Benedict appears to have been more of a feudal baron than a pope: he restored papal authority in the Campagna and in Roman Tuscany by force of arms; he defeated the Saracens' attack on northern Italy (1016–17); and he encouraged the Norman freebooters in their attacks on Byzantine power in the south. Benedict also strove for ecclesiastical reform. A friend of St. Odilo, abbot of Cluny, Fr., Benedict supported the monastic reform movement led there by the Benedictine monks.

A council summoned by Benedict at Pavia, Lombardy, in 1022, also attended by Henry, forbade uncelibate clergy and the sale of church offices.

• **Benedict IX**, original name TEOFILATTO, Latin THEOPHYLACTUS (d. 1055/56, Grottaferrata, Papal States [Italy]), pope three times, from 1032 to 1044, from April to May 1045, and from 1047 to 1048. The last of the popes from the powerful Tusculani family, he was notorious for selling the papacy and then reclaiming the office twice.

The son of Count Alberic of Tusculum, he was the nephew of two previous popes, Benedict VIII and John XIX. While still a youth, he was thrust into the papacy by the Tusculani in 1032, and he excommunicated ecclesiastical leaders who were hostile to him. His violent and licentious conduct provoked the Romans to insurrection; he fled Rome, and in January 1045 they elected Bishop John of Sabina to succeed him as Sylvester III. But Sylvester was quickly driven out by Benedict's brothers and retired to his old bishopric in the Sabine hills, whereupon Benedict sold the papacy to his godfather, Giovanni Graziano, a Roman priest, who offered Benedict a pension. Graziano, known as an honest and pious man, is believed to have taken this action to

save the Holy See from Benedict's scandalous conduct; he became pope as Gregory VI (May 1045).

In the following year, however, both Benedict and Sylvester returned to Rome, each claiming to be pope instead of Gregory. None of the three was favoured at the Council of Sutri, held by Henry III of Germany in December 1046. Sylvester was declared a false claimant and imprisoned; Benedict was deposed; and Gregory was charged with simony, deprived of the papacy, and replaced by the Saxon bishop Suidger of Bamberg as Clement II. After Clement's death (Oct. 9, 1047) Benedict reappeared in Rome and installed himself on November 8. Finally, on July 17, 1048, Boniface of Tuscany, by order of Henry, drove Benedict from Rome and replaced him with Bishop Poppo of Brixen as Damasus II. Benedict was never seen in Rome again. He is supposed to have lived until 1055 or 1056, traditionally a penitent at the monastery of Grottaferrata.

• **Benedict (X)**, original name GIOVANNI MINCIO, Latin JOHANNES MINCIUS (d. c. 1080, Sant'Agnese, Italy), antipope from April 1058 to January 1059. His expulsion from the papal throne, on which he had been placed through the efforts of the powerful Tusculani family of Rome, was followed by a reform in the law governing papal elections. The new law, enacted in 1059, established an electoral body, which subsequently became the Sacred College of Cardinals, charged with sole responsibility for choosing the pope.

Benedict had previously been bishop of Velletri, near Rome, and was intruded in the papacy upon the death of Pope Stephen IX (X). Expelled through the efforts of the reforming monk Hildebrand (later Pope St. Gregory VII) and the German court, he died a prisoner in the monastery of Sant'Agnese.

• **Benedict XI**, BLESSED, original name NICCOLÒ BOCCASINI (b. 1240, Treviso, March of Trevigiana—d. July 7, 1304, Perugia, Umbria; beatified April 24, 1736; feast day July 7), pope from 1303 to 1304. His brief reign was taken up with problems he inherited from the quarrel of his predecessor, Boniface VIII, with King Philip IV the Fair of France and the King's allies (the Colonna family of Rome).

He entered the Dominican order in 1254, becoming its general in May 1296. Created cardinal in 1298, he was legate to Hungary in 1302. He was one of two cardinals who stood by Boniface VIII at his palace at Anagni, near Rome, when the Pope, about to excommunicate Philip, was seized (Sept. 7, 1303) by the King's supporters, who sought to depose him from the papacy. The Pope was freed by the local populace but died shortly thereafter. The quarrel had originated over the King's wish to wrest taxes from the French clergy. The Colonna had become allies of Philip because they viewed the growing power of the Pope's family as a threat to their own.

Benedict was unanimously elected pope (Oct. 22, 1303) and did much to conciliate his predecessor's enemies. While he demanded no retribution for the outrage done to Boniface at Anagni, he refused to pardon both Sciarra Colonna, who led the attack, and Guillaume de Nogaret, Philip's chief adviser, who denounced Boniface at Paris in 1303.

• **Benedict XII**, original name JACQUES FOURNIER (b. Savcrdun, near Toulouse, Fr.—d. April 25, 1342, Avignon, Provence), pope from 1334 to 1342; he was the third pontiff to reign at Avignon, where he devoted himself to reform of the church and its religious orders. In the political sphere his efforts, influenced by King Philip VI of France, were generally unsuccessful. One of his most significant

Benedict XII, detail from a bust by Paolo da Siena, 1342; in the Grotto of the Vatican, Rome

Altman—Anderson/Art Resource/EB Inc

failures was his inability to curb the conflict between England and France, which began during his pontificate and came to be known as the Hundred Years' War (1337–1453).

Entering the Cistercian order at Boulbonne and graduating as doctor of theology at Paris, he first became abbot of the French monastery of Fontfroide (1311), then bishop of the French diocese of Pamiers (1317), and bishop of Mirepoix (1326). He was made cardinal in December 1327. His distinction as a theologian and the zeal with which he opposed heretics recommended him to the cardinals in Avignon, who elected him (Dec. 20, 1334) to succeed John XXII. He worked to settle a controversy that had agitated the close of John's pontificate—the controversy over the question of the Beatific Vision, a vision of God promised to the redeemed. John had preached in several sermons that this vision would be granted only after Judgment Day. Benedict ended the dispute by issuing a bull, *Benedictus Deus* (1336), in which he formulated the church's teaching that the souls of the just are granted the vision immediately after death.

He attempted to reform the religious orders through the imposition of stringent constitutions. These rigorous measures aroused much hostility, and most of his reforming work was undone by successors. He did not return the papacy to Rome, as the Romans, at least, had hoped he would, but he sent money for the repair of its strife-ridden churches and for the aid of its strife-ridden populace. In Avignon he built a costly papal palace and brought in Siennese artists to decorate the local churches.

• **Benedict (XIII)**, original name PEDRO DE LUNA (b. c. 1328, Illueca, Kingdom of Aragon—d. 1423, Peñíscola, in Valencia), antipope from 1394 to 1423. He reigned in Avignon, Provence, in opposition to the reigning popes in Rome, during the Western Schism (1378–1417), when the Roman Catholic Church was split by national rivalries claiming the papal throne.

Of noble birth, he was professor of canon law at Montpellier University in southern France before he was made cardinal in 1375. The Schism began in 1378 with the election of Robert of Geneva as Clement VII in opposition to Pope Urban VI. Benedict gave his allegiance to Clement and, upon Clement's death, was elected to succeed him by the cardinals supporting Avignon, with the understanding that he would abdicate voluntarily if that would help to end the division in the church. This he later refused to do, however, when asked to resign by the French princes who had been among his supporters. Eighteen of his 23 cardinals deserted him, and the papal palace in Avignon was besieged by the French (1398). In 1403 Benedict escaped from the palace to

Provence, rallied his cardinals, and—largely through the support of Louis, duc d'Orléans—won back the obedience of France. He began negotiations to reach a compromise with the reigning pope Gregory XII (1407), but they came to nothing, and in 1408 the French declared themselves neutral in the dispute. In June 1409 the Council of Pisa, summoned by the rival colleges of cardinals to end the rift, pronounced both popes deposed and elected Alexander V in their stead. Benedict, still possessing the allegiance of some states, refused to submit to the Council of Pisa, but he subsequently had to take refuge in his castle at Peñíscola in 1415. On July 26, 1417, when the Council of Constance pronounced Benedict deposed, he lost all governmental recognition except that of Armagnac (in France) and of Scotland. But Benedict, who had maintained his claims against three Roman popes (Boniface IX, Innocent VII, and Gregory XII) and two antipopes whose claims derived from the Council of Pisa (Alexander V and John XXIII), refused to yield to Pope Martin V, who was elected in November 1417 to achieve unity. Benedict maintained to the end of his life that he was the rightful pope and created four new cardinals as late as November 1422.

• **Benedict (XIV)**, original name BERNARD GARNIER (d. c. 1433), counter-antipope from 1425 to c. 1433.

In 1417 the Council of Constance deposed the antipope Pope Benedict (XIII) and elected Martin V, thus officially terminating the Western Schism between Avignon and Rome. However, Benedict, protected in his castle of Peñíscola in Valencia, resisted until his death in 1423 and even reconstituted his court by creating four new cardinals. The intrigues of King Alfonso V of Aragon, who wanted to prolong the Schism, caused this College of Cardinals in 1423 to elect a new antipope, Clement VIII (who reigned until his abdication in 1429). Meanwhile, Jean Carrier, one of Benedict's cardinals, who had not been invited to the conclave of 1423, held his own conclave in the castle of Peñíscola and elected (Nov. 12, 1425) Bernard Garnier as Benedict XIV, who was thus an antipope countering an already reigning antipope. Garnier had formerly been the sacristan of Rodez, County of Rodez, near Toulouse.

As Benedict XIV, Garnier so secretly conducted his office that even his residence was uncertain, and he thus became known as the "hidden pope." In a letter from the Count of Armagnac to St. Joan of Arc, it is revealed that only Carrier knew Benedict's location. Benedict, having few followers, ended his reign in 1430, naming one Jean Farald as cardinal.

Carrier was captured in 1433 and imprisoned in the castle of Foix, County of Foix, Gascony. Upon Garnier's death, presumably about the same time, Cardinal Farald, continuing the peculiar fanaticism of his uncanonical tradition, elected Carrier as pope. He "reigned" imprisoned as a self-styled Benedict XIV, dying on an unknown date.

• **Benedict XIII**, original name PIETRO FRANCESCO VINCENZO MARIA ORSINI (b. Feb. 2, 1649, Gravina, Kingdom of Naples—d. Feb. 21, 1730, Rome), pope from 1724 to 1730.

Entering the Dominican order in 1667, Orsini taught philosophy at Brescia, Venetian Republic, before Pope Clement X made him cardinal in 1672. He was successively archbishop of Manfredonia (1675), of Cesena (1680), and of Benevento (1686). He had taken part in five conclaves for the election of popes before the conclave that chose him on May 29. His attack on the extravagance of the cardinals and on the worldliness of ecclesiastics, most forcefully asserted at a provincial council at Rome (1725), had little effect. His own mode of living was noted for its simplicity. Unfortunately, he left state

affairs almost entirely to the unpopular cardinal Niccolò Coscia, whose abuse of his office to amass riches marred Benedict's reign. Papal relations with the Bourbon monarchies of France and Spain, made difficult by the belief in absolutism that prevailed among European kings in the 18th century, were allowed to deteriorate. He continued the opposition of the papacy to Jansenism, a Roman Catholic movement of unorthodox tendencies that had begun in 17th-century France, although he allowed the Dominicans to preach the Augustinian doctrine of grace, which bordered on the Jansenist teaching. A scholar, Benedict wrote many theological works.

• **Benedict XIV**, original name PROSPERO LAMBERTINI (b. March 31, 1675, Bologna, Papal States—d. May 3, 1758, Rome), pope from 1740 to 1758; his intelligence and moderation won praise even among deprecators of the church at a time when it was beset by criticism from the philosophers of the Enlightenment and its prerogatives were challenged by absolutist monarchs. Typical of his pontificate were his promotion of scientific learning and his admonition to those in charge of drawing up the *Index Librorum Prohibitorum* (*Index of Forbidden Books*) to act with restraint.

Of a noble family, he received a doctorate in theology and law from the University of Rome. In 1728 he was created a cardinal, and in 1731 he was made archbishop of Bologna by Pope Clement XII, whom on Aug. 17, 1740, he was elected to succeed.

In the Papal States he reduced the burden of taxation, encouraged agriculture, and supported a policy of free trade. He was conciliatory in his relations with the secular powers, making vast concessions to the kings of Spain, Portugal, Sardinia, and Naples in matters of patronage, the right of nomination to vacant sees, and secular jurisdiction over ecclesiastical changes. In his bulls *Ex quo singulari* (1742) and *Omnium sollicitudinum* (1744), he prohibited certain traditional practices that the Jesuits had allowed converts to retain in China and India. This ban set back the winning of converts in Asia and was partially reversed in 1939, when the church allowed acts of ancestor veneration, provided they were without religious significance. In 1756 he condemned the practice of refusing last rites to French ecclesiastics who still opposed the bull *Unigenitus*, directed against certain propositions of Jansenism, a Roman Catholic movement of unorthodox tendencies that had begun in 17th-century France.

Benedict was an active scholar all his life, founding several learned societies and laying the groundwork for the present Vatican Museum. He corresponded with many of the great men of his age, including Voltaire, who dedicated his tragedy *Mahomet* to him.

• **Benedict XV**, original name GIACOMO DELLA CHIESA (b. Nov. 21, 1854, Pegli, Kingdom of Sardinia—d. Jan. 22, 1922, Rome), pope from 1914 to 1922.

Benedict XV, 1921
UPI

After graduating from the University of Genoa, he studied for the priesthood in the

Collegio Capranica in Rome and entered the papal diplomatic service, later spending four years in Spain before being employed in the department of the secretary of state (1887). Pope Pius X made him archbishop of Bologna (1907), and cardinal (1914). He was elected pope a month after the outbreak of World War I, and the greater part of his papacy was occupied with war problems.

Trying to follow a policy of strict neutrality, Benedict abstained from condemning any action of the belligerents. He concentrated the church's efforts initially toward the alleviation of unnecessary suffering. Later he made positive efforts toward reestablishing peace, though hampered by the pro-Austrian sentiments of the majority of cardinals. When the United States entered the war and took up the Allies' attitude that peace could not be restored to Europe until Germany had been defeated, his principal attempt to mediate (1917) failed.

By 1919 the papacy lacked the prestige it had enjoyed under Pope Leo XIII, and Benedict was excluded from the peace negotiations. His last years were concerned with readjusting the machinery of papal administration made necessary by the territorial changes that followed the war and with directives on missionary work. During this period official relations were resumed with France, and a British representative was accredited to the Vatican for the first time since the 17th century.

• **Benedict XVI**, original name JOSEPH ALOIS RATZINGER (b. April 16, 1927, Marktl am Inn, Ger.), the bishop of Rome and the head of the Roman Catholic church from 2005. His papacy faced several challenges, including a decline in vocations and church attendance, divisive debates concerning the direction of the church, and the lingering effects of the scandal of the late 1990s and early 2000s surrounding the church's handling of numerous cases of sexual abuse by priests.

Early life and career. Ratzinger's father was a policeman and his mother a hotel cook. The youngest of three children, Ratzinger was six years old when the Nazis took power in Germany in 1933; his parents, who were staunch Catholics, were hostile to the regime. Ratzinger entered the seminary in 1939. In 1941 he was compelled to join the Hitler Youth, and in 1943 he was drafted into the German military, serving in an anti-aircraft unit in Bavaria before being sent to Hungary to set tank traps in 1945. He deserted in April of that year and was captured by American forces and held prisoner for a brief period.

Ratzinger was ordained a priest in June 1951. In 1953 he was awarded a doctorate in theology at the University of Munich. After earning his teaching license in 1957, he taught dogma and theology at the higher school of philosophy and theology in Freising until 1959, later moving to the University of Bonn (1959–69) and also teaching at universities in Münster (1963–66) and—at the invitation of the theologian Hans Küng—Tübingen (1966–69). In 1969 he moved to the University of Regensburg, where he later became vice president.

Ratzinger wrote a number of important theological works, including *Introduction to Christianity* (1968) and *Dogma and Revelation* (1973). His work in theology attracted the attention of the archbishop of Cologne, Joseph Frings, who asked Ratzinger to serve as his expert assistant at the Second Vatican Council (1962–65). One of the more progressive figures at the council, Ratzinger opposed those who hoped to limit reform. He contributed to a document that criticized the Sacred Congregation of the Holy Office and that eventually led

to its reorganization as the Congregation for the Doctrine of the Faith. Ratzinger's university years, however, brought about a transformation of his views. The student protests and denunciations of Christianity that he witnessed while teaching at Tübingen reminded

Pope Benedict XVI
Vincenzo Pinlo—AFP/Getty Images

him of the tactics of the Nazis and led him to adopt a conservative theological perspective.

In March 1977 Ratzinger was appointed archbishop of Munich by Paul VI, who bestowed the cardinal's hat on him three months later. On Nov. 25, 1981, he was made prefect of the Congregation for the Doctrine of the Faith by his friend Pope John Paul II (1978–2005). The pope and his prefect shared a similar history, and their views concerning the church were substantially the same.

As prefect, Ratzinger earned a reputation as a hard-line enforcer of doctrinal uniformity. He condemned liberation theology and suppressed more-liberal theologians such as the Brazilian Leonardo Boff and the American Charles Curran. Despite his reputation, even his harshest critics recognized his intelligence and his ability to discuss controversial matters in an objective and disinterested spirit. He was also recognized for his humility and gentleness as well as for his many talents; he spoke several languages and was an accomplished pianist, with a particular fondness for Mozart.

Election as pope. Ratzinger's election as pope on the second day of the conclave was something of a surprise because of his status as a leading candidate; front-runners are almost never chosen. His position with the cardinal electors was apparently secured by his long service to John Paul and his devotion to his predecessor's teachings and ideals. Ratzinger humbly accepted his election on April 19, 2005, becoming at age 78 the oldest newly elected pope since Clement XII (1730–40). His choice of the name Benedict XVI recalled St. Benedict of Nursia, the patron saint of Europe and the founder of Western monasticism, as well as earlier popes of the same name, including Benedict XV (1914–22), who sought to mediate between the belligerents during World War I. Benedict XVI took steps to continue John Paul's dialogue with Judaism and Islām and with other Christian churches, and he declared that one of the goals of his papacy would be to revitalize the Catholic church in Europe. He also indicated that he would maintain his predecessor's conservative orthodoxy on matters of sexuality, priestly celibacy, and ecclesiastical organization.

Benedict BISCOP, SAINT, also called BENET BISCOP, or BISCOP BADUCING (b. c. 628, Northumbria, Eng.—d. Jan. 12, 689/690, Wearmouth, Northumbria; feast day January 12; for English Benedictines and dioceses of Liverpool and Hexham February 13), founder and first abbot of the celebrated twin monasteries of SS. Peter (at Wearmouth) and Paul (at Jarrow on Tyne, nearby); he is considered to be the father of Benedictine monasticism in England.

Of noble birth, he was a thane of King Oswiu (Oswy) of Northumbria before renouncing (653) a worldly life. In that year he went to Rome, and after a second Roman journey, he became a monk at Lérins, France (666–667), where he took the name of Benedict.

Once more in Rome, he conducted (668–669) St. Theodore of Tarsus, who had just been consecrated archbishop of Canterbury, to England. In 669 Benedict was appointed abbot of SS. Peter and Paul (later St. Augustine's), Canterbury, Kent. He made a fourth journey to Rome in 671 to receive instructions in monastic practices, and in 674 he built on land granted to him by King Ecgrith of Northumbria the monastery of St. Peter at Wearmouth, where he introduced the Benedictine Rule. With St. Ceolfrith, prior and later his successor at Wearmouth, Benedict went to Rome c. 678, returning with an instructor in ecclesiastical music. In 682 he built the sister foundation of St. Paul at Jarrow, returning in 687 to Rome.

These repeated Roman visits enabled him to make a splendid collection of manuscripts, relics, and pictures with which he endowed his monasteries, so that by the late 7th and early 8th century they comprised one of the most flourishing centres of Christian scholarship and art in western Europe. Among his pupils was the celebrated historian the Venerable Bede. The fine library that Benedict had assembled made possible the work of Bede, whose *Historia abbatum* ("Lives of the Abbots") is the best source on Benedict's life.

From the monastic foundations laid by Benedict came a tradition of learning and artistic achievement that influenced the whole of northwestern Europe. Crippled c. 686, he remained bedridden until his death. His relics reportedly were translated in 970 to the abbey of Thorney, Isle of Ely.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Benedict OF NURSIA, SAINT, Nursia also spelled NORCIA (b. c. 480, Nursia [Italy]—d. c. 547, Monte Cassino; feast day July 11, formerly March 21), founder of the Benedictine monastery at Monte Cassino and father of Western monasticism; the rule that he established became the norm for monastic living throughout Europe. In 1964, in view of the work of monks following the Benedictine Rule in the evangelization and civilization of so many European countries in the Middle Ages, Pope Paul VI proclaimed him the patron saint of all Europe.

Life. The only recognized authority for the facts of Benedict's life is book 2 of the *Dialogues* of St. Gregory the Great (Pope Gregory I), who said that he had obtained his information from four of Benedict's disciples. Though Gregory's work includes many signs and wonders, his outline of Benedict's life may be accepted as historical. He gives no dates, however. Benedict was born of good family and was sent by his parents to Roman schools. His life spanned the decades in which the decayed imperial city became the Rome of the medieval papacy. In Benedict's youth, Rome under Theodoric still retained vestigial remains of the old administrative and governmental system, with a Senate and consuls. In 546 Rome was sacked and emptied of inhabitants by the Gothic king Totila, and when the attempt of Emperor Justinian I to reconquer and hold Italy failed, the papacy filled the administrative vacuum and shortly thereafter became the sovereign power of a small Italian dominion virtually independent of the Eastern Empire.

Benedict thus served as a link between the monasticism of the East and the new age that was dawning. Shocked by the licentiousness of Rome, he retired as a young man to Enfide (modern Affile) in the Simbruinian hills, and later to a cave in the rocks beside the lake then existing near the ruins of Nero's palace above Subiaco, 40 miles east of Rome in the foothills of the Abruzzi. There he lived alone for three years, furnished with food and monastic garb by Romanus, a monk of one of the numerous monasteries nearby.

When the fame of his sanctity spread, he was persuaded to become abbot of one of these monasteries. His reforming zeal was resisted, however, and an attempt was made to poison him. He returned to his cave; but again disciples flocked to him, and he founded 12 monasteries, each with 12 monks, with himself in general control of all. Patricians and senators of Rome offered their sons to become monks under his care, and from these novices came two of his best known disciples, Maurus and Placid. Later, disturbed by the intrigues of a neighbouring priest, he left the area, while the 12 monasteries continued in existence.

A few disciples followed him south, where he settled on the summit of a hill rising steeply above Cassino, halfway between Rome and Naples. The district was still largely pagan, but the people were converted by his preaching. His sister Scholastica, who came to live nearby as the head of a nunnery, died shortly before her brother. The only certain date in Benedict's life is given by a visit from the Gothic king Totila about 542. Benedict's feast day is kept by monks on March 21, the traditional day of his death, and by the Roman Catholic Church in Europe on July 11.

His character, as Gregory points out, must be discovered from his Rule, and the impression given there is of a wise and mature sanctity, authoritative but fatherly, and firm but loving. It is that of a spiritual master, fitted and accustomed to rule and guide others, having himself found his peace in the acceptance of Christ.

Rule of St. Benedict. Benedict had begun his monastic life as a hermit, but he had come to see the spiritual dangers of a solitary life, even though he continued to regard it as the crown of monasticism. His Rule is concerned with a life spent wholly in community, and among his contributions to the practices of the monastic life none is more important than his establishment of a full year's probation, followed by a vow of obedience to the Rule.

On the constitutional level, Benedict's supreme achievement was to provide a succinct and complete directory for the government and well-being of a monastery. The abbot, elected for life by his monks, maintains supreme power and in all normal circumstances is accountable to no one. He should seek counsel of the seniors or of the whole body but is not bound by their advice. He is bound only by the law of God and the Rule, but he is continually advised that he must answer for his monks, as well as for himself, at the judgment seat of God. He appoints his own officials and controls all the activities of individuals and the organizations of the common life. Ownership, even of the smallest thing, is forbidden. The ordering of the offices for the canonical hours (daily services) is laid down with precision. Novices, guests, the sick, cooks, and porters all receive attention, and punishments for faults are set out in detail.

The spiritual and human counsel given throughout the Rule is noteworthy among all the monastic and religious rules of the Middle Ages. Benedict's advice to the abbot and to the cellarer, and his instructions on humility, silence, and obedience have become part of the spiritual treasury of the church.

St. Benedict also displayed a spirit of moderation. His monks are allowed clothes suited to the climate, sufficient food (with no specified

fasting apart from the times observed by the Roman church), and sufficient sleep (7½–8 hours). The working day is divided into three portions: five to six hours of liturgical and other prayer; five hours of manual work, whether domestic work, craft work, garden work, or field work; and four hours reading of the Scriptures and spiritual writings. This balance of prayer, work, and study is another of Benedict's legacies.

All work was directed to making the monastery self-sufficient and self-contained; intellectual, literary, and artistic pursuits were not envisaged, but the presence of boys to be educated and the current needs of the monastery for service books, Bibles, and the writings of the Church Fathers implied much time spent in teaching and in copying manuscripts.

Benedict's discretion is manifested in his repeated allowances for differences of treatment according to age, capabilities, dispositions, needs, and spiritual stature; beyond this is the striking humanity of his frank allowance for weaknesses and failure, of his compassion for the physically weak, and of his mingling of spiritual with purely practical counsel.

In preparing his Rule, Benedict drew from the anonymous "Rule of the Master," a much longer and rambling document. Although indebted to the earlier rule, the Rule of Benedict provided a more humane and structured monastic life and would become the preeminent rule of the Roman Catholic church.

(M.D.K.)

Benedict, Ruth, née FULTON (b. June 5, 1887, New York City—d. Sept. 17, 1948, New York City), anthropologist whose theories had a profound influence on cultural anthropology, especially in the area of culture and personality; *Patterns of Culture* (1934) is her most famous work.

Ruth Benedict
By courtesy of Columbia University, New York

She approached anthropology from a strong humanistic background, having studied English literature at Vassar College, Poughkeepsie, N.Y. (1905–09). Even after entering anthropology in the 1920s, she continued to write poetry under the pseudonym Anne Singleton until the early '30s. From the outset of her career in social science she conceived of cultures as total constructs of intellectual, religious, and aesthetic elements. She received her Ph.D. under Franz Boas at Columbia University for her thesis on a pervasive theme among North American Indians, *The Concept of the*

Guardian Spirit in North America (1923). An assistant professor at Columbia from 1930, she was advanced to professor in 1948.

Fieldwork engaged her among tribes of the southwestern United States, the Serrano of California, and the Canadian Blackfoot; her research on folklore and religion resulted in *Zuni Mythology*, 2 vol. (1935). In *Patterns of Culture*, which was translated into 14 languages, she emphasized how small a part of the range of possible human behaviour is elaborated or emphasized in any one society. She described how these forms of behaviour are integrated into patterns or configurations and she supported cultural relativism, judging any cultural phenomenon in the context of the culture in which it occurs.

As a contribution to questions of human equality, Benedict wrote *Race: Science and Politics* (1940) and, after applying anthropological methods to the study of Japanese culture, *The Chrysanthemum and the Sword* (1946). At the time of her death she was directing an ambitious project on the study of contemporary European and Asiatic cultures. A biography, *Ruth Benedict*, by Margaret Mead, was published in 1974.

Benedictine, member of the ORDER OF SAINT BENEDICT (O.S.B.), the confederated congregations of monks and lay brothers who follow the rule of life of St. Benedict (c. 480–c. 547) and who are descendants of the traditional monasticism of the early medieval centuries in Italy and Gaul. The Benedictines, strictly speaking, do not constitute a single religious order because each monastery is autonomous.

St. Benedict wrote his rule, the so-called Benedictine Rule, c. 535–540 with his own abbey of Montecassino in mind; the rule spread slowly in Italy and Gaul and provided a complete directory for the government and spiritual and material well-being of a monastery; it carefully integrated prayer, manual labour, and study into a well-rounded daily routine. By the 7th century the rule had been applied to women, as nuns, whose patroness was deemed Scholastica, sister of St. Benedict.

By the time of Charlemagne at the beginning of the 9th century, the Benedictine Rule had supplanted most other observances in northern and western Europe. During the five centuries following the death of Benedict, the monasteries multiplied both in size and in wealth. They were the chief repositories of learning and literature in western Europe and were also the principal educators. One of the most celebrated of Benedictine monasteries was the Burgundian Abbey of Cluny, founded as a reform house by William of Aquitaine in 910. The Cluniac reform was often imitated by other monasteries, and a succession of able abbots gradually built up throughout western Europe a great network of monasteries that followed the strict Cluniac customs and were under the direct jurisdiction of Cluny.

The great age of Benedictine predominance ended about the middle of the 12th century, and the history of the main line of Benedictine monasticism for the next three centuries was to be one of decline and decadence.

The 15th century saw the rise of a new Benedictine institution, the congregation. In 1424 the congregation of Santa Giustina of Padua instituted reforms that breathed new life into Benedictine monasticism. Superiors were elected for three years; the monks no longer took vows to a particular house but to the congregation; and ruling authority was concentrated in the annual general chapter, or legislative meeting. This radical reform spread within a century to all the Benedictines of Italy and became known as the Cassinese Congregation. There were similar reforms throughout Europe. These reforms were confronted by the turmoil of the Protestant Reformation in the 16th century. Within a few years (1525–60)

the monasteries and nunneries disappeared almost entirely from northern Europe, and, for almost a century, they suffered greatly in France and central Europe. Benedictinism revived in France and Germany during the 17th century, however, and several congregations were founded, notably that of the male Maurists (q.v.) in France and the female Perpetual Adoration in Paris (1653) and Our Lady of Calvary (1617). Although the 18th century witnessed a new decline, from the middle of the 19th century Benedictine monasteries and nunneries again began to flourish. Foundations, including Solesmes, with its emphasis on the celebration of the liturgy, arose throughout Europe; monks and nuns returned to England; congregations were established in North and South America; and monasteries scattered all over the world. In the face of this revival, Pope Leo XIII desired to bring about some sort of unity among the traditionally independent Benedictines. In 1893 he created the office of abbot primate as head of the federation of autonomous congregations; and gradually this office, though unwelcomed because of the Benedictine desire for autonomy, has developed in influence.

Benedictines, in addition to their monastic life of contemplation and celebration of the liturgy, are engaged in a variety of activities including education, scholarship, and parochial and missionary work.

Benedictine Armenian Antonine Monks, Congregation of: see Mechitarist.

benediction, a verbal blessing of persons or things, commonly applied to invocations pronounced in God's name by a priest or minister, usually at the conclusion of a religious service. The Aaronic benediction (Num. 6:24–26) was incorporated by Luther into his German Mass and is preserved by modern Lutherans because of its impressive dignity; it is also used in the Mozarabic liturgy of Spain before the reception of the Host. The Swedish liturgy appends a trinitarian formula to this same benediction. Some Christian churches, however, prefer the Pauline benediction (II Cor. 13:14).

In the Roman Catholic Church benediction commonly means a blessing of persons (e.g., the sick) or objects (e.g., religious articles). Benediction of the blessed sacrament, a non-liturgical devotional service, has as its central act the blessing of the congregation with the eucharistic Host.

Benedictsson, Victoria, byname ERNST AHLGREN (b. March 6, 1850, Skåne, Swed.—d. July 21, 1888, Copenhagen), writer who in her short literary career produced some of the most natural and unpretentious stories of Swedish folk life and also novels dealing with the social problems of her period, especially the emancipation of women.

Having grown up in a home marred by marital discord, she married, at an early age, a widower much older than herself. Her marriage was unhappy. After an illness that left her permanently crippled, she turned to literature and in 1884 published her first collection of stories of rural life in her native province, *Från Skåne* ("From Skåne"). It was followed by a novel, *Pengar* (1885; "Money"), a critical view of a society that confers status and security on women only through marriage; and another, somewhat contradictory novel, *Fru Marianne* (1887; "Mrs. Marianne"), in which a doll wife outgrows her early romantic notions and finds fulfillment in sharing work and responsibilities with her husband. Her success made her acquainted with the brilliant and influential critic Georg Brandes, whom she had long admired. She fell deeply in love with him, but he was unable to return her feeling. Her posthumously published letters and diaries, describing her thwarted love and the desperation that drove her to suicide,

rank with those of August Strindberg in the frankness of their self-revelation.

Benedictus, also called SONG OF ZECHARIAH, hymn of praise and thanksgiving sung by Zechariah, a Jewish priest of the line of Aaron, on the occasion of the circumcision and naming of his son, John the Baptist. Found in Luke 1:68–79, the canticle received its name from its first words in Latin (*Benedictus Dominus Deus Israel*, "Blessed be the Lord God of Israel").

The hymn is addressed to the Israelite people about their long-cherished messianic hopes, and to John the Baptist as the prophet and forerunner of the Messiah whose kingdom of peace is about to begin.

Scholarly disputes regarding the origin of this canticle have suggested three possible composers: Zechariah, Luke, and followers of John the Baptist. The Benedictus was used as a hymn beginning in the 4th century in both Eastern and Western liturgies.

Benediktsson, Einar (b. Oct. 31, 1864, Ellidhavatn, Icc.—d. Jan. 14, 1940, Herdísarvík), poet called by some the greatest Icelandic poet of the 20th century.

Son of a leader of the Icelandic independence movement, he received a law degree at Copenhagen in 1892 and briefly edited a newspaper, *Dagskrá* (1896–98), advocating the cause of Icelandic independence. Much of his life was spent abroad raising capital to develop Icelandic industries. His five volumes of Symbolist verse—*Sögur og kvaedi* (1897; "Stories and Poems"), *Hafblik* (1906; "Smooth Seas"), *Hrannir* (1913; "Waves"), *Vogar* (1921; "Billows"), *Hvammar* (1930; "Grass Hollows")—showing a masterful command of the language, exemplify his patriotism, mysticism, and love of nature, and the influence of his extensive travels. He translated Ibsen's *Peer Gynt* into Icelandic. A selection of his poems was translated into English as *Harp of the North* (1955) by Frederic T. Wood.

benefice, a particular kind of land tenure that came into use in the 8th century in the kingdom of the Franks. A Frankish sovereign or lord, the seigneur, leased an estate to a freeman on easy terms in *beneficium* (Latin: "for the benefit [of the tenant]"), and this came to be called a *beneficium*, a benefice. The lease normally came to an end on the death of the seigneur or of the tenant, though holders of benefices often succeeded in turning them into hereditary holdings.

Although by the 12th century benefice was dying out as a term for feudal land tenure, it retained an important place in the law of the Western Church and later in that of the Church of England; it came to designate an ecclesiastical office to which the church attached the perpetual right of receiving income. In the early history of the church, all endowments were generally centralized under the administration of the bishop, and there was no endowment attached to a particular ecclesiastical office. By the 8th century, churches were being founded in villages by the seigneurs, usually laymen, who were allowed to appoint the priest. Parish churches thus fell into two groups, the earlier type founded and controlled by bishops and the later type under the control of the lay seigneurs. Both bishops and seigneurs began to treat each church and its endowments as property to be leased like any other part of their estates, and they appointed the priest by leasing to him as a piece of property the church and its endowment in return for his carrying out the spiritual duties and frequently the paying of some rent. The priest held the church for life, unless a term of years was specifically mentioned in the lease.

In the 12th century the procedure for granting

ecclesiastical benefices was made to conform to the ideals of Pope Gregory VII (reigned 1073–85). A lay seigneur could not grant an ecclesiastical office directly to a priest or receive rent or payment for it. The lay seigneur became the patron of the church; he chose the priest but could not lease him the church or receive any rent for it. The church had to be leased or granted to the priest by the bishop. Once inducted or invested with the benefice, the priest held it for life or, if he resigned, until his resignation was accepted by the bishop. Otherwise he was bound to vacate the benefice only if he was deprived of it in a court of law or if he received another benefice, in which case he automatically vacated the first benefice unless he had a dispensation to hold two or more benefices in plurality.

The procedure in the Church of England for giving a benefice to a priest and the terms on which he holds it have been modified in two respects. First, the bishop has wider powers of refusing the patron's nominee, and in a vacancy the parochial church council has the right to be consulted before an appointment is made. Second, the circumstances under which a priest can be removed from his benefice have been enlarged. In the Roman Catholic Church, the law concerning benefices has been set down in great detail in the Code of Canon Law (*Codex Juris Canonici*).

The benefice system, by making the parish priest dependent on no man's pleasure for his income or continuance in office, gave him an immeasurable status and strength in carrying out his duties.

beneficiary, in Anglo-American law, one for whose benefit a trust is created. Beneficiaries of private trusts must be identifiable legal entities (natural persons or corporations) or a class of persons (such as children of the creator of the trust). Whereas the beneficiaries must be described with certainty, provision may be made for the addition of new beneficiaries as persons are born and other events happen, and thus the group may shift in membership from time to time. Beneficiaries of charitable trusts are not identifiable persons, since society is the beneficiary. Thus, in the case of a trust to aid the poor, the individuals chosen yearly to receive trust income are not deemed to be the beneficiaries; rather, society, which is benefited by the relief of poverty, is the beneficiary.

beneficiation, removal of worthless particles from pulverized metal ore. *See* ore dressing.

benefit of clergy (law): *see* clergy, benefit of.

benefit performance, in theatre, originally a supplemental performance by an actor or actress, who kept all or part of the proceeds to compensate for insufficient salary. In modern times a benefit performance is given by an actor, entertainer, or company of them to benefit a charitable organization, which may sell tickets and keep the proceeds; or, less strictly, it is a performance for which a charitable organization has bought out at a discounted price and raises funds by selling tickets at a full or premium price.

From the Restoration to the close of the 19th century an actor was hired for one or two years with a contracted salary and a guarantee of at least one benefit performance a year. Although each benefit performance was a gamble, the benefit system in England usually increased an actor's income. It also, however, authorized managers to lower salaries. The year 1685 marked the first benefit for an actor, given for a Mrs. Barry, whose performance elicited "extraordinary applause." She remained the sole beneficiary of this new system until ten years later, when financial woes affected many actors' salaries. The benefit sys-

tem soon became a test of an actor's success or, more likely, of his popularity. The system forced actors to solicit their friends and acquaintances to buy tickets.

The benefit system varied with each theatre, and there were several types of benefit. The clear benefit, coveted by all performers, provided the actor with the full proceeds of his performance, the management agreeing to pay all additional charges. With a half-clear benefit, the actor divided the gross income with the manager. The benefit proper stipulated that the actor pay for use of the theatre, receiving all profits above that. With a half benefit, all profits above the costs of production were split between the actor and manager. Occasionally, several actors shared a benefit in a joint benefit performance. Although these were the most common practices, there were some instances of two-thirds benefits. In some cases, the player had to compensate the manager if ticket sales for a benefit fell below regular box-office returns. The use of benefits declined in the 1860s, when practice in theatrical engagements switched from seasonal contracts to terms based on the length of time a play ran. This change justified managers in paying higher salaries during a profitable run and none when a play's audience disappeared.

Beneke, Friedrich Eduard (b. Feb. 17, 1798, Berlin—d. March 1, 1854, Berlin), Prussian philosopher and psychologist who argued that inductive psychology was the foundation for study of all philosophical disciplines. He rejected existing idealism for a learning process that begins with developing inner perceptions before developing generalized concepts.

Beneke's first anti-Hegelian books, *Erkenntnislehre nach dem Bewusstsein der reinen Vernunft* (1820; "Theory of Knowledge According to the Consciousness of Pure Reason") and *Erfahrungseelenlehre als Grundlage alles Wissens* (1820; "Experiential Theory of the Soul as the Foundation of All Knowledge"), written after theology and philosophy study at Halle and Berlin universities, caused his nonacceptance into academia until his University of Berlin appointment in 1832 as professor of philosophy. Other important works include *Psychologische Skizze*, 2 vol. (1825–27; "Psychological Sketches"), *Grundlinien des natürlichen Systems der praktischen Philosophie* (1837; "Essentials of Natural Systems of Practical Philosophy"), and *Pragmatische Psychologie* (1850; "Pragmatic Psychology").

Benelux Countries (Belgium, The Netherlands, and Luxembourg): *see* Low Countries.

Benelux Economic Union, French Union Economique BENELUX, Dutch BENELUX ECONOMISCHE UNIE, economic union of Belgium, The Netherlands, and Luxembourg, with the objective of bringing about total economic integration by ensuring free circulation of persons, goods, capital, and services; by following a coordinated policy in the economic, financial, and by social fields; and by pursuing a common policy with regard to foreign trade.

Belgium and Luxembourg had bilaterally formed an economic union in 1921; plans for a customs union of the three countries were made in the London Customs Convention in September 1944 and became operative in 1948. By 1956 nearly all of the internal trade of the union was tariff-free. On Feb. 3, 1958, the Treaty of the Benelux Economic Union was signed; it became operative in 1960. Benelux became the first completely free international labour market; the movement of capital and services was also made free. Postal and transport rates were standardized, and welfare policies were coordinated. In 1970 border controls were abolished.

The day-to-day operations of Benelux are conducted by the Secretariat-General; the executive authority of the organization rests with the Committee of Ministers, which meets quarterly.

Benelux was once regarded as a promising experiment by which neighbouring countries would form customs unions that might then merge into wider economic unions. Following the ratification of the treaty establishing the European Coal and Steel Community in 1952, however, interest in such developments shifted to plans for the European Economic Community, of which Belgium, The Netherlands, and Luxembourg are members.

Beneš, Edvard (b. May 28, 1884, Kozlany, Bohemia, Austria-Hungary—d. Sept. 3, 1948, Sezimovo Ústí, Czech.), statesman, foreign

Beneš
H. Roger-Viollet

minister, and president, a founder of modern Czechoslovakia who forged its Western-oriented foreign policy between World Wars I and II but capitulated to Hitler's demands during the Czech crisis of 1938.

After studying at Prague, Paris, and Dijon, Beneš received a doctorate of laws in 1908 and taught at the Prague Commercial Academy and the Czech University of Prague before World War I. Influenced by the nationalist ideas of Tomáš Masaryk, who wished to liberate the Czechs and Slovaks from Austrian rule, Beneš followed his mentor to Switzerland during World War I and then established himself in Paris. With Masaryk and the Slovak leader Milan Štefánik, Beneš formed a propaganda organization that eventually became a Czechoslovak provisional government on Oct. 14, 1918. With the collapse of Austria-Hungary in November 1918, a new Czechoslovak state was quickly formed. As foreign minister, a post he was to retain until 1935, Beneš headed his country's delegation to the Paris Peace Conference in 1919 and championed the League of Nations throughout the interwar period, serving as its Council chairman six times. Opposed to plans for union between Austria and Germany (after World War I and again in 1931), which he deemed a threat to Czechoslovakia's continued existence, he attempted to reestablish a balance of power in eastern Europe. To fill the partial power vacuum created by the collapse of the Austro-Hungarian monarchy, Beneš negotiated the treaties with Romania and Yugoslavia (1921) that formed the Little Entente, originally aimed at revisionist Hungary. France joined in 1924, and thereafter the alliance became a bloc against Germany and, to a lesser extent, the Soviet Union. In 1935, however, he signed a mutual assistance pact between his country and the Soviet Union.

With the resignation of Masaryk as president in 1935, Beneš was elected to that office. Relations with Poland and Germany, never amicable, steadily worsened. Though he granted substantially the first Sudetenland German autonomy demands in 1938, he was nevertheless unable to avert the crisis that led to the

destruction of the Czechoslovak state. Abandoned by his allies, Beneš capitulated before the German ultimatum, and his country lost the Sudetenland in September 1938. Poland soon occupied the disputed Teschen area. Resigning on Oct. 5, 1938, Beneš went into exile. After the outbreak of World War II he established in France a Czechoslovak national committee, which moved to London in 1940. Reestablishing a government on his native soil on April 3, 1945, Beneš entered Prague on May 16 to the enthusiastic welcome of the population. His was the only eastern European exile government to be allowed to return after the war. Nevertheless, Beneš realized that Czechoslovakia had to cooperate closely with the Soviet Union. Increasingly ill, he suffered two strokes in 1947. When his Communist prime minister, Klement Gottwald, demanded on Feb. 25, 1948, that Beneš accept a Communist-dominated cabinet, he again had no choice but to capitulate. Refusing to sign the new constitution, he resigned on June 7, 1948. Having witnessed the apparent suicide of his lifelong friend Jan Masaryk (son of Tomáš Masaryk) a few months earlier, Beneš died a broken man in 1948. His unfinished *Memoirs: From Munich to New War and New Victory* appeared in English in 1954.

Benét, Stephen Vincent (b. July 22, 1898, Bethlehem, Pa., U.S.—d. March 13, 1943, New York, N.Y.), American poet, novelist, and writer of short stories, best known for *John Brown's Body*, a long narrative poem on the American Civil War.

Born into a military family with literary inclinations, Benét was reared on army posts. His father read poetry aloud to Stephen, an older brother, William Rose, and a sister, Laura, all of whom became writers. Stephen published his first book at the age of 17. Civilian service during World War I interrupted his education at Yale University. He received his A.M. degree after the war, submitting his third volume of poems instead of a thesis.

After publishing the much-admired *Ballad of William Sycamore 1790–1880* (1923), three novels, and a number of short stories, he went to France, where he wrote *John Brown's Body* (1928), his most widely read work. Dramatized by Charles Laughton in 1953, it was played across the country.

A Book of Americans (1933), poems written with his wife, the former Rosemary Carr, brought many historical characters to life for American schoolchildren. Benét's preoccupation with historical themes was also the basis for *Western Star*, an ambitious epic verse narrative on American history that Benét first

Benet Biscop (c. 628–689/690): see Benedict Biscop, Saint.

Benet Goita, Juan (b. 1927, Madrid, Spain—d. Jan. 5, 1993, Madrid), Spanish writer noted for his intricate novels and experimental prose style.

Benet lived with his family outside Spain during the Civil War (1936–39). After returning to Spain, he studied civil engineering and earned an advanced degree in 1954. He became a highway engineer in rural areas of Spain, working in León in northwestern Spain, Asturias, and the Basque provinces.

In 1961 he published a volume of short stories, *Nunca llegarás a nada* ("You'll Never Amount to Anything"). He settled in Madrid in 1964. In his first novel—*Volverás a Región* (1967; "You Will Return to Región")—Benet Goita recounts the attitudes of different characters living in an area he calls Región, somewhat resembling León. The novel caused considerable interest in Spain because of its tantalizing effects. There are frequent changes in viewpoint, and many of the passages are open to conflicting interpretation. It comprises a trilogy with *Una meditación* (1969; "A Meditation") and *Un viaje de invierno* (1972; "A Winter Journey"). Benet's works, which also include *En el estado* (1977; "In the State"), are complex and demanding of the reader's participation. He also wrote plays and critical essays.

Beneventan script, in calligraphy, southern Italian hand, cultivated in the mother house of the Benedictine order at Montecassino. It has a peculiar jerky rhythm and retains individ-

ual cursive forms, which together with many abbreviations and ligatures make for difficult reading. Nevertheless, from humble vernacular beginnings, it rose to be an admired literary script and held that position for more than 500 years, well into the 13th century.

Benevento, Latin *BENEVENTUM*, city, capital and archiepiscopal see of Benevento *provincia*, Campania *regione*, southern Italy. The city lies on a ridge between the Calore and Sabato rivers, northeast of Naples. It originated as Malies, a town of the Oscans, or Samnites; later known as Maleventum, or Malventum, it was renamed Beneventum by the Romans. It became an important town on the Apian Way and was a base for Roman expansion in southern Italy. In 275 BC, Pyrrhus, king of Epirus, was defeated at Beneventum in his last battle with the Romans. After partial destruction by Totila, king of the Ostrogoths, in AD 452, Benevento in 571 became the capital of an important Lombard duchy controlling much of southern Italy. It passed in the 11th century to the Byzantines and then to the papacy, which ruled it—except for a brief period (1806–15) when it was governed as a principality by Napoleon's minister Talleyrand—until it became part of Italy in 1860. In 1266 Charles I of Anjou defeated and killed the Hohenstaufen Manfred, king of Naples and Sicily, at Benevento.

Although damaged by earthquakes and devastated by Allied air raids in World War II, the city preserves many historic buildings. Monuments from classical times include Trajan's Arch (Porta Aurea; AD 114–117), the ruins of a Roman theatre, and the Ponte Lebbroso, a

bridge over the Sabato River. The frequently rebuilt cathedral (founded 7th century), with magnificent bronze doors; the 12th-century cloister of the Church of Santa Sofia (8th century, rebuilt 1688); and the castle (1321) are notable medieval buildings.

Benevento is an agricultural centre for wheat, grapes, olives, and vegetables; its products include almond cakes, a liqueur called Strega, chocolate, biscuits, and agricultural machinery. Wine, bricks, and matches are also manufactured. Pop. (1991 prelim.) mun., 62,683.

benevolence, in English history, any sum of money, disguised as a gift, extorted by various English kings, from Edward IV to James I, from their subjects without Parliament's consent. Forced loans had been taken earlier, but Edward IV discarded even the pretense of repayment, and the word benevolence was first used in 1473 to describe an extorted gift. Richard III's attempts to raise benevolences were opposed by Parliament, which in 1484 abolished them as "new and unlawful inventions." In spite of the law, Henry VII made widespread use of the practice, in 1495 persuading Parliament to make those who had promised gifts legally liable for unpaid arrears. Henry VIII demanded benevolences in 1528 and 1545, but the practice was not followed by his successors. It was revived by James I, who received large sums in 1614. Further attempts to exact gifts in 1615, 1620, and 1622 aroused considerable protest, and the practice was finally discontinued.

Bénézet, SAINT, Latin *BENEDICTUS* (b. c. 1165—d. c. 1184; feast day April 14), builder who instigated and directed the building of the Pont d'Avignon over the Rhône River at Avignon, France.

An uneducated shepherd, Bénézet claimed that he was divinely commanded to build the bridge at a point where the force of the Rhône was so great that it had discouraged even Roman engineers in antiquity. The bishop of Avignon, at first skeptical, finally approved the project, and work began in 1177. Bénézet reputedly overcame many obstacles miraculously. He died four years before the bridge was completed and was buried in a chapel built on one of the piers. After almost 500 years, his body was removed and his relics are at Saint-Didier in Avignon.

Benezet, Anthony (b. Jan. 31, 1713, Saint-Quentin, France—d. May 3, 1784, Philadelphia, Pa., U.S.), eminent teacher, Abolitionist, and social reformer in 18th-century America.

Escaping Huguenot persecution in France, the Benezet family fled first to Holland and then to London. Anthony was there apprenticed in a mercantile house, and he joined the Quaker sect. In 1731 he and his family immigrated to Philadelphia.

Disliking the merchant's life, Benezet tried several other vocations before finally deciding to become a teacher. He taught at the Germantown Academy and then at the Friends' English Public School in Philadelphia. In 1755, distressed at the unequal educational opportunities afforded women, he established a school for girls. He devoted the remainder of his life to teaching. Convinced that personal kindness was the key to harmonious social relationships, Benezet made that principle the basis of his teaching methodology.

By the 1760s Benezet was an ardent Abolitionist, writing and distributing pamphlets at his own expense to encourage opposition to slavery and the slave trade. Late in his life he established and taught a school for blacks, and in his will he left his modest estate to endow the school. At various times during his long philanthropic career, Benezet came to the assistance of refugee French Acadians, Amer-

planned in 1934 as possibly five books but left uncompleted at the time of his death. Book I, complete in itself and finished in 1942, was published posthumously. In all, Benét published more than 17 volumes of prose and verse. His best-known short story, "The Devil and Daniel Webster" (1937), a humorous treatment of a theme from folklore, was the basis for a play, an opera by Douglas Moore, and a motion picture.

Benin, one of the principal historic kingdoms of the western African forest region (fl. 13th–19th century).

Tradition asserts that the Edo people became dissatisfied with the rule of a dynasty of semi-mythical kings, the *ogisos*, and in the 13th century they invited Prince Oranmiyan of Ife to rule them. His son Eweka is regarded as the first oba, or king, of Benin, though authority would remain for many years with a hereditary order of local chiefs. Late in the 13th century, royal power began to assert itself under the oba Ewedo and was firmly established under the most famous oba, Ewuare the Great (reigned c. 1440–80), who was described as a great warrior and magician. He established a hereditary succession to the throne and vastly expanded the territory of the Benin kingdom, which by the mid-16th century extended from the Niger River delta in the east to what is now Lagos in the west. (Lagos was in fact founded by a Benin army and continued to pay tribute to the oba of Benin until the end of the 19th century.) Ewuare also rebuilt the capital (present-day Benin City), endowing it with great walls and moats. The oba became the supreme political, judicial, economic, and spiritual leader of his people, and he and his ancestors eventually became the object of state cults that utilized human sacrifice in their religious observances.

Ewuare was succeeded by a line of strong obas, chief of whom were Ozolua the Conqueror (c. 1481–c. 1504; the son of Ewuare) and Esigie (early to mid-16th century; the son of Ozolua), who enjoyed good relations with the Portuguese and sent ambassadors to their king. Under these obas Benin became a highly organized state. Its numerous craftsmen were organized into guilds, and the kingdom became famous for its ivory and wood carvers. Its brass smiths and bronze casters excelled at making naturalistic heads, bas-reliefs, and other sculptures. From the 15th through the 18th century Benin carried on an active trade in ivory, palm oil, and pepper with Portuguese and Dutch traders, for whom it served as a link with tribes in the interior of western Africa. It also profited greatly from the slave trade. But during the 18th and early 19th centuries the kingdom was weakened by violent succession struggles between members of the royal dynasty, some of which erupted into civil wars. The weaker obas sequestered themselves in their palaces and took refuge in the rituals of divine kingship while indiscriminately granting aristocratic titles to an expanding class of nonproductive nobles. The kingdom's prosperity declined with the suppression of the slave trade, and, as its territorial extent shrank, Benin's leaders increasingly relied on supernatural rituals and large-scale human sacrifices to protect the state from further territorial encroachment. The practice of human sacrifice was stamped out only after the British burned Benin City in 1897, after which the depopulated and debilitated kingdom was incorporated into British Nigeria. The descendants of Benin's ruling dynasty still occupy the throne in Benin City (although the present-day oba has only an advisory role in government).

Benin, officially REPUBLIC OF BENIN, French REPUBLIQUE DU BÉNIN, formerly (until 1975) DAHOMEY, or (1975–90) PEOPLE'S REPUBLIC OF BENIN, country of western Africa, stretching northward and inland for some 420 miles (675 km) from the Bight of Benin between the Niger River to the north and the Atlantic Ocean to the south. The official capital is the

Benin

coastal city of Porto-Novo, but the de facto capital is just to the west at Cotonou. Benin is bordered by Togo to the west, Burkina Faso to the northwest, Niger to the northeast, and Nigeria to the east. The country stretches approximately 200 miles (320 km) from east to west at its widest, but its narrow southern coastline extends for only 75 miles (120 km). Area 43,483 square miles (112,622 square km). Pop. (2003 est.) 7,041,000.

A brief treatment of Benin follows. For full treatment, see MACROPAEDIA: Western Africa.

For current history and for statistics on society and economy, see BRITANNICA BOOK OF THE YEAR.

The land. Benin consists of five natural regions roughly from south to north: a coastal region, the *barre* (clay) country, the Benin plateaus, the Atakora Mountains, and the Niger plains. The coastal region is low-lying, flat, and sandy and is backed by tidal marshes and a network of lagoons. North of it lies the *barre* region, a fertile plateau of lateritic clay that contains a vast marshy depression known as Lama Marsh. The Benin plateaus, occupying south-central Benin, consist of clays on a crystalline base and are 300 to 750 feet (90 to 230 m) in elevation. The Atakora Mountains in the northwest of the country form a continuation of the Togo Mountains to the south and reach an elevation of 2,103 feet (641 m) at their highest peak. The Niger plains in the northeast slope down to the Niger River valley and consist of clayey sandstones. Benin's longest river, the Ouémé, flows southward into the Porto-Novo Lagoon and is navigable for 125 miles (200 km) of its 280 miles (450 km).

The coastal region has an equatorial climate with a steady temperature between 72° and 93° F (22° and 34° C). The south has two rainy seasons, one from March to July and the other from late September to November, separated by two dry seasons. In the north the rainy season lasts from May to September, and the remainder of the year is dry. Average rainfall of 30 to 50 inches (760 to 1,270 mm) per year in the south gradually diminishes toward the north. The southern part of the country has been largely cleared of its original rainforest and now supports the cultivation of oil palms, rônier palms, coconut palms, kapok, mahogany, and ebony trees. North of Abomey the vegetation is a mixture of forest and savanna, giving way farther north to savanna. The country's varied animal life includes elephant, panther, lion, several species of antelope, monkey, wild pig, crocodile, and buffalo. About one-sixth of the land is arable, and little is available as pasture.

The people. The Fon people and related groups constitute about two-fifths of the total population and are predominant in the south. The Yoruba, living in the east, make up about one-eighth of the population. A Voltaic-speaking group, comprising the Somba, Bariba, and other related tribes, accounts for some one-fifth and is found in northern Benin. Nomadic

and seminomadic Fulani inhabit semidesert areas.

While French is the official language, the most widely spoken language is Fon, which tends to be a national language. More than half of the populace are adherents of African traditional religions. Islām has adherents in the north and southeast who, together with Christians, account for most of the remainder of the population.

Nearly half of Benin's population is younger than 15 years of age. The population distribution is uneven, with the southern third of the country containing about two-thirds of the populace. Some areas in the north are inhabited only by Fulani nomads. The urban population comprises more than two-fifths of the country's total. Cotonou, the focus of the commercial and political life of the country, is a modern, European-built city, whereas Porto-Novo, the national capital, was founded by Africans and combines both African and European features.

The annual rate of population growth is more than twice the world average and exceeds that of western Africa as a whole. Government policy is directed toward lowering this rate and toward balancing population distribution.

Economy. Benin has a developing, centrally planned economy based largely on agriculture and transit trade. Modest economic growth was interrupted in the late 1970s by drought and increased world oil prices. Recovery has often been hampered by a serious lack of skilled labour, as well as an extremely costly public sector. The gross national product (GNP) is growing slightly faster than the population, and the GNP per capita remains among the lowest in the world.

Agriculture accounts for roughly one-third of the gross domestic product (GDP) and employs more than half of the workforce. Production of palm oil, once the main agricultural export, was severely curtailed after the droughts of the 1970s and '80s. Production of other important export crops, such as cotton, peanuts (groundnuts), coffee, and cocoa beans, is uneven. Production of the main food crops of cassava, yams, and corn (maize) is growing steadily, and Benin is self-sufficient in staple foods. The country's traditional fishing industry is much diminished from previous levels as a result of the salinization of the coastal lagoons by development projects, but investment in the more modern sectors of the industry, such as deep-sea fishing, is growing. Limestone deposits are exploited for cement. The Sémé offshore oil field, developed in the early 1980s, produced large quantities of crude petroleum for export, but production had ceased by the end of the 1990s.

Manufacturing, utilities, and construction account for about one-seventh of the GDP and employ one-tenth of the workforce. Manufacturing is mainly small-scale, with most major enterprises controlled by the government. The textile complex at Parakou is the country's most important industrial plant; other industry is engaged in processing primary products for export or import substitution of simple consumer goods.

Most of Benin's electricity requirements are imported from Ghana's Volta River Project. In 1988 the Mono River Dam, a joint venture between Benin and Togo on their common southern boundary, began to produce hydroelectricity, but output is sporadic.

Services account for nearly half of the GDP and employ more than one-third of the workforce. Tourism is largely undeveloped.

Government spending has risen sharply since the 1980s, with most of the funds going toward the salaries of public employees. The development budget is largely financed from foreign aid. Imports amount to about twice the value of exports, but the deficit is at least partly made up by unofficial transit trade (par-

ticularly of food) to Nigeria and remittances from Beninians overseas. Major trade partners include India, France, Portugal, Thailand, and Italy.

Government and social conditions. Benin has a multiparty democracy under a constitution approved in December 1990. The constitution established a unicameral legislature known as the National Assembly, with 83 members elected by direct universal suffrage. The president of the country, who is also directly elected, shares the nation's executive authority with the Assembly. Political parties include the People's Revolutionary Party of Benin and the Assembly of Democratic Forces. The judiciary is made up of a supreme court and Jesser courts.

Education has been restructured to stress practical training for employable skills, as well as the traditional subjects. Though education is compulsory for children of age 6 to 11, less than half of primary-school-age children and about one-tenth of secondary-school-age youths attend school, and most are male.

Health conditions are not good, and health care is still at a rudimentary level. Like most of western Africa, Benin has a severe shortage of physicians and other health personnel. Life expectancy averages about 54 years.

Cultural life. Examples of Benin's rich culture—including carved wooden masks, appliqué tapestry, pottery, and bronze statuettes—are sold in marketplaces and exhibited in museums located in Porto-Novo, Abomey, and Parakou. Traditional dance and music are heard in frequent village and neighbourhood ceremonies.

News media are strictly controlled by the ruling party; all radio and television service is owned and operated by the state, as is the major daily newspaper, *Ehuzi*.

History. The history of the peoples of the northern part of Benin has not yet been compiled. The Dahomey, or Fon, of the south established the Abomey kingdom in 1625. Wegbaja (c. 1645–85), the first strong ruler of the kingdom, attacked and defeated Dã (or Dan), the king of a small neighbouring state, whose corpse was thrown into the foundations of the palace that Wegbaja was building; hence the name Dahomey (*Dã-ho-mé*, "On the Belly of Dã"). King Agaja (1708–32), the son of Wegbaja, eventually conquered Allada and Ouidah, where French forts had been established by the French East India Company in the 17th century. The Dahomey kingdom extended its frontiers northward under the reign of King Gezo (1818–58), who conducted many campaigns against the Yoruba in Nigeria to obtain slaves.

In 1857 the French established themselves at Grand-Popo. The ceding of Cotonou to the French in 1878 was repudiated by the king of Dahomey, Behanzin, leading to the Franco-Dahomian Campaigns of 1892–94. Behanzin surrendered in January 1894, and Dahomey became a French protectorate.

In 1904 Dahomey was incorporated into the federation of French West Africa. On the outbreak of World War I, French forces from Dahomey participated in the conquest of German-ruled Togoland (1914). During World War II Dahomey followed French West Africa in adhering to the Allied cause. In 1959 it became an autonomous state of the French Community. Dahomey proclaimed independence in 1960, and a new constitution was adopted the same year. After 11 government changes, including 5 military interventions and 2 new constitutions, Major Mathieu Kérékou took over the government in 1972.

In 1975 Dahomey became the People's Republic of Benin, and in 1980 the National Assembly elected Kérékou president. From 1974 to 1989 the government was dedicated to revolutionary socialism, but, in the wake of the eastern European revolutions of 1989, Benin formally rejected Marxism-Leninism and in

1990 changed the country's name from the People's Republic of Benin to the Republic of Benin. The nation's first free elections were held in 1991, and in 1995 Kérékou was returned to power by popular vote. The nation's weak economy has remained the country's major concern.

Benin, Bight of, also called BIGHT OF BONNY, bay of the Atlantic Ocean on the western African coast that extends eastward for about 400 miles (640 km) from Cape St. Paul (Ghana) to the Nun outlet of the Niger River (Nigeria). It lies within the Gulf of Guinea and is bordered by southeastern Ghana, Togo, Benin, and southwestern Nigeria. The bay receives a portion of the Niger River delta and also the Sio, Haho, Mono, Couffo, Ouémé, Benin, Forcados, and other rivers. Major ports on the bay are Lomé, Togo; Cotonou, Benin; and Lagos, Nigeria.

The bight was the scene of extensive slave trading between the 16th and the 19th centuries, and the region of coastal lagoons west of the Niger delta became known as the Slave Coast. By the 1830s trade in palm oil became the main economic activity, and it has maintained its importance to the present. Petroleum, discovered in the late 1950s in the Niger delta area, is now a major economic asset to Nigeria. Palm kernels, cocoa, coffee, hardwood, and rubber are other major coastal exports. *See also* Slave Coast.

Benin City, also called EDO, capital and largest city of Edo state, southern Nigeria. Benin City is situated on a branch of the Benin River and lies along the main highways from Lagos to the Niger bridge at Asaba and the eastern states. The city is also linked by roads to Sapele, Siluko, Okene, and Ubiaja and is served by air and the Niger River delta ports of Koko and Sapele.

Formerly the principal city of the Edo (Bini) kingdom of Benin, it burned down (and was ransacked for nearly 2,500 of its famous

Mud relief sculpture, oba's (king's) palace, Benin City, Nigeria

Joe B. Blossom—Photo Researchers

bronzes) in 1897 when the British occupied the city after the Edo had massacred a purportedly unarmed British diplomatic mission. Traces of the old wall and moat remain, but the new town is a close-packed pattern of houses and streets converging on the palace and compound of the oba (Edo: "king") and the government offices. In the main square is a statue of Emotan, a woman honoured for offering herself as a sacrifice to restore the prestige of her husband, the oba. The present oba retains an advisory role in government.

Benin City has long been famous for its "bronzes"—actually brass work—some of which is said to date from the 13th century, and for its ivory and wood carvings; its museum (1960) has a notable collection of some of the kingdom's early pieces. The city's present artisans still practice the ancient method of cire perdue ("lost-wax") casting, and its wood-carvers are organized into a craft society.

The centre of Nigeria's rubber production, modern Benin City has several processing plants and a creping factory; the Rubber Re-

search Institute of Nigeria (1961) is at nearby Iyanomo. Benin City has been known for sawmilling since the 1930s, and the products now made in the city include furniture, beer, and soft drinks. The traditional export of palm oil and kernels remains important. The Nigerian Institute for Oil Palm Research (1939) is just outside the city on the old road to Lagos. Benin City is the site of the University of Benin (1970). Pop. (1996 est.) 229,400.

Benivieni, Girolamo (b. 1453, Florence [Italy]—d. 1542, Florence), poet who was an intimate of several great men of Renaissance Florence. He is important for his versification of the philosopher Marsilio Ficino's translation of Plato's *Symposium*, which influenced other writers during the Renaissance and afterward.

As a member of the Florentine Medici circle, Benivieni was well acquainted with the Renaissance humanists Ficino, Giovanni Pico della Mirandola, and Politian (Angelo Poliziano). Ficino translated the *Symposium* about 1474 with his own commentary, which Benivieni summarized in the canzone "De lo amore celeste" ("Of Heavenly Love"), and this in turn became the subject of an extensive commentary by Pico della Mirandola. Thus, through all these sources, Platonism reached many other writers, including the Italians Pietro Bembo and Baldassare Castiglione and the English poet Edmund Spenser. Benivieni eventually fell under the spell of the fiery Renaissance religious reformer Girolamo Savonarola. After his conversion, Benivieni rewrote some of his sensual poetry, translated a treatise of Savonarola's into Italian (*Della semplicità della vita cristiana*; "On the Simplicity of the Christian Life"), and wrote some religious poetry. He was buried in the Church of San Marco, Florence, next to his closest friend, Pico della Mirandola.

Benjamin, according to biblical tradition, one of the 12 tribes that constituted the people of Israel, and one of the two tribes (along with Judah) that later became the Jewish people. The tribe was named after the younger of two children born to Jacob (also called Israel) and his second wife, Rachel.

After the death of Moses, Joshua led the Israelites into the Promised Land and, dividing the territory among the 12 tribes, assigned south-central Palestine to the tribe of Benjamin. Members of the tribe were separated when two distinct kingdoms were established after the death of King Solomon (922 BC) and the territory of Benjamin was divided between them. Jews belonging to the 10 tribes of the northern kingdom of Israel disappeared from history after the Assyrian conquest of 721 BC and are known in legend as the Ten Lost Tribes of Israel. Benjaminites in the southern kingdom of Judah were assimilated by the more powerful tribe of Judah and gradually lost their identity. Modern Jews thus consider themselves to be descendants of the tribes of Judah and Benjamin or are classed as Levites to indicate an affinity with the religious functionaries who at one time exercised the priesthood in ancient Israel. Saul, the first of Israel's kings, and St. Paul the Apostle were both of the tribe of Benjamin.

Benjamin of TUDELA (b. Navarre [France]; fl. 12th century), rabbi who was the first known European traveler to approach the frontiers of China and whose account of his journey, *Massa'ot* (*The Itinerary of Benjamin of Tudela*, 1907), illuminates the situation of Jews in Europe and Asia in the 12th century.

Motivated by commercial interests as well as a desire to learn of the conditions of Jews, he spent about 13 years journeying through Italy, Greece, Palestine, Persia, and the western bor-

ders of China, returning by way of Egypt and Sicily (1159–73). Though the *Itinerary* contains errors and treats places he may not have visited, it remains valuable.

Benjamin, Asher (b. June 15, 1773, Greenfield, Mass. [U.S.]—d. July 26, 1845, Springfield, Mass.), American architect who was an early follower of Charles Bulfinch. His greatest influence on American architecture, lasting until about 1860, was through the publication of several handbooks, from which many other 18th-century architects and builders, including Ammi Young and Ithiel Town, copied plans. These books included the various editions of *American Builder's Companion; The Architect, or Practical House Carpenter; Practice of Architecture*; and *Builder's Guide*. These and other works were reprinted in the second half of the 20th century.

Benjamin was trained as a carpenter. Early in his career, he designed many residences in and near Greenfield, Mass. In 1803 he moved to Boston and came under the influence of Bulfinch. He designed houses throughout the state, including Linden Hall (Springfield, 1811), West Church (Boston, 1806), and Headquarter's House (Boston, 1807–08).

Benjamin, Judah P(hilip) (b. Aug. 6, 1811, St. Croix, Virgin Islands—d. May 6, 1884, Paris, Fr.), prominent lawyer in the United States before the American Civil War (1861–65) and in England after that conflict; he also held high offices in the government of the Confederate States of America. The first professing Jew elected to the U.S. Senate (1852; reelected 1858), he is said to have been the most prominent American Jew during the 19th century.

Born a British subject (St. Croix was then a part of the British Virgin Islands), Benjamin was taken to the United States in his early youth, settling in Charleston, S.C. For two years (1825–27) he studied law at Yale University and then settled in New Orleans, La. He was admitted to the Louisiana bar in 1832, and his practice became extremely successful in the fields of commercial and insurance law. He also prospered for a time as a sugar planter, helped to organize the Illinois Central Railroad, and was elected to the Louisiana legislature in 1842. In the U.S. Senate he was noted for his proslavery speeches. After his state had seceded from the Union, he was appointed attorney general in the Confederate government (Feb. 21, 1861). Later that year

Judah Benjamin

he was named secretary of war by his friend President Jefferson Davis. It was charged that his mismanagement of the war office led to several major military defeats, and he resigned, but Davis promptly named him secretary of state (Feb. 7, 1862). Late in the war he enraged many white Southerners by urging that slaves be recruited into the Confederate Army and emancipated after their term of service.

At the end of the Civil War Benjamin es-

caped to England, where he was called to the bar (June 1866) after only five months' residence and where he achieved his greatest professional success. In 1872 he became a queen's counsel. His *Treatise on the Law of Sale of Personal Property* (1868) was the principal textbook on its subject for many years in England and the United States.

BIBLIOGRAPHY. Eli N. Evans, *Judah P. Benjamin: The Jewish Confederate* (1988), examines Benjamin in the contexts of both Southern Jewish and Civil War history.

Benjamin, Walter (b. July 15, 1892, Berlin, Ger.—d. Sept. 26, 1940, near Port-Bou, Fr.), man of letters and aesthete, now considered to have been the most important German literary critic in the first half of the 20th century.

Born into a prosperous Jewish family, Benjamin studied philosophy in Berlin, Freiburg im Breisgau, Munich, and Bern. He settled in Berlin in 1920 and worked thereafter as a literary critic and translator. His halfhearted pursuit of an academic career was cut short when the University of Frankfurt rejected his brilliant but unconventional doctoral thesis, *Ursprung des deutschen Trauerspiels* (1928; *The Origin of German Tragic Drama*). Benjamin eventually settled in Paris after leaving Germany in 1933 upon the Nazis' rise to power. He continued to write essays and reviews for literary journals, but upon the fall of France to the Germans in 1940 he fled southward with the hope of escaping to the United States via Spain. Informed by the chief of police at the town of Port-Bou on the Franco-Spanish border that he would be turned over to the Gestapo, Benjamin committed suicide.

The posthumous publication of Benjamin's prolific output won him a growing reputation in the later 20th century. The essays containing his philosophical reflections on literature are written in a dense and concentrated style that contains a strong poetic strain. He mixes social criticism and linguistic analysis with historical nostalgia while communicating an underlying sense of pathos and pessimism. The metaphysical quality of his early critical thought gave way to a Marxist inclination in the 1930s. Benjamin's pronounced intellectual independence and originality are evident in the extended essay *Goethes Wahlverwandtschaften* (1924–25; "Goethe's Elective Affinities") and the essays collected in *Illuminationen* (1961; *Illuminations*).

Benkei (d. 1189, Japan), warrior-monk whose legendary superhuman exploits in the service of his master, the famous warrior Minamoto Yoshitsune, made him one of the most popular figures in Japanese history and a favourite in many traditional stories and plays and even in motion pictures.

Although his name appears twice in documents from the period, thus affirming his actual existence, Benkei is better known as a legendary figure. He is said to have met his master while attempting to collect 1,000 swords from passersby whom he nightly challenged to duels on the Gojō Bridge in the capital city of Kyōto. Having collected 999 swords, he was foiled in his attempt for the 1,000th by Yoshitsune, whose follower he then became.

After ingeniously aiding his master in many battles, Benkei is said to have died defending Yoshitsune, who was surrounded and forced to commit suicide at the Battle of Koromogawa. According to legend, Benkei's body, which was pierced with arrows, remained erect, even after death.

Benlowes, Edward (b. July 12, 1602, Fincham, Essex, Eng.—d. Dec. 18, 1676, Oxford, Oxfordshire), English poet of the metaphysical school and a patron of the arts.

Though his family was Roman Catholic, Benlowes early became a vehement Protestant. He

Benlowes, engraving

By courtesy of the trustees of the British Museum, photograph, J.R. Freeman & Co. Ltd

used the wealth from his large inherited estates to support his various artistic endeavours; he commissioned engravings to illustrate his own and his friends' poems, and he owned his own printing press. During the 1640s he composed *Theophila, or Loves Sacrifice* (printed 1652), a long poem describing, in some fine rhapsodic passages but with extravagant conceits, the progress of the soul toward mystic communion with God. Financially crippled by the English Civil Wars and litigation, he spent his declining years at Oxford, reading in the Bodleian Library and occasionally writing poetry.

Benn, Sir Ernest John Pickstone, 2ND BARONET (b. June 25, 1875, Hackney, Middlesex, Eng.—d. Jan. 17, 1954, Oxted, Surrey), British publisher whose Sixpenny Library and Sixpenny Poets were among the first popular series of paperback educational books.

Benn was the eldest son of Sir John Williams Benn, who was a trade-journal publisher and a Liberal member of Parliament. While his father pursued political interests, the son assumed management of the family publishing business before he was 21. He enlarged it to include hardcover and paperback books, as

Sir Ernest Benn

Popperfoto

well as additional periodicals. The firm (Ernest Benn Ltd.) became publisher of the well-known series of travel books (*Blue Guides*) edited by L. Russell Muirhead.

During World War I he served in the ministries of munitions and reconstruction. He succeeded to his father's baronetcy in 1922. His strong individualist views are expressed in some of his works: *The Confessions of a Capitalist* (1925), "Governed to Death" (pamphlet, 1948), and *The State the Enemy* (1953).

Benn, Gottfried (b. May 2, 1886, Mansfeld, Ger.—d. July 7, 1956, Berlin), German poet and essayist whose expressionistic pessimism and conjurations of decay in the period immediately after World War I gradually mellowed into a philosophy of pragmatism. Perhaps the most influential writer in post-Hitlerian Germany, Benn is often considered that nation's counterpart of T.S. Eliot, who wrote about him.

The son of a Lutheran clergyman, Benn studied theology at the University of Mar-

burg, then transferred to the academy there for military-medical instruction and became a specialist in venereal and skin diseases. He took medical jobs on cruise ships, got to know the Mediterranean (a frequent setting in his poems), and as a German officer in World War I was made medical supervisor of jail inmates and prostitutes in occupied Brussels.

Degeneracy and decay are important allusions in his early poems, which also were shadowed by the death of his first wife (1914) and the suicide of an actress friend. His first and third collections of verse were fittingly titled *Morgue* (1912) and *Fleisch* (1917; "Flesh").

Because of his expressionism and despite his right-wing political views, the Nazi regime penalized him both as a writer and as a physician; in 1937, he was forbidden to publish. To escape harassment, he rejoined the army.

Benn regained literary attention with *Statische Gedichte* (1948; "Static Poems") and the simultaneous reappearance of his old poems. He remained a practicing physician until he was 68. His gradual loss of cynicism is richly reflected in the autobiography *Doppelleben* (1950; "Double Life"). A broad selection of his poetry and prose in English translation was published under the title *Primal Vision* (1961). Later translations of his work include *Prose, Essays, Poems* (1987), *Poems, 1937-1947* (1991), and *The Voice Behind the Screen* (1996).

BIBLIOGRAPHY. J.M. Ritchie, *Gottfried Benn: The Unreconstructed Expressionist* (1972); Reinhard Alter, *Gottfried Benn: The Artist and Politics (1910-1934)*; Augustinus P. Dierick, *Gottfried Benn and His Critics. Major Interpretations, 1912-1992* (1992).

Benn, Tony, original name ANTHONY NEIL WEDGWOOD BENN, also called (1960-63) 2ND VISCOUNT STANSGATE OF STANSGATE (b. April 3, 1925, London, Eng.), British politician, member of the Labour Party, and unofficial leader of the party's radical populist left.

Though a fierce critic of the British class system, Benn came from a moneyed and privileged family himself. Both of his grandfathers had been members of Parliament, and his father, William Wedgwood Benn (1877-1960), had been a Liberal and then a Labour MP who in 1942 entered the House of Lords as 1st Viscount Stansgate. The younger Benn joined the Labour Party in 1943, attended New College, Oxford (M.A., 1949), and was first elected to Parliament in 1950. Anticipating that inheritance of his father's title would immediately disqualify him from continuing to serve in the House of Commons, he introduced a personal bill to permit him to renounce the title. The bill was defeated; but, after his father's death in 1960, he continued the struggle, and in 1963 the Peerage Act enabled peers to renounce their titles for their lifetimes. Benn not only renounced his viscountcy (July 31, 1963) but later shed the names with which he had been christened, Anthony Neil Wedgwood, to become simply Tony Benn.

When Labour formed a government under Harold Wilson in 1964, Benn became postmaster general in 1964 and was minister of technology from 1966 to 1970. When Labour was in power again (1974-79) under first Wilson and then James Callaghan, Benn was secretary of state for industry and minister for posts and telecommunications (1974-75) and secretary of state for energy (1975-79).

In 1981, after he led a successful fight for Labour's left wing to wrest control of leadership selection from members of Parliament (which prompted the party's right-wing MPs to form the new Social Democratic Party), Benn challenged Denis Healey for deputy leader of the party; he was narrowly defeated. Benn lost his parliamentary seat in the elections of 1983 but returned to Commons in a by-election in 1984.

During the 1970s and '80s he became the

most influential of left-wing thinkers in the Labour Party and was often at odds with the more moderate members of the party. He set out his ideas in a book called *Arguments for Socialism*, published in 1979. Benn also argued for Britain's withdrawal from Northern Ireland, from the North Atlantic Treaty Organization, and from the European Union. He was a lively critic of "New Labour" until his retirement in 2001.

benne: see sesame.

Bennet, Henry: see Arlington, Henry Bennet, 1st earl of.

Bennet, John (b. c. 1575; fl. 1599-1614), English composer known chiefly for his madrigals, which ranged from light and festive in character to serious and even solemn.

Little is known about Bennet's life, but the dedication in his 1599 book of madrigals suggests that he came from northwest England. In his madrigals, Bennet was known to have occasionally borrowed madrigal texts from existing collections and reset them to original tunes; however, he did not borrow tunes. One of Bennet's sources of such texts was Thomas Morley, to whose *Triumphs of Oriana* Bennet contributed the well-known madrigal "All creatures now are merry-minded." In addition to two volumes of madrigals, he composed a serious piece, for viol accompaniment, to celebrate Queen Elizabeth I and a verse anthem "for the King's inauguration," *O God of Gods*.

Bennett, Arnold, in full ENOCH ARNOLD BENNETT (b. May 27, 1867, Hanley, Staffordshire, Eng.—d. March 27, 1931, London), British novelist, playwright, critic, and essayist whose major works form an important link between the English novel and the mainstream of European realism.

Bennett's father was a self-made man who had managed to qualify as a solicitor: the family atmosphere was one of sturdily respectability and self-improvement. Arnold, the eldest of nine children, was educated at the Middle School, Newcastle-under-Lyme; he then entered his father's office as a clerk. In 1889 he moved to London, still as a solicitor's clerk, but soon gained a footing in literature by writing popular serial fiction and editing a women's magazine. After the publication of his first novel, *A Man from the North* (1898), he became a professional writer, living first in the Bedfordshire countryside, then, moving to Paris in 1903. In 1907 he married a French actress, Marguerite Soulié; they separated in 1921.

Bennett is best known for his highly detailed novels of the "Five Towns"—the Potteries, since amalgamated to form the city of Stoke-on-Trent, in his native Staffordshire. As a young writer he learned his craft from intensive study of the French realistic novelists, especially Gustave Flaubert and Honoré de Balzac, who emphasized detailed description of people, scenes, and events. He also owes an

Arnold Bennett, drawing by Walter Ernest Tittle, 1923; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

immediate debt to George Moore. Bennett's criticism was of such high calibre that, if he had never written fiction, he would rank as an important writer. He was less successful in his plays.

As early as 1893 he had used the "Five Towns" as background for a story, and his major novels—*Anna of the Five Towns* (1902), *The Old Wives' Tale* (1908), and *Clayhanger* (1910; included with its successors, *Hilda Lessways*, 1911, and *These Twain*, 1916, in *The Clayhanger Family*, 1925)—have their setting there, the only exception being *Riceman Steps* (1923), set in London.

During Bennett's eight years in Paris he made full use of his opportunities to study music, art, and literature as well as life. He retained an understanding of provincial life, but he shed the provincial outlook, becoming one of the least insular of Englishmen. At a time when the popular culture and the arcane complacencies of the elite were equally inbred, Bennett was a cosmopolitan. Later, reviewing a constant stream of new books, he unerringly picked out many of the important writers of the next generation—James Joyce, D.H. Lawrence, William Faulkner, Ernest Hemingway—and praised them discerningly. When Bennett returned to England, he divided his time between London and a country home in Essex.

Bennett wrote 30 novels, and even many of the lesser ones display the essential Bennettian values, ironic yet kindly, critical yet with a large tolerance. *The Journals of Arnold Bennett, 1896-1928* were published in three volumes (1932-33).

BIBLIOGRAPHY. Biographies include Frank Swinerton, *Arnold Bennett* (1961) and *Arnold Bennett: A Last Word* (1978); Margaret Drabble, *Arnold Bennett* (1974); and Walter Allen, *Arnold Bennett* (1949, reissued 1973). Also useful is Anita Miller, *Arnold Bennett: An Annotated Bibliography, 1887-1932* (1977).

Bennett, Floyd (b. Oct. 25, 1890, Warrensburg, N.Y., U.S.—d. April 25, 1928, Quebec, Can.), American pioneer aviator who piloted the explorer Richard E. Byrd on the first successful flight over the North Pole on May 9, 1926. For this feat both Bennett and Byrd received the U.S. Congressional Medal of Honor. Floyd Bennett Airport in Brooklyn, N.Y., was named for him in 1931.

Bennett attended a mechanics school in his early years, and subsequently managed garages in New York state. Enlisting in the U.S. Navy in 1917, he underwent pilot and mechanic training. After his historic polar flight in 1926, Bennett made an 8,000-mile (12,000-kilometre) flight around the United States to prove that long-distance airline operations were feasible.

Bennett, James Gordon (b. Sept. 1, 1795, Newmill, Banffshire, Scot.—d. June 1, 1872, New York, N.Y., U.S.), Scottish-born American editor who shaped many of the methods of modern journalism.

Bennett immigrated to America in the spring of 1819 and eventually settled in New York City, where he founded a school, gave lectures on political economy, and did subordinate work for the journals. During the next 10 years he was employed on various papers. He was the Washington, D.C., correspondent of the *New York Enquirer* and associate editor of the *Morning Courier and New York Enquirer*, his articles attracting much attention. He founded the short-lived *Globe* in New York City in 1832, and in 1833-34 he was the chief editor and one of the proprietors of *The Pennsylvania* at Philadelphia.

With a capital of \$500 he published on May 6, 1835, the first number of a four-page penny

ders of China, returning by way of Egypt and Sicily (1159–73). Though the *Itinerary* contains errors and treats places he may not have visited, it remains valuable.

Benjamin, Asher (b. June 15, 1773, Greenfield, Mass. [U.S.]—d. July 26, 1845, Springfield, Mass.), American architect who was an early follower of Charles Bulfinch. His greatest influence on American architecture, lasting until about 1860, was through the publication of several handbooks, from which many other 18th-century architects and builders, including Ammi Young and Ithiel Town, copied plans. These books included the various editions of *American Builder's Companion*; *The Architect, or Practical House Carpenter*; *Practice of Architecture*; and *Builder's Guide*. These and other works were reprinted in the second half of the 20th century.

Benjamin was trained as a carpenter. Early in his career, he designed many residences in and near Greenfield, Mass. In 1803 he moved to Boston and came under the influence of Bulfinch. He designed houses throughout the state, including Linden Hall (Springfield, 1811), West Church (Boston, 1806), and Headquarter's House (Boston, 1807–08).

Benjamin, Judah P(hilip) (b. Aug. 6, 1811, St. Croix, Virgin Islands—d. May 6, 1884, Paris, Fr.), prominent lawyer in the United States before the American Civil War (1861–65) and in England after that conflict; he also held high offices in the government of the Confederate States of America. The first professing Jew elected to the U.S. Senate (1852; reelected 1858), he is said to have been the most prominent American Jew during the 19th century.

Born a British subject (St. Croix was then a part of the British Virgin Islands), Benjamin was taken to the United States in his early youth, settling in Charleston, S.C. For two years (1825–27) he studied law at Yale University and then settled in New Orleans, La. He was admitted to the Louisiana bar in 1832, and his practice became extremely successful in the fields of commercial and insurance law. He also prospered for a time as a sugar planter, helped to organize the Illinois Central Railroad, and was elected to the Louisiana legislature in 1842. In the U.S. Senate he was noted for his proslavery speeches. After his state had seceded from the Union, he was appointed attorney general in the Confederate government (Feb. 21, 1861). Later that year

he was named secretary of war by his friend President Jefferson Davis. It was charged that his mismanagement of the war office led to several major military defeats, and he resigned, but Davis promptly named him secretary of state (Feb. 7, 1862). Late in the war he enraged many white Southerners by urging that slaves be recruited into the Confederate Army and emancipated after their term of service.

At the end of the Civil War Benjamin es-

caped to England, where he was called to the bar (June 1866) after only five months' residence and where he achieved his greatest professional success. In 1872 he became a queen's counsel. His *Treatise on the Law of Sale of Personal Property* (1868) was the principal textbook on its subject for many years in England and the United States.

BIBLIOGRAPHY. Eli N. Evans, *Judah P. Benjamin: The Jewish Confederate* (1988), examines Benjamin in the contexts of both Southern Jewish and Civil War history.

Benjamin, Walter (b. July 15, 1892, Berlin, Ger.—d. Sept. 26, 1940, near Port-Bou, Fr.), man of letters and aesthete, now considered to have been the most important German literary critic in the first half of the 20th century.

Born into a prosperous Jewish family, Benjamin studied philosophy in Berlin, Freiburg im Breisgau, Munich, and Bern. He settled in Berlin in 1920 and worked thereafter as a literary critic and translator. His halfhearted pursuit of an academic career was cut short when the University of Frankfurt rejected his brilliant but unconventional doctoral thesis, *Ursprung des deutschen Trauerspiels* (1928; *The Origin of German Tragic Drama*). Benjamin eventually settled in Paris after leaving Germany in 1933 upon the Nazis' rise to power. He continued to write essays and reviews for literary journals, but upon the fall of France to the Germans in 1940 he fled southward with the hope of escaping to the United States via Spain. Informed by the chief of police at the town of Port-Bou on the Franco-Spanish border that he would be turned over to the Gestapo, Benjamin committed suicide.

The posthumous publication of Benjamin's prolific output won him a growing reputation in the later 20th century. The essays containing his philosophical reflections on literature are written in a dense and concentrated style that contains a strong poetic strain. He mixes social criticism and linguistic analysis with historical nostalgia while communicating an underlying sense of pathos and pessimism. The metaphysical quality of his early critical thought gave way to a Marxist inclination in the 1930s. Benjamin's pronounced intellectual independence and originality are evident in the extended essay *Goethes Wahlverwandschaften* (1924–25; "Goethe's Elective Affinities") and the essays collected in *Illuminationen* (1961; *Illuminations*).

Benkei (d. 1189, Japan), warrior-monk whose legendary superhuman exploits in the service of his master, the famous warrior Minamoto Yoshitsune, made him one of the most popular figures in Japanese history and a favourite in many traditional stories and plays and even in motion pictures.

Bennet, Henry: see Arlington, Henry Bennet, 1st earl of.

Bennet, John (b. c. 1575; fl. 1599-1614), English composer known chiefly for his madrigals, which ranged from light and festive in character to serious and even solemn.

Little is known about Bennet's life, but the dedication in his 1599 book of madrigals suggests that he came from northwest England. In his madrigals, Bennet was known to have occasionally borrowed madrigal texts from existing collections and reset them to original tunes; however, he did not borrow tunes. One of Bennet's sources of such texts was Thomas Morley, to whose *Triumphs of Oriana* Bennet contributed the well-known madrigal "All creatures now are merry-minded." In addition to two volumes of madrigals, he composed a serious piece, for viol accompaniment, to celebrate Queen Elizabeth I and a verse anthem "for the King's inauguration," *O God of Gods*.

Bennett, Arnold, in full ENOCH ARNOLD BENNETT (b. May 27, 1867, Hanley, Staffordshire, Eng.—d. March 27, 1931, London), British novelist, playwright, critic, and essayist whose major works form an important link between the English novel and the mainstream of European realism.

Bennett's father was a self-made man who had managed to qualify as a solicitor: the family atmosphere was one of sturdy respectability and self-improvement. Arnold, the eldest of nine children, was educated at the Middle School, Newcastle-under-Lyme; he then entered his father's office as a clerk. In 1889 he moved to London, still as a solicitor's clerk, but soon gained a footing in literature by writing popular serial fiction and editing a women's magazine. After the publication of his first novel, *A Man from the North* (1898), he became a professional writer, living first in the Bedfordshire countryside, then, moving to Paris in 1903. In 1907 he married a French actress, Marguerite Soulié; they separated in 1921.

Bennett is best known for his highly detailed novels of the "Five Towns"—the Potteries, since amalgamated to form the city of Stoke-on-Trent, in his native Staffordshire. As a young writer he learned his craft from intensive study of the French realistic novelists, especially Gustave Flaubert and Honoré de Balzac, who emphasized detailed description of people, scenes, and events. He also owes an

Arnold Bennett, drawing by Walter Ernest Tittle, 1923; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

immediate debt to George Moore. Bennett's criticism was of such high calibre that, if he had never written fiction, he would rank as an important writer. He was less successful in his plays.

As early as 1893 he had used the "Five Towns" as background for a story, and his major novels—*Anna of the Five Towns* (1902), *The Old Wives Tale* (1908), and *Clayhanger* (1910; included with its successors, *Hilda Lessways*, 1911, and *These Twain*, 1916, in *The Clayhanger Family*; 1925)—have their setting there, the only exception being *Riceyman Steps* (1923), set in London.

During Bennett's eight years in Paris he made full use of his opportunities to study music, art, and literature as well as life. He retained an understanding of provincial life, but he shed the provincial outlook, becoming one of the least insular of Englishmen. At a time when the popular culture and the arcane complacencies of the elite were equally inbred, Bennett was a cosmopolitan. Later, reviewing a constant stream of new books, he unerringly picked out many of the important writers of the next generation—James Joyce, D.H. Lawrence, William Faulkner, Ernest Hemingway—and praised them discerningly. When Bennett returned to England, he divided his time between London and a country home in Essex.

Bennett wrote 30 novels, and even many of the lesser ones display the essential Bennettian values, ironic yet kindly, critical yet with a large tolerance. *The Journals of Arnold Bennett, 1896-1928* were published in three volumes (1932-33).

BIBLIOGRAPHY. Biographies include Frank Swinerton, *Arnold Bennett* (1961) and *Arnold Bennett: A Last Word* (1978); Margaret Drabble, *Arnold Bennett* (1974); and Walter Allen, *Arnold Bennett* (1949, reissued 1973). Also useful is Anita Miller, *Arnold Bennett: An Annotated Bibliography, 1887-1932* (1977).

Bennett, Floyd (b. Oct. 25, 1890, Warrensburg, N.Y., U.S.—d. April 25, 1928, Quebec, Can.), American pioneer aviator who piloted the explorer Richard E. Byrd on the first successful flight over the North Pole on May 9, 1926. For this feat both Bennett and Byrd received the U.S. Congressional Medal of Honor. Floyd Bennett Airport in Brooklyn, N.Y., was named for him in 1931.

Bennett attended a mechanics school in his early years, and subsequently managed garages in New York state. Enlisting in the U.S. Navy in 1917, he underwent pilot and mechanic training. After his historic polar flight in 1926, Bennett made an 8,000-mile (12,000-kilometre) flight around the United States to prove that long-distance airline operations were feasible.

Bennett, James Gordon (b. Sept. 1, 1795, Newmill, Banffshire, Scot.—d. June 1, 1872, New York, N.Y., U.S.), Scottish-born American editor who shaped many of the methods of modern journalism.

Bennett immigrated to America in the spring of 1819 and eventually settled in New York City, where he founded a school, gave lectures on political economy, and did subordinate work for the journals. During the next 10 years he was employed on various papers. He was the Washington, D.C., correspondent of the *New York Enquirer* and associate editor of the *Morning Courier and New York Enquirer*, his articles attracting much attention. He founded the short-lived *Globe* in New York City in 1832, and in 1833-34 he was the chief editor and one of the proprietors of *The Pennsylvaniaian* at Philadelphia.

With a capital of \$500 he published on May 6, 1835, the first number of a four-page penny

paper bearing the title of *The New York Herald* and issuing from a cellar. By his industry and sagacity he made the paper a commercial success. He devoted attention to the gathering of news and was the first to introduce many of the methods of modern reporting. He published on June 13, 1835, the first Wall Street financial article to appear in any American paper; printed a vivid and detailed account of the great fire of Dec. 1835 in New York; was the first, in 1838, to establish correspondents in Europe; was the first, in 1846, to obtain the report in full by telegraph of a long political speech; maintained during the Civil War a staff of 63 war correspondents; was a leader in the use of illustrations; introduced a society department; and, with the Helen Jewett case

James Bennett, engraving from the *Democratic Review*, c. 1852, after a daguerreotype by M. Brady

(1836), was the first in American journalism to publish an account of a love-nest murder.

Bennett, Michael, original name MICHAEL BENNETT DIFIGLIA (b. April 8, 1943, Buffalo, N.Y., U.S.—d. July 2, 1987, Tucson, Ariz.), American dancer, choreographer, and stage musical director.

Bennett studied many styles of dance and began his career as a dancer in productions of *West Side Story* and *Subways Are for Sleeping*. His major contribution to the dance scene was as a choreographer-director of Broadway musicals, notably in *Promises, Promises* (1968), *Coco* (1969), *Company* (1970), *Follies* (1971), *A Chorus Line* (1975), and *Dreamgirls* (1981). His beginnings as a dancer were most strongly reflected in *A Chorus Line*, a musical that was conceived, directed, choreographed, and coproduced by Bennett; it won nine Tony awards and the 1976 Pulitzer Prize for drama and became the longest-running musical in the history of the Broadway theatre. Bennett received eight Tony awards and several New York Drama Critic awards during his career.

Bennett (of Mickleham and of Calgary and Hopewell), Richard Bedford Bennett, Viscount (b. July 3, 1870, Hopewell, N.B., Can.—d. June 27, 1947, Mickleham, Surrey, Eng.), statesman and prime minister

Viscount Bennett

National Film Board of Canada Phototheque

of Canada (1930–35) during the Great Depression.

Bennett was admitted to the bar in 1893 and practiced in his native province of New Brunswick. In 1897 he moved westward and entered politics, serving in the legislative assemblies of the Northwest Territories and Alberta. In 1911 he entered the Canadian House of Commons, representing Calgary, Alta., and later became director general of national service (1916) and minister of justice (1921).

Bennett became the leader of the Conservative Party in 1927 and prime minister after the 1930 election, having promised the voters to vigorously combat the effects of the Great Depression. But Bennett underestimated the severity and longevity of the Depression, and his measures to combat widespread unemployment amounted merely to slightly strengthened tariffs and some measures for unemployment relief. After the Canadian economy had languished for four years, he proposed a bold program in January 1935 that in some respects resembled the New Deal put forth in the United States by President Franklin D. Roosevelt. But Bennett's reform measures aroused distrust in his own party and failed either to revive the public's enthusiasm or to counter its resentment over his previous laissez-faire policies, and in the October 1935 election he was overwhelmingly defeated by W.L. Mackenzie King and the Liberals. He remained as leader of the opposition until 1938, and in 1939 he retired to England, where he was made a viscount in 1941 (the peerage became extinct when he died, unmarried).

Bennett, Tony, original name ANTHONY DOMINICK BENEDETTO (b. Aug. 3, 1926, Astoria, Queens, N.Y., U.S.), American popular singer known for his dusky voice and interpretive abilities with songs in a variety of genres.

Bennett studied music and painting as a youth and embarked on a singing career in 1949. His first hit was "Boulevard of Broken Dreams" in 1951; it was soon followed by "Because of You," "Stranger in Paradise," "Just in Time," and "Rags to Riches." He worked with several noted jazz artists throughout the 1950s.

Bennett's 1962 recording of "I Left My Heart in San Francisco" became his biggest-selling recording and the song with which he remains most associated. Other '60s hits included "I Wanna Be Around" and "The Good Life." His popularity declined during the 1970s and '80s, but he had a remarkable comeback in the '90s, which proved to be the most commercially successful and critically praised period of Bennett's career. His many albums of these years—especially those he recorded in tribute to such artists as Frank Sinatra, Fred Astaire, Billie Holiday, and Duke Ellington—sold in the millions and received several Grammy awards and nominations.

Bennett's immediately recognizable voice is well-suited to ballads, uptempo numbers, and contemporary pop. He has also garnered praise for his work as a painter.

Bennett, Sir William Sterndale (b. April 13, 1816, Sheffield, Yorkshire, Eng.—d. Feb. 1, 1875, London), British pianist, conductor, and composer, a notable figure in the musical life of his time.

He became a chorister at King's College, Cambridge, and in 1826 entered the Royal Academy of Music. In 1833 his first piano concerto greatly impressed Felix Mendelssohn, who became a close friend. In 1842 he was appointed one of the directors of the Philharmonic Society in London, and in 1849 he founded the London Bach Society, at which, in 1854, he conducted the first performance in England of Bach's *St. Matthew Passion*. Bennett was appointed conductor of the Philharmonic Society in 1856 and in the same year became professor of music at Cambridge. In 1866 he became principal of the Royal Academy of Music. He was knighted in 1871.

William Bennett, engraving by E. Stodart after a photograph

By courtesy of the trustees of the British Museum, photograph, J.R. Freeman & Co. Ltd

Bennett's work, consisting chiefly of concerti and solo pieces for the piano, enjoyed a wide popularity in England and Germany. His cantata *The May Queen* and the quartet "God Is a Spirit," from the oratorio *The Woman of Samaria* (1867), are still sung by village and church choirs.

Bennettiales (plant fossil): see Cycadeoidales.

Bennigsen, Leonty Leontyevich, Graf von (Count of), original name LEVIN AUGUST GOTTLIEB (THEOPHIL) VON BENNIGSEN (b. Feb. 10, 1745, Brunswick, Duchy of Brunswick [Germany]—d. Oct. 3, 1826, Banteln, near Hildesheim, Hanover), general who played a prominent role in the Russian Army during the Napoleonic Wars.

Having gained military experience while serving in the Hanoverian army (until 1764), Bennigsen joined the Russian Army in 1773 as a field officer and fought against the Turks in 1774 and 1778. He became a colonel in 1787 and participated in the Russian suppression of a Polish uprising (1793), as well as in the brief Russian invasion of Persia in 1796.

Opposed to the policies of the emperor Paul I (reigned 1796–1801), Bennigsen was active in the conspiracy that led to Paul's assassination (March 23 [March 11, Old Style], 1801). He subsequently was appointed governor-general of Lithuania (1801) and general of the cavalry (1802) by the new emperor Alexander I (reigned 1801–25). After Russia joined the third coalition against Napoleon (1805), Bennigsen was placed in command of an army that successfully defended Pultusk (near Warsaw) from a French attack (Dec. 26, 1806), and he inflicted severe losses upon Napoleon before retreating from the battlefield at Eylau (Feb. 8, 1807). On June 14, 1807, however, he was decisively defeated at the Battle of Friedland; Russia made peace with France (Treaty of Tilsit; July 1807), and Bennigsen retired.

When the war with France resumed (1812) he again played a leading role, commanding the Russian centre at the Battle of Borodino (Sept. 7, 1812) and defeating the French marshal Joachim Murat at Tarutino (Oct. 18, 1812). A dispute with the supreme Russian commander, General Mikhail Kutuzov, forced him into retirement again; but after Kutuzov died (1813) and Russia pursued the French into Prussia and the Duchy of Warsaw, Bennigsen was recalled to duty. On the final day of the Battle of Leipzig (Oct. 16–19, 1813) he led one of the columns that made the decisive attack, and that evening he was made a count. Afterward he fought the forces of the French marshal Louis Davout in northern Germany. In 1818 Bennigsen retired for the last time, settling on his Hanoverian estate.

Bennigsen, (Karl Wilhelm) Rudolf von (b. July 10, 1824, Lüneburg, Hanover [Germany]—d. Aug. 7, 1902, Bennigsen, Hanover), Hanoverian politician who combined liberalism with support for Prussian hegemony in a united Germany.

Rudolf von Bennigsen, detail from an oil painting by Franz von Lenbach, 1896, in the Landesmuseum, Hanover
By courtesy of the Niedersächsisches Landesmuseum, Hanover

After studying law at the University of Göttingen, Bennigsen, the son of a Hanoverian major general, entered the civil service of Hanover but had to resign in 1856 in order to accept his election to the lower chamber of that kingdom. A vigorous defender of freedom of religion, he became leader of the liberal opposition and, in 1859, president of the Nationalverein (German National Union), which he founded with Johannes von Miquel. The organization's aims were a united Germany led by Prussia, an all-German parliament, and the exclusion of Austria's non-Germans. After the Nationalverein was dissolved (1867), he was instrumental in founding the National Liberal Party, which was the dominant group in the Reichstag for most of the 1870s.

Bennigsen had unsuccessfully attempted to prevent Hanover from entering the Seven Weeks' War (1866) on the side of Austria and, after the defeat of the Austrian alliance, wanted his sovereign's territories to remain a separate state. Upon the transformation of Hanover into a province of Prussia, however, he entered the Prussian chamber of deputies and the diet of the North German Confederation, turning down Chancellor Otto von Bismarck's offer to head the provisional government of the new province. From 1871 to 1879, with the exception of a four-year retirement (1883–87), he was a member of the all-German Reichstag and served as its president from 1873 to 1879. In 1877 Bismarck's attempt to bring him into the cabinet collapsed because of Emperor William I's opposition and Bennigsen's insistence on the appointment of two other party colleagues to ministerial posts. Relations with the German chancellor cooled when the National Liberals rejected Bismarck's protectionist policies in 1879, an action that also destroyed the power of the party. The same year a right-wing protectionist group split away, the next year a radical group.

In 1888 Emperor William II appointed Bennigsen president of the province of Hanover. Bennigsen retired from public life in 1897.

Bennington, town (township), one of the seats of Bennington county (the other is Man-

Old First (Congregational) Church, Bennington, Vt.
W.D. Murphy—Shostal/EB Inc.

chester), in the southwest corner of Vermont, U.S., on the Walloomsac River, between the Taconic and Green ranges. It includes the villages of Old Bennington, Bennington, and North Bennington. The site, chartered as a town in 1749, was settled in 1761 and named for Benning Wentworth, governor of New Hampshire, who issued the grant. The settlers were led by Samuel Robinson, who camped in the river valley on his return from the French and Indian War and established the First Congregational Church. Within the year the group had organized a town-meeting government that has survived to this day with only slight modifications. These pioneers, among them Ethan Allen's "Green Mountain Boys," successfully resisted the claims to Bennington lands by absentee landlords of New York, and the independence of Vermonters was soon established.

During the 19th century, the town grew into a textile, pottery, wood-products, and paper centre. Its present economy is based on manufacturing (furniture, textiles, batteries, lithography, and transistors), agriculture (dairy products, apples, maple sugar, and poultry), and tourism. Nearby ski areas attract many visitors.

Extant colonial buildings include the Walloomsac Inn (in continuous service since c. 1763), and the houses of Parson Jedediah Dewey, Gov. Isaac Tichenor, and Gen. David Robinson. The Old First Church (1806) was restored in 1937 as a state monument; the grave of Robert Frost, the poet, is in Old Burying Ground. The Bennington Museum, founded in 1876, has a historical collection centred on regional materials, particularly those associated with the Battle of Bennington in 1777; it includes genealogical records, the oldest stars and stripes flag in existence, an art collection containing stoneware and porcelain objects from local potteries, and paintings, including a number of works by Grandma Moses. The city is the seat of Southern Vermont College (1926) and Bennington College (1932). Pop. (1990) 16,451.

Bennington, Battle of (Aug. 16, 1777), in U.S. War of Independence, victory by American militiamen defending colonial military stores in Bennington, Vt., against a British raiding party.

In early August the British commander, Gen. John Burgoyne, hoped to capture needed supplies and overawe New Englanders by dispatching a well-equipped regiment to Bennington under the German colonel Friedrich Baum. On the 16th, Baum's force of 800 British, Germans, Loyalists, and Indians was decisively defeated by about 1,600 colonial troops gathered from neighbouring militia by Ethan Allen and Seth Warner and led by Gen. John Stark. Reinforcements on both sides arrived too late to influence the outcome, and about 700 of the British forces were taken prisoner. The outcome of this engagement went far in enhancing American morale.

The battle, which took place at the site of the present village of Walloomsac, N.Y. (several miles west of Bennington), contributed to the eventual defeat of Burgoyne (see Saratoga, Battles of). It is commemorated by a historical park near Walloomsac and by a 306-ft (93-m) obelisk at the village of Old Bennington.

Benno, SAINT (b. c. 1010, Hildesheim?, Saxony—d. probably June 16, c. 1106, Meissen, March of Thuringia; canonized 1523; feast day June 16), bishop of Meissen.

While a canon with the imperial collegiate church of Goslar, he was made bishop of Meissen in 1066. In the troubles between empire and papacy that followed, Benno took part against the emperor Henry IV, for which he was imprisoned. In 1085 he was deposed by the Synod of Mainz, but after the death of Pope Gregory VII, whose cause Benno championed, he submitted. On the recommenda-

tion of the antipope Clement III, Benno was restored to his see, which he held until his death. Other than legendary or traditional lore, little else is known of Benno's life. His canonization by Pope Adrian VI drew from Martin Luther a pamphlet entitled *Wider den neuen Abgott und alten Teufel, der zu Meissen soll erhoben werden* ("Against the New Idol and the Old Devil About to Be Set up at Meissen"). He is the patron saint of Munich, where his relics were enshrined in 1580.

Benny, Jack, original name BENJAMIN KUBELSKY (b. Feb. 14, 1894, Chicago—d. Dec. 27, 1974, Beverly Hills, Calif., U.S.), entertainer whose unusual comedic method and expert timing made him a legendary success in U.S. radio and television for more than 30 years.

Benny Kubelsky was reared in Waukegan, a small city north of Chicago, where his father operated a saloon and later a dry goods store. As a boy he helped out in the store and took up the violin, and by his high school years had become proficient with the instrument. He played it in vaudeville from 1912, and in 1918 when he was taken into the U.S. Navy he was assigned to entertainment duties. It was there that his comic talent came to light and, while he remained a competent violinist in private, on stage his violin soon became little more than a prop which he played ineptly for comic effect.

After World War I Benny returned to vaudeville as a comedian. He appeared in his first motion picture in 1927, completing 18 more between 1930 and 1945. The turning point in his career, however, came in 1932 when he entered radio and quickly gained a large following.

Audiences responded to Benny's type of humour. In an era of comedy characterized by broad jokes and rapid delivery, his style was subtle and languid. Over the years, he and his cast—including Eddie Anderson as Rochester, his chauffeur and valet; and Benny's wife, Sadie Marks, as Mary Livingstone, his nemesis—carefully developed his stage image as a vain, stingy man and would-be violinist. He was notable for his verbal inflection and his acute sense of timing.

"The Jack Benny Program" remained on network radio for 23 years, at which time Benny moved to television, where he appeared regularly until 1965.

Benois, Alexandre, Russian in full ALEKSANDR NIKOLAYEVICH BENOIS (b. May 4 [April 21, old style], 1870, St. Petersburg, Russia—d. Feb. 9, 1960, Paris), Russian theatre art director, painter, and ballet librettist who with Léon Bakst and Scrieg Diaghilev cofounded the influential magazine *Mir iskusstva* ("World of Art"), from which sprang the Diaghilev Ballets Russes.

Benois aspired to achieve a synthesis of new western European trends and certain elements of traditional Russian folk art; *Mir iskusstva*, established in 1899 in St. Petersburg, attacked the low artistic standards of the realist Peredvezhnik Society and the deadening influence of the Russian Academy and stressed individualism and artistic personality. The magazine, which he coedited until 1904, soon exerted great influence on stage design.

Benois began his career (c. 1901) at the Mariinsky Theatre, St. Petersburg, as scenic designer for the ballets *Sylvia* and *Cupid's Revenge*. When the Diaghilev Ballets Russes opened in 1909, Benois designed decor and costumes for, among others, *Les Sylphides* (1909), *Giselle* (1910), and *Petrushka* (1911), on which he collaborated with Igor Stravinsky. His later works include grand designs for *La Valse* (1929, Ida Rubinstein Company), *The Nutcracker* (1940, Ballet Russe de Monte

Carlo), and *Graduation Ball*, for which he also wrote the libretto (1957, London Festival Ballet). Among his writings are *Reminiscences of the Ballet Russe* (1941) and *Memoirs* (1960). Benoît's collaboration with Stravinsky and Michel Fokine presented some of the greatest dance drama in history and helped found modern ballet.

Benoît DE SAINTE-MAURE, Sainte-Maure also spelled SAINTE-MORE (fl. 12th century, Sainte-Maure?, near Poitiers, France), author of the Old French poem *Roman de Troie*.

Benoît's poem, consisting of about 30,000 octosyllabic couplets, was probably written about 1160 and was dedicated to Eleanor of Aquitaine. A travesty of the story told in the *Iliad*, it is based on late Hellenistic romances by Dares Phrygius and Dictys Cretensis that purported to be eyewitness accounts of the events described by Homer. The *Roman de Troie* is an immense tapestry of Greek lore and fable. A prelude to the main story tells of Jason and the Argonauts and an earlier sack of Troy, while an epilogue contains the stories of Orestes, Andromache, and Ulysses. In the main plot Hector, rather than Achilles, is the principal hero. Much is said of Achilles' love for the Trojan princess Polyxena, while the amours of Briseida, the daughter of a renegade Trojan priest, are the first version of the Troilus and Cressida story used by later, more important writers.

Benoît's picture of Greek antiquity was strongly coloured by his own 12th-century feudal society. His poem, which analyzes various forms of love, was widely popular in its day but was eventually superseded by an imitation, the Latin *Historiae destructionis Troiae* (1287). Benoît also wrote a 43,000-line verse history of the dukes of Normandy.

Benoît, Peter, in full PETER LÉONARD LÉOPOLD BENOÎT (b. Aug. 17, 1834, Harelbeke, Belg.—d. March 8, 1901, Antwerp), Belgian composer and teacher who was responsible for the modern renaissance of Flemish music.

Benoît studied at the Brussels Conservatory and in 1857 won the Prix de Rome. He traveled in Germany and in 1861 went to France, where he conducted at the Bouffes-Parisiens. Back in Belgium (after 1863) he came under the influence of the novelist Hendrik Conscience, becoming an ardent proponent of a Flemish national movement in music. Benoît published numerous articles and pamphlets propagandizing Flemish music. In 1867 in Antwerp he founded the Flemish School of Music (later the Royal Flemish Conservatory), which he directed until his death.

His compositions include his *Rubens-cantata* (1877), which evoked historical events in Antwerp; the operas *Het dorp in't gebergte* (1857; "The Mountain Village") and *Pompeja* (1895); the oratorio *Lucifer* (1866), considered his masterpiece; the children's oratorio *De waereld in* (1878; "In the World"); and the *Quadrilogie religieuse* (1864). He turned from his early innovative, harmonic style to one of more simplicity. Most of his compositions were choral, many intended to be sung by the common people.

Benoni, town, Gauteng province, South Africa, east of Johannesburg. It is situated at 5,419 feet (1,652 m) above sea level and covers two sides of a valley that borders four lakes.

Benoni was established as a mining camp after the local discovery of gold in 1887. The local mining chairman, Sir George Farrar, landscaped the valley in the early 1900s, and Benoni was officially declared a town in 1907. It is now part of the industrial complex of the Witwatersrand and is particularly noted for its iron and steel works and brass foundry.

Johannesburg (Jan Smuts) Airport is immediately northwest. Pop. (1985) 94,926.

Benozzo DI LESE: see Gozzoli, Benozzo.

Benserade, Isaac de (b. either 1612, Normandy, or 1613, Paris, France—d. Oct. 20, 1691, Paris), minor but brilliant French literary light of the courts of Louis XIII and Louis XIV.

Benserade, detail of an engraving by G. Edelinck
H. Roger-Viollet

Benserade began visiting the salon of the Marquise de Rambouillet, the literary centre of Paris, in 1634 and wrote a succession of romantic verses that won him a reputation culminating in the "sonnets controversy" of 1649, in which his sonnet "Job" was pitted against Vincent Voiture's "Uranie" in a lively court debate over poetic style. Although Benserade was adjudged the loser, he became a favourite and was repeatedly called upon to write libretti for royal ballets, a function that he discharged with a wit frequently regarded by his court audience as daring and even impertinent. Elected to the French Academy in 1674, Benserade was criticized in 1676 for his *Metamorphoses d'Ovide en rondeaux*. He distinguished himself, however, by his support of the candidacy of Jean de La Fontaine for the academy and by his defense of the rationalism of Pierre Bayle, which the censorship threatened.

Benson, Edward White (b. July 14, 1829, Birmingham, Warwickshire, Eng.—d. Oct. 11, 1896, Hawarden, Cheshire), archbishop of Canterbury (1883–96), whose Lincoln Judgment (1890), a code of liturgical ritual, helped resolve the Church of England's century-old dispute over proper forms of worship.

Edward White Benson, detail from a portrait by Sir Hubert von Herkomer, 1883; in Lambeth Palace, London

By courtesy of the Archbishop of Canterbury, photograph, Courtauld Institute of Art

After serving as assistant master at Rugby School, Warwickshire, from 1852 to 1858, Benson was made headmaster at Wellington College, Berkshire, in 1859. In 1873 he became chancellor of the diocese of Lincoln, where he founded a seminary and established night schools and university extension lectures. He was consecrated in 1877 as bishop of the new diocese of Truro, Cornwall, where

he was mainly responsible for the building of a cathedral. He was enthroned as archbishop of Canterbury in 1883 after being appointed to that post by his friend, Prime Minister William E. Gladstone. As archbishop, Benson sought reforms of church patronage and discipline, secured by acts of Parliament in 1892 and 1898, and he successfully resisted efforts to disestablish the Anglican church in Wales.

The most significant episode of Benson's archbishopric occurred during 1888–90, when he heard arguments in the case of Edward King, bishop of Lincoln, who had been charged with improper ritualism in the celebration of the Eucharist. Benson concluded the case with the Lincoln Judgment, a definition of liturgical practices sanctioned by a tradition of usage. Based on historical analysis of ritualistic practices, the judgment held that certain forms of observance, such as altar lights and the singing of the Agnus Dei, were legitimate but that manual acts by the clergy not visible to the congregation and the sign of the cross in the blessing were illegal.

Benson facilitated a reconciliation among the various factions within the English church and virtually brought to an end the prosecutions relating to ritualism that had plagued Anglicanism during the 19th century. His writings include a study of *Cyprian* (published posthumously in 1897), the martyred 3rd-century bishop of Carthage.

Benson, Sir Frank, in full SIR FRANK ROBERT BENSON (b. Nov. 4, 1858, Alresford, Hampshire, Eng.—d. Dec. 31, 1939, London), British actor-manager whose touring company and acting school were important influences on contemporary theatre.

Sir Frank Benson, 1882

By courtesy of the Victoria and Albert Museum, London

While at New College, Oxford, Benson produced *Agamemnon*, the first play to be done there in the original Greek. In 1882 he made his first professional appearance at the Lyceum Theatre, London, under Sir Henry Irving, playing the role of Paris in *Romeo and Juliet*. The next year he formed a company of his own. In 1886 he married Gertrude Constance Featherstonhaugh (1860–1946), who acted in his company and played leading parts with him. Besides appearing in London he toured the English provinces regularly in Shakespeare and went to Canada (1913) and South Africa (1921). His finest parts were Hamlet, Coriolanus, Richard II, Lear, and Petruccio. From the first he devoted himself largely to the production of Shakespeare's plays. After 1888 he organized 26 of the annual Stratford-upon-Avon Shakespearean festivals. His acting school was founded in 1901. He was knighted in 1916 in Drury Lane Theatre. *My Memoirs* was published in 1930.

Bent, Charles (b. Nov. 11, 1799, Charleston, Va., U.S.—d. Jan. 19, 1847, Taos [New Mexico]), fur-trading pioneer who became civil governor for the United States of the newly captured province of New Mexico.

After moving from Charleston, Va., to Marietta, Ohio, in 1805, the Bent family settled in

St. Louis the following year. Charles and his brother William developed an interest in the fur trade, and they probably worked for John Jacob Astor's American Fur Company during the early 1820s.

In 1824 the two brothers joined with Ceran St. Vrain on a fur-trapping expedition on the upper Arkansas River. In 1828 the three organized the company of Bent & St. Vrain and built Bent's Fort near La Junta, in the Louisiana Territory (now Colorado). It became the most famous of the mountain trading posts.

Leaving William behind to manage the post, Charles Bent and St. Vrain moved on to the Mexican province of New Mexico, where they directed the field operations of their company. In 1835 Charles settled at San Fernando de Taos. Eleven years later, during the Mexican War, U.S. forces took over the province, and Bent was appointed civil governor. After four months, the U.S. troops withdrew, and Charles Bent was one of several U.S. civilians killed in a revolt by Mexican and Pueblo Indians in the territory.

Bent, James Theodore (b. March 30, 1852, Leeds, Yorkshire, Eng.—d. May 5, 1897, London), British explorer and archaeologist who excavated the ruined Zimbabwe (*dzimbahwe*; i.e., stone houses, or chiefs' graves) in the land of the Shona people of eastern Rhodesia (now Zimbabwe Rhodesia).

Bent first travelled to islands of the Aegean and, in 1890, to southern Turkey before he began in 1891 to examine the great Zimbabwe remains that he described in *The Ruined Cities of Mashonaland* (1892). Later archaeological searches took him to Ethiopia, the Nilotic Sudan, and the southern Arabian peninsula.

bent grass, any of the annual and perennial grasses of the genus *Agrostis* (family Poaceae), with about 125 species distributed in temperate and cool parts of the world and at high altitudes in subtropical and tropical areas. At least 40 species are found in the United States; some are weeds, others are forage and turf plants. Bent grasses have slender stems, flat blades, and open or dense clusters of small spikelets. Many have creeping stolons (horizontal, subsurface stems).

Redtop (*A. gigantea*), 1 to 1.5 metres (about 3 to 5 feet) tall, was introduced into North America during colonial times as a hay and pasture grass. It spreads by rhizomes and has

reddish flowers. The smaller, creeping bent (*A. stolonifera* variety *palustris*), known as fiorn in England, whose stolons grow up to 1.2 m per season, and colonial bent (*A. tenuis*) are popular lawn grasses. The many strains of both species are planted in golf courses and bowling greens around the world; they are closely cut to develop a finely textured, spongy firm turf.

Benten, also called BENZAITEN (Japanese: Divinity of the Reasoning Faculty), in Japanese mythology, one of the Shichi-fuku-jin (Seven

Benten playing a *biwa*, copy of a painting by Yoshinobu, 17th century; in the Museum für Völkerkunde, Vienna
By courtesy of the Museum für Völkerkunde, Vienna

Gods of Luck); the Buddhist patron goddess of literature and music, of wealth, and of femininity. She is generally associated with the sea; many of her shrines are located near it, and she is frequently depicted riding on, or accompanied by, a sea dragon. According to one legend, she married a sea dragon, thus putting an end to his ravages of the island Enoshima. She is often shown playing the *biwa*, a kind of lute. A white serpent serves as her messenger.

Benten is identified with the Indian goddess Sarasvatī, also a patron of literature and the arts, who probably travelled to Japan along with Buddhism. See also Shichi-fuku-jin.

Bentham, George (b. Sept. 22, 1800, Stoke, Devon, Eng.—d. Sept. 10, 1884, London), British botanist whose classification of seed plants (Spermatophyta), based on an exhaustive study of all known species, served as a foundation for modern systems of vascular plant taxonomy.

Impressed by the French naturalist Pyrame de Candolle's analytic tables of French flora, Bentham began to study botany while managing his father's estate near Montpellier, Fr., and serving as secretary (1826–32) to his uncle, the British philosopher and jurist Jeremy Bentham. In 1833, upon his inheritance of wealth following the deaths of his father and uncle, Bentham turned his full attention to botany.

After he donated his herbarium of more than 100,000 specimens to the Royal Botanical Gardens at Kew, Surrey, in 1854, the director of the Gardens, Sir William Hooker, invited him to establish permanent quarters

there. At Kew, Bentham participated in the Gardens' definitive survey of floras of the British colonies and possessions, for which he prepared the *Flora Hongkongensis* (1861) and the *Flora Australiensis* (7 vol., 1863–78), cataloging and describing more than 7,000 species.

Realizing the inadequacy of current criteria for assigning species to their appropriate genera, he undertook the ambitious task of compiling an unambiguous descriptive classification of all seed plants. Collaborating with Hooker's son Sir Joseph, Bentham spent 27 years in research and examination of specimens for the work *Genera Plantarum* (3 vol., 1862–83). It was published in Latin and covered 200 "orders" (analogous to what are now known as families) of 7,569 genera, which included more than 97,200 species.

Although their general system of classification represented little more than a refinement of Candolle's taxonomy and failed to recognize the dynamic nature of plant speciation postulated by Charles Darwin's principles of organic evolution, it established an authoritative taxonomy of genera and species that has been largely adopted by modern systems of classification based upon evolutionary theory.

George Bentham, oil painting by Lewis Dickenson, 1870; in the collection of the Linnean Society of London
BBC Hulton Picture Library

Bentham and Hooker's taxonomy, with modifications, persists throughout the British Commonwealth. Bentham's *Handbook of British Flora* (1858; 7th ed., 1924) remains a standard work.

Bentham, Jeremy (b. Feb. 15, 1748, London—d. June 6, 1832, London), English philosopher, economist, and theoretical jurist, the earliest and chief expounder of Utilitarianism.

Early life and works At the age of four, Bentham, the son of an attorney, is said to have read eagerly and to have begun the study of Latin. Much of his childhood was spent happily at his two grandmothers' country houses. At Westminster School he won a reputation for Greek and Latin verse writing. In 1760 he went to Queen's College, Oxford, and took his degree in 1763. In November he entered Lincoln's Inn to study law and took his seat as a student in the King's Bench division of the High Court, where he listened with rapture to the judgments of Chief Justice Lord Mansfield. In December 1763 he managed to hear Sir William Blackstone lecture at Oxford but said that he immediately detected fallacies that underlay the grandiloquent language of the future judge. He spent his time performing chemical experiments and speculating upon the more theoretical aspects of legal abuses rather than in reading law books. On being called to the bar, he "found a cause or two at nurse for him, which he did his best to put

Creeping bent (*Agrostis stolonifera* variety *palustris*)
R.G. Doord from the Natural History Photographic Agency—EB Inc

to death," to the bitter disappointment of his father, who had confidently looked forward to seeing him become lord chancellor.

Bentham's first book, *A Fragment on Government*, appeared in 1776. The subtitle, "being an examination of what is delivered, on the subject of government in general, in the introduction to Sir William Blackstone's *Commentaries*," indicates the nature of the work. Bentham found the "grand and fundamental" fault of the *Commentaries* to be Blackstone's

"antipathy to reform." Bentham's book, written in a clear and concise style different from that of his later works, may be said to mark the beginning of philosophic radicalism. It is also a very good essay on sovereignty. Lord Shelburne (afterward 1st Marquess of Lansdowne), the statesman, read the book and called upon its author in 1781. Bentham became a frequent guest at Shelburne's home. At this period Bentham's mind was much-occupied with writing the work that was later published in French in 1811 by his admirer Étienne Dumont and entitled *Théorie des peines et des récompenses*. This work eventually appeared in English as *The Rationale of Reward* (1825) and *The Rationale of Punishment* (1830). In 1785 Bentham started, by way of Italy and Constantinople, on a visit to his brother, Samuel Bentham, an engineer in the Russian armed forces; and it was in Russia that he wrote his *Defence of Usury* (published 1787). This, his first essay in economics, presented in the form of a series of letters from Russia, shows him as a disciple of the economist Adam Smith but one who argued that Smith did not follow the logic of his own principles. Bentham held that every man was the best judge of his own advantage, that it was desirable from the public point of view that he should seek it without hindrance, and that there was no reason to limit the application of this doctrine in the matter of lending money at interest. His later works on political economy followed the laissez-faire principle, though with modifications. In the "Manual of Political Economy" he gives a list of what the state should and should not do, the second list being much longer than the first.

Mature works. Disappointed, after his return to England in 1788, in the hope of making a political career, he settled down to discovering the principles of legislation. The

great work on which he had been engaged for many years, *An Introduction to the Principles of Morals and Legislation*, was published in 1789. In this book he defined the principle of utility as "that property in any object whereby it tends to produce pleasure, good or happiness, or to prevent the happening of mischief, pain, evil or unhappiness to the party whose interest is considered." Mankind, he said, was governed by two sovereign motives, pain and pleasure; and the principle of utility recognized this state of affairs. The object of all legislation must be the "greatest happiness of the greatest number." He deduced from the principle of utility that, since all punishment involves pain and is therefore evil, it ought only to be used "so far as it promises to exclude some greater evil."

The fame of his writings spread widely and rapidly. Bentham was made a French citizen in 1792, and in later life his advice was respectfully received in several of the states of Europe and America. With many of the leading men of these countries Bentham maintained an active correspondence. The codification of law was one of Bentham's chief preoccupations, and it was his ambition to be allowed to prepare a code of laws for his own or some foreign country. He was accused of having underestimated both the intrinsic difficulties of the task and the need for diversity of institutions adapted to the tradition and civilization of different countries. Even so, Bentham must be reckoned among the pioneers of prison reform. It is true that the particular scheme that he worked out was bizarre and spoiled by the elaborate detail that he loved. "Morals reformed, health preserved, industry invigorated, instruction diffused" and other similar desiderata would, he thought, be the result if his scheme for a model prison, the "Panopticon," were to be adopted; and for many years he tried to induce the government to adopt it. His endeavours, however, came to nothing; and though he received £23,000 in compensation in 1813, he lost all faith in the reforming zeal of politicians and officials.

In 1823 he helped to found the *Westminster Review* to spread the principles of philosophic radicalism. Bentham had been brought up a Tory, but the influence of the political theory of the Enlightenment served to make a democrat of him. As far back as 1809 he had written a tract, *A Catechism of Parliamentary Reform*, advocating annual elections, equal electoral districts, a wide suffrage, and the secret ballot, which was, however, not published until 1817. He drafted a series of resolutions based on this tract that were introduced in the House of Commons in 1818. A volume of his *Constitutional Code*, which he did not live to complete, was published in 1830.

After Bentham's death, in accordance with his directions, his body was dissected in the presence of his friends. The skeleton was then reconstructed, supplied with a wax head to replace the original (which had been mummified), dressed in Bentham's own clothes and set upright in a glass-fronted case. Both this effigy and the head are preserved in University College, London.

Bentham's life was a happy one. He gathered around him a group of congenial friends and pupils, such as the philosopher James Mill, father of John Stuart Mill, with whom he could discuss the problems upon which he was engaged. His friends, too, practically rewrote several of his books from the mass of rough though orderly memoranda that Bentham himself prepared. Thus the *Rationale of Judicial Evidence*, 5 vol. (1827), was put in its finished state by J.S. Mill and the *Book of Fallacies* (1824) by Peregrine Bingham. The services of Étienne Dumont in recasting as well as translating the works of Bentham were still more important.

Assessment. Bentham was less a philosopher than a critic of law and of judicial and

political institutions. Unfortunately, he was not aware of his limitations. He tried to define what he thought were the basic concepts of ethics, but the majority of his definitions are oversimpler or ambiguous or both, and his "felicific calculus," a method for calculating amounts of happiness, as even his warmest admirers have admitted, cannot be used. As a moralist and psychologist, Bentham has similarly appeared to be inadequate; his arguments, though sometimes elaborate, rest too often on insufficient and ambiguous premises. His analyses of the concepts that men use to describe and explain human behaviour are too simple. He seems to have believed both that man is completely selfish and that everyone ought to promote the greatest happiness, no matter whose. Not even the formula of which he made so much, "the greatest happiness of the greatest number," possesses a definite meaning.

Given all this, it should be noted that the publication since World War II of Bentham's previously unknown manuscripts has done much to enhance his reputation as a philosopher of law. His Victorian editor, Sir John Bowring, cut out from Bentham's work much that was both original and well-argued. The more up-to-date scholarship of such Bentham specialists as Herbert L.A. Hart, J.H. Burns, Frederick Rosen, and Lea Campos-Boralevi has revealed a more rigorous and systematic thinker than the legendary muddled Utilitarian that Bentham appeared to be to earlier generations.

As a critic of institutions Bentham was admirable. In his *Rationale of Judicial Evidence* he describes the methods that a court should use to get at the truth as quickly as possible; and in the *Essay on Political Tactics* he describes what he considers the most effective forms of debate for a legislative assembly—an account largely based on the procedure of the House of Commons. In these works and in others Bentham is concerned to discover what makes for efficiency. Though he defines efficiency in terms of happiness, his reader need not do so; or, if he does, he need not think of happiness as Bentham did. Bentham's assumptions about what makes for happiness are often quite ordinary and sensible; the reader can accept them and still insist that happiness is not to be defined in terms of pleasure and is not to be measured. Whatever is excellent, ingenious, and original in Bentham—and there is a great deal of it—need not depend on the "felicific calculus" and "the greatest happiness of the greatest number." (J.P.Pl./Ed.)

Burns (gen. ed.), *The Collected Works of Jeremy Bentham* (1968–); Leslie Stephen, *The English Utilitarians*, vol. 1 (1900, reprinted 1968), still one of the best general accounts of Bentham's life and thought; Elie Halevy, *La Formation du radicalisme philosophique*, 3 vol. (1901–04; *The Growth of Philosophical Radicalism*, 1928), a study of Bentham's philosophy seen in the context of the history of English thought in his time. Later works on Bentham's thought and philosophy include Herbert L.A. Hart, *Essays on Bentham* (1982); Frederick Rosen, *Jeremy Bentham and Representative Democracy* (1983); Lea Campos-Boralevi, *Bentham and the Oppressed* (1984); and Ross Harrison, *Bentham* (1983).

Bentham, Sir Samuel (b. Jan. 11, 1757, England—d. May 31, 1831, London), British engineer, naval architect, and navy official in Russia (1780–91) and England (from 1795) who was an early advocate of explosive-shell weapons for warships.

Bentham led Russian vessels fitted with shell guns to victory over a larger Turkish force (June 7, 1788). As inspector of naval works in England, he developed the Arrow class of sloops used against France. He was the brother of the philosopher Jeremy Bentham and father of the botanist George Bentham.

benthos, the assemblage of organisms inhabiting the seafloor. Benthic epifauna live upon

the seafloor or upon bottom objects; the so-called infauna live within the sediments of the seafloor. By far the best-studied benthos are the macrobenthos, those forms larger than 1 mm (0.04 inch), which are dominated by polychaete worms, pelecypods, anthozoans, echinoderms, sponges, ascidians, and crustaceans. Meiobenthos, those organisms between 0.1 and 1 mm in size, include polychaetes, pelecypods, copepods, ostracodes, cumaceans, nematodes, turbellarians, and foraminiferans. The microbenthos, smaller than 0.1 mm, include bacteria, diatoms, ciliates, amoeba, and flagellates.

The variety and abundance of the benthos vary with latitude, depth, water temperature and salinity, locally determined conditions such as the nature of the substrate, and ecological circumstances such as predation and competition. In shallow water the rapidly changing physical environment outweighs biotic factors. Infaunal environmental conditions are less subject to change than epifaunal.

The principal food sources for the benthos are plankton and organic debris from land. In shallow water, larger algae and flowering plants are important, and, where light reaches the bottom, benthic photosynthesizing diatoms are also a significant food source. Hard and sandy substrates are populated by suspension feeders such as sponges and pelecypods. Softer bottoms are dominated by deposit eaters, of which the polychaetes are the most important. Fishes, starfish, snails, cephalopods, and the larger crustaceans are important predators and scavengers.

Benti, also spelled **BENTY**, town and seaport, western Guinea, western Africa. It lies at the head of the estuary of the Mélikhouré (Mela-cocée) River, 10 miles (16 km) upstream from the Atlantic coast. Important for the export of bananas (second only to Conakry), its port can accommodate oceangoing vessels of 21-foot (6-metre) draft. Benti is also a collecting and trading centre for pineapples, swamp rice, fish, salt, coconuts, and palm oil and kernels that are grown in the hinterland by the Mandenya (Mmani) people. Formerly the site of a French military post (founded in the 1860s), the town has an agricultural training school.

Bentinck, Lord George, in full **WILLIAM GEORGE FREDERICK CAVENDISH-SCOTT-BENTINCK, LORD BENTINCK** (b. Feb. 27, 1802, Welbeck, Nottinghamshire, Eng.—d. Sept. 21, 1848, Welbeck), British politician who in 1846–47 articulately led the protective-tariff advocates who opposed the free-trade policy of Prime Minister Sir Robert Peel.

The second son of the 4th Duke of Portland, Bentinck served in the army before entering (1828) the House of Commons. Initially a moderate Whig, he voted for the emancipation (parliamentary enfranchisement) of Roman Catholics in 1829 and for the Reform Bill of 1832, but subsequently he became more conservative. In 1846, when Peel declared in favour of free trade and against the Corn

Laws, Bentinck devoted himself completely and effectively to the leadership of the protectionists. With his purely political antagonism he combined personal vindictiveness toward Peel, who he believed had "hounded to the death" the former prime minister George Canning, a relative of Bentinck.

Apart from the tariff question, Bentinck's views proved too independent for the comfort of most of his colleagues. In opposition to the rest of his party, for instance, and to please his chief adviser, Benjamin Disraeli, he supported a bill for removing Jewish political disabilities. The result was that in December 1847 he resigned his leadership of the protectionist opposition.

A celebrated sportsman, Bentinck was the last member of the House of Commons to wear a pink hunting coat there; and he exercised great authority at race meetings. Until within three years of his death he was little-known out of the sporting world. He then abandoned his connection with the turf, disposed of his magnificent string of race horses (including the next Derby winner), and devoted his whole energies to the laborious duties of a parliamentary leader.

Bentinck, Lord William, in full **WILLIAM HENRY CAVENDISH-BENTINCK, LORD BENTINCK** (b. Sept. 14, 1774, Bulstrode, Buckinghamshire, Eng.—d. June 17, 1839, Paris), British governor-general of Madras (in effect, of India) from 1828 to 1835. He reformed the finances, opened up administrative and judicial posts to Indians, and suppressed such practices as thuggee, or ritual murder by robber gangs. The innovations effected in his years of office were decisive milestones on the road that was ultimately to lead to independence more than a century later.

Early career. The second son of the 3rd Duke of Portland, Bentinck, at the age of 17, received a commission as ensign in the Coldstream Guards; by 1794 he was a lieutenant colonel. Born to wealth and rank, he was a promising, if not outstanding, young officer. Nevertheless, his appointment as governor of Madras in 1803, at the early age of 29, caused surprise.

Although he performed his duties satisfactorily enough, his administration was clouded by his disagreements with his council and was abruptly terminated by the mutiny at Vellore. An unwise order by the commander in chief of the Madras Army had forbidden the native troops to wear their traditional beards and turbans; Bentinck, even more unwisely, would not allow the order to be rescinded. The consequence was a serious mutiny in July 1806, accompanied by attacks on officers and British troops. The outbreak was suppressed with heavy loss of life, and the ill-considered order was finally withdrawn. Bentinck, nevertheless, was held responsible and recalled. Believing he had been treated unjustly, he pressed for the next 20 years for a chance to vindicate his name by service in India.

Tour in Sicily. The Napoleonic Wars were on, and he was next assigned to Spain, where he commanded a brigade at Corunna, after which he was appointed commander of the British troops in Sicily. Italy was then in the hands of Napoleon, but in Sicily the Bourbon monarchs of Naples still reigned under the protection of the British fleet. Bentinck's orders were to raise a Sicilian Army of 10,000 men to supplement his 5,000 British soldiers and land on the east coast of Spain with his combined forces to assist in the campaign against Napoleon. Had Bentinck been no more than a soldier, his course would have been clear. But he was a man of imagination, a Whig (a liberal) by family tradition, and a radical in the eyes of his contemporaries. Therefore, besides merely raising a Sicilian Army, he engineered the deposition of the Bourbon king—in favour of the heir apparent—as well as the adoption

of a liberal Sicilian constitution with a legislative body modeled on the English Parliament. Further, he planned to invade Italy and rally the people not only to expel Napoleon but to set up a constitutional monarch. The British government would never have supported such a plan; in fact, it intended eventually to restore Austrian rule in Italy. The Italian landing did not take place at that time, however, and Bentinck delayed his landing in Spain beyond the date when he was most needed. When he finally did land in Italy, at Genoa in 1814, his liberal proclamations again embarrassed his government, and he was recalled to England in 1815. On his return, he was elected to the House of Commons.

Governor-general of India. He refused reappointment to the governorship of Madras in 1819, waiting to attain his real ambition—the appointment as governor-general of India and governor of Bengal, which came in 1827. Bentinck's immediate instructions were to rescue India from its financial difficulties; at this time the government in India operated on an annual deficit of about £1,500,000. Bentinck soon succeeded in turning the deficit into a surplus of about the same amount. He next turned to judicial and administrative reforms, which included making more administrative and judicial positions available to Indians and improving the salaries and status of Indian judges. Bentinck also made English, instead of Persian, the language of the higher courts and of higher education and arranged for financial aid to colleges, which were to be adapted to the Western models.

Bentinck showed great courage and humanity by his decision to abolish *sati* (sati), the custom of burning widows alive with the corpse of their husbands. Previous governors-general had shrunk from prohibiting the custom as an interference in religion and one particularly likely to upset the Indian Army; but Bentinck cut through these hesitations without facing much open opposition. He was also responsible for the measures taken to suppress the murder of unwanted children, human sacrifice, and the *thugs* (thugs)—bands of robbers, bound together by oaths and ritual, who murdered unsuspecting travelers in the name of the goddess Kālī. Flogging in the Indian Army was also abolished, long before it ended in the British Army.

Assessment. Bentinck left India in March 1835 and died in Paris a few years later. It has been argued that the reforms he initi-

Lord George Bentinck, detail of an oil painting by S. Lane, 1836; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

ated and those that followed in the next 20 years—which accelerated the westernization of India—were partly responsible for the Indian Army's Mutiny of 1857. That argument may have little force; his reforms were liberal, not radical, and would eventually have become inevitable. Bentinck was not an original thinker; his philosophical masters were the utilitarians Jeremy Bentham and James Mill; his practical instructor, especially in the field of education, was the historian Thomas Babington Macaulay, among others. He borrowed useful elements from the creed of his liberal Whig ancestors and of Bentham and combined them in policies that were sensible, practical, and humanitarian. Toward the end of his career he had lost the impetuosity that had characterized his earlier years in Sicily and the tactlessness that had appeared when he first held office in Madras. Though certainly not the most brilliant of the governors-general, in solid achievements and in utilizing the resources available to him, he must rank among the most successful. (P.Ma.)

BIBLIOGRAPHY. There is no good biography. John Rosselli, *Lord William Bentinck & the British Occupation of Sicily, 1811–1814* (1956), examines his actions during his Sicilian appointment, while *Lord William Bentinck: The Making of a Liberal Imperialist, 1774–1839* (1974), places Bentinck's career in historical perspective.

Bentinck, William Henry Cavendish: see Portland, William Henry Cavendish Bentinck, 3rd Duke of.

Bentivoglio FAMILY. Italian family that controlled Bologna during the second half of the 15th century.

Long prominent in Bolognese affairs, the Bentivogli are first recorded there in 1323. Emboldened by the power that they had gained as pro-papist Guef chiefs in the 14th century, they made two unsuccessful attempts to seize power. First, Giovanni I Bentivoglio, declared *signore* ("lord") in 1401, was defeated in 1402 by the Visconti of Milan, who were expanding their territory. Second, Anton Galeazzo, who seized power in 1420, was forced to yield to Pope Martin V, who had reestablished papal authority.

The family was unable to dominate Bologna until Annibale (d. 1445), son of Anton Galeazzo, returned from exile (1438) to become virtual *signore* from 1443 to 1445. Upon Annibale's assassination, the Bentivogli chose as his successor Sante (1424–63), a little-known member of the family who had been reared in Florence. Nominally only a member of the Sixteen, the city's ruling body, Sante, in fact, ruled Bologna. He reached an extremely important agreement with the papacy (*Capitula*, 1447) defining the extent of Bologna's independence from papal control. Sante Bentivoglio established his family's close relationship with the Sforza family of Milan, often an important ally during wars.

Sante's successor, Giovanni II (1443–1508), improved the town and its waterways, made the army more efficient, and maintained a family tradition of patronage of the arts and letters. He successfully evaded the designs of Pope Paul II, who wished to increase papal control of Bologna.

Having been the target of many conspiracies, Giovanni became suspicious and so tyrannical that, when the Bentivogli were challenged by Pope Julius II, they received little popular support and were driven from Bologna in 1506. The family finally moved to Ferrara. To the Ferrarese branch belonged many gifted persons, including the writers and diplomats Cardinals Guido (1579–1644) and Cornelio (1668–1732).

Bentivoglio, Guido (b. Oct. 4, 1579, Ferrara [Italy]—d. Sept. 7, 1644, Rome), Italian

churchman, diplomat, and historian, whose writings give precise accounts of his diplomatic activities and of affairs in the countries he visited. Pope Paul V sent him as nuncio to Flanders (1607–15) and to France (1616–21) and created him cardinal (January 1621).

Among Bentivoglio's important works are his *Relazioni in tempo delle sue nunziature* (1629; partial Eng. trans., *Historical Relations of the United Provinces and Flanders*); his *Della guerra di Fiandra* (1632–39; *The Compleat History of the Warrs of Flanders*), and his diplomatic letters to the papal secretariat of state (ed. by L. De Steffani, *La Nunziatura di Francia del cardinale Guido Bentivoglio*, 4 vol., 1863–70, and by R. Belvederi, *Guido Bentivoglio diplomatico*, 1947). Bentivoglio's *Opere storiche* were edited with a life by L. Barotti, and his *Memorie e lettere* were edited (1934) by C. Panigada.

not letter by letter

Bentley, Arthur F(isher) (b. Oct. 16, 1870, Freeport, Ill., U.S.—d. May 21, 1957, Paoli, Ind.), American political scientist and philosopher known for his work in epistemology, logic, and linguistics and for his contributions to the development of a behavioral methodology of political science.

Bentley received his B.A. in 1892 and his Ph.D. in 1895 from Johns Hopkins University and taught a seminar in sociology the following year at the University of Chicago. He then engaged in reporting and editorial work for the *Times-Herald* and *Record-Herald* of Chicago until 1910, when he retired to Paoli, Ind., to manage his orchard and write. He was active in the Red Cross during World War I and was Indiana leader of the presidential campaign of Senator Robert M. La Follette of the Progressive Party in 1924.

In *The Process of Government: A Study of Social Pressures* (1908), his most noted work, Bentley attempted to develop a methodology of behavioral social-science research and urged concentration of study on overt human activity, the raw material of the political process. He arranged political data in terms of groups, interests, and pressures (a given activity might be viewed as the activity of a group, the expression of an interest, or the exertion of pressure). He did not attempt to formulate a general group theory and in his later work was prepared to consider the individual as the focal point of inquiry into the political process. Concerned more with methodology than with theory, he saw the study of manifest behaviour as the way to more profound understanding of human affairs. Together with the philosopher John Dewey, Bentley developed a "transactional" view of social explanation that went beyond the existing prescientific "self-action" and mechanistic "interaction" approaches and postulated knowledge as a social phenomenon.

In *The Process of Government* Bentley dealt with the social nature of language, in which all description and thought are to be found. Other works by Bentley include *Relativity in Man and Society* (1926), *Linguistic Analysis of Mathematics* (1932), *Behavior, Knowledge, Fact* (1935), *Knowing and the Known* (1949, with John Dewey), and *Inquiry into Inquiries: Essays in Social Theory* (1954).

Bentley, E(dmund) C(lerihew) (b. July 10, 1875, London, Eng.—d. March 30, 1956, London), British journalist and man of letters who is remembered as the inventor of the clerihew (*q.v.*) and for his other light verse and as the author of *Trent's Last Case* (1913), a classic detective story that remains a best-seller.

After attending St. Paul's School in London (where he met G.K. Chesterton, who became his closest friend) and the University of Ox-

ford, Bentley lived in London and studied law. He soon abandoned the law, however, for journalism, which he practiced for most of his life.

The clerihew, a "baseless biography," consisting of a four-line stanza of two rhyming couplets, the first rhyme being provided by the name of the subject, was introduced in *Biography for Beginners*, by "E. Clerihew" (1905), and was immediately popular and soon widely imitated. *More Biography* (1929) was followed by *Baseless Biography* (1939), illustrated by Bentley's son, Nicolas. In *Clerihews Complete* (1951) all Bentley's clerihews are collected.

Bentley wrote *Trent's Last Case* in exasperation at the infallibility of Sherlock Holmes, and the book has been said to mark the end of the Holmes era in detective fiction. Two decades later, Bentley revived this character in *Trent's Own Case* (1936; with Warner Allen) and in *Trent Intervenes* (1938), a collection of short stories.

Bentley, Eric (Russell) (b. Sept. 14, 1916, Bolton, Lancashire, Eng.), critic, translator, and stage director responsible for introducing the works of many European playwrights to the United States and known for his original, literate reviews of theatre and critical works on drama.

Bentley studied at the University of Oxford (B.A., 1938; Litt.B., 1939). His Ph.D. dissertation from Yale University (1941) was expanded into the book *A Century of Hero Worship* (1944; reissued as *The Cult of the Superman*, 1969). From 1948 to 1951 Bentley directed in numerous European cities, including Dublin, Zurich, and Padua. In 1950 in Munich he worked with Bertolt Brecht on a production of Brecht's play *Mother Courage*. Concurrent with his directing, Bentley contributed reports on European theatre to *Theatre Arts* and the *Kenyon Review* in the United States. Bentley's translations of Brecht and reviews of European theatre won him recognition and various grants in the United States. From 1974 to 1982 he was professor of theatre at the State University of New York (Buffalo), and from 1982 he taught at the University of Maryland (College Park).

Bentley's criticism is noteworthy for covering practical, aesthetic, and philosophical aspects of theatre, and it stems from a belief that art must rescue humanity from meaninglessness. Rejecting simple theories, Bentley's books are exhilarating for the enthusiasm with which he embraces a blend of reason and creativity. Criticized by some for his negative opinion of the Broadway stage and popular theatre in general, Bentley is defended by others who maintain that his beliefs are based on a solid critical approach. His *The Life of the Drama* (1964) has been hailed as one of the best general books on the theatre ever written. Other books include *The Playwright as Thinker* (1946; Eng. ed. *The Modern Theatre*, 1948), *In Search of Theater* (1953), *The Theory of the Modern Theatre* (1968, rev. ed. 1976), *Brecht Commentaries* (1981), and *Thinking About the Playwright* (1987).

Bentley, Richard (b. Jan. 27, 1662, Oulton, Yorkshire, Eng.—d. July 14, 1742, Cambridge, Cambridgeshire), British clergyman, one of the great figures in the history of classical scholarship who combined wide learning with critical acuteness. Gifted with a powerful and logical mind, he was able to do much to restore ancient texts and to point the way to new developments in textual criticism and scholarship.

He was educated at Wakefield Grammar School and St. John's College, Cambridge. In 1689 he made the acquaintance of John Mill at Oxford, who asked him to look through the proof sheets of the Oxford edition of the chronicler John Malalas. The request gave rise to Bentley's *Epistola ad Joannem Milium* (1691), a short treatise in which his skill

Richard Bentley, detail of an oil painting by James Thornhill, 1710; in Trinity College, Cambridge.

By courtesy of the Master and Fellows of Trinity College, Cambridge, Eng.

in textual emendation and his knowledge of ancient metre were strikingly displayed.

Bentley was appointed Boyle lecturer at the University of Oxford in 1692, and in 1694 he became keeper of the Royal Library and fellow of the Royal Society. In 1699 he published his *Dissertation upon the Epistles of Phalaris*, a work in which he attacked the authenticity of the epistles, bringing all his learning and critical powers to bear in proof of their spuriousness.

In 1700 Bentley was chosen master of Trinity College, Cambridge, and in 1717 he became regius professor of divinity. His tenure as master was marked by friction and litigation. His domineering temper and his contemptuous treatment of the fellows led to various attempts to secure his ejection and embroiled him in controversy and feuding for the next 30 years.

Through it all, however, Bentley continued his classical studies. He published a critical appendix to John Davies' edition of Cicero's *Tusculan Disputations* in 1709, and two years later he published an edition of Horace. His later works include an edition of Terence, published in 1726, together with the fables of Aesop and the *Sententiae* of Publilius Syrus, and in 1739 an edition of Manilius. On other classical authors, such as Nicander, Plautus, Lucretius, and Lucan, he left notes, which were published after his death. Bentley made a particularly important scholarly contribution through his discovery that a sound (represented by the letter "digamma" in transcriptions of some Greek dialects) was present in certain Homeric Greek words, though it was not represented by any letter when the words were written.

Bento Gonçalves, city, northeastern Rio Grande do Sul *estado* ("state"), southern Brazil. Situated in the hills overlooking the

Grape harvest in Bento Gonçalves, Braz.

Plessner International

Jaguari River valley, Bento Gonçalves is a commercial centre in a fertile agricultural region settled by Italians in the late 19th century. Viticulture is the primary economic activity. The city is a railroad junction on the Pôrto Alegre-Curitiba line. It is also accessible

by highway. Pop. (1991 prelim.) city, 63,594; mun., 78,680.

Benton, city, seat (1835) of Saline county, central Arkansas, U.S. It lies along the Saline River, 25 miles (40 km) southwest of Little Rock. The site on the old Military Road, a main Missouri-Texas route, was settled about 1815. The community was named in honour of Thomas Hart Benton, a Missouri political leader.

Salt mining and pottery making were early occupations, and by 1900 lumbermen were logging pine, oak, and gum trees. During World War II, aluminum processing, based on local deposits of high-grade bauxite, developed; there has since been light industrial growth. Hot Springs National Park and sections of the Ouachita National Forest are to the west. Inc. city, 1848. Pop. (1994 est.) 21,891.

Benton, Thomas Hart (b. March 14, 1782, near Hillsborough, N.C., U.S.—d. April 10, 1858, Washington, D.C.), American writer and Democratic Party leader who championed agrarian interests and westward expansion during his 30-year tenure as a senator from Missouri.

After military service in the War of 1812, Benton settled in St. Louis, Mo., in 1815

Thomas Hart Benton, c. 1845–50

By courtesy of the Library of Congress, Washington, D.C.

and became editor of the *St. Louis Enquirer* (1818–20). Vigorously asserting that the West must "share in the destinies of this Republic," he appealed to a mixture of agrarian, commercial, and slaveholding interests and was elected a U.S. senator in 1820, an office he held until 1851.

Building an electoral base among small farmers and traders in the mid-1820s, Benton became a crusader for the distribution of public lands to settlers. His views on many issues grew to coincide with those of President Andrew Jackson, and he was soon acknowledged as the chief spokesman for the Democratic Party in the Senate. In the 1830s he led in Congress Jackson's successful fight to dissolve the Bank of the United States. Benton also eschewed wildcat state banks as economically unsound; rather, he advocated a federal independent treasury and a hard-money policy.

Although he was generally considered proslavery and pro-Southern and was an early supporter of statehood for Missouri without restriction on bondage, in the 1840s he came to oppose the extension of slavery into the territories on the grounds that it inhibited the national growth and was a menace both to the Union and to his vision of the freeholder's Arcadia. This steadfast antislavery position, applied repeatedly to emotionally charged sectional issues, finally cost him his Senate seat in 1851. He continued his opposition in the House of Representatives, however, from 1853 to 1855. Unlike many other antislavery Democrats, he rejected the newly formed Republican Party, and he went so far as to oppose his own son-in-law, John C. Frémont, as Republican presidential nominee (1856).

Benton's imposing memoir-history of his years in the Senate, *Thirty Years' View*, 2 vol. (1854–56), was eloquent with agrarian and Jacksonian Democratic faith, opposition to slavery extension, and concern for the imperiled Union. He produced a learned *Examination of the Supreme Court's Dred Scott decision* in 1858 (which reaffirmed that the status of slaves, as property, could not be affected by federal legislation), and his 16-volume *Abridgement of the Debates of Congress* through 1850 is still useful.

Benton, Thomas Hart (b. April 15, 1889, Neosho, Mo., U.S.—d. Jan. 19, 1975, Kansas City, Mo.), one of the foremost painters and muralists associated with the American Regionalists of the 1930s.

The son of a member of Congress, Benton worked as a cartoonist for the *Joplin (Missouri) American* in 1906 and then studied at the Art Institute of Chicago. He studied at the Académie Julian during a three-year stay in Paris and was briefly influenced by such modern movements as Synchronism and Cubism. Upon his return to the United States he moved in avant-garde art circles, but he abandoned modernism about 1920, and in 1924 he began traveling through the rural American South and Midwest, sketching the scenes and people he encountered.

Benton emerged as the spokesman for the American Regionalist painters about 1929. His portrayals of Midwestern people and landscapes are done in an original style marked by rhythmically undulating forms and plasticity of movement, stylized features, cartoonlike figures, and brilliant colour. Like his fellow Regionalists, Benton was impatient with the domination of French art and believed that the rural areas of the South and Midwest were the source and strength of American art.

In the 1930s Benton painted a number of notable murals, among them several "City Scenes" (1930–31) for the New School for Social Research in New York City and the "Arts of the West" (1932; now in New Britain Museum of American Art, New Britain, Conn.)

"July Hay," oil and egg tempera painting by Thomas Hart Benton, 1943; in the Metropolitan Museum of Art, New York City

By courtesy of the Metropolitan Museum of Art, New York City, George A. Hearn Fund, 1943

for the Whitney Museum of American Art. He frequently transposed biblical and classical stories to rural American settings, as in

"Susanna and the Elders" (1938) and "Persephone" (1939).

Benton taught at the Art Students League in New York City, where Jackson Pollock was one of his pupils, and from 1935 to 1941 at the Kansas City Art Institute and School of Design, Kansas City, Mo.

Benton, William, in full WILLIAM BURNETT BENTON (b. April 1, 1900, Minneapolis, Minn., U.S.—d. March 18, 1973, New York, N.Y.), American publisher of *Encyclopædia Britannica* (1943–73), advertising executive, and government official.

William Benton
Blackstone/Shellburne, New York

The descendant of missionaries and educators, Benton was greatly influenced by his indomitable mother, a professor's widow, pioneer woman school superintendent, and Montana homesteader who instilled in him the drive to excel. As a schoolboy he spent summers helping his mother "prove up" her homestead claim. After a year at Carleton College (Northfield, Minn.), he transferred to Yale University, where he demonstrated an ability to write, became chairman of the *Yale Record*, and graduated in 1921. He also made one of the most influential friendships of his life with his classmate Robert M. Hutchins.

Benton was attracted to the advertising business, and, after eight years of increasing success in New York City and Chicago, he took on as partner Chester Bowles and founded the New York agency of Benton and Bowles in 1929. The agency flourished through the Great Depression, due in part to its innovations in radio entertainment programs sponsored by advertisers. By 1935 it was the sixth-largest advertising firm in the world, but Benton had grown restive in the profession and sold out to his partners for approximately \$1,000,000.

Hutchins, who had become president of the University of Chicago, urged Benton to come to the university as a vice president; in 1937 he agreed. His restless energy was well-suited to the educational ferment Hutchins was developing there, and his advertising and radio background enabled him to develop the distinguished "University of Chicago Round Table" of the air into an extremely popular national radio forum. While at the university, he played a significant role in helping one of its trustees, Paul G. Hoffman, organize the Committee for Economic Development. He was also, prior to U.S. involvement in World War II, active with Hutchins in the America First movement. There he came to know Robert E. Wood, chairman of Sears, Roebuck and Company.

Surprised to learn that the mail-order company reluctantly owned *Encyclopædia Britannica*, Benton suggested that Sears give the encyclopaedia to the university, and Wood shortly thereafter agreed. But the trustees were hesitant to take on responsibility for operating capital and general management, and Benton offered to put up his own money. The university accepted the gift, committing management and common stock to Benton

and retaining preferred stock and a royalty contract. Later, Benton acquired all the stock, and the royalty arrangements were modified; by the year after his death, the accumulated royalties to the university amounted to \$47,800,000.

In 1945 Benton resigned from the university to become U.S. assistant secretary of state. He converted for peacetime use the U.S. Information Service, the cultural exchange programs, and the Voice of America, and he organized U.S. participation in the establishment of UNESCO, in which he later (1963–69) served as U.S. representative. He also lobbied the Fulbright Scholarship Act and the Foreign Service Act of 1946 through Congress.

Appointed to a vacant U.S. Senate seat from Connecticut in 1949, Benton won reelection in 1950 to the remaining two years of that term. In the Senate he was among the first to decry the tactics for which Senator Joseph R. McCarthy of Wisconsin was eventually censured. He was defeated for a full term in the Republican electoral landslide of 1952.

Thereafter, for the first time since 1945, he devoted sustained attention to *Encyclopædia Britannica*, Inc., which he led on an unprecedented course of acquisition and expansion. He acquired an educational filmmaker, ERPI, from Western Electric and renamed it *Encyclopædia Britannica Films* (1943; later given to his four children); he published the 54-volume *Great Books of the Western World* (1952) and *Enciclopedia Barsa* (Spanish, 1957; Portuguese, 1964); and he set in motion joint ventures leading to the publication of major foreign encyclopaedias (*Encyclopædia Universalis*, French, 1968–75; *Britannica International Encyclopædia*, Japanese, 1972–75). He acquired *Compton's Pictured Encyclopædia* (1961), G. & C. Merriam Company (1964; Webster's dictionaries), and Frederick A. Praeger, Inc. (1964–76). Shortly thereafter he authorized a massive effort to create the 15th edition of the *Britannica*, the costs of which were ultimately \$32,000,000. He died a year before publication. In accordance with his wishes, the ownership of the *Britannica* went to the William Benton Foundation, a support foundation for the University of Chicago; the foundation held the *Britannica* until 1996. His own writings include two books: *This Is the Challenge* (1958) and *The Voice of Latin America* (1961). In 1968 Benton was honoured by the University of Chicago with the first William Benton Distinguished Service Medal.

Benton Harbor, city, Berrien county, southwestern Michigan, U.S. It lies on Lake Michigan near the mouth of the St. Joseph River, opposite its twin city of St. Joseph. Origin-

Shiloh, office building of the House of David religious sect, Benton Harbor, Mich.

Milt and Joan Mann from CameraMann

nally called Brunson Harbor and a part of St. Joseph, it was renamed for Thomas Hart Benton (a Missouri senator who had supported statehood for Michigan) and was separately incorporated as a village in 1869, following a disagreement over bridging the river. The House of David, a religious sect, established a colony there in 1903. The city is also the site of Lake Michigan (junior) College (1946).

Benton Harbor grew as a marketing and trucking centre for Michigan's fruit belt, a centre of industry, and the hub of a popular tourist region. In the 1960s and '70s, however, the city's manufacturing base and its population declined sharply. By the mid-1980s most businesses in the downtown area had closed. Inc. city, 1891. Pop. (2000) city, 11,182; Benton Harbor MSA, 162,453.

Bentong, town, West (Peninsular) Malaysia. It lies on the Bentong River, northeast of Kuala Lumpur, across the Main Range. It is a commercial centre for local rubber estates and alluvial tin mines. Genting Highlands is a nearby hill resort, and Genting Pass provides a spectacular panorama of hills and valleys dotted with vegetable gardens. The Bilut River valley, close-by, is the site of a rural development project. Raka Hill (3,000 feet [914 m]) and Chamang Falls are nearby recreation areas. Pop. (1991 prelim.) 23,975.

bentonite, clay formed by the alteration of minute glass particles derived from volcanic ash. It was named for Fort Benton, Mont., near which it was discovered.

The formation of bentonite involves the alteration of volcanic glass to clay minerals; this requires hydration (taking up or combination with water) and a loss of alkalies, bases, and possibly silica, with the preservation of the textures of the original volcanic glass. Bentonite consists chiefly of crystalline clay minerals belonging to the smectite group, which are hydrous aluminum silicates containing iron and magnesium as well as either sodium or calcium. Two types of bentonite are recognized, and the uses of each depend on specific physical properties.

Sodium bentonites absorb large quantities of water, swelling to many times their original volume, and give rise to permanent suspensions of gellike masses. These have been used to seal dams; in bonding foundry sands, asbestos, and mineral wool; as drilling muds; in portland cements and concrete, ceramics, emulsions, insecticides, soaps, pharmaceuticals, and paints; in the manufacture of paper; for clarifying water, juices, and liquors; and as a water softener to remove calcium from hard water. Calcium bentonites are nonswelling and break down to a finely granular aggregate that is widely used as an absorbent clay sometimes called fuller's earth.

Bentonite occurs in rocks that were deposited in the Ordovician to Tertiary periods (about 505 to 1.6 million years ago). In the United States the principal producers are Wyoming, Montana, California, Arizona, and Colorado. Important world producers are Greece, Japan, Italy, Brazil, Romania, Germany, Mexico, Argentina, Spain, India, Hungary, Poland, Canada, Turkey, and Cyprus.

bentwood furniture, type of furniture made by bending wooden rods into the required shape after they have been heated with steam. Although this method of bending wood was used by makers of the Windsor chair in the 18th century, it was not until the 1840s that its possibilities were exploited fully.

Michael Thonet, an Austrian cabinetmaker working in Vienna, experimented with designs based on birch rods bent into curvilinear shapes. His bentwood chairs are among the most successful examples of early mass-produced furniture. They were exhibited at the Great Exhibition of 1851 in London and were sold in vast quantities throughout Europe and

the United States for the rest of the century. Because bentwood furniture was light, comfortable, and inexpensive, as well as strong and graceful, it was widely used in clubs, hotels, shops, and restaurants. Many of the early bentwood pieces were stained black or dark brown. Seats were commonly made of cane or plywood and were the only portions not made by the bentwood method. One of the most aesthetically pleasing examples of bentwood furniture is the Thonet rocking chair.

Bent beechwood armchair by the Thonet brothers, Austria, c. 1870; in the Museum of Modern Art, New York City

By courtesy of the Museum of Modern Art, New York gift of Thonet Industries

The bentwood technique was revived by Le Corbusier and other leading designers and architects of the 20th century. The early tubular-steel furniture of the 1920s was also based on designs by Thonet and his sons.

Benty (Guinea): see Benti.

Benue, state, east-central Nigeria. A wooded savanna region, it is bounded on the south by Cross River and Enugu states, on the west by Kogi state, and on the north and east by Plateau and Taraba states. The Benue River defines the western half of Benue's northern boundary; to the southeast it has a common border of less than 25 miles (40 km) with Cameroon, where the Mokamoum River rises in the mountains of that country. The area is inhabited by the Tiv (the largest ethnic group in the state), the Idoma, and a number of smaller groups; all are mainly agricultural peoples, cultivating sesame seed, soybeans, shea nuts, cotton, yams, corn (maize), and rice as cash crops. Yams, sorghum, millet, peanuts (groundnuts), and cassava are raised as staple foods.

Mining is important in several scattered areas: south of the Benue River there are lead deposits near Akwana and limestone deposits near Yandev; north of the river there are saline springs in the Benue valley and major deposits of tin, niobium, and marble.

Makurdi (the state capital) and Oturkpo, on the railway from Port Harcourt, are among Benue's largest urban centres. Makurdi is the chief port of the Benue River. Gboko, which has a cement factory, and Katsina Ala are also sizable market towns. There are postsecondary institutions at Makurdi. Pop. (1991) 2,780,398.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Benue-Congo languages, largest language branch of the Niger-Congo language family, both in terms of numbers of speakers and of geographic extent. Languages of the Benue-Congo group are spoken from Nigeria south-

ward to the Cape of Good Hope in South Africa. The Benue-Congo group includes a number of minor languages and language subgroups of Nigeria and Cameroon and the extensive Bantu subgroup spoken throughout southern Africa. See also Bantu languages.

Benue River, also spelled BÉNOUÉ, river in western Africa, longest tributary of the Niger, about 673 miles (1,083 km) in length. It rises in northern Cameroon as the Bénoué at about 4,400 feet (1,340 m) and, in its first 150 miles (240 km), descends more than 2,000 feet (600 m) over many falls and rapids, the rest of its course being largely uninterrupted. During flood periods its waters are linked via the Mayo-Kebbi tributary with the Logone, which flows into Lake Chad. Below the Mayo-Kebbi the river is navigable all year by boats drawing less than 2.5 feet (0.75 m) and by larger boats for more restricted periods. A considerable volume of imports (particularly petroleum) is transported by river, and cotton and peanuts (groundnuts) are exported in the same way from the Chad region. Between Yola and Makurdi the Benue is joined by the Gongola, and it then flows east and south for about 300 miles (480 km).

A sandbar crosses the Benue at its confluence with the Niger, allowing only about 2 feet (0.6 m) of water when the flow is minimal. River traffic moving upstream from the delta is frequently delayed at Lokoja, Nigeria, waiting for a sufficient depth of water, and is obliged to return before the level falls too low.

Benxi (China): see Pen-hsi.

Benz, Karl (Friedrich) (b. Nov. 25, 1844, Karlsruhe, Baden [Germany]—d. April 4, 1929, Ladenburg, near Mannheim, Ger.), German mechanical engineer who designed and in 1885 built the world's first practical automobile to be powered by an internal-combustion engine.

Although the original Benz car (a three-wheeled vehicle, the *Motorwagen*, now preserved in Munich) first ran early in 1885, its design was not patented until Jan. 29, 1886. Benz & Co. was founded in Mannheim in 1883 to build stationary internal-combustion engines; the company completed its first four-wheeled automobile in 1893 and produced the first of a series of racing cars in 1899. In 1926 the Benz company merged with Daimler-Motoren-Gesellschaft to form Daimler-Benz, maker of Mercedes-Benz automobiles. Benz had left the firm about 1906 to organize C. Benz Söhne, Ladenburg, with his sons, Eugen and Richard.

Benzeniten (Japanese goddess): see Bentein.

benzaldehyde (C₆H₅CHO), the simplest representative of the aromatic aldehydes, occurring naturally as the glycoside amygdalin. Prepared synthetically, it is used chiefly in the synthesis of other organic compounds and to some extent in perfumes and flavouring agents.

Benzaldehyde was first isolated in 1803, and in the 1830s the German chemists Justus von Liebig and Friedrich Wöhler investigated the compound in studies that laid the foundation for the structural theory of organic chemistry. Industrially, benzaldehyde is made by processes in which toluene is first chlorinated to benzyl chloride or to benzal chloride. Direct oxidation of toluene with manganese dioxide also produces benzaldehyde.

Benzaldehyde is readily oxidized to benzoic acid and is converted to addition products by hydrocyanic acid or sodium bisulfite. It undergoes simultaneous oxidation and reduction with alcoholic potassium hydroxide, giving potassium benzoate and benzyl alcohol; with alcoholic potassium cyanide, it is converted to benzoin; with anhydrous sodium acetate and acetic anhydride, it gives cinnamic acid.

benzaldehyde green: see malachite green.

benzene (C₆H₆), the simplest aromatic hydrocarbon, widely used in industry. Discovered by the English scientist Michael Faraday in 1825 in illuminating gas made from whale oil, it was named benzene in 1845 by A.W. von Hofmann, the German chemist, who detected it in coal tar.

Benzene is obtained chiefly from coke-oven gas, which yields various grades of benzol sufficiently pure for most markets. Since 1950 benzene has also been prepared from petroleum. It is highly toxic, and long exposure to it may cause leukemia.

The structure of benzene has been of interest since its discovery. In 1865 the German chemist August Kekule proposed the hexagonal formula with alternate single and double bonds; it is still used despite two objections: benzene does not show the properties normally associated with double bonds, and the number of isomeric disubstituted benzenes is smaller than would be predicted. Kekule, therefore, postulated an oscillation of the double bonds, giving the ring the symmetry demanded by the number of known isomers. In 1931 the American chemist Linus Pauling, applying quantum mechanics, described a hybrid state resulting from resonance of the two structures that Kekule had assumed to be in equilibrium. This hybrid state explains the low reactivity of benzene by giving the carbon-carbon bond in the ring properties intermediate between those of normal double and single bonds. X-ray data support this view: the distance between the carbon atoms of a normal double bond is 1.34 angstroms, that of a single bond 1.54, and that of a benzene bond 1.39. A similar symmetrical structure is indicated by molecular-orbital considerations.

The parent substance of a large class of chemical compounds, benzene is used for the commercial synthesis of ethyl benzene, phenol, and maleic anhydride (used to make plastics); aniline (for dyestuffs); dodecylbenzene (for detergents); and chlorobenzenes (for insecticides). With sulfuric acid and with nitric acid, benzene gives monosubstituted, disubstituted, and trisubstituted products. With chlorine and bromine, substitution or addition takes place.

Benzene is remarkably resistant to oxidation, but, with vanadium oxide at 450° C (842° F), benzoquinone and maleic anhydride are formed. Reduction to cyclohexane takes place in the presence of hydrogen and nickel at 180° C (356° F). Passed through a red-hot tube, benzene yields diphenyl, diphenylbenzenes, acetylene, and hydrogen.

A colourless, limpid liquid with a characteristic odour, benzene boils at 80.1° C (176.2° F) and solidifies at 5.5° C (41.9° F). It is only slightly soluble in water. It is an excellent solvent for rubber, gums, fats, and a number of resins.

benzene hexachloride (BHC), any of several isomeric compounds (*i.e.*, of the same composition but different structures) formed by the reaction of chlorine with benzene in the presence of light; one of these isomers is an insecticide called Lindane, or Gammexane.

Benzene hexachloride was first prepared in 1825; the insecticidal properties were identified in 1944 with the γ -isomer, which is about 1,000 times more toxic than any of the other isomers formed in the reaction. The structural differences among these individuals are in the orientations of the chlorine atoms with respect to the ring of carbon atoms.

The chemical addition of chlorine to benzene produces a mixture containing at least six of the eight possible isomers of BHC; the γ -isomer, which makes up 20–25 percent of this mixture, is more soluble than the other isomers in certain solvents and can therefore be extracted in concentrated form. More volatile

than DDT, BHC has a faster but less protracted action upon insects. Its use had declined by the 1960s because of competition from other insecticides and its effects on fishes, which are killed by concentrations as low as one part per million in water.

Benzer, Seymour (b. Oct. 15, 1921, New York City), U.S. molecular biologist who developed (1955) a method for determining the detailed structure of viral genes and coined the term *cistron* to denote functional sub-units of genes. He also did much to elucidate the nature of genetic anomalies, called non-sense mutations, in terms of the nucleotide sequence of deoxyribonucleic acid (DNA), the "gene substance," and discovered a reversal, or suppression, of these mutations in certain bacteria.

Benzer received his Ph.D. from Purdue University, West Lafayette, Ind., in 1947. After holding various positions elsewhere, he returned to Purdue in 1953 and in 1967 joined the faculty of the California Institute of Technology. In 1975 he became the Boswell professor of neuroscience at that institution.

benzidine, an organic chemical belonging to the class of amines and used in making numerous dyestuffs. The azo dyes derived from benzidine are important because, unlike simpler classes of azo dyes, they become strongly fixed to cotton without a mordant.

Benzidine is prepared from nitrobenzene by reduction in alkaline medium to hydrazobenzene ($C_6H_5NHNHC_6H_5$), which is converted to benzidine by treatment with strong acid. This process is the simplest case of a general reaction, the benzidine rearrangement.

The chemical reactions of benzidine are typical of aromatic primary amines; with nitrous acid it yields the bisdiazonium salt, which may be coupled with aromatic amino or hydroxyl compounds to produce azo dyes.

Benzidine, a colourless, crystalline solid, practically insoluble in water, is toxic, causing dermatitis and bladder tumours. It is used in forensics for the identification of bloodstains.

benzoic acid, a white, crystalline organic compound belonging to the family of carboxylic acids, widely used as a food preservative and in the manufacture of various cosmetics, dyes, plastics, and insect repellents.

First described in the 16th century, benzoic acid exists in many plants; it makes up about 20 percent of gum benzoin, a vegetable resin. It was first prepared synthetically about 1860 from compounds derived from coal tar. It is commercially manufactured by the chemical reaction of toluene (a hydrocarbon obtained from petroleum) with oxygen at temperatures around 200° C (about 400° F) in the presence of cobalt and manganese salts as catalysts. Pure benzoic acid melts at 122° C (242° F) and is very slightly soluble in water.

Among the derivatives of benzoic acid are sodium benzoate, a salt used as a food preservative; benzyl benzoate, an ester used as a miticide; and benzoyl peroxide, used in bleaching flour and in initiating chemical reactions for preparing certain plastics.

benzoquinone, simplest member of the quinone family of organic compounds; see quinone.

benzyl alcohol, an organic compound, of molecular formula $C_6H_5CH_2OH$, that occurs combined with carboxylic acids (as esters) in balsams and oils of jasmine and other flowers. Several of its natural and synthetic esters have long been used in perfumery; the alcohol itself has become important in the second half of the 20th century as a developer booster in the processing of colour motion-picture film and as a dyeing assistant for filament nylons. Ben-

zyl alcohol is manufactured by the hydrolysis of benzyl chloride in the presence of soda ash.

Beograd (Yugoslavia): see Belgrade.

Beorhtric (d. 802), king of the West Saxons, or Wessex (from 786), succeeding Cynewulf.

Beorhtric was a descendant of Cerdic, founder of Wessex, but his parentage is unknown. In his time the Danes first began invading England, landing in Dorset. Beorhtric was troubled by a rival to his crown, Egbert (his eventual successor) and, failing to have him killed, succeeded in driving him into exile on the Continent, with the aid of his father-in-law Offa, king of Mercia. According to legend, Beorhtric died by poison, accidentally tasting a preparation made by his wife Eadburg, an ambitious woman who was wont to destroy her enemies by stratagem, or failing that, by poison.

Beothuk, extinct American Indian tribe of hunters and gatherers that resided on the island of Newfoundland; their language, Beothukan, may be related to Algonkian, but some authorities believe it to have been an independent language. When discovered by John Cabot in 1497 the tribe probably numbered no more than 500 persons; in the succeeding centuries the Beothuk were decimated by Europeans and by Micmac hunters crossing from Nova Scotia. A few survivors may have escaped to Labrador to intermarry with the Montagnais, but the last known Beothuk, Nancy Shewanahdit, died in 1829.

Little is known of Beothuk culture. The people were apparently divided into small bands of a few related families, each band having its own leader. Their skill as canoeists was noted by many early writers; they speared seals with primitive harpoons and fished for salmon and shellfish. Equally at home in the woods, they tracked deer with bow and arrow. Birch bark was used to make cooking vessels and wigwams. They smeared red ochre on their skin, apparently for both religious reasons and protection against insects; this habit is thought to be the source of the European reference to "Red" Indians.

Beowulf, heroic poem, the highest achievement of Old English literature and the earliest European vernacular epic. Preserved in a single manuscript (Cotton Vitellius A XV) from c. 1000, it deals with events of the early 6th century and is believed to have been composed between 700 and 750. It did not appear in print until 1815. Although originally untitled, it was later named after the Scandinavian hero Beowulf, whose exploits and character provide its connecting theme. There is no evidence of a historical Beowulf, but some characters, sites, and events in the poem can be historically verified.

The poem falls into two parts. It opens in Denmark, where King Hrothgar's splendid mead hall, Heorot, has been ravaged for 12 years by nightly visits from an evil monster, Grendel, who carries off Hrothgar's warriors and devours them. Unexpectedly, young Beowulf, a prince of the Geats of southern Sweden, arrives with a small band of retainers and offers to cleanse Heorot of its monster. The King is astonished at the little-known hero's daring but welcomes him, and after an evening of feasting, much courtesy, and some discourtesy, the King retires, leaving Beowulf in charge. During the night Grendel comes from the moors, tears open the heavy doors, and devours one of the sleeping Geats. He then grapples with Beowulf, whose powerful grip he cannot escape. He wrenches himself free, tearing off his arm, and leaves, mortally wounded.

The next day is one of rejoicing in Heorot. But at night as the warriors sleep, Grendel's mother comes to avenge her son, killing one of Hrothgar's men. In the morning Beowulf seeks her out in her cave at the bottom of

a mere and kills her. He cuts the head from Grendel's corpse and returns to Heorot. The Danes rejoice once more. Hrothgar makes a farewell speech about the character of the true hero, as Beowulf, enriched with honours and princely gifts, returns home to King Hygelac of the Geats.

The second part passes rapidly over King Hygelac's subsequent death in a battle (of historical record), the death of his son, and Beowulf's succession to the kingship and his peaceful rule of 50 years. But now a fire-breathing dragon ravages his land and the doughty but aging Beowulf engages it. The fight is long and terrible and a painful contrast to the battles of his youth. Painful, too, is the desertion of his retainers except for his young kinsman Wiglaf. Beowulf kills the dragon but is mortally wounded. The poem ends with his funeral rites and a lament.

Beowulf belongs metrically, stylistically, and thematically to the inherited Germanic heroic tradition. Many incidents, such as Beowulf's tearing off the monster's arm and his descent into the mere, are familiar motifs from folklore. The ethical values are manifestly the Germanic code of loyalty to chief and tribe and vengeance to enemies. Yet the poem is so infused with a Christian spirit that it lacks the grim fatality of many of the Eddic lays or the Icelandic sagas. Beowulf himself seems more altruistic than other Germanic heroes or the heroes of the *Iliad*. It is significant that his three battles are not against men, which would entail the retaliation of the blood feud, but against evil monsters, enemies of the whole community and of civilization itself. Many critics have seen the poem as a Christian allegory, with Beowulf the champion of goodness and light against the forces of evil and darkness. His sacrificial death is not seen as tragic but as the fitting end of a good (some would say "too good") hero's life.

That is not to say that *Beowulf* is an optimistic poem. The English critic J.R.R. Tolkien suggests that its total effect is more like a long, lyrical elegy than an epic. Even the earlier, happier section in Denmark is filled with ominous allusions that were well understood by contemporary audiences. Thus, after Grendel's death, King Hrothgar speaks sanguinely of the future, which the audience knows will end with the destruction of his line and the burning of Heorot. In the second part the movement is slow and funereal; scenes from Beowulf's youth are replayed in a minor key as a counterpoint to his last battle, and the mood becomes increasingly sombre as the *wyrd* (fate) that comes to all men closes in on him. John Gardner's *Grendel* (1971) is a retelling of the story from the point of view of the monster.

Beppu, city, Ōita Prefecture (*ken*), Kyushu, Japan, facing Beppu-wan (Beppu Bay). Lo-

Hot springs at Beppu, Japan

cated at the base of a steep symmetrical fan of coarse volcanic detritus, it has been a major hot-springs resort since the late 19th century. After World War II the city's accommodations were increased when former villas were converted into hotels and convalescent homes. Beppu also houses national medical facilities and volcanic-research institutes.

The Beppu district, including eight spas, is also noted for its boiling ponds, called *jigoku* ("hell"), which eject mud high into the air. Other tourist attractions are Mount Tsurumi, Lake Shidaka, and the Kijima plateau. Pop. (1994 est.) 129,387.

Berain, Jean, THE ELDER (b. Oct. 28, 1637, Saint-Mihiel, France—d. Jan. 24, 1711, Paris), French draftsman, engraver, painter, and designer who was called by his contemporaries the oracle of taste in all matters of decoration.

Trained under the great French decorator Charles Le Brun, Berain was working at the Louvre when appointed, in 1674, royal designer to King Louis XIV of France. After the death of Le Brun in 1690, he was commissioned to compose and supervise the entire exterior decoration of Louis's ships. Skillful in adapting the work of his predecessors, he designed tapestries, accessories, furniture, costumes, and decorations for opera, court festivals, and public solemnities. His work inspired the ornamentation of rooms and furniture by other cabinetmakers, such as André-Charles Boulle, whose elaborate work in etched brass and tortoiseshell marquetry owes much of its inspiration to Berain's designs. Other craftsmen followed Berain in using Berain for their chief source, and soon he exercised enormous influence all over Europe.

Berain satisfied Louis's passionate appetite for splendour and grand entertainment. He designed chimneypieces, drapery, ornamental mounts, andirons, faience, chandeliers, sconces, and wall panels—all filled with such fantastic iconography as flaming hearts being hammered on anvils by cupids, assorted animals integrated into florid arabesques, and

daisms, a benediction (expression of praise or thanks directed to God) that is recited at specific points of the synagogue liturgy, during private prayer, or on other occasions (e.g., before performing a commandment or for being spared from harm in the face of danger). Most berakoth begin with the words *Barukh Attah Adonai Eloheinu Melekh ha-Olam* ("Blessed art Thou, O Lord our God, King of the Universe").

Berakoth for food and wine are customarily recited in many Jewish homes as a grace before meals—e.g., "Blessed art Thou, O Lord our God, King of the Universe, who has created the fruit of the vine." Many of the berakoth also thank God for choosing the Jewish people to observe the holidays and remember him in this way.

Béranger, Pierre-Jean de (b. Aug. 19, 1780, Paris, France—d. July 16, 1857, Paris), French poet and writer of popular songs, celebrated for his liberal and humanitarian views during a period when French society as a whole was undergoing rapid and sometimes violent change.

Béranger, detail of a lithograph by Metznmacher, 1835

By courtesy of the Bibliothèque Nationale, Paris

Béranger was active in his father's business enterprises until they failed. He then found work as a clerk at the University of Paris (1809). He led a marginal existence, sleeping in a garret and doing literary hackwork in his spare time. After the downfall of Napoleon, he composed songs and poems highly critical of the government set up under the restored Bourbon monarchy. They brought him immediate fame through their expression of popular feeling, but they led to dismissal from his post (1821) and three months' imprisonment (an experience he compared favourably to life in his garret).

Béranger's lyrical, tender songs glorifying the just-passed Napoleonic era and his satires ridiculing the monarchy and reactionary clergy were written in a clear, simple, attractive style. Both song and satire soon made him as well known among ordinary country people as in the liberal literary circles of Paris. He thus became an influential and respected figure in his own lifetime. He was able to live on the proceeds of his works and refused all official honours, even membership of the French Academy. After the Revolution of 1848 he was elected a member of the new democratic parliament.

In his private character he was noted for his amiability and generosity, as ready to receive help from his many friends in Paris literary society as he was to give it when able. His best-known poems are "Le Roi d'Yvetot" (written c. 1813; "The King of Yvetot"), "Le Dieu des pauvres gens" ("The God of the Poor People"), "Le Sacre de Charles le Simple" ("The Coronation of Charles the Simple"), "La Grand-Mère" ("The Grandmother"), and "Le Vieux Sergent" ("The Old Sergeant").

Consult the INDEX first

Berār, also spelled BIRĀR, cotton-growing region in east-central Mahārāshtra state, western

India. The region extends for approximately 200 miles (320 km) east-west along the Pūrna River basin and lies 700 to 1,600 feet (200 to 500 m) above sea level. Berār is bounded on the north by the Gāwīlgarh Hills (Melghāt) and on the south by the Ajanta Range. Historically the name Berār was given to a province of varying extent, but it no longer has any administrative meaning, having been superseded by the term Vidarbha, though this name refers to a larger area including the Nāgpur Plain and other territory in the easternmost part of Mahārāshtra.

Berār emerged as a distinct political entity after the incursions of Muslim armies in the 13th century AD. It formed part of several Muslim kingdoms until, on the breakup of the Mughal Empire, it fell to the Nizām of Hyderābād. It came under British control in 1853 and was administratively abolished as a province in 1948.

The southernmost reaches of Berār on the Buldāna-Yeotmāl plateau are generally less developed than the rich cotton area of the Pūrna River basin. The region is predominantly agricultural, with half of the land under cash crops (cotton and oilseeds). Almost all industry is based on the processing of these crops. The principal cities are Amrāvati and Akola.

Berat, city, southern Albania. It lies along the Osum River, just west of Tomorr Peak (7,927 feet [2,416 m]). The town is situated among steep hills cut through by the Osum. The terraced houses and several mosques and churches are surmounted by the ruins of a citadel. The oil field at Stalin is 7 miles (11 km) north.

Located strategically between the ancient regions of Illyria and Epirus, Berat was the scene of many battles. Probably the site of the ancient Greek town Antipatreia (Byzantine Pulcheriopolis), the city was rebuilt in the 13th century and renamed Beligrad (from which the name Berat derives) in the 14th century by the Serbs. It was refortified by Ali Paşa, the Turkish grand vizier, in the 19th century. A Turkish bridge (1780) connects the west-bank Christian quarter of Goritsa (Old Slavonic: "Little Village") with the east-bank Muslim quarter of Moré-Tchélépi.

In the late 19th century, as the capital of southern Albania, Berat served as the centre of the Albanian nationalist movement and a major base of support for the Albanian League. It was in Berat, in 1944, that the communist-controlled Anti-Fascist National Liberation Council proclaimed itself as the provisional government of the country. Pop. (1990 est.) 43,800.

Berber, any of the descendants of the pre-Arab inhabitants of North Africa. The Berbers are scattered in tribes across Morocco, Algeria, Tunisia, Libya, and Egypt and tend to be concentrated in the mountain and desert regions of those countries. Smaller numbers of Berbers live in the northern portions of Mauritania, Mali, and Niger. They speak various languages belonging to the Afro-Asiatic language family. (See Berber languages.)

The ancient Numidians, who were at first allies of Carthage and then clients of the Roman Empire, were Berbers. (The term Berber is derived from the Roman term for barbarians, *barbara*, as is the name Barbary, which formerly denoted the North African coast.) The Berbers strenuously resisted the Arab invasion of the 7th century AD, but they were eventually converted to Islām. Many Berbers also adopted Arabic as their language and were thus assimilated into the Arab community. The Berbers played an important role in the Muslim conquest of Spain in the 8th century, and two distinct confederations of

Engraving of a design for a table from his book, *Ornaments Inventory*, by Jean Berain the Elder, c. 1670-1700

By courtesy of the Victoria and Albert Museum, London

similar grotesqueries. As a result of Louis's fondness for Oriental art, Berain delved into Chinese motifs, which became the height of fashion in the mid-18th century. His decorative experiments during the last part of Louis's reign influenced subsequent Rococo artists in fields ranging from furniture to porcelain.

Berain designed the stage decor for extravagant theatrical productions devised by Molière. His son Jean Berain the Younger (1678-1726), best known as an engraver, was his pupil and succeeded to his official functions. His brother Claude Berain (d. 1726?) was an engraver to the king.

berakah, also spelled BERAKHA, or BERACHAH (Hebrew: "blessing"), plural BERAKOTH, BERAKOT, BERACHOTH, or BERACHOT, in JU-

Berber tribes, the Almoravids and Almohads, built Islāmic empires in northwestern Africa and Spain in the 11th–13th century. In the 12th century a wave of invading Bedouin Arabs wrecked the Berbers' peasant economy in coastal North Africa and converted many of the settled tribes into nomads. In subsequent centuries, the Berbers of the mountain and desert regions often remained beyond the control of the coastal states. They were pacified by the French in the 1880s, however.

In the late 20th century there were about 8,900,000 Berbers in Morocco, about 4,700,000 in Algeria, and smaller numbers in neighbouring countries. The Berbers are divided into a number of tribes that speak distinct languages. The largest of these tribes are the Rif, Kabyle, Shawia, Tuareg, Harāṭīn (*qq.v.*), Shluh, and Beraber.

Though most Berbers are sedentary farmers, some tribes cultivate the lowlands in winter and graze their flocks in mountain meadows during the summer. Others are year-round pastoral nomads. The principal Berber crops are wheat, barley, fruits, vegetables, nuts, and olives. Cattle, sheep, and goats are maintained in herds, together with oxen, mules, camels, and horses for draft and transportation. Sedentary farmers occupy single-story stone houses, and seasonally nomadic tribes erect strongholds of pounded earth for defense and storage and live in goat-hair tents when at pasture. Most home industries, such as pottery making and weaving, are in the women's domain. Many modern-day Berbers are migrant labourers working in Spain or France, and others have migrated to large cities in their native countries to seek employment.

Almost all Berbers are Muslims, but various pre-Islāmic religious elements survive among them, chiefly the worship of local saints and the veneration of their tombs. Women have a greater degree of personal freedom among the Berbers than they do among Arabs, and Berber local governments tend to be more communal and less authoritarian than their Arab counterparts. Berber society is quite fragmented. A handful of families make up a clan, several clans form a community, and many communities make a tribe. The simplest Berber political structure, found in villages in Algeria and the High (Haut) Atlas mountains, is the *jamā'ah*, a meeting of all reputable adult men in the village square. Fully nomadic tribes elect a permanent chieftain and council, while seasonal nomads annually elect a summer chief to direct the migration. The largest Berber social units, the tribes, are only loosely organized.

Berber languages, also called BERBERO-LIBYAN, group of languages spoken in scattered areas throughout northern Africa from Egypt westward to the Atlantic Ocean and from the Niger River northward to the Mediterranean Sea. The Berber languages belong to the Afro-Asiatic (formerly Hamito-Semitic) language family, together with the Semitic, Cushitic, and Chadic languages.

The group includes Tamashek (Tamahaq, Tamajeq), or Tuareg, spoken by the Tuaregs in the central Sahara and north of the Niger River; Shawia, or Chaouīa, spoken by the Shawias, and Kabyle, or Zouaouah, in Algeria; Rif and Tamazight in Morocco; Shluh (Tashelhayt, or Chleuh), spoken by the Shluhs in Morocco and Mauritania; Zenaga in Mauritania and northern Senegal; and the ancient extinct Libyan, or Numidian, language. Some scholars also place the extinct Guanche language of the Canary Islands in this group, but the relationship has not been proved. The Berber languages differ greatly from one another in their sound systems but only slightly in grammar and vocabulary.

The Arabic script is used for writing all the present-day languages of this group except for Tamashek, which uses a modified form of the writing system used by speakers of the ancient Libyan language. The languages borrowed many words from Arabic, and some also contain words borrowed in ancient times from Latin and Punic. Except for the numerous short inscriptions in ancient Libyan and a few modern religious texts, the Berber languages have practically no written literature.

Berbera, port, northwestern Somalia, on the Gulf of Aden. It lies at the terminus of roads from the towns of Hargeysa and Burko and has an airport. Known during classical times and to Ibn Sa'īd (d. 1286) and other early Arab geographers, Berbera was one of the Muslim settlements of the medieval state of Adal. It was sacked by the Portuguese in 1518 and occupied by the sharifs of Mocha in the 17th century, by the Egyptians in 1875, and by the British in 1884. It served as the capital of British Somaliland until 1941. Water is supplied by pipeline from Dubar to the south. Berbera's trade, mainly with Aden (Yemen), 150 miles (240 km) north and across the Gulf of Aden, has increased since World War II because of improved port facilities, which were further modernized in the late 1960s and early '70s. Exports include sheep, hides and skins, ghee, frankincense, myrrh, and gum arabic. A portion of the population migrates to the Galgodon (Ogo) Highlands during the hot season. Pop. (1985 est.) 70,000.

Berberidaceae, the barberry family of the buttercup order (Ranunculales), comprising 12 genera of perennial herbs and shrubs. Its members occur in most temperate regions of the world. In the shrubs the leaves are spiny-margined. The form of the flower is highly variable.

The most important and largest genus is *Berberis*, with about 500 species, among which are many ornamentals, including the barberry. Other members of interest include heavenly bamboo (*Nandina domestica*), an indoor pot plant; mayapple (*Podophyllum peltatum*), a woodland wildflower; *Epimedium*, a ground cover; and Oregon grape (*Mahonia*), a genus of broad-leaved evergreen shrubs.

Berbice River, river in eastern Guyana. The Berbice River rises in the highlands of the Rupununi region and flows northward for 370 miles (595 km) through dense forests to the coastal plain. It enters the Atlantic Ocean at New Amsterdam, where its flow is obstructed by shallows. The basin of the Berbice is restricted by the proximity of its larger neighbours, the Essequibo and Courantyne rivers, and its only tributary of consequence is the Canje. The river is navigable for 100 miles (160 km) by small vessels; many rapids lie farther upstream. Its name is that of the Dutch colony of Berbice, which in 1831 became part of British Guiana (now Guyana).

Berceo, Gonzalo de (b. c. 1198, Berceo, Spain—d. c. 1264), the first author of verse in Castilian Spanish whose name is known.

Berceo was a secular priest associated with the Monastery of San Millán de Cogolla in the Rioja, where he served as an administrator and notary. His works combined classical rhetorical style, popular poetic form, and the exhortative style of the sermon.

Berceo's subjects were religious topics—the lives of the saints, the Mass, and the miracles of the saints and the Virgin. He wrote in Castilian, a dialect which was then considered inferior to Galician-Portuguese, in order to bring religious learning to the common people. He used both Latin and folk sources and adhered consistently to the *cuaderna vía*, a verse form of four-line stanzas, 14 syllables to the line, with each line broken by a caesura. In *Vida de San Millán* (c. 1234; "Life of Saint Millán"), Berceo promoted a local

saint in order to encourage contributions to the monastery. Among his other works were *Vida de Santa Oria* (c. 1265; "Life of Saint Oria"), *Milagros de Nuestra Señora* (c. 1245–60; "Miracles of Our Lady"), and *Sacrificio de la misa* (c. 1237; "Sacrifice of the Mass").

Berceo's verse rarely reaches poetic heights but has simplicity and homely charm. Its clear and amusing rustic images contrast with the chivalric epics of the period and the author's own devout mysticism. It also sheds light on medieval thought and its development.

berceuse (French: "lullaby"), musical composition, typically of the 19th century, having the character of a lullaby. While the word appears to imply no particular formal pattern, rocking rhythms in $\frac{3}{4}$ time are common not only in the vocal prototype but also in its stylized instrumental counterparts, usually for piano. A well-known example of the latter is Frédéric Chopin's *Berceuse*, Opus 57, with its abundant figurations above a sequence of chords in the left hand.

Prominent among subsequent composers of berceuses were Franz Liszt, Camille Saint-Saëns, and Maurice Ravel. An appealing instance is the *Berceuse* for voice, piano, and cello by the early 20th-century Dutch composer Alphons Diepenbrock.

Berchem, Nicolaes Pietersz(oon), also called CLAES PIETERSZ. BERCHEM, Berchem also spelled BERGHEM, or BERRIGHEN (b. Oct. 1, 1620, Haarlem, Neth.—d. Feb. 18, 1683, Amsterdam), Dutch landscape painter and etcher who achieved wide popularity.

"Italian Landscape," painting by Nicolaes Pietersz. Berchem, 1656; in the Rijksmuseum, Amsterdam
By courtesy of the Rijksmuseum, Amsterdam

Berchem received instruction from his father, Pieter Claesz, a prominent still-life painter, and from several other Dutch masters. After study in Italy, he produced many landscapes in warm colours and an Italian style. He also painted cityscapes and winter and pastoral scenes, all in the tradition of Dutch naturalism enlivened by vivid colours and glowing light. His finest pictures are at the Rijksmuseum in Amsterdam and the Hermitage, St. Petersburg.

Berchtesgaden, town, Bavaria Land (state), southern Germany, situated on the Berchtesgaden Stream in a deep valley surrounded on three sides by Austrian territory. The opening of its salt mines in the 12th century was the beginning of many centuries of bitter rivalry with Salzburg and Hallein. From 1300 the town was ruled by the provosts of its Augustinian abbey (founded c. 1102), who became princes of the Holy Roman Empire in 1491. The town was occupied by Austrian troops

Berchtesgaden, Ger., with the Watzmann, a peak of the Salzburg Alps, in the background

© Ric Ergenbright

in 1704 and was annexed to Austria in 1805. Following a brief period of French rule (1809–10), it passed to the Bavarian kingdom. The town was a major resort and recreational centre during the Allied occupation after World War II.

Medieval landmarks include the abbey church, on the site of the 12th-century basilica, and the castle, which was originally the residence of the provosts and was later the summer residence of the Bavarian kings (it now houses a museum). On the Obersalzberg, 1,640 feet (500 m) above the town (linked by a cable railway), were the chalets of Adolf Hitler, Hermann Göring, Martin Bormann, and other Nazi leaders, with air-raid shelters, barracks, and various installations. Hitler's chalet, the Berghof, became quite prominent in the years before World War II. In a conference there in February 1938, Hitler compelled Chancellor Kurt von Schuschnigg to accept the German domination of Austria. In mid-September, Hitler met the British prime minister, Neville Chamberlain, at the chalet for their first face-to-face discussion of his demands on Czechoslovakia. Destroyed in an Allied air attack in April 1945, the Berghof's ruins were leveled in 1952, and trees were planted on the site. An elevator cut in solid rock connects with Hitler's private retreat on top of the mountain, the "Eagle's Nest," which is now a teahouse.

Berchtesgaden's economic mainstay is the tourist trade, which is based on the scenic locale (including the Königssee, a picturesque Alpine lake to the south), mountain-climbing and skiing facilities, and saline baths. The ancient salt mines are still in operation. Other activities include agriculture, wood carving, brewing, the manufacture of stockings and buttons, and china painting. Pop. (1992 est.) 7,865.

Berchtold, Leopold, Count (Graf) von, in full LEOPOLD ANTON JOHANN SIGISMUND JOSEPH KORSINUS FERDINAND, COUNT VON BERCHTOLD (b. April 18, 1863, Vienna, Austria—d. Nov. 21, 1942, near Csepreg, Hung.), Austro-Hungarian foreign minister whose ultimatum to Serbia (July 23, 1914) was followed (Aug. 1) by the outbreak of World War I.

A wealthy landowner in Hungary and Moravia, Berchtold, through marriage, became one of the richest men in Austria-Hungary. He entered the diplomatic service in 1893, held posts in Paris and London, and in 1906 was appointed ambassador to Russia. On Feb. 19, 1912, after the death of Aloys, Count Lexa von Aehrenthal, Berchtold reluctantly succeeded him as foreign minister. He soon fell under the influence of Franz, Count Conrad von Hötzendorf, chief of the general staff, but was restrained by the heir presumptive, Archduke Francis Ferdinand. At the be-

ginning of the First Balkan War (October–December 1912), Berchtold unrealistically attempted to maintain the territorial status quo, and after the war he prevented Serbia from gaining a corridor to the Adriatic Sea. He was subsequently confronted with the Serbian ambition to form a state comprising all the South Slav peoples, including those subject at that time to Austria-Hungary. His vacillation aggravated the tension between Austria and Serbia, leading to the assassination of Archduke Francis Ferdinand by a Bosnian Serb at Sarajevo, Bosnia, June 28, 1914.

Encouraged by Conrad von Hötzendorf, who for years had urged a preventive war against Serbia, Berchtold, with the consent of the council of joint ministers, decided on an ultimatum, the onerous terms of which would assure its rejection by the Serbian government. He informed Germany, which granted Austria-Hungary a "blank check" for unconditional support, but not Italy, for fear that Rome would report immediately to St. Petersburg and thereby hasten the mobilization

Berchtold

of Russia on Serbia's side—a prospect that Berchtold earlier had failed to take seriously. After the outbreak of the war, when Italy demanded territory from Austria-Hungary in return for no more than "benevolent neutrality," Berchtold was forced to resign Jan. 13, 1915. He then accepted high office at court.

Berdiaev, Nikolay Aleksandrovich: *see* Berdyayev, Nikolay Aleksandrovich.

Berdiansk (Ukraine): *see* Berdyansk.

Berdichev (Ukraine): *see* Berdychiv.

Berdichevsky, Micah Joseph, pseudonym MICAH JOSEPH BIN GORION (b. Aug. 19, 1865, Medzhibozh, Podolia, Russian Empire [now Medzhybizh, Ukraine]—d. Nov. 18, 1921, Berlin, Ger.), author of works in Hebrew, German, and Yiddish. His impassioned writings, perhaps more than those of any other Jewish author, bear poignant witness to the "rent in the heart" of 19th-century Jews torn between tradition and assimilation. He was also the author of enduring reconstructions of Jewish legends and folklore.

Berdichevsky was the son of a Hasidic rabbi. His teenage marriage was broken off when his enraged father-in-law discovered that he was secretly studying works of the *Haskala* (Enlightenment), a movement advocating that Jews integrate themselves into modern secular society. Berdichevsky studied for a time at the Volozhin seminary and then entered the University of Breslau (now Wrocław, Pol.) at the age of 25.

In these years the inner struggle between his upbringing and his desire for spiritual liberation intensified. Over the next several decades, he expressed this conflict in an outpouring of stories, essays, and novels. He spent the last 10 years of his life in Berlin, working as a dentist and re-creating with insight and poetic appreciation portions of the Haggada, Jewish writings dealing with legends and folklore. He published part of them in Hebrew as *Me-Otsar*

ha-agadah (1913–14; "From the Treasures of the Haggada").

Berdichevsky's stories, collected in volumes such as *Me-Huts le-tehum* (1922–23; "Out of the Pale") and *Ben ha-homot* ("Between the Walls"), all deal with the travails of Jewish life. His fiction varies in style and deals either with protagonists striving futilely to escape the weight of Jewish tradition through assimilation or with Jews attempting to survive within the pale of the ghetto.

Berdichevsky's essays, collected posthumously in nine volumes in 1922, include *Bi-sede sefer* ("In the Field of Literature"), *Ba-derekh* ("On the Way"), and *Malshavot ve-torat* ("Reflections and Teachings"). They contain literary criticism, polemics against the dead hand of Jewish tradition, and idealizations of Hasidism. Also among his essays are those attacking the "spiritual Zionism" of the eminent author Ahad Ha'am. Berdichevsky promulgated an idiosyncratic theory of Jewish history, maintaining that there had been no unified spiritual philosophy in Judaism's past (thus justifying his own departure from tradition). His essays entitled *Horeb* (a biblical name for Mount Sinai) interpret sympathetically some of the beautiful and humane ideas to be found in Haggada writings. In the opinion of some authorities, Berdichevsky's most enduring contribution to literature is his retelling of the Haggada stories.

Berdsck, city, Novosibirsk *oblast* (province), central Russia. It lies along the Novosibirsk Reservoir just south of Novosibirsk city. Founded at the beginning of the 18th century as a fortress, it became a city in 1944. Berdsck's industrial activities include flour milling and radio production. It is on the Turksib Railway. A recreation centre, it has sanatoriums on the outskirts. Pop. (1993 est.) 81,900.

Berdyansk, also spelled BERDIANSK, formerly (1939–58) OSIPENKO, city and port, Zaporizhzhya *oblast* (province), southeastern Ukraine. It lies along the Berdyansk Gulf of the Sea of Azov. Founded in 1827, the city is a holiday and health resort. Its industries include engineering, oil processing, flour milling, and fishing. Pop. (1991 est.) 138,700.

Berdyayev, Nikolay Aleksandrovich, Berdyayev also spelled BERDIAEV (b. March 6, 1874, Kiev, Ukraine, Russian Empire—d. March 23, 1948, Clamart, France), religious thinker, philosopher, and Marxist who became a critic of Russian implementation of Karl Marx's views and a leading representative of Christian existentialism, a school of philosophy that stresses examination of the human condition within a Christian framework.

During his student days at Kiev University (from 1894), Berdyayev engaged in Marxist activities that led in 1899 to a sentence of three years' exile in Vologda, in northern Russia. After his release he traveled through Germany, returning in 1904 to Russia. After another visit abroad in 1907 he moved to Moscow, where he joined the Russian Orthodox Church. He was somewhat of a nonconformist, and he attacked the church's Holy Synod in an article and was tried for it in 1914. Escaping sentence after his case was dropped at the outbreak of the Russian Revolution (1917), he was in favour with the new regime and was appointed professor of philosophy at Moscow University in 1920.

Two years later Berdyayev was expelled from the Soviet Union when it became clear that he would not embrace orthodox Marxism. Other exiles joined him in founding the Academy of Philosophy and Religion in Berlin in 1922. In 1924 he transferred the academy to Paris and founded there a journal, *Put* (1925–40; "The Way"), in which he criticized Russian com-

munism. He became known as the foremost Russian émigré in France.

In further developing his existentialist philosophy, Berdyayev was inclined to prefer un-systematic and mystical modes of expression over logic and rationality. He asserted that truth was not the product of a rational quest but the result of "a light which breaks through from the transcendent world of the spirit." He believed that man's greatness was his share in this world of the spirit and in the divine capacity to create. A human act of creation enables man to arrive at truth by penetrating the confusion of the surrounding environment.

Highly sensitive to the moods of his time, Berdyayev believed that the "contradictions of modern history" portended a new era of "divine-human creation" through which man could revitalize the world. Implicit in that belief were remnants of his early Marxist faith that man could improve his lot. Though Berdyayev condemned "the crimes and violence of the Soviet order," he claimed to see signs of the "divine-human creation" in the progress made in Russia after the revolution.

Among his significant works are *Dukh i realnost* (1927; *Freedom and the Spirit*), *O naznacheni cheloveka* (1931; *The Destiny of Man*), *Essai de métaphysique eschatologique* (1946; *The Beginning and the End*), *Santopoznaniye: Opyt filosofskoy avtobiografii* (1949; *Dream and Reality: An Essay in Autobiography*), and *Istoki i smysl russkogo kommunizma* (1955; *The Origin of Russian Communism*).

BIBLIOGRAPHY. Biography and criticism are found in Oliver Fielding Clarke, *Introduction to Berdyayev* (1950); Matthew Spinka, *Nicolas Berdyayev: Captive of Freedom* (1950); and Donald Alexander Lowrie, *Rebellious Prophet* (1960).

Berdychiv, Russian BERDICHEV, or BERDIČEV, city, Zhytomyr oblast (province), northwestern Ukraine. Founded in 1482 as a Lithuanian fortress, Berdychiv was Polish from 1569 until 1793. The 16th-century fortress walls survive, as does the Roman Catholic church in which the French novelist Honoré de Balzac married Eveline Hanska, a wealthy Russian widow, in 1850 after an 18-year courtship. Before 1917 an important trading centre, Berdychiv is now significant for its engineering works, sugar refinery, tannery, and clothing factories and is a railway junction on the Zhytomyr-Vinnitsya and Rivne-Kozyatyn lines. Pop. (1991 est.) 93,400.

Bérégovoy, Pierre, in full PIERRE EUGÈNE BÉRÉGOVOY (b. Dec. 23, 1925, Déville-les-Rouen, France—d. May 1, 1993, Nevers), French politician, prime minister from April 1992 to March 1993.

In 1941, at the age of 15, Bérégovoy left school to work as a machinist. He later worked for the national railways and joined the French Resistance. In 1950 he took a job at Gaz de France, the national gas utility. He remained with this company for 31 years, eventually rising to an executive position.

After World War II Bérégovoy joined the socialist party (SFIO). He was a leading member of various socialist organizations until 1969, when he rejoined the reorganized Socialist Party (PS), becoming a member of its executive.

When François Mitterrand was elected president of France in 1981, Bérégovoy was named secretary-general of the Élysée Palace. In 1982 he became minister of social affairs and in 1984 minister of the economy, finance, and budget. A moderate socialist, Bérégovoy implemented an economic austerity program, supported a strong franc, and reformed and modernized France's financial markets. He lost his ministry when the Socialist government left office in 1986 but was reappointed when they returned to power in 1988.

In April 1992 Mitterrand named Bérégovoy to succeed Edith Cresson as prime minister. He resigned in March 1993, when the Socialists were overwhelmingly defeated in general elections. Bérégovoy's popularity had declined along with that of his party, whose policies were blamed for a sharp rise in unemployment and a slowdown in the economy; he and other leading Socialists had also been accused of corruption. Bérégovoy shot himself a few weeks after stepping down.

Berengar, name of rulers grouped below by country and indicated by the symbol ●.

Foreign-language equivalents:

German Berengar

Italian Berengario

GERMANY/HOLY ROMAN EMPIRE

● **Berengar**, also called BERENGARIO, DUKE AND MARCHESE (duca e marchese) DEL FRIULI (d. April 7, 924), king of Italy from 888 (as Berengar I) and Holy Roman emperor from 915. He was the founder of a line of princes of the 9th–11th century who in popular Italian histories are ranked incorrectly as national kings. Through his mother he was a grandson of the Carolingian emperor Louis I the Pious.

After the fall of the emperor Charles III the Fat, Berengar was elected king of Italy in 888 at Pavia. He acknowledged the overlordship of the East Frankish king Arnulf, and from early 889 he was confined to northeastern Italy by Guy of Spoleto (d. 894), who at that time ruled the rest of Italy. After the death of Guy's son and successor, Lambert (898), Berengar finally was recognized throughout the kingdom.

In 899 Berengar was defeated on the Brenta River by the invading Magyars. In 900 King Louis of Provence (the future emperor Louis III the Blind) was invited to Italy by a group of nobles antagonistic to Berengar. Louis was crowned king of the Lombards and then, in 901, was made emperor by Pope Benedict IV. Within a year Berengar had expelled Louis from Italy. Louis returned, however, and was captured at Verona on July 21, 905, blinded, and sent back to Provence. Berengar himself was crowned emperor by Pope John X in 915. But once again he was challenged by some Italian noblemen, who in 922 called in King Rudolf II of Burgundy. Rudolf defeated Berengar the next year at Fiorenzuola, near Piacenza. The following spring Berengar was murdered by one of his own men.

ITALY

● **Berengar I**: see Berengar (Germany/Holy Roman Empire).

● **Berengar II**, also called BERENGARIO, MARCHESE D'IVREA E DI GISLA (b. c. 900—d. 966), grandson of Berengar I and king of Italy from 950 to 952.

Berengar was important in the career of the German king and Holy Roman emperor Otto I the Great. For several months in 951 he held captive Adelaide, the daughter and widow of kings of Italy; she escaped and married Otto, who assumed the title of king of the Lombards and made Berengar his vassal. Later (from 960) Berengar and his son Adalbert attacked Pope John XII, on whose appeal Otto marched into Rome and was crowned emperor (962). John's subsequent negotiations with Berengar caused Otto to depose the pope and imprison Berengar in Germany (963).

Berengar OF TOURS, Latin BERENGARIUS, French BÉRENGER DE TOURS (b. c. 999, probably Tours, Touraine [now in France]—d. Jan. 10, 1088, priory of Saint-Cosme, near Tours), theologian principally remembered for his leadership of the losing side in the crucial eucharistic controversy of the 11th century.

Having studied under the celebrated Fulbert at Chartres, Berengar returned to Tours after

1029 and became canon of its cathedral and head of the School of Saint-Martin, which rivaled Bec under Lanfranc, who was later to be his opponent. Berengar befriended Geoffrey, Count of Anjou, and Eusebius Bruno, later bishop of Angers. About 1040 he was appointed archdeacon of Angers.

Shortly thereafter, Berengar, who always exhibited great independence of thought, began to teach ideas contrary to prevailing beliefs. Most notably, he rejected the then-current view of transubstantiation credited to the 9th-century abbot of Corbie, St. Paschasius Radbertus, who professed that the bread and wine, after consecration in the mass, became the real body and blood of Christ. Berengar favoured the interpretation formulated in *De corpore et sanguine Domini* ("Concerning the Body and Blood of the Lord") by Ratramnus, a monk of Corbie, to whom the elements became the body and blood of Christ in a symbolic sense. Berengar's restatement of these views aroused severe opposition. He boldly wrote (c. 1050) to Lanfranc against his condemning Ratramnus. The letter arrived in Lanfranc's absence and, after being read by several persons, finally reached him at Rome. Pope Leo IX excommunicated Berengar at the Easter Synod of 1050 and ordered him to the Council of Vercelli (1050). Berengar reluctantly obeyed. He went to Paris to get permission from the French king Henry I, his nominal abbot, to attend the synod. He was imprisoned by Henry and condemned at Vercelli in absentia.

On his release from prison, Berengar took refuge with his protector, Geoffrey, and Henry ordered a synod at Paris to judge Berengar and his supporter Eusebius. The synod condemned them both (1051). In 1054 the powerful papal legate Cardinal Hildebrand came to France to preside at the Synod of Tours. To preserve peace, a compromise was reached under which Berengar signed a vague eucharistic statement. In 1059 he was summoned to Rome for another council, at which he was refused a hearing and was asked to sign an extreme statement repugnant to his ideas. After this, Geoffrey died, and Eusebius began to draw away from Berengar. Berengar nevertheless published a treatise (c. 1069) against the Roman council of 1059, which was answered by Hugo of Langres and by Lanfranc, with a rejoinder by Berengar.

Berengar's position was steadily worsening, and the rigorous pattern of examination, condemnation, and recantation was repeated at the nearly violent Council of Poitiers (1076), the Roman synods of 1078 and 1079, and a trial at Bordeaux in 1080. Thereafter Berengar was silent. He retired to ascetic solitude in the priory of Saint-Cosme.

Berengar's eucharistic doctrine is expressed in his *De sacra coena* ("On the Holy Supper"), written in reply to Lanfranc. More than any of his contemporaries, Berengar applied to theological development the method of dialectic. He based his argument on belief that Paschasius' view was contrary to the Scriptures, the Church Fathers, and reason. Thus in some respects he was an important forerunner of Protestantism.

BIBLIOGRAPHY. A.J. Macdonald, *Berengar and the Reform of Sacramental Doctrine* (1930, reprinted 1977), examines his thought and its results.

Berengario (Italian personal name): see *under* Berengar, except as below.

Berengario da Carpi, Jacopo (b. c. 1460, Carpi [Italy]—d. c. 1530, Ferrara), Italian physician and anatomist who was the first to describe the heart valves. He also was one of the first to illustrate medical works with drawings from nature.

Berengario was a professor at the University of Bologna from 1502 to 1527. While there he became known for his use of mercurial ointment in the treatment of syphilis.

Berenguer (y Fusté), Dámaso, Count (conde) DE XAUEN (b. Aug. 4, 1873, Cuba—d. May 19, 1953, Madrid, Spain), Spanish general who served briefly as prime minister (January 1930–February 1931) before the establishment of the Second Republic.

Berenguer entered the army in 1889, served in Cuba and Morocco, and was promoted to general in 1909. He was minister of war in 1918, when, after a long interval, the army began to express its political views. He then served as high commissioner in Morocco and was appointed head of King Alfonso XIII's military household. When the dictatorship of Miguel Primo de Rivera came to an end, Alfonso made Berenguer prime minister, hoping that he would be able to prepare for a return to constitutional rule. But the political parties blamed the king for permitting the dictatorship; and the republicans, socialists, and Catalans left demanded that he abdicate. Berenguer negotiated from January to December 1930 without success. Then there occurred a small military revolt at Jaca. Berenguer resigned on Feb. 14, 1931, but served as minister of war under his successor, Admiral Juan Bautista Aznar-Cabañas. The municipal elections of April 1931 showed the republicans to be in the majority in the main cities, and Alfonso XIII left the country. The republicans took over, and Berenguer was in prison during most of the Second Republic. In 1946 he published a defense of his administration.

Berenice, also spelled BERNICE, Greek BERENICHE, or BERENIKHE, name of queens of the Ptolemaic rulers of Egypt, grouped below chronologically and indicated by the symbol ●.

● **Berenice I** (fl. c. 317–c. 275 BC), queen of Egypt, third wife of Ptolemy I Soter, and mother of Arsinoe II and Ptolemy II Philadelphus.

Berenice arrived in Egypt in the retinue of Eurydice, Ptolemy's second queen, whom he married as part of a political agreement with her father, Antipater of Macedonia. About 317 Ptolemy married Berenice. Probably because she was not of royal blood, a genealogy was fabricated to make her a half sister of the king. In 308 Berenice gave birth to Ptolemy II Philadelphus, and in 290 Ptolemy made her queen of Egypt. In 285 Ptolemy II was made coregent and successor to his father, bypassing Eurydice's children. Ptolemy II's second wife was his sister Arsinoe II, also the child of Berenice.

● **Berenice II** (b. c. 269—d. 221 BC), daughter of Magas, king of Cyrene (in modern Libya), whose marriage to Ptolemy III Euergetes reunited her country with Egypt.

Magas' queen, who favoured an alliance with the Seleucid dynasty of Syria, tried to thwart the marriage by summoning Demetrius the Fair, a Macedonian prince, as a husband for Berenice. The princess, however, arranged Demetrius' murder and married Ptolemy about 245. When Ptolemy set forth to avenge the murder of his sister (the widow of Antiochus II) in Syria, Berenice dedicated a lock of her hair for his safe return. According to the

court astronomer, it was transferred to heaven, where it formed a new constellation that was consequently named Coma Berenices, "Hair of Berenice." Berenice and Ptolemy had four children: the future Ptolemy IV Philopator, Arsinoe III, Magas, and Berenice, who died as a child. The queen survived her husband, but her son Ptolemy IV linked her to a plot with her father, Magas, and had her poisoned.

● **Berenice III** (d. 80 BC), queen of Egypt, daughter of Ptolemy IX, the most strong-willed member of the royal family. She ruled during a period of violent civil strife.

Daughter of either Cleopatra Selene or Cleopatra IV, Berenice first married her uncle, Ptolemy X, sometime before 101. After the death in 101 of the dowager queen, Cleopatra III, the widow of Ptolemy VIII, Berenice became full queen. In 87 Ptolemy X was expelled from Egypt by an insurrection of the people of Alexandria, who believed that he had assassinated the dowager queen. He recruited a mercenary army in Syria and, after returning to Egypt, plundered the tomb of Alexander the Great in Alexandria in order to pay his troops. Outraged, the Alexandrian populace again expelled him, and he fled with Berenice to Lycia in Asia Minor. After her husband was killed, Berenice returned to Egypt. She married Ptolemy XI, upon whose death, in 80, Berenice became the sole ruler of Egypt. Young Ptolemy Alexander, son of Ptolemy X, had, meanwhile, been befriended by Lucius Cornelius Sulla, the Roman dictator, with whose aid he was sent to Egypt to be married to Queen Berenice. Neither the queen nor the people of Alexandria were consulted about the matter. When Ptolemy learned that Berenice was loath to surrender her authority, he arranged for her murder, for which the enraged Alexandrians killed him; he was the last legitimate Ptolemaic ruler of Egypt.

● **Berenice IV** (d. 55 BC), eldest daughter of Ptolemy XII Auletes of Egypt, sister of the great Cleopatra VII, and ruler of Egypt during her father's absence in 58–55. She was executed by him after his return.

Ptolemy, driven from Egypt by the threat of popular insurrection in 58, went to Rome. When his queen died shortly after his departure, Berenice was proclaimed queen. In 57 Ptolemy, employing bribery and intrigue, succeeded in inducing the Romans to restore him to his kingdom. The Alexandrians, however, resolved to oppose him and dispatched a delegation to Rome to refute Ptolemy's accusations against them and to present charges of his misrule. After arranging the murder of these delegates and even of some Romans who suspected him, Ptolemy departed for Ephesus, in Asia Minor, late in 57. While other issues obscured his cause in Rome, Ptolemy was able to buy the support of Aulus Gabinius, Roman proconsul of Syria. The Alexandrians, meanwhile, sought a prince for Berenice. Archelaus, reputedly a Pontic prince, appeared in 56 and was married to her. Gabinius, however, marched against Alexandria and the following year restored Ptolemy, who promptly executed Berenice and her supporters.

Berenice (d. c. 246 BC), daughter of Ptolemy II Philadelphus and Arsinoe I of Egypt. She was married to the Seleucid ruler Antiochus II Theos, supplanting his first wife, Laodice, whose children she persuaded him to bar from the succession to the throne in favour of her own. Laodice, however, persuaded Antiochus to come to Ephesus (in Asia Minor), where he died in 246, perhaps a victim of her intrigues. The former queen then ordered her partisans to kill Berenice and her children, who had taken refuge at Daphne, near Antioch, in Syria. Aroused by the murder, Ptolemy III Euergetes, Berenice's brother, launched a successful war (the Third Syrian War) against Laodice and her son, Seleucus II.

Berenice (b. c. AD 28), mistress of the Roman emperor Titus and a participant in the events leading up to the fall of Jerusalem.

The eldest daughter of Herod Agrippa I by his wife Cypros, Berenice was married at a young age to Marcus, the son of Alexander the Alabarch. Before consummating the marriage, Marcus died, and Berenice then married Herod, king of Chalcis, with whom she had two sons. Following his death in AD 48, she lived with her brother, Herod Agrippa II. Suspicion that they enjoyed an incestuous relationship caused her to marry Polemon, priest-king of Cilicia, but she soon left him and returned to her brother.

During a massacre of Jews at Jerusalem in 65, Berenice risked her life to intercede for them with the Roman procurator of Judaea, Gessius Florus. She and Herod Agrippa II worked at that time to dissuade the Jews from their planned rebellion.

Titus had fallen in love with Berenice during the period that he was in Judaea (67–70). After the Roman recapture of Jerusalem, Berenice and her brother went to Rome (c. 75). Titus took her as his mistress and lived openly with her for a time. He dared not marry her because of her foreign origins, and finally he sent her away. She returned to Rome in 79, but the love affair was not resumed.

Berenson, Bernard, Bernard originally spelled BERNHARD (b. June 26, 1865, Vilnius, Lithuania, Russian Empire—d. Oct. 6, 1959, Settignano, Italy), American art critic, especially of Italian Renaissance art.

Reared in Boston, Berenson was educated at Harvard University, from which he was graduated in 1887. His first book, *The Venetian Painters of the Renaissance* (1894), displayed a concise writing style. He was also endowed with a discriminating eye, exceptional memory, perceptive intelligence, and humanistic learning. For a time he was an adviser to the international art dealer Lord Duveen, and his

Berenson, photograph by David Seymour Seymour—Magnum

opinion was often sought in the purchase of paintings. Many masterpieces now in American museums were bought upon his recommendation.

Although Berenson retained his U.S. citizenship, he lived in Italy most of his life. He was sequestered during World War II in Tuscany, and his diary *Rumour and Reflection, 1941–1944*, was published in 1952. He bequeathed to Harvard University his villa, I Tatti, with its art collection and magnificent library to be administered as a Center for Italian Renaissance Culture. Among his major works are *Aesthetics and History in the Visual Arts* (1948), *The Drawings of the Florentine Painters* (1938), and the monumental *Italian Painters of the Renaissance* (1952).

Berent, Waclaw (b. Sept. 28, 1873, Warsaw, Pol.—d. Nov. 22, 1940, Warsaw), novelist, a member of the Young Poland movement, which was dominated by a desire to emphasize the expression of feeling and imagination in literature.

Berent's first novel, *Fachowiec* (1895; "The Expert"), composed while he was a student of biology at the University of Zürich, describes, in a realistic style, a student who leaves school to become a common labourer. Berent later studied biology in Munich and while there wrote his best-known and most characteristic work, *Próchno* (1903; "Rotten Wood"), a caustic portrait of late 19th-century artistic and intellectual life in Berlin. As with his later novels, the style of *Próchno* is elaborate and difficult; Berent was never a popular author. *Ozimina* (1911; "Winter Corn") centres on a group of wealthy aristocrats, gentry, and bourgeois at a ball in Warsaw. *Zywe kamienie* (1918; "Live Stones"), intended to be a poetic vision of the European Middle Ages, demonstrating the power of poetry and art and their influence on life, is long and elaborate and was not well received. His last novel, *Nurt* (1934; "The Current"), is an impressionistic and anecdotal biography of Polish personalities of the late 18th and early 19th centuries.

Beresford, John (b. March 14, 1738, Dublin, Ire.—d. Nov. 5, 1805, near Londonderry [now in Northern Ireland]), political leader in the struggle to preserve the political monopoly of the Protestant landowning aristocracy in Ireland. He was once called "king of Ireland" because of his great wealth and control of a vast political patronage.

Beresford served as a member of the privy councils of Ireland (from 1768) and Great Britain (from 1786). As a subordinate commissioner (1770–80) and first commissioner (1780–1802) of Irish revenue, he capably administered and reformed the taxation system, but he gave government jobs to numerous relatives and political allies. He helped to frame Prime Minister William Pitt's abortive Anglo-Irish Trade Treaty (proposed 1784–85), which was attacked by Henry Grattan and other Irish nationalists who wanted greater commercial independence from Great Britain.

In 1795 Beresford was dismissed from office by the new British viceroy of Ireland, the 2nd Earl Fitzwilliam, who advocated conciliating other Irishmen besides the Protestant landowners. Fitzwilliam, however, was quickly superseded by the 2nd Earl (afterward 1st Marquess) Camden, who began a program of Irish repression that had Beresford's full approval. Beresford was involved in planning the fiscal relations between Great Britain and Ireland under the Act of Union (Aug. 1, 1800).

The architect James Gandon owed to Beresford's influence the commissions for the custom house (1781–91) and several other distinguished government buildings in Dublin.

Beresford, William Carr Beresford, Viscount, BARON BERESFORD OF ALBUERA AND DUNGARVAN, DUKE (duque) DE ELVAS (b. Oct. 2, 1768—d. Jan. 8, 1854, Bedgebury, Kent, Eng.), British general and Portuguese marshal prominent in the (Iberian) Peninsular War of 1808–14. For his costly victory over the French at La Albuera, Spain, on May 16, 1811, he was subjected to harsh criticism in Great Britain.

Viscount Beresford, detail of a portrait by Richard Rothwell; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

An illegitimate son of the 2nd Earl of Tyrone (afterward 1st Marquess of Waterford), Beresford entered the British army in 1785. As a brigadier general he led a raid, unauthorized but informally encouraged by his superiors, on the Spanish colonial city of Buenos Aires—Spain at the time (1806) being an ally of Napoleonic France. Beresford captured the town easily, but local forces compelled him to surrender on Aug. 12, 1806. Escaping after six months' imprisonment, he was appointed governor of Madeira, which was then held by the British on behalf of Portugal. Recalled to combat service, he fought well under General Sir John Moore at Corunna, Spain (La Coruña; Jan. 16, 1809). General Sir Arthur Wellesley, the future Duke of Wellington, chose him to reorganize the Portuguese army, in which Beresford was given the rank of marshal (March 7, 1809).

In command of a British corps at La Albuera, near Badajoz, Beresford lost one-fourth of his men while defeating the French marshal Nicolas-Jean de Dieu Soult, Duke de Dalmatic. Resuming command of Portuguese troops, he was wounded at Salamanca (July 22, 1812). He served Portugal until 1819, being successively created count, marquess, and duke in that country's peerage. During Wellington's first prime ministry he was master general of the ordnance (1828–30).

Beresteczko, Battle of (June 28–30, 1651), military engagement in which the king of Poland, John Casimir (reigned 1648–68), inflicted a severe defeat upon the rebel Cossack leader Bohdan Khmelnytsky.

In 1648 Khmelnytsky organized an insurrection among the Zaporozhian Cossacks, who lived along the Dnieper River, against their Polish rulers, who had been trying to limit the Cossacks' autonomy by reducing their numbers, restraining them from conducting lucrative raids upon their Turkish and Crimean Tatar neighbours, and forcing them into a condition of serfdom. After a series of military victories, the Cossacks exacted the Compact of Zborów (1649) from the Polish king.

Although that settlement granted a large degree of autonomy to the "registered" Cossacks (i.e., those forming a privileged class), it failed to satisfy either the Poles or the "unregistered" Cossacks. Within 18 months, hostilities were resumed. The Cossacks were formally taken under the protection of the Turkish sultan (April 1651) and were reinforced by the sultan's vassal, the khan of the Crimean Tatars. In June the Cossack-Tatar force advanced

against the Poles and engaged them in battle at Beresteczko, on the Styr River in Volhynia south of Lutsk. The Cossacks' army was approximately three times larger than the Poles'. But in the midst of the fighting the Tatar khan and his force left the field of battle. This action, which has been described by some historians as treasonous desertion and by others as a maneuver to establish another line of defense closer to the Dnieper to protect Kiev from an advancing Lithuanian army, enabled the numerically inferior Polish army to gain a victory over the Cossacks.

Subsequently, the defeated rebels accepted a new peace settlement, concluded at Biłła Cerkiew (Sept. 28, 1651), which reduced the number of "registered" Cossacks from 40,000 to 20,000 and deprived them of the right to settle in and control various provinces that had been designated in the Compact of Zborów. Neither the Cossacks nor the Polish Sejm (parliament) accepted the new treaty, and in January 1654 the Cossacks chose to recognize the suzerainty of the Russian tsar and to incorporate their community into the Muscovite state (Union of Pereyaslav).

Beretta SpA, in full **FABBRICA D'ARMI PIETRO BERETTA SPA** (Italian: "Pietro Beretta Arms Works Limited"), Italian-based manufacturer of sporting, military, and personal firearms, one of the world's oldest industrial enterprises. It has affiliates in France, Greece, and the United States. Headquarters are in Gardone Val Trompia, near Milan, Italy.

The founder of the business, Bartolomeo Beretta, was known as a *maestro da canne*, or master gun-barrel maker, for the republic of Venice as early as 1526. His son Giovanni inherited his father's work in Gardone Val Trompia, and thereafter the family business was handed down over the centuries in an unbroken chain from fathers to sons or, more lately, nephews. Pietro Beretta (1791–1853), after furnishing gun barrels for Napoleon's conquering armies, decided after the peace of 1815 to turn to the manufacture of whole weapons and diversified into sporting guns. Another Pietro Beretta (1870–1957) introduced modern production techniques and more than trebled the company's factory space. By the late 20th century the company was being directed by 12th and 13th generations of the Beretta family.

The company manufactures and markets, worldwide, arms for hunters, competition shooters, law-enforcement officers, and military personnel; the products include field and high-grade sporting shotguns, rifles, pistols, military arms, knives, and such accessories as sights and scopes and binoculars.

Berezina River, river in Belarus, a tributary of the Dnieper, which it joins near Rechitsa. Its 381-mile (613-kilometre) length drains 9,450 square miles (24,500 square km). Rising north of the Minsk Elevation, it flows to the south-southeast in a meandering course through a swampy, forested basin. It is

Berezina River bend, Belarus
Novosti Press Agency

navigable only by small craft. During Napoleon's retreat from Moscow in 1812, a bitter engagement was fought on the Berezina.

Berezniki, city, Perm *oblast* (province), west-central Russia. It is situated on the left bank of the Kama River at the head of the Kama Reservoir. Huge local deposits of salt and potassium have resulted in the city's development as one of the largest chemical centres of Russia, producing nitrogenous fertilizers, potash, nitric and sulfuric acids, soda, chlorine, titanium sponge, and pesticides. It was incorporated as a city in 1932. Pop. (1991 est.) 200,700.

Berg, former duchy of the Holy Roman Empire, on the right bank of the Rhine, now in the administrative districts of Düsseldorf and Cologne in Germany.

In the 11th century the counts of Berg came into possession of Westphalian lands east of Cologne. From 1161 these were divided between the senior branch of Berg and the junior branch of Altena (later Mark), which acquired the countyship of Cleves in 1368. The Berg line became extinct with the assassination in 1225 of Engelbert I the Holy, the third member of the family to hold the archbishopric of Cologne, and the title passed to the House of Limburg. In 1288 Count Adolf V began to develop Düsseldorf (later Berg's capital) as a port. A member of the House of Jülich, Gerhard VI (died 1360) married the heiress of Berg in 1348; in 1380 his son William was created duke; and in 1423 Duke Adolf also inherited Jülich, thus uniting the two duchies and associated lands. When the male line became extinct in 1511, the territories passed to John III, duke of Cleves. Berg became a leading iron and textile manufacturing centre in the 17th and 18th centuries. In 1806 Napoleon made it a grand duchy in his Confederation of the Rhine, with his brother-in-law Joachim Murat as grand duke. Berg, along with Jülich, which had been annexed by the French, became part of Prussia's Rhine province by award of the Congress of Vienna in 1814–15.

Berg, Alban (b. Feb. 9, 1885, Vienna—d. Dec. 24, 1935, Vienna), Austrian composer in the atonal style. He composed orchestral music (including *Five Orchestral Songs*, 1912), chamber music, songs, and two sensational operas, *Wozzeck* (1925) and *Lulu* (1937).

Apart from a few short musical trips abroad and annual summer sojourns in the Austrian Alps, Berg's life was spent in the city of his birth. At first, the romantically inclined youth leaned toward a literary career. But, as in most Viennese middle-class homes, music was regularly played in his parents' house, in keeping with the general musical atmosphere of the city. Encouraged by his father and older brother, Alban Berg began to compose music without benefit of formal instruction. His output consisted of more than 100 songs and piano duets, most of which remain unpublished.

In September 1904 he met Arnold Schoenberg, an event that decisively influenced his life. The death of Berg's father had left little money for composition lessons, but Schoenberg was quick to recognize Berg's talent and accepted the young man as a free pupil. The musical precepts and the human example provided by Schoenberg shaped Berg's artistic personality for the next six years.

In the circle of Schoenberg's students, Berg presented his first public performance in the fall of 1907: *Piano Sonata*, Opus 1 (1908). This was followed by *Four Songs*, Opus 2 (1909), and *String Quartet*, Opus 3 (1910), each strongly influenced by the young composer's musical gods, Gustav Mahler and Richard Wagner.

Having come into a small inheritance, Berg married Helene Nahowski, daughter of a high-ranking Austrian officer, in 1911. The Bergs took an apartment in Vienna, where he settled

Alban Berg, oil painting by Arnold Schoenberg, c. 1900; in the Historisches Museum der Stadt Wien

By courtesy of the Historisches Museum der Stadt Wien

down to devote the remainder of his life to music, although they participated freely in the intellectual life of the city. Among their closest friends were Adolph Loos (1870–1933), one of the pioneers of modern architecture, and the painter Oskar Kokoschka.

A characteristic of Berg's creative activity was the slow, often hesitant, manner in which he gave final form to the musical ideas that, for the most part, were the result of sudden inspiration. This fastidious, perfectionist manner of composing explains his relatively small number of works. In 1912 Berg finished his first work since his student days with Schoenberg, *Five Orchestral Songs*, Opus 4. The inspiration for this composition came from postcard messages addressed to both his friends and foes by the eccentric Viennese poet Peter Altenberg. These sometimes erotic postcard texts were sufficiently nonconformist to prompt Berg to use them as background for even less traditional music than he had composed in the past. But when two of these songs were presented at a concert of the Academic Society for Literature and Music in March 1913, they provoked a near riot, in which performers and audience freely participated.

The genesis of Berg's first work for the stage was a memorable theatrical experience: the performance of Georg Büchner's (1813–37) *Woyzeck*, a drama built around a poor working man who murders his faithless sweetheart and then commits suicide while their child, unable to comprehend the tragedy, plays nearby. The theme fascinated Berg. But his work on the opera—which, varying the spelling, he would call *Wozzeck*—was delayed by World War I. During the course of the war, Berg (always in frail health) worked in the War Ministry. When he did begin composition, he was confronted by the gigantic task of compressing 25 scenes into three acts. Although he managed to write the libretto in 1917, he did not begin composing the score until the war was over. He completed the opera in 1921, dedicating it to Alma Mahler,

the widow of Gustav Mahler, the composer and conductor who had dominated Vienna's musical life during Berg's youth.

Wozzeck—perhaps the most frequently performed theatrical work in the atonal idiom—represents Berg's first attempt to deal with social problems within the framework of opera. From numerous statements he made, it is evident that he intended the opera to portray far more than the tragic fate of the protagonist. He wanted, in fact, to make it symbolical of human existence. Musically, its unity stems from large overall symmetries within which are set traditional forms (such as the passacaglia and sonata), excerpts in popular music style, dense chromaticism (use of notes not belonging to the composition's key), extreme atonality, and passing approaches to traditional tonality, all of which function to create a work of notable psychological and dramatic impact. Although it antedates Schoenberg's early 12-tone compositions, the opera also includes a theme using the 12 notes of the chromatic scale.

After 137 rehearsals, *Wozzeck* was presented in its entirety for the first time on Dec. 14, 1925, at the Berlin State Opera, with Erich Kleiber conducting. Critical response was unrestrained. Typical of the prevailing attitude was the reaction of a reviewer in the *Deutsche Zeitung*:

As I was leaving the State Opera I had the sensation of having been not in a public theatre but in an insane asylum. . . . I regard Alban Berg as a musical swindler and a musician dangerous to the community.

But another critic described the music as "drawn from *Wozzeck's* poor, worried, inarticulate, chaotic soul. It is a vision in sound."

Upon completion of *Wozzeck*, Berg, who had also become an outstanding teacher of composition, turned his attention to chamber music. His *Chamber Concerto*, Opus 8, for violin, piano, and 13 wind instruments was written in 1925, in honour of Schoenberg's 50th birthday.

Berg searched for a new opera text. He found it in two plays by the German dramatist Frank Wedekind (1864–1918). From *Erdgeist* ("Earth Spirit") and *Büchse der Pandora* ("Pandora's Box"), he extracted the central figure for his opera *Lulu*. This work engaged him, with minor interruptions, for the next seven years, and the orchestration of its third act remained incomplete at his death (it was completed by the Austrian composer Friedrich Cerha and given its premiere in Paris in 1979). Symbolically and musically complex and highly expressionistic in idiom, *Lulu* was composed entirely in the 12-tone system.

With the seizure of power by the Nazis in Germany in 1933, Berg lost most of his income. Although, unlike their teacher Schoenberg, Berg and his friend and colleague Anton von Webern were of non-Jewish descent, they, with Schoenberg, were regarded as representatives of "degenerate art" and were increasingly excluded from performances in Germany. The meagre response that Berg's works evoked in Austria caused him particular anguish; abroad, he was considered more and more as the representative Austrian composer, and his works were performed at leading musical festivals.

Berg's last complete work, the *Violin Concerto*, originated under unusual circumstances. In 1935 the U.S. violinist Louis Krasser commissioned Berg to compose a violin concerto for him. As usual, Berg procrastinated at first. But after the death of Manon, the beautiful 18-year-old daughter of Alma Mahler (by then the wife of the architect Walter Gropius), Berg was moved to compose the work as a kind of requiem and to dedicate it to the "memory of an angel"—Manon. Having found his inspiration, Berg worked at fever pitch, in the

seclusion of his villa in the Austrian province of Carinthia, and completed the concerto in six weeks. By the time the work was finally presented by Krasner in Barcelona in April 1936, it had become a requiem not only for Manon Gropius but for Alban Berg as well. One of the major violin concerti of the 20th century, it is a work of highly personal, emotional content achieved through the use of 12-tone and other resources—symbolic as well as musical.

In mid-November 1935 he returned, a sick man, to Vienna. Although his mind was completely absorbed in his desire to finish the opera *Lulu*, he had to be hospitalized in December with septicemia and, after a deceptive initial improvement, he died suddenly.

A man of strikingly attractive appearance and reserved, aristocratic bearing, Berg had also a generous personality that found expression in his correspondence and among his friends. He was an outstanding teacher of composition who encouraged his pupils to undertake significant work of their own. Few honours were accorded Berg in his lifetime, but, within a few years after his death, he became widely recognized as a composer who broke with tradition, mastered a radical technique, and blended the two to create, with Schoenberg and Webern, a 20th-century Viennese school of music.

Berg's powerful and complex works draw from a broad range of musical resources but are chiefly shaped by a few central techniques: the use of a complex chromatic expressionism, which nearly obscures, yet actually remains within, the framework of traditional tonality; the recasting of classical musical forms with atonal content—i.e., abandoning traditional tonal structure dependent upon a centrally important tone; and a deft handling of the 12-tone approach developed by his teacher, the composer Arnold Schoenberg, as a method of structuring atonal music. Berg dealt with the new medium so skillfully that the classical heritage of his compositions is not obliterated, thus justifying the term frequently applied to him—the “classicalist of modern music.”

BIBLIOGRAPHY. Hans F. Redlich, *Alban Berg: The Man and His Music* (1957), is especially noteworthy for its prodigious use of examples in presenting a basic analysis of the music. Willi Reich, *The Life and Work of Alban Berg* (1965, reprinted 1981), is an authoritative text. Mosco Carner, *Alban Berg: The Man and the Work*, 2nd rev. ed. (1983), utilizes the Berg-Schoenberg correspondence. Karen Monson, *Alban Berg* (1979), incorporates recent research on the history of *Lulu*.

Berg, Lev Simonovich (b. March 14 [March 2, Old Style], 1876, Bendery, Bessarabia, Russia [now in Moldova]—d. Dec. 24, 1950, Leningrad [St. Petersburg], Russia), geographer and zoologist who established the foundations of limnology in Russia with his systematic studies on the physical, chemical, and biological conditions of fresh waters, particularly of lakes. Important, too, was his work in ichthyology, which yielded much useful data on the paleontology, anatomy, and embryology of fishes in Russia. Of broader significance were Berg's findings on the periodicity of reproduction among fishes and the influence of climatic variations on migratory species. He is also credited with having discovered the symbiotic relationship between lampreys and salmon.

Berg extended his ichthyological research to zoogeography, a field of study concerned with the distribution of animals. Data from his zoogeographic analyses enabled him to reconstruct with considerable accuracy the chronology of the major glaciations. In turn, he used these paleoclimatological reconstructions to investigate the origin of various sedimentary

rocks and the formation of soils, the results of which demonstrated the efficacy of integrating the procedures of modern geography and historical geology.

Berg, Patty, byname of PATRICIA JANE BERG (b. Feb. 13, 1918, Minneapolis, Minn., U.S.), American winner of more than 80 golf tournaments and first president of the Ladies' Professional Golfers' Association (LPGA) in 1950.

From a golf-playing family, Berg first took up speed skating and placed second in the U.S. girls' speed-skating championship in 1933. She turned to golf after an injury at age 15, and she finished second in the U.S. Women's Amateur golf tournament in 1935 and won it in 1938. After winning more than 40 amateur tournaments, Berg turned professional in 1940. She won every major LPGA event, including the U.S. Women's Open (1946) and the World Championship (1953–55, 1957). She led the LPGA in money winnings three times (1954–55, 1957). Berg was a major force in popularizing women's golf. She was named by the Associated Press among the 15 greatest female athletes of 1900–77. She wrote with Mark Cox *Golf Illustrated* (1950; also published as *Golf for Women*).

Berg, Paul (b. June 30, 1926, New York, N.Y., U.S.), American biochemist whose development of recombinant-DNA techniques won him a share (with Walter Gilbert and Frederick Sanger) of the Nobel Prize for Chemistry in 1980.

After graduating from Pennsylvania State College in 1948 and taking a Ph.D. from Western Reserve University in 1952, Berg pursued further studies at the Institute of Cytophysiology in Copenhagen and at Washington University in St. Louis, where he remained as assistant professor of microbiology until 1959. From 1959 he was associated with the medical school of Stanford University, serving as chairman of the biochemistry department in 1969–74 and becoming Willson professor in 1970.

In the course of studying the actions of isolated genes, Berg evolved methods for splitting DNA molecules at selected sites and attaching segments of the molecule to the DNA of a virus or plasmid, which could then enter bacterial or animal cells. The foreign DNA was incorporated into the host and caused the synthesis of proteins that were not ordinarily found there. One of the earliest practical results of recombinant technology was the development of a strain of bacteria containing the gene for producing the mammalian hormone insulin.

Bergama, town, İzmir vilâyet (province), western Turkey, 50 miles (80 km) north of the city of İzmir (Smyrna). It shares the site of ancient Pergamum (*q.v.*), of which there are extensive ruins remaining. The modern town lies over the remains of the Roman city, while the remains of the ancient Greek city with its acropolis lie northeast across the Bergama River, on a high hill with terraced slopes. Greek ruins also lie on the western outskirts. The Archaeological Museum in town contains a large collection of artifacts from the area, ranging in age from Paleolithic to Byzantine. The town has cotton and leather industries, and in the surrounding area there is farming in cotton, tobacco, and grapevines. Pop. (1990) 42,554.

Bergama carpet, any of several types of village floor coverings handwoven in the vicinity of Bergama, western Turkey, or brought there for market from the interior of the country. Although most Bergama carpets date from the 19th and 20th centuries, rare examples survive from the 17th century.

The bold patterns, usually in red, blue, and white, are highly varied. Several designs, showing rows of panels or centralized medallion

Bergama carpet from western Anatolia, 19th century; in the collection of Joseph V. McMullan. Collection of Joseph V. McMullan, photograph, Otto E. Nelson

designs, preserve the fashions of much earlier centuries. Large central diamond designs, for example, are derived from a wreath motif seen in Ottoman court prayer rugs of the 17th century. The format of Bergama carpets is usually more nearly square than in other Turkish types, and the few known prayer rugs tend to be unusually small. An erosive red-dye process sometimes causes the pile to look as if it had been cut in relief.

bergamasca, also spelled BERGOMASK, lusty 16th-century dance depicting the reputedly awkward manners of the inhabitants of Bergamo, in northern Italy, where the dance supposedly originated. It was performed as a circle courtship dance for couples: men circled forward and women backward until the melody changed; partners then embraced, turned a few steps, and began again. The rustics in Shakespeare's *Midsummer Night's Dream* perform a *bergomasca*.

The *bergamasca* never became a court dance, although it gained some popularity as an instrumental composition built on a ground bass. Claude Debussy's *Suite bergamasque* (1890) and Gabriel Fauré's *Masques et bergamasques* (1919) did not use the *bergamasca* as a specific musical form; both works were inspired by Verlaine's poem "Clair de lune," in which the name of the bygone dance *bergamasque* evokes a dreamy image.

Bergamo, Latin BERGOMUM, city, capital of Bergamo *provincia*, Lombardy (Lombardia) region, northern Italy, in the southern foothills of the Alps between the Brembo and Serio rivers, northeast of Milan. Originally the centre of the Orobic tribe, it became a Roman town (Bergomum) in 196 BC. Rebuilt after destruction by Attila the Hun, it was later the seat of a Lombard duchy and became an independent commune in the 12th century. Ruled by the Milanese Visconti family after 1329, it passed in 1428 to Venice until 1797, when the French took control and then included it in the Cisalpine Republic (established by Napoleon). In 1815 it became Austrian and, in 1859, part of the Italian kingdom.

The city is divided into the upper (*alta*) and lower (*bassa*, or *piana*) towns, linked by a cable railway. Notable landmarks of the older upper town include the Romanesque cathedral, rebuilt 1483 and 1639; the Cappella (chapel) Colleoni (1470–76), by Giovanni Antonio Amadeo, with ceiling frescoes by Giovanni Battista Tiepolo; the Basilica of Santa Maria Maggiore (begun 1137, rebuilt 14th and 15th centuries); the baptistry (1340); and the

Palazzo della Ragione (rebuilt 1538–54). The Rocca, a 14th-century castle, houses the Roman and Risorgimento museums, and the old citadel has a museum of geology and natural history. The birthplace of the composer Gaetano Donizetti is preserved as a museum. The

Colleoni Chapel, Bergamo, Italy
Marzani—SCALA from Art Resource

modern lower town, the community centre since the 19th century, has a fine collection of paintings in the Carrara Academy.

Bergamo is an industrial centre with textile mills, engineering works, and cement, mechanical, and electrical manufactures. Pop. (1990 est.) mun., 117,584.

bergamot, any of several North American perennial plants of the mint family, Lamiaceae (or Labiatae); their leaves are used as an herb. *Monarda didyma*, a variety native to the United States, is made into Oswego tea, a beverage used by the Oswego tribe of American Indians and said to be the drink adopted by American colonists during their boycott of British tea. The leaves are also used to flavour punches, lemonade, and other cold drinks. Other names for the aromatic herb include bee balm, fragrant balm, and Indian's plume.

The bergamot orange, *Citrus bergamia*, is found chiefly in the south Italian province of Calabria and yields a pear-shaped fruit valued by the flavouring and perfume industries for the essential oil extracted from its peel. The bergamot pear, a popular winter pear cultivated in Britain since the time of the Romans, is a large, round fruit with a yellowish green skin that has russet markings.

Berganza, Teresa (b. March 16, 1935, Madrid, Spain), Spanish mezzo-soprano, known for her performance of coloratura roles in the operas of Gioacchino Rossini and W.A. Mozart and for her concert singing.

Berganza studied at the Madrid Conservatory. In 1955 she made her debut in Madrid as a concert singer and toured Spain, Portugal, France, Italy, Austria, and Germany. She made her stage debut in 1957 at the Aix-en-Provence Festival in France as Dorabella in Mozart's *Così fan tutte*, and in the following year she appeared in Milan at La Scala in Rossini's *Le Comte Ory*; at the Glyndebourne Festival in East Sussex, Eng., as Cherubino in Mozart's *Le nozze di Figaro*, and in Dallas, Texas, as Isabella in Rossini's *L'italiana in Algeri*. In 1960 she sang her first Rosina in Rossini's *Il barbiere di Siviglia* at Covent

Garden, London, and in 1967 she made her debut at the Metropolitan Opera in New York City in *Le nozze di Figaro*.

Berganza has appeared in many of the world's opera houses and made many concert tours accompanied by her husband, the pianist-composer Felix Lavilla.

Bergbom, Kaarlo (b. Oct. 2, 1843, Vyborg, Russia—d. Jan. 17, 1906, Helsinki, Fin.), activist in the struggle to enhance Finnish-language institutions, and founder-director of the first stable Finnish-language theatre, the Finnish National Theatre. Bergbom, himself the author of a romantic tragedy, directed the first performance of Aleksis Kivi's one-act biblical drama *Lea* (1869), the event cited as the beginning of professional theatre in the Finnish language.

In 1872 Bergbom founded the Finnish National Theatre as a touring troupe; with the lifelong assistance of his sister, Emilie, he managed the theatre until his death. During the first year of its existence, the National Theatre performed 36 plays, of which only 13, all single-act, were native works; by its 20th season the ratio was reversed, two-thirds of the plays being Finnish and including the premieres of six full-length Finnish plays. Bergbom also produced notable Finnish versions of classics and works by foreign authors, among them the first Finnish-language productions of Shakespeare (*Romeo and Juliet*, 1881) and Goethe (*Faust*, 1885). In 1902 a permanent building was constructed in Helsinki as home for the theatre. Bergbom was assisted in his endeavours by such company members as the actress Ida Aalberg and by the important Finnish playwright Minna Canth, whose works concerning the emancipation of women were premiered by the company.

Bergdama, also called DAMARA, a nomadic Negroid people of mountainous central Namibia. They speak a click Khoikhoïn (Hotentot) language, but racially they are more like the peoples of central and western Africa, though their origin is obscure. When first encountered by Europeans, in the 17th and 18th centuries, many of the Bergdama were serfs of the Khoikhoïn and Herero. Knowing the arts of iron forging and pottery making, they provided iron implements and ornaments for their masters. They also served them as cattle herdsmen.

Bergdama in the aboriginal state subsisted on wild plant foods, and some groups also kept goats. They were scattered in small bands of migratory families composed of several closely related kin—each band, when temporarily settled, inhabiting a circle of grass-covered huts enclosed by a thornbush fence. A sacred fire burned in the centre of each village. The band chief, advised by his elder male kinsmen, con-

trolled the group, and he was also its ritual leader and fire keeper. There was no larger-scale political or social organization.

Bergdama religion included the concept of a supreme being responsible for rain and the annual renewal of plant life. There was also belief in life after death and that sickness and death were caused by the deity or by the souls of departed men who required food. Many Bergdama have adopted Christianity.

Bergen (Belgium): see Mons.

Bergen, city, port, and seat of Hordaland fylke (county), southwestern Norway. The principal port and business section is on a peninsula projecting into By Fjord, bounded on the north by the inlet and harbour of Vågen (for small ships) and on the south by Pudde Bay (for larger vessels) and the Store Lungegård Lake.

Originally called Bjørgvin, the city was founded in 1070 by King Olaf III. About 1100 a castle was built on the northern edge of the Vågen harbour, and Bergen became commercially and politically important; it was Norway's capital in the 12th and 13th centuries. An episcopal see was established there in the 12th century. A trade centre for centuries, Bergen exported fish and furs and imported grain and manufactured goods. In the 14th century, German Hanseatic merchants acquired control over the city's trade; their influence in a weakened Norway lasted into the 18th century. Bergen has remained the most important port on the west coast of Norway, despite its repeated destruction by fire (most notably in 1702 and 1916); wider streets and buildings of brick and stone have been built in response to these disasters.

In modern times, Bergen has developed a diversified economy, based largely on fishing, shipbuilding and associated industries (repairing and equipment), machinery and metal products, and food processing. It is now the second largest city of Norway. Notable buildings are the 12th-century Mary Church, the city's oldest structure; Bergenhus fortress, including Håkonshallen (Haakon's Hall, built in the 13th century); and the Rosenkrantz Tower. The latter two buildings were severely damaged during the German occupation (1940–45). Bergen is the seat of a university (1948) as well as of the Norwegian School of Economics and Business Administration (1936). Its Western Norway Museum of Applied Art (1887) has a fine collection. Bergen was the birthplace of Edvard Grieg, the composer; Ole Bull, the violinist; Johan Christian Dahl, the landscape painter; and Ludvig Holberg, the dramatist. Pop. (1991 est.) mun., 213,356.

Bergen, Edgar, byname of EDGAR JOHN BERGEN (b. Feb. 16, 1903, Chicago, Ill., U.S.—d. Sept. 30, 1978, Las Vegas, Nev.), noted American ventriloquist and radio comedian whose career in vaudeville, radio, and motion pictures spanned almost 60 years. Bergen was best known as the foil of his ventriloquist's dummy Charlie McCarthy. The "Edgar Bergen-Charlie McCarthy Show" was a permanent fixture on American network radio from 1937 until 1957. Other characters created by Bergen, such as Mortimer Snerd and Effie Klinker, were woven into the perennially popular program, which was rated as radio's most popular in 1937-40 and 1942-43, and among the top seven from 1937 to 1952.

Bergen's parents took him on a visit to their native Sweden when he was four years old; there he learned the language that various of his later characters would occasionally articulate. He attended public schools in Chicago where, when he was 11, he discovered a facility for vocal tricks that gave him an interest in ventriloquism. He had the head of the dummy Charlie McCarthy carved (although he made the body himself) while he was still in high school. By the time he attended Northwestern University he was proficient enough to earn his expenses with ventriloquism and magic tricks.

He went into vaudeville and performed in nightclubs in the United States and Europe. During World War II Bergen took Charlie with him to entertain American service personnel, touring the Aleutian Islands, Alaska, and Greenland and appearing on many special radio shows. After their radio show terminated, Bergen and McCarthy appeared often as guests on variety television shows.

Bergen-Belsen, also called BELSEN, German Nazi concentration camp near the villages of Bergen and Belsen, about 10 miles (16 km) northwest of Celle, then in Prussian Hanover, Ger. Originally established in July 1943 partly as a prisoner-of-war camp and partly as a Jewish transit camp, it was designed for 10,000 prisoners but, by war's end, held 41,000. Although Bergen-Belsen contained no gas chambers, some 37,000 prisoners died from starvation, overwork, disease, and some of the most squalid, fetid living conditions of any of Germany's camps; corpses were bulldozed into mass graves. Anne Frank, whose wartime diary would later become world famous, died at Bergen-Belsen in March 1945.

Taken by the British on April 15, 1945, it was the first such camp to be liberated by the Western Allies and received instant notoriety. The SS commandant, Josef Kramer (*q.v.*), the "Beast of Belsen," was tried by a British military court and hanged.

Bergen op Zoom, *gemeente* (commune), Noordbrabant *provincie*, southwestern Netherlands, on the small Zoom River, near its canal junction with the East Scheldt (Oosterschelde) Channel. It was taken by the Normans in 880. Bergen op Zoom (meaning "hills on the border [of the marshes]") became a lordship in 1287 by separation from Breda and was a hereditary fief of the duchy of Brabant. It prospered in the 15th century as a trade centre, its fairs being visited by English merchants who enjoyed special privileges. In 1533 it was raised to a margravate by Charles V. It resisted Spanish rule, was fortified, and successfully resisted several Spanish assaults between 1581 and 1622. Taken by the French (1747) during the War of the Austrian Succession and again

in 1795, it was held against the English until the fall of Napoleon in 1814. The fortifications were dismantled in 1867, and the town was occupied by the Germans during World War II.

The Gevangenpoort (gate; c. 1300) is a remnant of the medieval fortifications; the Ravelin fortress remains of the ramparts that were completed in 1740. Historic buildings include the medieval town hall; the Grote Kerk (also called St. Gertrude's Church), dating originally from the 14th century but much restored; and the Markiezenhof ("Court of the Marquis," 1485-1520).

Economic activities include fishing (anchovies), oyster culture, and asparagus growing; industries include metallurgical and engineering works, confectioneries, biscuit factories, and one of Europe's largest distilleries. Pop. (1989 est.) 46,842.

Berger, Victor (Louis) (b. Feb. 28, 1860, Nieder-Rehbach, Austria-Hungary—d. Aug. 7, 1929, Milwaukee, Wis., U.S.), a founder of the U.S. Socialist Party, the first Socialist elected to Congress.

Berger immigrated to the United States in 1878. He taught public school in Milwaukee for a time and from 1892 was editor successively of *Vorwärts*, a German-language newspaper that he founded, and the *Social Democratic Herald*, later known as the *Milwaukee Leader*. With Eugene V. Debs, he founded the Social Democratic Party, which in 1901 became the Socialist Party. Elected from Milwaukee to the U.S. House of Representatives in 1910, Berger served one term.

During World War I, he joined other socialists in actively opposing U.S. participation; as a result, he was prosecuted under the Espionage Act, found guilty, and sentenced to 20 years in prison. Meanwhile, in 1918, he had again been elected to Congress. This time, however, members voted to deny him his seat. A special election was held in 1919, and Berger was again sent to Congress and again refused admittance. On an appeal to the Supreme Court, Berger had his espionage conviction overturned in 1921 and the following year was elected yet again to the House. Thus vindicated, he was permitted to take his seat; he served until 1929. In 1927 he succeeded Debs as chairman of the Socialist Party executive committee, a post he held until his death.

Bergerac, town, Dordogne *département*, Aquitaine *région*, southwestern France, on the Dordogne River, east of Bordeaux. It was intermittently held by the English from 1152

Church of Notre-Dame in Bergerac, Fr.
Editions Modernes "Theojac"

until 1450, and in the 16th and 17th centuries it became a centre of French Protestantism. The Treaty of Bergerac (1577), between Henry III and the Huguenot princes, was a futile attempt to end the Wars of Religion. In 1621 Bergerac was subdued by a royal army, and its fortifications were destroyed. Features include the 19th-century Church of Notre-Dame, Maison Peyrarède (Kings' House), the Tobacco Museum (in the town hall), and the Récol-

lets' Cloister cellar. The marketing of wines, chestnuts, and truffles is augmented by light manufacturing (tobacco, confectionary, shoes, fruit preserves). The national powder works, dating from World War I, has been converted to chemical production. Pop. (1982) 24,604.

Bergerac, Savinien Cyrano de: see Cyrano de Bergerac, Savinien.

Bergeron, Tor Harold Percival (b. Aug. 15, 1891, Godstone, near London, Eng.—d. June 13, 1977, Stockholm, Swed.), Swedish meteorologist best known for his work on cloud physics.

He was educated at the universities of Stockholm and Oslo, from the latter of which he received his Ph.D. in 1928. He taught at the University of Stockholm (1935-45) and the University of Uppsala, Swed. (1946-60). From 1918 to 1921 he was a student and co-worker of the pioneering meteorologist Vilhelm Bjerknes and was actively engaged in the development of new methods of weather forecasting.

Bergeron was noted for his studies in the analysis of air masses and the formation of warm and cold fronts. He was also the first meteorologist to take into account upper atmospheric phenomena and their effect on climate. His theory on the origin of precipitation was instrumental in the further exploration of cloud physics. He wrote a number of works on such subjects as weather fronts, ice nuclei in clouds, methods and problems of weather forecasting, build-up of ice sheets, and the Earth's future supply of fresh water.

Bergey, David Hendricks (b. Dec. 27, 1860, Skipack, Pa., U.S.—d. Sept. 5, 1937, Philadelphia, Pa.), American bacteriologist, primary author of *Bergey's Manual of Determinative Bacteriology*, an invaluable taxonomic reference work.

Bergey taught in the schools of Montgomery county, Pa., until he began studies at the University of Pennsylvania. In 1884 he received the B.S. and M.D. degrees and practiced medicine until 1893. He then joined the staff at the University of Pennsylvania and was appointed Thomas A. Scott fellow in the Laboratory of Hygiene in 1894. He received a doctor of public health degree in 1916, served as professor of hygiene and bacteriology in both undergraduate and graduate schools of the university, became director of the laboratory in 1929, and served in other university posts until his retirement in 1932. He was the director of biological research of the National Drug Company in Philadelphia until his death in 1937.

Bergey's publications include the *Handbook of Practical Hygiene* (1899) and *The Principles of Hygiene* (1901). His research included such varied topics as tuberculosis, food preservatives, phagocytosis (engulfment of particles by cells), and anaphylaxis (reaction of an organism to a foreign substance) and a systematic arrangement of the class of microorganisms called Schizomycetes.

Berghem, Claes Pietersz(oon) (Dutch painter): see Berchem, Nicolaes Pietersz(oon).

Bergisch Gladbach, city, North Rhine-Westphalia *Land* (state), western Germany, just east-northeast of Cologne. Chartered in 1856, Bergisch Gladbach has a 12th-century Romanesque church (in the Paffrath district), the moated castles of Zwielfelsstrunden and Blegge, and the 16th-century headquarters of the Order of St. John (in Herrenstrunden). Paper is the city's chief product, but machinery, electrical equipment, wool, glass fibre, and pharmaceutical products are also manufactured, and iron is smelted. Nearby Bensberg, which was annexed by Bergisch Gladbach in 1975, is the site of a nuclear reactor building company. The city serves as a tourist base for the Bergisches Land, a hilly

in the lower Rhine Valley. Pop. (1989 est.) 101,983.

Bergisches Land, region, North Rhine-Westphalia Land (state), western Germany, along the east bank of the Rhine River, between the Sieg River south of Cologne and the Ruhr River near Duisburg, merging into the Sauerland, a hilly region to the east. The Bergisches Land extends over the area that was the medieval county and duchy of Berg (q.v.). It comprises a gentle plateau with little agriculture but has numerous industries, which are largely dependent on the Ruhr coalfields to the north.

Bergius, Friedrich (b. Oct. 11, 1884, Goldschmieden, near Breslau, Ger.—d. March 30, 1949, Buenos Aires), German chemist who succeeded in converting coal dust and hydrogen directly into gasoline and lubricating oils without isolating intermediate products. For his work in developing the hydrogenation method necessary for this process he shared the 1931 Nobel Prize for Chemistry with Carl Bosch of Germany.

Bergius was educated at the universities of Breslau, Leipzig, and Berlin and at technical schools in Karlsruhe and Hannover. He described his research in *The Use of High Pressure in Chemical Actions* (1913). These studies led to his work on converting coal into liquid hydrocarbons.

Bergius also researched the conversion of wood into sugar and of sugar into other food products. This work helped to provide Germany with food during World War II.

Bergman, Bo Hjalmar (b. Oct. 6, 1869, Stockholm—d. Nov. 17, 1967, Stockholm), Swedish lyrical poet whose early pessimistic and deterministic view of life gave way to a militant humanism under the pressures of the political and social dangers of his time; his simplicity and clarity of style greatly influenced 20th-century Swedish poetry.

Bergman began writing while an official of the Swedish post office, from which he retired in 1933. *Marionetterna* (1903; "Marionettes"), his first volume of poetry, was an expression of melancholy passivity, but each of the ensuing volumes increasingly attacked the political developments in Europe, particularly his last three volumes of verse: *Trots allt* (1931; "In Spite of Everything"), *Garnla gudar* (1939; "Old Gods"), and *Riket* (1944; "The Kingdom"). Bergman's prose works include five volumes of short stories, five novels, five monographs, and autobiographical fragments.

Bergman, Hjalmar Fredrik Elgérus (b. Nov. 19, 1883, Örebro, Swed.—d. Jan. 1, 1931, Berlin), Swedish dramatist, novelist, and short-story writer, who was notable for his intense interest in psychological complexities.

The son of a wealthy banker, Bergman was brought up in conventional middle-class ease with no notice taken of his extreme sensibility and imaginative powers. In his early teens his father, who had hitherto despised him,

Hjalmar Bergman

By courtesy of the Swedish Institute for Cultural Relations, Stockholm

became aware of his precocious talents, and the shy, awkward, but observant boy became

the object of an overpowering and domineering affection. At this period he accompanied his father on business trips to Bergslagen, the mining district outside Örebro, which was to form the background of many of his books.

During 1900–01 Bergman studied at Uppsala University. From 1901 to 1908 he travelled in Europe, especially in Italy: Florence became his favourite city. Delicate nerves and the threat of blindness made his life difficult. In 1908 he married Stina, the daughter of the actor-producer August Lindberg, and she became his defense against the world. They settled first in Lindsberg, then for a time in Rome. For the rest of his life, except during World War I, Bergman led a restless and curiously isolated existence between Sweden and other parts of Europe.

His first play, *Maria, Jesu moder* (1905), owes much to the literary ideas of the 1890s, but shows an original approach to the psychology of Christ and the Virgin Mary. His other early plays reveal the influence of Ibsen. His most original contribution to drama was *Marionettspel* (1917; "Plays of Marionettes"), reflecting the same pessimism as his later novels. His first popular novel *Hans Nåds testamente* (1910; "His Grace's Will") was set in Bergslagen, and portrayed the eccentric Baron Roger and his valet Vickberg in richly comic scenes. Beneath the humour, however, there are undertones of tragedy, as is characteristic, too, of his later works. A collection of short stories *Amourer* (1910), mostly set in Italy, displays his subtle understanding of the irrational as a decisive factor in human behaviour. Bergman produced a series of novels and long short stories, starting with *Vi Bookar, Krok och Rothar* (1912) and ending with *En döds memoarer* (1918; "Memoirs of One Dead"). These were mainly concerned with Bergslagen, from early times, and with the fortunes and complicated feuds of certain families and characters.

His amazing memory and powers of observation enabled Bergman to create out of his own experiences and out of oral traditions, a grotesque, fantastic, sombre, and yet moving world that was peculiarly his own, despite its real-life setting. His work was appreciated by a discriminating few, until with *Markurells i Wadköping* (1919; *God's Orchid*, 1924) he at last captured the wider public. The action of this vigorous comic novel takes place, with numerous recapitulations, within a 24-hour period. It tells the story of the grotesque innkeeper Markurell, who, although he has succeeded in getting most of the inhabitants of the town of Wadköping in his power, shows mercy, out of love for his only son Johan, whose real father proves to be the innkeeper's chief enemy. The novel is written ironically, but a sense of tragedy permeates it.

Bergman followed this with other successes, including *Farmor och vår Herre* (1921; *Thy Rod and Thy Staff*, 1937) and *Chefen Fru Ingeborg* (1924; *The Head of the Firm*, 1936), and *Clownen Jac* (1930; "The Clown Jac").

His play *Swedenhielms* (1925) is among the few living Swedish comedies and his dramatization of *Markurells* also has remained popular. Four of his plays (*Markurells of Wadköping*, *The Baron's Will*, *Swedenhielms*, and *Mr. Sleeman Is Coming*) were published in English translation in 1968. He also wrote radio and film scripts. Fundamentally a pessimist, Bergman felt for all the weaknesses of man with an understanding pity irradiated by humour.

Bergman, (Ernst) Ingmar (b. July 14, 1918, Uppsala, Swed.), Swedish film writer-director who achieved world fame with such films as *Det sjunde inseglet* (1956; *The Seventh Seal*); *Smultronstället* (1957; *Wild Strawberries*); the trilogy *Såsom i en spegel* (1961; *Through a Glass Darkly*), *Nattvardsgästerna* (1961; *The Communicants*, or *Winter Light*), *Tystnaden*

(1963; *The Silence*), and *Viskingar och rop* (1972; *Cries and Whispers*). He is noted for his versatile camera work and for his fragmented

Ingmar Bergman

Camera Press

narrative style, which contribute to his bleak depiction of human loneliness, vulnerability, and torment.

Life. Bergman was the son of a Lutheran pastor and frequently remarked on the importance of his childhood background in the development of his ideas and moral preoccupations. Even when the context of his film characters' sufferings is not overtly religious, they are always implicitly engaged in a search for moral standards of judgment, a rigorous examination of action and motive, in terms of good and bad, right and wrong, which seems particularly appropriate to someone brought up in a strictly religious home. Another important influence in his childhood was the religious art Bergman encountered, particularly the primitive yet graphic representations of Bible stories and parables found in rustic Swedish churches, which fascinated him and gave him a vital interest in the visual presentation of ideas, especially the idea of evil as embodied in the devil.

Bergman attended Stockholm University, where he studied art, history, and literature. There for the first time he became passionately involved in the theatre and began writing and acting in plays and directing student productions. From these he went on to become a trainee director at the Mäster Olofsgården Theatre and the Sagas Theatre, where he produced a spectacularly unconventional and disastrous production of the Swedish playwright August Strindberg's *Ghost Sonata*. In 1944 he was given his first full-time job as a director, at Hålsingborg municipal theatre. Also, and more importantly, he met Carl-Anders Dymling, the head of the Svensk Filmindustri. Dymling was sufficiently impressed by him to commission an original screenplay, *Hets* (1944; *Frenzy*, or *Torment*). This was directed by Alf Sjöberg, then Sweden's leading film director, and had an enormous success, both at home and abroad. Largely as a result of this success, Bergman was, in 1945, given a chance to write and direct a film of his own, *Kris* (*Crisis*), and from this point on, his career was under way.

The films that Bergman wrote or directed, or both, in the next five years were, if not directly autobiographical, at least very much concerned with the sort of problems that he himself was encountering at that time: the role of the young in a changing society, ill-fated young love, and military service. At the end of 1948 he directed his first film based on an original screenplay of his own, *Fängelse*

(1949; *Prison, or The Devil's Wanton*). It recapitulated all the themes of his previous films in a complex, perhaps overambitious story, built around the romantic and professional problems of a young film director who considers making a film based on the idea that the devil rules the world. While this is not to be taken without qualification as Bergman's message in his early work, it may at least be said that his imaginative world is divided very sharply between the worlds of good and evil, the latter always overshadowing the former, the devil lying in wait at the end of each idyll.

In 1951 Bergman's career in films, like nearly the whole of Swedish filmmaking, came to an abrupt halt as the result of a major economic crisis in Sweden. But in 1952 he returned with two films, *Kvinnors väntan* (*Waiting Women, or Secrets of Women*) and *Sommaren med Monika* (*Summer with Monika, or Monika*), that marked the beginning of his mature work. He was also appointed director of the Malmö municipal theatre, where he remained until 1959. This new phase introduced two markedly new characteristics in his work. In subject matter, Bergman, now himself married, returned again and again to the question of marriage. Viewing it from many angles, he examined the ways by which two people adjust to living together, their motives for being faithful or unfaithful to each other, and their reactions to bringing children into the world. At this time Bergman began to gather around him, in his film and stage productions, a faithful "stock company" of actors with whom he worked regularly to give his work and their interpretation of it a manifest consistency and style.

In 1955 Bergman had his first great international success with *Sommernattens leende* (*Smiles of a Summer Night*), a bittersweet romantic comedy-drama in a period setting. In the next few years, a kind of Bergman fever swept over the international film scene; concurrently with the succession of his new films, which included two masterpieces, *The Seventh Seal* (1956), a medieval morality play, and *Wild Strawberries* (1957), a meditation on old age, all of his early work was shown, and Bergman was universally recognized as one of the most important figures in cinema. Indeed, a far wider section of the cultured public became aware of his work than of that of any previous filmmaker; for the first time a filmmaker was as widely and as highly regarded as artists in any of the more traditional media.

Inevitably, a reaction set in, though Bergman continued to make films and direct plays with undiminished activity; and his trilogy of films, *Through a Glass Darkly*, *Winter Light*, and *The Silence*, dealing with the border line between sanity and madness and that between human contact and total withdrawal, was regarded by many as his crowning achievement.

About this time, he acquired a country home on the bleak island of Fårö; and the island provided a characteristic stage for the dramas of a whole series of films that included *Persona* (1966), *Vargtimmen* (1968; *Hour of the Wolf*), *Skammen* (1968; *Shame*), and *En passion* (1969; *The Passion, or The Passion of Anna*), all dramas of inner conflicts involving a small, closely knit group of characters. With *Beröringen* (1971; *The Touch*), his first English-language film, Bergman returned to an urban setting and more romantic subject matter, though fundamentally the characters in the film's marital triangle are no less mixed up than any in the Fårö cycle of films; and then *Viskingar och rop* (1972; *Cries and Whispers*), *Scener ur ett aktenskap* (1974; *Scenes from a Marriage*), and *Herbstsonate* (1978; *Autumn Sonata*), all dealing compassionately with intimate family relationships, won popular as

well as critical fame. Throughout the years he continued to direct for the stage, most notably at Stockholm's Royal Dramatic Theatre. In 1977 he received the Swedish Academy of Letters Great Gold Medal, and in the following year the Swedish Film Institute established a prize for excellence in filmmaking in his name. Later films include *Fanny och Alexander* (1983; *Fanny and Alexander*), in which the fortunes and misfortunes of a wealthy theatrical family in turn-of-the-century Sweden are portrayed through the eyes of a young boy.

Assessment. Bergman established a worldwide reputation for writing and directing films that, in an unmistakably individual style, examine the issues of morality by exploring man's relationship to himself, to others, and to God. His work and the worldwide vogue it enjoyed in the late 1950s and early 1960s introduced many people for the first time to the idea of the total filmmaker, the writer-director who throughout a sizable body of work uses the medium of film to express his own ideas and perceptions, with as much ease and conviction as artists in earlier generations used the novel or the symphony or the fresco. In addition, the immense international popularity of his films has tended to ensure that Bergman's picture of Sweden and the Swedish temperament is the first and often the only impression received by the outside world; and when other Swedish films seem to present much the same image, it is usually because the influence of Bergman on his Swedish colleagues is so pervasive rather than because his highly personal vision should be taken as an objectively true portrait of his country.

Bergman's anguished appraisal of the human situation has lost nothing of its intensity through the years; rather, he has progressively stripped away the distracting decorations in his films to create an abstract drama of man's relation with man and perhaps with God (if he exists). He deals with man's attempt to define his own personality by removing his masks to see if there is a face underneath. The images of the creator as actor and the creator as magician recur throughout Bergman's work. He himself embodies elements of both the thinker and the actor, the preacher and the charlatan; in Bergman they all fuse to create an artist of great force and individuality whose work is always unmistakably his own. (J.R.T.)

MAJOR WORKS. *Kris* (1945; *Crisis*); *Skepp till Indienland* (1947; *A Ship to India, or The Land of Desire*); *Hamnstad* (1948; *Port of Call*); *Fångelse* (1949; *Prison, or The Devil's Wanton*); *Törst* (1949; *Thirst, or Three Strange Loves*); *Till glädje* (1949; *To Joy*); *Sommarlek* (1951; *Illicit Interlude, or Summer Interlude*); *Kvinnors väntan* (1952; *Secrets of Women, or Waiting Women*); *Gycklarnas afton* (1953; *The Naked Night, or Sawdust and Tinsel*); *En lektion i kärlek* (1954; *A Lesson in Love*); *Kvinnodrom* (1955; *Dreams, or Journey into Autumn*); *Sommernattens leende* (1955; *Smiles of a Summer Night*); *Det sjunde inseglet* (1956; *The Seventh Seal*); *Smultronstället* (1957; *Wild Strawberries*); *Nära livet* (1958; *Brink of Life, or So Close to Life*); *Ansiktet* (1958; *The Magician, or The Face*); *Jungfrukällan* (1960; *The Virgin Spring*); *Djävulens öga* (1960; *The Devil's Eye*); *Såsom i en spegel* (1961; *Through a Glass Darkly*); *Nattsvardsgästerna* (1961; *Winter Light*); *Tysnaden* (1963; *The Silence*); *För att inte tala om alla dessa kvinnor* (1964; *All These Women, or Now About These Women*); *Persona* (1966); *Vargtimmen* (1968; *Hour of the Wolf*); *Skammen* (1968; *Shame*); *En passion* (1969; *The Passion of Anna*); *Beröringen* (1971; *The Touch*); *Viskingar och rop* (1972; *Cries and Whispers*); *Scener ur ett aktenskap* (1974; *Scenes from a Marriage*); *Trollflöjten* (1974; *The Magic Flute*); *The Serpent's Egg* (1977); *Herbstsonate* (1978; *Autumn Sonata*); *From the Life of the Marionettes* (1980); *Fanny och Alexander* (1983; *Fanny and Alexander*).

BIBLIOGRAPHY. Jorn Donner, *Djävulens ansikte: Ingmar Bergmans filmer* (1962; Eng. trans., *The Personal Vision of Ingmar Bergman*, 1964), a perceptive study of Bergman's themes and images by

a fellow filmmaker; John Russell Taylor, *Cinema Eye, Cinema Ear* (1964), contains a critical study of Bergman, filmography, and bibliography; Henrik Sjogren, *Ingmar Bergman på teatern* (1968), a complete account of Bergman's theatrical work, with pictures and credits; *Four Screenplays of Ingmar Bergman: Smiles of a Summer Night, The Seventh Seal, Wild Strawberries, The Magician (The Face)* (1960), and *A Trilogy: Through a Glass Darkly, Winter Light, The Silence* (1965), two collections of English translations of Bergman's principal screenplays.

Bergman, Ingrid (b. Aug. 29, 1915, Stockholm—d. Aug. 29, 1982, London), one of the most popular motion-picture actresses in the United States from the 1940s until her death and an international star in Swedish, French, German, Italian, and British films. The natural charm, freshness, intelligence, and vitality

Ingrid Bergman
EB Inc

with which she approached her varied roles made her the image of sincerity and ideal womanhood.

Bergman studied at the Royal Dramatic Theatre, in Stockholm. Her screen debut in *Munkbrogreven* (*The Count of the Monk's Bridge*, 1935), was followed by challenging roles in such Swedish films as *En kvinnas ansikte* (*A Woman's Face*, 1938) and the original *Intermezzo* (1939). Brought to the United States to star in the Hollywood version of *Intermezzo* (1939, released in Great Britain as *Escape to Happiness*), Bergman achieved tremendous popularity through a series of critical and commercial successes that included *Casablanca* (1942); *For Whom the Bell Tolls* (1943); *Gaslight* (1944), for which she won the Academy Award for best actress; *Saratoga Trunk* (1945); *Spellbound* (1945), a thriller directed by Alfred Hitchcock; *The Bells of St. Mary's* (1945); and another Hitchcock thriller, *Notorious* (1946). Her love affair with the Italian director Roberto Rossellini, during the filming of *Stromboli* (1950), led her first husband to divorce her. The scandal forced her to return to Europe, where she appeared in Italian and French films, such as *Europa '51* (1952; *The Greatest Love*, 1954) and *Un viaggio in Italia* (1954; *Journey to Italy*, 1955). After her marriage to Rossellini in 1950 ended in divorce, she made a triumphant Hollywood comeback in *Anastasia* (1956), for which she won her second Academy Award. She won her third Oscar, for best supporting actress, for her role in the highly successful film *Murder on the Orient Express* (1974). She was nominated for an Academy Award for her role as a concert pianist in the Swedish film *Autumn Sonata* (1978), directed by Ingmar Bergman. Her last role was that of Golda Meir, the Israeli prime minister, in the television play *A Woman Called Golda* (1981).

On the stage from 1940, when she starred in *Liliom*, Bergman appeared in critically acclaimed plays such as *Hedda Gabler* (Paris, 1962), *A Month in the Country* (Great Britain, 1965), *Captain Brassbound's Conver-*

sion (London, 1971), and *The Constant Wife* (New York, 1975). She also starred in the television plays *The Turn of the Screw* (1959) and *Hedda Gabler* (1963).

My Story (1980) is her autobiography with alternating sections by Alan Burgess.

Bergman, Torbern Olof (b. March 20, 1735, Katrineberg, Swed.—d. July 8, 1784, Medevi), Swedish chemist and naturalist who introduced many improvements in chemical analysis and made important advances in the theory of crystal structure.

Torbern Bergman, detail of an oil painting by Per Krafft; in the Royal Swedish Academy of Sciences, Stockholm

By courtesy of Svenska Portrattarkivet, Stockholm

Bergman was appointed associate professor of mathematics at the University of Uppsala in 1761, and six years later he became professor of chemistry there. His early studies were on rainbows and on the Aurora Borealis, which he estimated to have a height of 740 kilometres (460 miles). Bergman also investigated the pyroelectric properties of the mineral tourmaline and discovered that when a tourmaline crystal is heated, the ends become oppositely charged.

Bergman's most important paper is probably his *Disquisitio de Attractionibus Electivis* (1775; *A Dissertation on Elective Attractions*), in which he included tables listing the elements in the order of their affinity (their ability to react and displace other elements in a compound). These tables were widely acclaimed and were included in chemical literature as late as 1808.

Bergman introduced many new reagents and devised analytical methods for chemical analysis. His *De Analysis Aquarum* (1778; "On Water Analysis") is the first comprehensive account of the analysis of mineral waters.

Bergmann, Ernst (Gustav Benjamin) von (b. Dec. 16, 1836, Riga, Latvia—d. March 25, 1907, Wiesbaden, Ger.), German surgeon and author of a classic work on cranial surgery, *Die Chirurgische Behandlung der Hirnkrankheiten* (1888; "The Surgical Treatment of Brain Disorders").

Bergmann was educated at Dorpat, where he was professor of surgery from 1871 to 1878. He then taught at Würzburg until 1882, when he settled at the University of Berlin.

Ernst von Bergmann
The Bettmann Archive

In addition to his contributions to cranial surgery, Bergmann is noted for introducing steam sterilization of instruments and dressings (1886), and in 1891 he introduced aseptic methods to the practice of surgery.

Bergmann's Rule, in zoology, principle correlating external temperature and the ratio of body surface to weight in warm-blooded animals. Birds and mammals in cold regions have been observed to be bulkier than individuals of the same species in warm regions. The principle was proposed by Carl Bergmann, a 19th-century German biologist, to account for an adaptive mechanism to conserve or to radiate body heat, depending on climate.

Bergner, Elisabeth (b. Aug. 22, 1900, Vienna—d. May 12, 1986, London), Austrian actress who was noted for her stage and motion-picture performances as well as for her fragile beauty.

Bergner began her career in Zurich in 1919 but reached international fame in Berlin under Max Reinhardt's direction in 1924 of *Saint Joan* by George Bernard Shaw. Although she was highly regarded as a stage actress—and she continued to perform through the 1960s—it was her motion-picture roles in sentimental romances that gained her the most enthusiastic audience.

Bergner made her first motion picture in 1923; *Nju* (1924), directed by her husband-to-be, Paul Czinner, was an instant success, as were the films that followed. Denounced by the Nazis, Bergner and Czinner moved to England. Her stage debut there as Gemma Jones in *Escape Me Never* (1933) was met with great enthusiasm, and she repeated the role in New York City (1935) and again for the film version that was directed by Czinner (1935); the latter performance garnered her an Academy Award nomination. Other English-language films of Bergner's included *Catherine the Great* (1934), *As You Like It* (1936), *Paris Calling* (1942; her only U.S. film), and *Cry of the Banshee* (1970). Her last motion-picture performance was in 1979.

J.M. Barrie wrote his last play (*The Boy David*; 1936) especially for Bergner, and she enjoyed a two-season run as Sally in Martin Vale's *The Two Mrs. Carrolls* (1943). After the war she returned on tour to her homeland on numerous occasions, and there she became the first actress to win the Schiller Prize (1963) for contributions to German cultural life. She also won awards at the Berlin Film festivals of 1963 and 1965.

bergomask (dance): *see* bergamasca.

bergschrand (German: "mountain crevice"), a crevasse or series of crevasses often found near the head of a mountain glacier. The erosion of the rock beneath a bergschrand often results in a cirque (*q.v.*), or natural amphitheatre.

Bergslagen, major ore-producing region in central Sweden, lying northwest of Stockholm and extending from Vänern (Sweden's largest lake) to the Gulf of Bothnia. It falls predominantly within the *län* (counties) of Kopparberg, Örebro, Värmland, and Västmanland.

In the Middle Ages iron was mined there on a large scale and was smelted with charcoal. Metal products were shipped to the south in exchange for cattle. New iron mines opened in the early 18th century. In 1877 an ore export port was constructed on the Baltic coast, at Oxelösund, and was connected by rail to the mines of Grängesberg and Stråssa. The development of Sweden's world-famous steel industry was based on raw materials from Bergslagen.

While iron is the principal ore, Bergslagen has also served as a source of copper (especially at Falun), silver, lead, and zinc. Today the region has many factories producing heavy engineering and metal products. Avesta has

important steel works. There are also a number of pulp and paper mills in the area.

Bergson, Henri(-Louis) (b. Oct. 18, 1859, Paris—d. Jan. 4, 1941, Paris), French philosopher, the first to elaborate what came to be called a process philosophy, which rejected static values in favour of values of motion, change, and evolution. He was also a master literary stylist, of both academic and popular appeal.

Early years. Through his father, a talented musician, Bergson was descended from a rich Polish Jewish family—the sons of Berek, or Berek-son, from which the name Bergson is derived. His mother came from an English Jewish family. Bergson's upbringing, training,

Bergson, 1928

Archiv für Kunst und Geschichte, West Berlin

and interests were typically French, and his professional career, as indeed all of his life, was spent in France, most of it in Paris.

He received his early education at the Lycée Condorcet in Paris, where he showed equally great gifts in the sciences and the humanities. From 1878 to 1881 he studied at the École Normale Supérieure in Paris, the institution responsible for training university teachers. The general culture that he received there made him equally at home in reading the Greek and Latin classics, in obtaining what he wanted and needed from the science of his day, and in acquiring a beginning in the career of philosophy, to which he turned upon graduation.

His teaching career began in various lycées outside of Paris, first at Angers (1881–83) and then for the next five years at Clermont-Ferrand. While at the latter place, he had the intuition that provided both the basis and inspiration for his first philosophical books. As he later wrote to the eminent American Pragmatist William James:

I had remained up to that time wholly imbued with mechanistic theories, to which I had been led at an early date by the reading of Herbert Spencer. . . . It was the analysis of the notion of time, as that enters into mechanics and physics, which overturned all my ideas. I saw, to my great astonishment, that scientific time does not endure . . . that positive science consists essentially in the elimination of duration. This was the point of departure of a series of reflections which brought me, by gradual steps, to reject almost all of what I had hitherto accepted and to change my point of view completely.

The first result of this change was his *Essai sur les données immédiates de la conscience* (1889; *Time and Free Will: An Essay on the Immediate Data of Consciousness*), for which he received the doctorate the same year. This work was primarily an attempt to establish the notion of duration, or lived time, as opposed to what he viewed as the spatialized conception of time, measured by a clock, that is employed by science. He proceeded by analyzing the awareness that man has of his inner self to show that psychological facts are qual-

itatively different from any other, charging psychologists in particular with falsifying the facts by trying to quantify and number them. Fechner's Law, claiming to establish a calculable relation between the intensity of the stimulus and that of the corresponding sensation, was especially criticized. Once the confusions were cleared away that confounded duration with extension, succession with simultaneity, and quality with quantity, he maintained that the objections to human liberty made in the name of scientific determinism could be seen to be baseless.

Philosophical triumphs. The publication of the *Essai* found Bergson returned to Paris, teaching at the Lycée Henri IV. In 1891 he married Louise Neuburger, a cousin of the French novelist Marcel Proust. Meanwhile, he had undertaken the study of the relation between mind and body. The prevailing doctrine was that of the so-called psychophysiological parallelism, which held that for every psychological fact there is a corresponding physiological fact that strictly determines it. Though he was convinced that he had refuted the argument for determinism, his own work, in the doctoral dissertation, had not attempted to explain how mind and body are related. The findings of his research into this problem were published in 1896 under the title *Matière et mémoire: essai sur la relation du corps à l'esprit (Matter and Memory)*.

This is the most difficult and perhaps also the most perfect of his books. The approach that he took in it is typical of his method of doing philosophy. He did not proceed by general speculation and was not concerned with elaborating a great speculative system. He began in this, as in each of his books, with a particular problem, which he analyzed by first determining the empirical (observed) facts that are known about it according to the best and most up-to-date scientific opinion. Thus, for *Matière et mémoire* he devoted five years to studying all of the literature available on memory and especially the psychological phenomenon of aphasia, or loss of the ability to use language. According to the theory of psychophysiological parallelism, a lesion in the brain should also affect the very basis of a psychological power. The occurrence of aphasia, Bergson argued, showed that this is not the case. The person so affected understands what others have to say, knows what he himself wants to say, suffers no paralysis of the speech organs, and yet is unable to speak. This fact shows, he argued, that it is not memory that is lost but, rather, the bodily mechanism that is needed to express it. From this observation Bergson concluded that memory, and so mind, or soul, is independent of body and makes use of it to carry out its own purposes.

The *Essai* had been widely reviewed in the professional journals, but *Matière et mémoire* attracted the attention of a wider audience and eventually led to Bergson's becoming one of the most popular and influential lecturers and writers of the day. In 1897 he returned as professor of philosophy to the École Normale Supérieure, which he had first entered as a student at age 19. Then, in 1900, he was called to the Collège de France, the academic institution of highest prestige in all of France, where he enjoyed immense success as a lecturer. From then until the outbreak of World War I, there was a veritable vogue of Bergsonism. William James was an enthusiastic reader of his works, and the two men became warm friends. Expositions and commentaries on the Bergsonian philosophy were to be found everywhere. It was held by many that a new day in philosophy had dawned that brought with it light to many other activities such as literature, music, painting, politics, and religion.

L'Évolution créatrice (1907; *Creative Evolu-*

tion), the greatest work of these years and Bergson's most famous book, reveals him most clearly as a philosopher of process at the same time that it shows the influence of biology upon his thought. In examining the idea of life, Bergson accepted evolution as a scientifically established fact. He criticized, however, the philosophical interpretations that had been given of it for failing to see the importance of duration and hence missing the very uniqueness of life. He proposed that the whole evolutionary process should be seen as the endurance of an *élan vital* ("vital impulse") that is continually developing and generating new forms. Evolution, in short, is creative, not mechanistic. (See creative evolution.)

In this developing process, he traced two main lines: one through instinct, leading to the life of insects; the other through the evolution of intelligence, resulting in man; both of which, however, are seen as the work of one vital impulse that is at work everywhere in the world. The final chapter of the book, entitled "The Cinematographical Mechanism of Thought and the Mechanistic Illusion," presents a review of the whole history of philosophical thought with the aim of showing that it everywhere failed to appreciate the nature and importance of becoming, falsifying thereby the nature of reality by the imposition of static and discrete concepts.

Among Bergson's minor works are *Le Rire: essai sur la signification du comique* (1900; *Laughter: An Essay on the Meaning of the Comic*) and *Introduction à la métaphysique* (1903; *An Introduction to Metaphysics*). The latter provides perhaps the best introduction to his philosophy by offering the clearest account of his method. There are two profoundly different ways of knowing, he claimed. The one, which reaches its furthest development in science, is analytic, spatializing, and conceptualizing, tending to see things as solid and discontinuous. The other is an intuition that is global, immediate, reaching into the heart of a thing by sympathy. The first is useful for getting things done, for acting on the world, but it fails to reach the essential reality of things precisely because it leaves out duration and its perpetual flux, which is inexpressible and to be grasped only by intuition. Bergson's entire work may be considered as an extended exploration of the meaning and implications of his intuition of duration as constituting the innermost reality of everything.

Later years. In 1914 Bergson retired from all active duties at the Collège de France, although he did not formally retire from the chair until 1921. Having received the highest honours that France could offer him, including membership, since 1915, among the "40 immortals" of the Académie Française, he was awarded the Nobel Prize for Literature in 1927.

After *L'Évolution créatrice*, 25 years elapsed before he published another major work. In 1932 he published *Les Deux Sources de la morale et de la religion (The Two Sources of Morality and Religion)*. As in the earlier works, he claimed that the polar opposition of the static and the dynamic provides the basic insight. Thus, in the moral, social, and religious life of men he saw, on the one side, the work of the closed society, expressed in conformity to codified laws and customs, and, on the other side, the open society, best represented by the dynamic aspirations of heroes and mystical saints reaching out beyond and even breaking the strictures of the groups in which they live. There are, thus, two moralities, or, rather, two sources: the one having its roots in intelligence, which leads also to science and its static, mechanistic ideal; the other based on intuition, and finding its expression not only in the free creativity of art and philosophy but also in the mystical experience of the saints.

Bergson in *Les Deux Sources* had come

much closer to the orthodox religious notion of God than he had in the vital impulse of *L'Évolution créatrice*. He acknowledged in his will of 1937, "My reflections have led me closer and closer to Catholicism, in which I see the complete fulfillment of Judaism." Yet, although declaring his "moral adherence to Catholicism," he never went beyond that. In explanation, he wrote: "I would have become a convert, had I not foreseen for years a formidable wave of anti-Semitism about to break upon the world. I wanted to remain among those who tomorrow were to be persecuted." To confirm this conviction, only a few weeks before his death, he arose from his sickbed and stood in line to register as a Jew, in accord with the law just imposed by the Vichy government and from which he refused the exemption that had been offered him.

Influence. Although it did not give rise to a Bergsonian school of philosophy, Bergson's influence has been considerable. His influence among philosophers has been greatest in France, but it has also been felt in the United States and Great Britain, especially in the work of William James, George Santayana, and Alfred North Whitehead, the other great process metaphysicians of the 20th century.

BIBLIOGRAPHY. A good introduction to the study of Bergson is provided by Harold A. Larrabee (ed.), *Selections from Bergson* (1949), with an introduction by the editor. The best edition of works is the *Oeuvres*, with notes by Andre Robinet and an introduction by Henri Gouhier (1959). Perhaps the best sympathetic account (in French) of the man and his work is that of Vladimir Jankélévitch, *Henri Bergson* (1959), a complete revision of his earlier work (*Bergson*, 1931). Critical, yet also sympathetic, are Jacques Maritain, *La Philosophie bergsonienne*, 2nd ed. (1930); and Jacques Chevalier, *Bergson* (1926; Eng. trans. 1928). A highly critical account is Bertrand Russell, *The Philosophy of Bergson* (1914). A good account of Bergson the man may be found in Jean Guitten, *La Vocation de Bergson* (1960). On Bergson's influence on literature and the arts, see Romeo Arbour, *Henri Bergson et les lettres françaises* (1955).

Bergström, Sune K. (b. Jan. 10, 1916, Stockholm, Swed.—d. Aug. 15, 2004, Stockholm), Swedish biochemist, corecipient with fellow Swede Bengt Ingemar Samuelsson and Englishman John Robert Vane (*qq.v.*) of the 1982 Nobel Prize for Physiology or Medicine. All three were honoured for their isolation, identification, and analysis of numerous prostaglandins, which are biochemical compounds that influence blood pressure, body temperature, allergic reactions, and other physiological phenomena in mammals. Bergström was the first to demonstrate the existence of more than one such compound and to determine the elemental compositions of two of them.

Bergström was educated at the Karolinska Institute, Stockholm, where he was awarded doctoral degrees in medicine and biochemistry in 1944. He held research fellowships at Columbia University and the University of Basel, then returned to Sweden to accept a professorship of chemistry at the University of Lund. In 1958 he moved to the Karolinska Institute, where he became dean of the medical faculty in 1963 and rector in 1969. After his retirement as rector in 1977 he continued to conduct research. He was also chairman of the Nobel Foundation (1975–87) and chairman of medical research at the World Health Organization (1977–82).

Beria, Lavrenty Pavlovich, Beria also spelled BERIYA (b. March 29 [March 17, Old Style], 1899, Merkheli, Russia—d. Dec. 23, 1953, Moscow), director of the Soviet secret police, who played a major role in the purges of Stalin's opponents.

Having joined the Communist Party in 1917, Beria participated in revolutionary activity in Azerbaijan and Georgia before he was drawn into intelligence and counterintelligence activ-

Beria
Keystone

ities (1921) and appointed head of the Cheka (secret police) in Georgia. He became party boss of the Transcaucasian republics in 1932 and personally oversaw the political purges in those republics during Stalin's Great Purge (1936–38). Beria was brought to Moscow in 1938 as the deputy to Nikolay Yezhov, head of the People's Commissariat for Internal Affairs (NKVD), the Soviet secret police. Yezhov was apparently arrested and shot on Stalin's orders, and Beria became head of the secret police (1938–53). He supervised a purge of the police bureaucracy itself and administered the vast network of labour camps set up throughout the country. In February 1941 he became a deputy prime minister of the U.S.S.R., and during World War II, as a member of the State Defense Committee, he not only controlled the Soviet Union's internal-security system but also played a major role in raw-materials production using the slave labour in the camps. He was made a marshal of the U.S.S.R. in 1945. He was also a member of the Central Committee of the Communist Party from 1934 and of the executive policy-making committee, the Politburo, from 1946. When the Politburo was reorganized as the Presidium in 1952, Beria retained his seat.

Soon after Stalin's death in March 1953, Beria became one of four deputy prime ministers as well as head of the Ministry of Internal Affairs, an organization which at that time combined both the secret political and regular police functions. During the ensuing struggle for power, Beria apparently attempted to use his position as chief of the secret police to succeed Stalin as sole dictator. By July 1953, however, he had been defeated by an anti-Beria coalition (led by Georgy M. Malenkov, Vyacheslav M. Molotov, and Nikita S. Khrushchev). He was arrested, deprived of his government and party posts, and publicly accused of being an "imperialist agent" and of conducting "criminal antiparty" and antistate activities." Convicted of these charges at his trial in December 1953, Beria was immediately executed.

beriberi, also called **VITAMIN B₁ DEFICIENCY**, nutritional disorder caused by a deficiency of vitamin B₁ (thiamine) and characterized by impairment of the nerves and heart. General symptoms include loss of appetite and overall lassitude, digestive irregularities, and a feeling of numbness and weakness in the limbs and extremities. (The term *beriberi* is derived from the Sinhalese word meaning "extreme weakness.") In the form known as dry beriberi, there is a gradual degeneration of the long nerves, first of the legs and then of the arms, with associated atrophy of muscle and loss of reflexes. In wet beriberi, a more acute form, there is edema (overabundance of fluid in the tissues) resulting largely from cardiac failure and poor circulation. In infants breast-fed by mothers who are deficient in thiamine, beriberi may lead to rapidly progressing heart failure.

The cardiac symptoms, in both infants and adults, generally respond promptly and dramatically to the administration of thiamine. When neurological involvement is present,

response to thiamine therapy is much more gradual; in more severe cases, the structural lesions of the nerve cells may be irreversible.

Thiamine normally plays an essential role as a coenzyme in the metabolism of carbohydrates; in its absence, pyruvic acid and lactic acid (products of carbohydrate digestion) accumulate in the tissues, where they are believed to be responsible for most of the neurological and cardiac manifestations.

Vitamin B₁ occurs widely in food but may be lost in the course of processing, particularly in the milling of grains. In Far Eastern countries, where polished white rice is a dietary staple, beriberi has been known for over 1,000 years. The history of the recognition, the cause, and the cure of beriberi is dramatic and is well-documented in medical literature. In the 1870s the Japanese navy reported that beriberi had been eradicated among its sailors as a result of adding extra meat, fish, and vegetables to their regular diet. Before that time, almost half of the sailors were likely to develop beriberi, and many died of it. In 1897 Christiaan Eijkman, working in the Dutch East Indies (now Indonesia), showed that a beriberi-like disease could be produced in chickens by a diet of polished rice. That beriberi in humans was also related to the ingestion of white rice was confirmed by British researchers in Malaysia. There, W. Fletcher in 1907 and Henry Fraser and A.T. Stanton in 1909 showed that in selected groups under close observation beriberi occurred in persons who were eating a polished-rice diet whereas those eating parboiled or brown rice did not develop the disease. In 1912 Casimir Funk demonstrated that beriberi could be cured in pigeons by feeding them a concentrate made from rice polishings. Following this discovery he proposed that this, as well as several other conditions, were due to the ingestion of diets that were deficient in specific factors which he termed "vitamines."

The incidence of beriberi in Asia has markedly decreased, partly because an improved standard of living has allowed a more varied diet and partly because of the gradual popular acceptance of partially dehusked, parboiled, and enriched rice—forms that contain higher concentrations of thiamine. The prevention of beriberi is accomplished by eating a well-balanced diet, since thiamine is present in most raw and untreated foods. In Western countries, thiamine deficiency is encountered almost solely in cases of chronic alcoholism.

Bering, Vitus (Jonassen) (b. 1681, Horsens, Den.—d. Dec. 19, 1741, Bering Island, near the Kamchatka Peninsula), navigator whose exploration of the Bering Strait and Alaska prepared the way for a Russian foothold on the North American continent.

After a voyage to the East Indies, Bering joined the fleet of Tsar Peter I the Great as a sublieutenant. In 1724 the tsar appointed him leader of an expedition to determine whether Asia and North America were connected by land, because Russia was interested both in colonial expansion in North America and in finding a northeast passage—*i.e.*, a sea route to China around Siberia. (In 1648 a Russian, Semyon Dezhnyov, had sailed through the Bering Strait, but his report went unnoticed until 1736.) On July 13, 1728, Bering set sail from the Siberian peninsula of Kamchatka and in August passed through the Bering Strait into the Arctic Ocean. Bad weather prevented thorough observation, and, though he did not sight the North American coast, he concluded that Siberia and America were not joined.

During the reign of Empress Anna, Bering sought to undertake a second expedition. His simple plan, however, was expanded into Russia's Great Northern Expedition (1733–43), which mapped much of the Arctic coast of Siberia. On June 4, 1741, Bering sailed from Kamchatka in the *St. Peter*, joined by Alek-

sey Chirikov commanding the *St. Paul*. A storm later separated the ships, and Chirikov went on to discover several Aleutian Islands independently. Bering sailed into the Gulf of Alaska on August 20. Anxious to get his ship back to safety, he was able to reconnoitre only the southwestern coast, the Alaska Peninsula, and the Aleutian Islands. Suffering from scurvy, he was unable to maintain effective command, and the ship was wrecked early in November on the shore of Bering Island, near Kamchatka. After his death there, a few survivors were able to reach Siberia and brought news of excellent fur-trading possibilities in the Aleutians and Alaska.

BIBLIOGRAPHY. Glimpses of personality have to be found in the descriptions of Bering's expeditions, such as F.A. Golder, *Bering's Voyages: An Account of the Efforts of the Russians to Determine the Relation of Asia and America*, 2 vol. (1922–1925, reissued 1968); and Robert Murphy, *The Haunted Journey* (1961). See also Raymond H. Fisher, *Bering's Voyages: Whither and Why* (1977).

Bering Canyon, submarine canyon in the Bering Sea, 250 miles (400 km) long, and possibly the longest such feature in the world. The canyon head is situated at the edge of the continental shelf north of Umnak Island in the Aleutians. Its upper half is fed by a number of tributary valleys and trends southwestward. With depth, the canyon turns gradually northwestward, then turns abruptly to trend north along its lower 45 miles (72 km) to its mouth on the continental rise at a depth of 10,500 feet (3,200 m). The canyon is asymmetric in cross section; along its northerly trend its western wall is as steep as 13°, and its eastern wall has slopes of only 2° to 3°. Maximum relief is at least 2,600 feet (800 m), and the canyon's volume has been estimated at 1,030 cubic miles (4,300 cubic km), compared with volumes of less than 75 cubic miles for most other canyons. Bering Canyon is believed to have formed during late Tertiary and Pleistocene times, when large masses of sediment supplied by Alaskan and Siberian rivers slumped down the continental slope.

Bering Sea, Russian **BERINGOVO MORE**, body of water in the northernmost Pacific Ocean that separates the continents of Asia (northeastern Siberia) and North America (Alaska). The Bering Sea covers 890,000 square miles (2,304,000 square km) and connects with the Arctic Ocean by way of the Bering Strait. The U.S.-Russian boundary passes through the sea and strait.

The following article summarizes information about the Bering Sea. For full treatment, see **MACROPAEDIA: Pacific Ocean**.

The Bering Sea is roughly triangular, with its apex to the north and its base formed by the 1,100-mile- (1,600-kilometre-) long arc of the Alaska Peninsula and the Aleutian Islands, which constitute part of the U.S. state of Alaska. Its maximum east-west width is 1,490 miles (2,400 km), and from north to south it is 990 miles (1,600 km). The numerous islands in the sea include the Aleutians, Nunivak, St. Lawrence, Nelson, and Karagin. The Bering Sea may be divided into two nearly equal parts. A relatively shallow plain, usually less than 500 feet (150 m) deep, extends along the continental and insular shelves in the north and east. The southwest portion of the sea is a much deeper plain, lying at depths of 12,000 to 13,000 feet (3,700 to 4,000 m).

Climate in the northern and eastern parts of the sea is subarctic with winter temperatures of -31° to -49° F (-35° to -45° C), high winds, and frequent storms. Almost all of the Bering Sea water comes from the Pacific Ocean. The sea is rich in plant and animal life; salmon, herring, cod, flounder, and hal-

ibut are commercially fished. The islands are breeding grounds for the fur seal and the sea otter; walrus, seal, and sea lion inhabit the northern areas. First explored by Russian ships under Semyon I. Dezhnyov in 1648, the sea is named after Vitus Bering, a Danish captain who visited the area in 1728.

Bering Sea Dispute, dispute between the United States, on the one hand, and Great Britain and Canada, on the other, over the international status of the Bering Sea. In an attempt to control seal hunting off the Alaskan coast, the United States in 1881 claimed authority over all the Bering Sea waters. Britain refused to recognize this claim. In 1886 the U.S. government ordered the seizure of all vessels found sealing in the Bering Sea. Thus, in 1886, 1887, and 1889, a number of vessels were seized, most of them Canadian ships manned by British subjects. In answer to protests by Canada and Great Britain, the U.S. insisted that the Bering Sea had been a *mare clausum* (i.e., a closed sea under the dominion of the state) under the Russians and that the U.S. had succeeded to the Russian rights.

Because of the rapid shrinking of the seal herd, an agreement was made in 1891 for both British and U.S. vessels to police the area, and a treaty of arbitration was signed the next year. This resulted in an international tribunal, which met in Paris in 1893 and condemned the U.S. seizures. It held that the Bering Sea was part of the high seas and that no single nation had jurisdiction over it. It assessed damages against the United States for the seizures at \$473,151. Restrictions were placed on sealing during the summer breeding months and in the waters surrounding the Pribilof Islands.

In 1911 the United States, Canada, and Japan signed the North Pacific Sealing Convention, which further restricted the area of pelagic sealing but awarded Canada a percentage of all the revenue derived from the annual hunt. In 1941 Japan withdrew from the agreement, claiming that the seals were damaging its fisheries, and the United States and Canada made other temporary arrangements. In 1956 representatives of Canada, the United States, Japan, and the Soviet Union worked out an interim convention, which came into force the following year.

Bering Strait, Russian *PROLIV BERINGA*, strait linking the Arctic Ocean with the Bering Sea and separating the continents of Asia and North America at their closest point. The strait averages 98 to 164 ft (30 to 50 m) in depth and at its narrowest is about 53 mi (85 km) wide. There are numerous islands in the strait, including the two Diomedea Islands (area, about 6 sq mi [16 sq km]), and to the south of the strait lies St. Lawrence Island (about 1,000 sq mi). The U.S.-Russian boundary extends through the strait.

Some of the Bering Sea water passes through the strait into the Arctic Ocean, but most of it returns to the Pacific. In winter the region is subject to severe storms and the sea is covered by ice fields averaging 4 to 5 ft thick. In mid-summer drift ice remains in the Bering Strait. The strait is named after Vitus Bering, a Danish captain, who sailed into the strait in 1728. During the Ice Age the sea level fell by several hundred feet, making the strait into a land bridge between Asia and North America, over which a considerable migration of plants and animals, as well as man (about 20,000 to 35,000 years ago), occurred.

Berio, Luciano (b. Oct. 24, 1925, Oneglia, Italy—d. May 27, 2003, Rome), Italian musician whose success as theorist, conductor, composer, and teacher placed him among the leading representatives of the musical avant-

garde. His style is notable for combining lyric and expressive musical qualities with the most advanced techniques of electronic and aleatoric music.

Luciano Berio, 1970

By courtesy of RCA Records

Berio studied composing and conducting at the Conservatorio Giuseppe Verdi in Milan, and in 1952 he received a Koussevitzky Foundation scholarship at Tanglewood, Mass., where he studied under the influential composer Luigi Dallapiccola. With another leading Italian composer, Bruno Maderna, he founded (1954) the Studio di Fonologia Musicale at Milan Radio. Under Berio's direction until 1959, it became one of the leading electronic music studios in Europe. There he attacked the problem of reconciling electronic music with *musique concrète* (i.e., composition using as raw material recorded sounds such as storms or street noises rather than laboratory-created sounds). Berio and Maderna also founded the journal *Incontri Musicali* ("Musical Encounters"), a review of avant-garde music.

In all his work Berio's logical and clear constructions are considered highly imaginative and poetic, drawing elements of style from such composers as Igor Stravinsky and Anton Webern. *Serenata I* (1957), his last major serial piece, was dedicated to Pierre Boulez. *Diffrérences* (1958–59, rev. 1967) contrasts live and prerecorded instruments. His *Sequenza* series (1958–2002) includes solo pieces for flute, harp, female voice, piano, and violin that incorporate aleatoric elements. Other compositions include *Laborintus II* (1965) and *Sinfonia* (1968), which incorporate a wide range of literary and musical references. Berio's *Coro* (1976) is written for 40 voices and 40 instruments. In addition to composing, Berio also taught at several universities and in 2000 became president and artistic director of the Accademia Nazionale di Santa Cecilia, posts he held until his death.

Beriosova, Svetlana (b. Sept. 24, 1932, Kausnas, Lith.—d. Nov. 10, 1998, London, Eng.), prima ballerina.

Daughter of Nicolas Beriosoff (a Russian who became a British subject), she was brought in 1940 to the United States, where she studied ballet. In 1952, after appearing with several major companies, including the Grand Ballet de Monte Carlo and the Metropolitan Ballet, she joined the Sadler's Wells (now Royal) Ballet, in which she became prima ballerina in 1955. As well as dancing the entire classical repertoire, Beriosova created the leading part in several modern ballets, including Kenneth MacMillan's *Fairy Kiss* (*Le Baiser de la fée*, 1960), and the title roles of *Antigone* (1959) and the speaking-dancing *Persephone* (1961). Her interpretation of *Giselle* is said to rank among the greatest of all time. She retired in 1975.

Bériot, Charles-Auguste de (b. Feb. 20, 1802, Louvain, Belg.—d. April 8, 1870, Brussels), Belgian violinist and founder of the Franco-Belgian school of violin playing.

The student and legal ward of Jean-François

Tiby, Bériot was performing publicly by age nine. His Paris and London debuts came in 1826, after a mutually unsatisfying period of instruction with Pierre Baillet. Returning to Brussels, he was named solo violinist to King William I of The Netherlands. The Revolution of 1830 brought an end to the appointment and he then toured widely with the singer Maria Malibran, marrying her in 1836. She died only months into the marriage, and he did not resume his career for two years. In 1842 he declined the chair left vacant by Baillet at the Paris Conservatory to serve as head of the violin faculty at the Brussels Conservatory. Impending blindness forced his retirement in 1852. Bériot's compositional and performance style made a synthesis of Paganini's virtuosic fireworks with the elegance and sensitivity of the classic French tradition.

Berkeley, city, Alameda county, west central California, U.S., on the northeast shore of San Francisco Bay, directly east of the Golden Gate and adjacent to Oakland (south). Originally part of the Rancho San Antonio, granted to the Peralta family in 1820, it was settled as Ocean View in 1853 and selected as a campus site by the College of California (founded 1853 in Oakland). With the creation of the University of California in 1868, the two schools merged and the campus (named for the philosopher George Berkeley) was opened in 1873. Population increased through an influx of refugees after the San Francisco earthquake (1906). Bridging the bay in the 1930s facilitated commuting and contributed to the city's growth. Various divinity schools, notably the Pacific School of Religion (1866), the California School for the Blind and Deaf, and Armstrong College (1918) are also located there. Berkeley Aquatic Park faces the bay. Inc. 1878. Pop. (2002 est.) 103,640.

Berkeley, Busby, original name WILLIAM BERKELEY ENOS (b. Nov. 29, 1895, Los Angeles—d. March 14, 1976, Palm Springs, Calif., U.S.), American motion-picture director and choreographer who was noted for the elaborate dancing girl extravaganzas he created on film. Using innovative camera techniques, he revolutionized the genre of the musical in the Depression era.

Berkeley's parents were itinerant actors. He was on the stage at age five and later moved from comedy acting and dancing to directing plays and musicals. As a Broadway choreographer he directed the dancing in more than 20 musicals. In 1930 producer Samuel Goldwyn brought him to Hollywood to do the dance numbers for the musical *Whoopie* (1930).

During the following decade Berkeley directed for Warner Brothers and completed his most creative work. *Gold Diggers of 1933* (1933) and *Footlight Parade* (1933) are representative in their subordination of plot to spectacle. Believing 20 dancers were better than one, Berkeley used huge chorus lines and new technical methods to create a mood of opulent prosperity. Berkeley's production trademarks are props such as mirrors and special lighting, coupled with a camera mounted on a monorail for easy movement. These movies have been called exhilarating, yet they are oddly surreal in the multiplication of images.

In 1939 Berkeley began directing popular but less innovative films for Metro-Goldwyn-Mayer Studios. Rising production costs made further spectacles unfeasible, and with *The Gang's All Here* (1943) such films became far less extravagant.

Critics agree that Berkeley liberated musicals from the traditional genre, giving viewers a sense of freedom and escape during the Depression. In the late 20th century Berkeley's films enjoyed a nostalgic revival, and in 1970 the New York Gallery of Modern Art presented a Berkeley retrospective. Berkeley himself returned briefly to Broadway to supervise a production of *No No Nanette* with Ruby Keeler in 1970.

Berkeley, George (b. March 12, 1685, near Dysert Castle, near Thomastown?, County Kilkenny, Ire.—d. Jan. 14, 1753, Oxford), Anglo-Irish Anglican bishop, philosopher, and scientist, best known for his Empiricist philosophy, which holds that everything save the spiritual exists only insofar as it is perceived by the senses.

George Berkeley, detail of an oil painting by John Smibert, c. 1732; in the National Portrait Gallery, London
By courtesy of the National Portrait Gallery, London

Early life and works. Berkeley was the eldest son of William Berkeley, described as a “gentleman” in George’s matriculation entry, and as a commissioned officer, a cornet of dragoons, in the entry of a younger brother. Brought up at Dysert Castle, Berkeley entered Kilkenny College in 1696 and Trinity College, Dublin, in 1700, where he was graduated with a B.A. degree in 1704. While awaiting a fellowship vacancy, he made a critical study of time, vision, and the hypothesis that there is no material substance. The principal influences upon his thinking were Empiricism, represented by the English philosopher John Locke, and Continental Skepticism, represented by Nicolas Malebranche and Pierre Bayle. His first publication, *Arithmetica and Miscellanea Mathematica* (published together in 1707), was probably a fellowship thesis.

Elected fellow of Trinity College in 1707, Berkeley began to “examine and revise” his “first arguings” in his revision notebooks. The revision was drastic and its results revolutionary. His old principle was largely superseded by his new principle; *i.e.*, his original line of argument for immaterialism, based on the subjectivity of colour, taste, and the other sensible qualities, was replaced by a simple, profound analysis of the meaning of “to be” or “to exist.” “To be,” said of the object, means to be perceived; “to be,” said of the subject, means to perceive.

Berkeley called attention to the whole situation that exists when a person perceives something, or imagines it. He argued that, when a person imagines trees or books “and no body by to perceive them,” he is failing to appreciate the whole situation: he is “omitting” the perceiver, for imagined trees or books are necessarily imagined as perceivable. The situation for him is a two-term relation of perceiver and perceived; there is no third term; there is no “idea of” the object, coming between perceiver and perceived.

The revision was a gradual development. At the start Berkeley held that nothing exists but “conscious things.” “On second thoughts,” he was certain of the existence of bodies and knew intuitively “the existence of other things besides ourselves.” His expressions, “in the mind” and “without the mind,” must be understood accordingly. As he wrote in his notebook, heat and colour (which philosophers had classed as secondary qualities because of their supposed subjectivity) are “as much without the mind” as figure and motion (classed as primary qualities) or as time; for both primary

and secondary qualities are *so* in the mind as to be in the thing, and are *so* in the thing as to be in the mind. The mind does not become red, blue, or extended when those qualities are in it; they are not modes nor attributes of mind. Colour and extension are not mental qualities for Berkeley: colour can be seen, and extension can be touched; they are “sensible ideas,” or sense-data, the direct objects of percipient mind.

Berkeley accepted possible perception as well as actual perception; *i.e.*, he accepted the existence of what a person is not actually perceiving but might perceive if he took the appropriate steps. The opposite view was held by some philosophers, including Materialists, who (in Berkeley’s words) “are by their own principles forced” to accept it. They are forced to accept that objects actually seen and touched have only an intermittent existence, that they come into existence when perceived and pass into nothingness when no longer perceived. Berkeley treated those views with respect; he denied that they are absurd; but he did not hold them, and he explicitly denied that they follow from his principles. In effect he said to his readers, “You may hold, if you will, that objects of sense have only an ‘in-and-out’ existence, that they are created and annihilated with every turn of man’s attention; but do not father those views on me. I do not hold them.” In his notebook he wrote, “Existence is *percipi* or *percipere*. The horse is in the stable, the Books are in the study as before.” Horse and books, when not being actually perceived by man, are still there, still perceivable “still with relation to perception.” To a nonphilosophical friend Berkeley wrote, “I question not the existence of anything that we perceive by our senses.”

Berkeley’s immaterialism is open to “gross misinterpretation,” as he said in his preface; rightly understood, it is common sense. Like most people, he accepted and built on “two heads,” “two kinds entirely distinct and heterogeneous”: (1) active mind or spirit, perceiving, thinking, and willing; and (2) passive objects of mind, *viz.*, sensible ideas (sense-data) or imaginable ideas.

Period of his major works. Berkeley’s golden period of authorship followed the revision. In *An Essay Towards a New Theory of Vision* (1709), he examined visual distance, magnitude, position, and problems of sight and touch, and concluded that “the proper (or real) objects of sight” are not without the mind, though “the contrary be supposed true of tangible objects.” In his *Treatise Concerning the Principles of Human Knowledge*, Part I (1710), he brought all objects of sense, including tangibles, within the mind; he rejected material substance, material causes, and abstract general ideas; he affirmed spiritual substance; and he answered many objections to his theory and drew the consequences, theological and epistemological. His *Three Dialogues between Hylas and Philonous* (1713), by its attractive literary form and its avoidance of technicalities, reinforced the main argument of the *Principles*; the two books speak with one voice about immaterialism.

Berkeley was made a deacon in 1709 and ordained a priest in 1710. He held his fellowship for 17 years, acting as librarian (1709), junior dean (1710–11), and tutor and lecturer in divinity, Greek, and Hebrew.

In politics Berkeley was a Hanoverian Tory, and he defended the ethics of that position in three sermons, published as *Passive Obedience* (1712). Thus, with four major books in five years, the foundations of his fame were laid; and, when he first left Ireland in 1713 on a leave of absence, he was already a man of mark in the learned world; his books were reviewed on the Continent, and Gottfried Wilhelm Leibniz, the wide-ranging author of the *Monadology*, knew of his immaterialism and commented upon it.

Among the London wits he was an immediate success. Jonathan Swift, dean of St. Patrick’s Cathedral, Dublin, presented him at court. For Sir Richard Steele, an essayist, he wrote essays in *The Guardian* against the free-thinkers. He was in the theatre with Joseph Addison, essayist and poet, on the first night of *Cato* and has left a spirited description of the experience. Alexander Pope credited him with “ev’ry virtue under heav’n.” In 1713–14 he went on an embassy to Sicily as chaplain with Charles Mordaunt, 3rd earl of Peterborough, whom Berkeley called an “ambassador extraordinary.” In 1715 during the Jacobite rebellion (on behalf of the exiled Stuarts) he proved his loyalty by publishing his *Advice to the Tories Who Have Taken the Oaths*. He was abroad again from 1716 to 1720 in Italy, acting as tutor to George Ashe, son of the Bishop of Clogher (later, of Derry); his four travel diaries give vivid pictures of sightseeing in Rome and of tours in southern Italy. On his return he published his *De motu* (1721), which rejected Sir Isaac Newton’s absolute space, time, and motion, gave a veiled hint of his immaterialism, and has recently earned him the title “precursor of Mach and Einstein.”

Resuming his work in Dublin, he took a full part in teaching and administration for more than three years. In 1724 he was appointed dean of Derry, and his 24 years’ connection with Trinity College ended.

His American venture and ensuing years. The deanery and legacy from Hester van Homrigh (Swift’s Vancssa) were seen by Berkeley as providences, furthering his “scheme of Bermuda,” in the *New World*. The frenzied speculation that preceded the bursting of the South Sea Bubble had shaken his faith in the Old World, and he looked in hope to the New. His *Essay Towards preventing the Ruin of Great-Britain* (1721) was soon succeeded by his prophetic verses on “Westward the course of empire takes its way.” Already by 1722 he had resolved to build a college in Bermuda for the education of young Americans (Indians), publishing the plan in *A Proposal For the better Supplying of Churches . . .* (1724). The scheme caught the public imagination; the King granted a charter; the Archbishop of Canterbury acted as trustee; subscriptions poured in; and Parliament passed a contingent grant of £20,000. But there was opposition; an alternative charity for Georgia was mooted; and the prime minister, Sir Robert Walpole, hesitated.

In 1728 Berkeley married Anne, daughter of Chief Justice Forster, a talented and well-educated woman, who defended her husband’s philosophy after his death. Soon after the wedding, they sailed for America, settling at Newport, R.I., where Berkeley bought land, built a house (Whitehall), and waited. Berkeley preached often in Newport and its neighbourhood, and a philosophical study group met at Whitehall. Eventually, word came that the grant would not be paid, and Berkeley returned to London in October 1731. Several American universities, Yale in particular, benefitted by Berkeley’s visit; and his correspondence with Samuel Johnson, later president of King’s College (Columbia University), is of philosophical importance.

Alciphron; or, The Minute Philosopher (1732) was written at Newport, and the setting of the dialogues reflects local scenes and scenery. It is a massive defense of theism and Christianity with attacks on deists and freethinkers and discussions of visual language and analogical knowledge and of the functions of words in religious argument.

Upon his return to London in 1731, Berkeley’s pen, never idle for long, became active. A writer in the *Daily Post-boy* commended *Alciphron* but attacked the appended *Essay*

on vision. Berkeley replied with *The Theory of Vision, or Visual Language . . . Vindicated and Explained* (1733). This fine work brought the metaphysics (theory of being) of the *Essay* into line with the *Principles* and added his doctrine of cause, admitting defects in the premises of the original *Essay*. *Alciphron* provoked replies from the satirist Bernard de Mandeville; John Hervey, Baron Hervey of Ickworth; the statesman Henry St. John, 1st Viscount Bolingbroke; and Peter Browne, Berkeley's former teacher and provost. To Browne, Berkeley sent a long, private letter on analogy—first published in *Mind* (July 1969)—which constitutes an important supplement to his 4th dialogue.

In 1734 Berkeley published *The Analyst; or, a Discourse Addressed to an Infidel Mathematician*, which Florian Cajori, a historian of mathematics, has called “the most spectacular event of the century in the history of British mathematics.” Besides being a contribution to mathematics, it was an argument *ad hominem* for religion. “He who can digest a second or third fluxion,” wrote Berkeley, “need not, methinks, be squeamish about any point in divinity.” A long and fruitful controversy followed. James Jurin, a Cambridge physician and scientist, John Walton of Dublin, and Colin Maclaurin, a Scottish mathematician, took part. Berkeley answered Jurin in his lively satire *A Defence of Free-Thinking in Mathematics* (1735) and answered Walton in an appendix to that work and again in his *Reasons For Not Replying* (1735).

Years as bishop of Cloyne. Berkeley was consecrated as bishop of Cloyne in Dublin in 1734. He found Trinity College flourishing: its new library was completed, and John Stearne's Doric printing house was being built. To the latter, Berkeley contributed a font of Greek type and also founded the Berkeley gold medal for Greek. His episcopate, as such, was uneventful. He took a seat in the Irish House of Lords in 1737 and, while in Dublin, published *A Discourse Addressed to Magistrates and Men in Authority* (1738), condemning the Blasters whose Hell-Fire Club, now in ruins, still can be seen near Dublin.

The see-house at Cloyne was a cultured home and a social centre and, during epidemics, a dispensary. On arrival, the family consisted of his wife and two sons; and two more sons and two daughters were born at Cloyne.

In 1745 Berkeley addressed open letters to his clergy and to the Roman Catholics of his diocese about the Stuart uprising. In letters to the press over his own name or through a friend, he expressed himself on several public questions, political, social, and scientific. Two major works stand out, *The Querist* and *Siris*. *The Querist*, published in three parts from 1735 to 1737, deals with basic economics—credit, demand, industry, and “the true idea of money”—and with special problems, such as banking, currency, luxury, and the wool trade. The final query puts the central question, “Whose fault is it if poor Ireland still continues poor?”

Siris (1744) passed through some six editions in six months. It is at once a treatise on the medicinal virtues of tar-water, its making and dosage, and a philosopher's vision of a chain of being, “a gradual evolution or ascent” from the world of sense to “the mind, her acts and faculties” and, thence, to the supernatural and God, the three in one.

In August 1752, Berkeley commissioned his brother, Dr. Robert Berkeley, as vicar-general and arranged with the bishop of Cork as to his episcopal duties and, with his wife and his children George and Julia, went to Oxford and took a house in Holywell Street, where he resided until his death. He was buried in Christ Church Chapel.

BIBLIOGRAPHY. The definitive edition of the philosopher's writings is *The Works of George Berkeley, Bishop of Cloyne*, 9 vol. (1948–57, reprinted in 3 vol., 1979). An informative bibliography is provided in A.A. Luce, *The Life of George Berkeley, Bishop of Cloyne* (1949, reprinted 1968). Other biographical studies include J.M. Hone and M.M. Rossi, *Bishop Berkeley: His Life, Writings, and Philosophy* (1931); John Wild, *George Berkeley: A Study of His Life and Philosophy* (1936, reissued 1962); and Edwin S. Gaustad, *George Berkeley in America* (1979). For broad analyses of Berkeley's philosophy, see Jonathan Dancy, *Berkeley, an Introduction* (1987); G.A. Johnston, *The Development of Berkeley's Philosophy* (1923, reprinted 1988); A.A. Luce, *Berkeley and Malebranche: A Study in the Origins of Berkeley's Thought* (1934, reprinted 1988); Kenneth P. Winkler, *Berkeley: An Interpretation* (1989); Warren E. Steinkraus (ed.), *New Studies in Berkeley's Philosophy* (1966, reprinted 1981); George Pitcher, *Berkeley* (1977, reprinted 1984); and C.B. Martin and D.M. Armstrong, *Berkeley: A Collection of Critical Essays* (1988). Special studies focusing on particular theories and arguments include D.M. Armstrong, *Berkeley's Theory of Vision* (1960, reprinted 1988); I.C. Tipton, *Berkeley: The Philosophy of Immaterialism* (1974, reprinted 1988); Harry M. Bracken, *The Early Reception of Berkeley's Immaterialism, 1710–1733*, rev. ed. (1965); A.A. Luce, *Berkeley's Immaterialism* (1945, reprinted 1968), and *The Dialectic of Immaterialism* (1963); A.C. Grayling, *Berkeley, the Central Arguments* (1986); Stephen R.L. Clark (ed.), *Money, Obedience, and Affection: Essays on Berkeley's Moral and Political Thought* (1989); and Willis Doney, *Berkeley on Abstraction and Abstract Ideas* (1989).

Berkeley, Sir Lennox, in full LENNOX RANDALL FRANCIS BERKELEY (b. May 12, 1903, Boars Hill, near Oxford, Oxfordshire, Eng.—d. Dec. 26, 1989, London), British composer whose works are noted for their classical elements.

Sir Lennox Berkeley, 1988

Frank Herman/Camera Press/Globe Photos

Berkeley was born into a titled family. He received his B.A. (1926) from Merton College, Oxford, and then studied (1927–32) in Paris under the renowned teacher Nadia Boulanger. While in Paris he met Igor Stravinsky and François Poulenc, both of whom influenced his style; Poulenc remained a lifelong friend. Berkeley returned to Britain in 1935, the year of his first major work, the oratorio *Jonah*. In 1936 he attended a music festival in Spain and there met Benjamin Britten. The two collaborated on an orchestral work, *Mont Juic* (1937), and maintained a strong professional, as well as personal, association.

Berkeley's works are characterized by their rich melodies and his flair for orchestral texture. His more notable works include the *Divertimento* (1943), a highly polished orchestral piece; *Piano Sonata*, Opus 20 (1945), which displays his subtle use of harmony; and his vocal music, much of it religious, such as the *Stabat Mater* (1947), written for Britten's English Opera Group. He wrote pieces for specific performers, such as guitarist Julian

Bream and oboist Janet Craxton. He composed several operas, including *Nelson* (1954) and *Ruth* (1956). His later works show some influence of atonality, notable examples of this style being *Sonatina*, Opus 61 (1962), and his *Symphony No. 4* (1977).

He was professor of composition at the Royal Academy of Music (1946–68), honorary professor of music at Keele University (from 1976), and from 1977 president of the Cheltenham Festival of Music. He received many honours and was knighted in 1974.

Berkeley, Sir William (b. 1606, Somerset, Eng.—d. July 9, 1677, Twickenham, Middlesex), British colonial governor of Virginia during Bacon's Rebellion, an armed uprising (1676) against his moderate Indian policy.

Berkeley was the youngest son of Sir Maurice Berkeley and the brother of John Berkeley, 1st Baron Berkeley of Stratton, one of the Caro-

Sir William Berkeley, detail of an oil painting attributed to Sir Peter Lely, c. 1644; in a private collection

lina and New Jersey proprietors. Soon after his graduation from the University of Oxford (B.A., 1624; M.A., 1629), he was given a seat in the privy chamber and served in the colonial office as a commissioner of Canadian affairs. He wrote a play, *The Lost Lady*, for the London stage in 1638, was knighted by Charles I in 1639, and was appointed governor of Virginia in 1641.

Berkeley's governorship of Virginia was almost continuous from this date until his death, except during much of the period of the English Commonwealth (1652–59). His first years as governor were very successful. Berkeley experimented with crop diversification, encouraged manufacturing, promoted expansion, and coped successfully with both Indian and Dutch hostilities. His loyalty to the crown during the English Civil Wars led him to declare Virginia an asylum for Charles II and his friends. This loyalty also resulted in his forced retirement from 1652 to 1659, when he remained on his Virginia plantation.

Berkeley's second period as governor after the Restoration of the monarchy in 1660 was marred by Indian attacks on the frontier, economic depression, crop failures, and high taxes. It was also marred by the ambitions of his cousin by marriage, Nathaniel Bacon. Berkeley wanted to foster trade with the Indians; Bacon was for their removal from the colony and in 1676 led an expedition against the Indians. Berkeley called it rebellion, and the forces of the two men clashed. Berkeley fought the rebels with great ferocity and bloodshed. (During the rebellion, Bacon died of natural causes.) Berkeley was recalled by Charles II to explain his behaviour but died before he had a chance to report to the king.

berkelium (Bk), synthetic chemical element of the actinide series in Group IIIb of the periodic table, atomic number 97. Not occurring in nature, berkelium (as the isotope berkelium-243) was discovered in December 1949 by Stanley G. Thompson, Albert Ghiorso, and Glenn T. Seaborg at the University of California at Berkeley as a product re-

sulting from the helium-ion bombardment of americium-241 (atomic number 95) in a 152-centimetre (60-inch) cyclotron. All berkelium isotopes are radioactive; berkelium-247 is the longest lived (1,400-year half-life). Berkelium-249 (314-day half-life) has been widely used in the chemical studies of the element because it can be produced in weighable amounts that are isotopically pure by nuclear reactions beginning with curium-244. Metallic berkelium has not yet been prepared, but it should be electropositive, reactive, and silver-coloured like the other actinide metals, with a specific gravity of about 14. Tracer chemical investigations have shown that berkelium exists in aqueous solutions in the +3 and +4 oxidation states, presumably as Bk^{3+} and Bk^{4+} ions. The solubility properties of berkelium in its two oxidation states are entirely analogous to those of the other actinides and to the lanthanide elements in the corresponding oxidation states. Solid compounds, including the oxides BkO_2 , Bk_2O_3 , and the chloride $BkCl_3$, have been synthesized on the submicrogram scale.

atomic number	97
stablest isotope	247
valence	3,4
electronic config.	2-8-18-32-26-9-2 (27-8-2) or (Rn)5f ⁷ 6d ¹ 7s ² or (Rn)5f ⁷ 7s ²

Berkhamsted, town ("parish"), Dacorum borough, administrative and historic county of Hertfordshire, England, 28 mi (45 km) northwest of London, on an old coaching route along the Bulbourne Valley of the Chiltern Hills, which now contains modern road, rail, and canal routes. A moated Norman castle has been thoroughly excavated and is preserved. Diversified light industry includes paper and furniture making. Pop. (1991) 18,044.

Berkner, Lloyd Viel (b. Feb. 1, 1905, Milwaukee, Wis., U.S.—d. June 4, 1967, Washington, D.C.), American physicist and engineer who first measured the extent, including height and density, of the ionosphere (ionized layers of the Earth's atmosphere), leading to a complete understanding of radio wave propagation. He later turned his attention to investigating the origin and development of the Earth's atmosphere. Need for data on a worldwide scale led him to propose the International Geophysical Year in 1950, the largest cooperative study of the Earth ever undertaken, which was carried out by the International Council of Scientific Unions while he was president in 1957–59.

In 1963 Berkner, with L.C. Marshall, advanced a theory to describe the way in which the atmospheres of the solar system's inner planets had evolved. As a naval officer beginning in 1926, Berkner was also active in the development of radar and navigation systems, naval aircraft electronics engineering, and studies that led to the construction of the Distant Early Warning system, a chain of radar stations designed to give the United States advance warning in the event of a missile attack across the North Pole. He wrote more than 100 papers and several books, including *Rockets and Satellites* (1958), *Science in Space* (1961), and *The Scientific Age* (1964).

Berkshire, geographic and ceremonial county of southern England that occupies the valleys of the middle Thames and its tributary, the Kennet, west of London. Its area is 485 sq mi (1,256 sq km), and it is divided administratively into six unitary authorities: Bracknell Forest, Reading, Slough, West Berkshire, Windsor and Maidenhead, and Wokingham.

The eastern end of the county is underlain largely by the river gravels and terraces of the Thames, and there are stretches of infertile, often forested, land, including Windsor Forest. The western part of the county is crossed by chalk downs, or uplands, that reach a height of

975 ft (297 m) in Inkpen Beacon, and through these downs the Thames cuts its way by means of the Goring Gap. The Thames and Kennet valleys provide major routes west from London for the railways to Oxford, Bristol, and the west of England. The motorway from London to South Wales crosses the county.

The Berkshire Downs supported numerous prehistoric settlements linked by ridgeways that led particularly to the focus of Stonehenge in the adjoining county of Wiltshire. Settlement of the river valleys and eastern Berkshire dates from the Iron Age, and the Belgic site at Silchester, southwest of Reading, later became a Roman route centre. With the Norman Conquest of 1066 the strategic importance of the Thames Valley was recognized, and the first Windsor Castle was built, later to become the main residence of the British royal family outside London. Windsor and Eton, on either bank of the Thames on Berkshire's eastern boundary, contain the county's most noted structures. Eton College, England's best-known boys' school, dating in part from the 15th century, is also located there.

Proximity to London and to major transport routes has encouraged the spread of industrial and urban development across the county. In the 19th century Reading, the historic county town (seat), was the focus of growth. Following World War I a new industrial centre grew up at Slough, while later growth occurred at Bracknell, one of Britain's new towns. Meanwhile, residential development spread westward from London, and, with excellent road and rail links, even Hungerford and Newbury at the western end of the county are within regular commuting range of London. Towns such as Maidenhead and Wokingham along the M4 motorway have attracted industrial and office development and numerous firms in the high-technology and software development sectors. Agriculture is now largely restricted to the western end of the county; the chalk downs support cereal crops, and Newbury and Lambourne are known for their racehorses. Pop. (1998 est.) 800,200.

Berkshire, breed of domestic pig originating in England, where in the early 19th century the name "Berkshire" became synonymous with improved pig strains of differing origin and type. Hogs imported from East Asia figured prominently in the improvement of varieties native to the region. The establishment of a herdbook in 1885 fixed current strains.

The Berkshire is medium-sized and predominantly black in colour, with white on its face, legs, and tip of tail. It has a short dished face with erect ears pointing slightly forward. The breed is used for fresh pork production in England, Japan, North and South America, and other areas. A larger bacon strain has been evolved in Australia and New Zealand.

Berkshire Hills, segment of the Appalachian Mountains, U.S., mainly in Berkshire county, western Massachusetts. Many summits rise to more than 2,000 ft (600 m), including Mt. Greylock (3,491 ft [1,064 m]), the highest point in Massachusetts. The scenic, wooded hills are a continuation of the Green Mountains of Vermont; they include the Hoosac Range and Taconic Range (Massachusetts and New York) and the Litchfield Hills (Connecticut). The chief streams are the Deerfield and Westfield (east) and the Hoosic and Housatonic (west). Crossed by the Appalachian National Scenic Trail (for hikers) and the Mohawk Trail scenic highway, the Berkshires have long been a favourite year-round vacation spot. Among the wilderness and the recreation areas are Beartown State Forest, Mount Greylock State Reservation, and October Mountain State Forest. The Tanglewood Music Festival in Lenox is a major summertime attraction, and there are seasonal theatre and dance festivals in other towns.

Berlage, Hendrik Petrus (b. Feb. 21, 1856, Amsterdam, Neth.—d. Aug. 12, 1934, The Hague), Dutch architect whose work, characterized by a use of materials based on their fundamental properties and an avoidance of decoration, exerted considerable influence on modern architecture in The Netherlands.

Berlage studied architecture in Zürich, Switzerland. Following a European tour, he began his practice in Amsterdam in 1889. His best-known work is the Stock Exchange in Amsterdam (1897–1903). It is notable for its rounded Romanesque arches and the forthright use of

Berlage, lithograph by C. Le Beau

By courtesy of The Netherlands Information Service, The Hague

structural steel and traditional brick, examples of Berlage's concern that materials be used truthfully. Beginning in the early 1900s, he carried out city planning for residential areas in a number of Dutch cities. He also designed furniture and wallpaper and had considerable interest in handicrafts.

On a visit to the U.S. in 1911, Berlage studied American building methods, later using them in his own work. He was exposed to the ideas of U.S. architects Louis Sullivan and Frank Lloyd Wright and introduced them to Europe. Notable Berlage buildings include the Algemeenen Nederlandschen Diamantbewerkerbond (Diamond Workers' Union building), Amsterdam (1899–1900), and the Haags Gemeentemuseum, The Hague (1934).

Berle, Milton, original name MILTON BERLINGER (b. July 12, 1908, New York City—d. March 27, 2002, Los Angeles, Calif., U.S.), American comedian who, as a popular entertainer in the early days of television in the United States, came to be known as "Mr. Television."

Berle first appeared on the vaudeville stage at age 10. With his mother's encouragement, he continued in vaudeville throughout his youth and also acted in more than 50 silent films. He attended a school for professional children and soon began to perform as a master of ceremonies, and in the legitimate theatre as a comedian. He was known for blatantly borrowing jokes and comic routines from other comedians. For a decade after 1939 Berle worked chiefly in nightclubs, at the same time vainly attempting to gain a radio audience. None of his radio programs lasted more than a year. He continued to appear in motion pictures, making 19 between 1937 and 1968, including *Let's Make Love* (1960) and *Mad Mad Mad Mad World* (1963).

Berle's type of comedy—rapid delivery accompanied by slapstick and facial contortions—and his willingness to elicit laughter at any cost seemed made for television. His hugely successful *Texaco Star Theater* (1948–54)

was credited with popularizing the new medium in the U.S.; the variety show, noted for its unpredictable live performances, led to a dramatic increase in the number of sets purchased. Especially popular were skits in which Berle dressed in women's clothing. He worked regularly on television until 1966 and was among the first inductees into the Television Academy Hall of Fame in 1984. In his later years, Berle was often seen smoking a cigar, which became his trademark. His books include *Out of My Trunk* (1945), *Milton Berle: An Autobiography* (1974), and *B.S. I Love You: Sixty Funny Years with the Famous and the Infamous* (1988).

Berlichingen, Götz von, GÖTZ also rendered GOTTFRIED, byname GÖTZ WITH THE IRON HAND, German GÖTZ MIT DER EISERNEN HAND (b. 1480, Jagsthausen Castle, Württem-

Berlichingen, detail from tomb sculpture, 1562; in Kloster Kirche Schöntal, Baden-Württemberg, Ger. Helga Schmidt-Glassner

berg [Germany]—d. July 23, 1562, Hornberg Castle), imperial knight (*Reichsritter*), romanticized in legend as a German Robin Hood and remembered as hero of J.W. von Goethe's play *Götz von Berlichingen*. His iron hand was a substitute for a hand shot away in the siege of Landshut (1504). He served under various masters in a series of campaigns, ending with the wars against the Turks in Hungary (1542) and the campaign of the Habsburg emperor Charles V against the French (1544). When not engaged as a warrior, he kidnapped nobles for ransom and attacked convoys of merchants for booty, activities that twice put him under ban of the empire. He led a section of rebels in the Peasants' War (1525), but, after claiming that he had been compelled by the rebels to do so, he was acquitted by the imperial chamber.

Perhaps most remarkable is that he lived to old age in a turbulent and violent era. His *Autobiography* (1731) is an entertaining account of an eventful period when knights such as Götz were becoming anachronisms.

Berlin, chief city and capital of Germany from 1871 to 1945 and designated the capital of reunified Germany in 1991. It was also, from 1990, a *Land* (state), the third smallest in area of the 16 German *Länder*. Berlin was divided into East and West Berlin from the end of World War II until the reunification of East and West Germany in 1990.

A brief treatment of Berlin follows. For full treatment (including a map), see MACROPAEDIA: Berlin.

Berlin is located in the eastern portion of Germany about 165 miles (265 km) southeast of Hamburg and about 35 miles (55 km) west of the Polish border. The city centre lies in the glacial outwash valley of the Spree River, which runs through the centre of the city. Its elevation is about 115 feet (35 m) above sea

level. A chain of lakes formed by the Havel River touches the city's western outskirts.

The town of Berlin became the capital of the mark of Brandenburg at the end of the 15th century and later became the capital of the kingdom of Prussia. When the various German states united to form the German Empire in 1871 and the king of Prussia became the new nation's emperor, Berlin became the capital of Germany as well as of the kingdom (from 1919–47 the *Land*) of Prussia.

The city was the capital of Germany until the end of World War II, when its division into separate Soviet- and Western- (*i.e.*, British, French, and American) occupied sectors mirrored the victorious Allies' apportionment of Germany itself into different zones of occupation. In 1949 the Western powers sponsored the formation of the Federal Republic of Germany, or West Germany, and the Soviets likewise approved the formation of the German Democratic Republic, or East Germany. The latter consisted of the easternmost third of Germany and contained the city of Berlin at its near-centre. But the western half of Berlin remained under the administration of the Western powers, and it thus became a part of West Germany, despite its physical isolation from that nation. (Berlin lay 110 miles [180 km] east of the East-West German border.) West Berlin became a *Land* of West Germany, although constitutionally not a constituent part of West Germany. East Berlin became the capital of East Germany.

From 1961 to 1989, East and West Berlin were physically separated from each other by the Berlin Wall, which was erected by the East German government to control the border, especially the flow of East Germans to the West. The political and physical division of Berlin continued until late 1989, when East Germany's communist government collapsed in the face of popular unrest. The Berlin Wall was dismantled, and in 1990 Berlin became the official capital of a reunified Germany.

During the 1990s, massive construction projects reintegrated the formerly divided city's transport system and infrastructure and produced new commercial and governmental buildings. The German government completed its relocation to Berlin in 1999–2000.

Government service has been the single most important economic activity throughout most of Berlin's history. The city is a major research, medical, and educational centre, and important manufactures include food processing, printing, machinery, electrical equipment, and pharmaceuticals.

Large sections of Berlin were destroyed by Allied bombing during World War II, but the city's durability was demonstrated in the vast reconstruction after the war. The erection of modern buildings and the restoration of historic ones have helped Berlin maintain its position as the most populous German city. Notable buildings include the Marien Church and the restored Nikolai Church, the Arsenal (Zeughaus), New Guardhouse (Neue Wache), the Berlin, German, and French cathedrals, the renovated Reichstag building, Charlottenburg Palace, the New National Gallery, and Philharmonic Hall. One of the city's most famous avenues is Unter den Linden, leading to the Brandenburg Gate. Another major thoroughfare is Kurfürstendamm, with its many shops. Several buildings ruined in World War II have been preserved to serve as war memorials; among these is the main tower of the Kaiser Wilhelm Memorial Church.

Berlin has traditionally played a leading role in German education. It is home to numerous institutes and academies and to three universities: the Humboldt University of Berlin, the Free University of Berlin, and the Technical University of Berlin.

Berlin has one of Europe's finest subway systems (the *U-Bahn*), as well as the *Stadtbahn* (S-Bahn) railway system.

The city is a focal point for Germany's super-highway, rail, and canal networks. Tegel and Berlin-Schönefeld airports handle domestic and international flights. Area 344 square miles (891 square km). Pop. (2002 est.) 3,388,434.

Berlin, town ("township"), Hartford county, west-central Connecticut, U.S., on the Mattabeset River, just southeast of New Britain. The first white settler was Richard Beckley of New Haven, who established Beckley's Quarter in 1660. Formerly called Kensington, the area was incorporated as a town from parts of Farmington, Middletown, and Wethersfield in 1785 and was renamed for the city of Berlin [then in Prussia]. It includes the villages of East Berlin and Kensington and was an early industrial town (pistols, implements, wagons, spectacles, leather, thread). The first American tinware was made there in 1740 by Edward and William Pattison, early itinerant Yankee peddlers. A diversified manufacturing economy now prevails. Pop. (2003 est.) 19,322.

Berlin, city, Coos county, northern New Hampshire, U.S., at the falls of the Androscoggin River and on the northern rim of the White Mountains. Chartered in 1771 as Maynesborough, it was not settled until 1821 and was renamed for the city of Berlin [then in Prussia] in 1829. Available waterpower led to the beginning of the lumber and pulp industry in 1825. Pulp and paper mills remain the economic mainstay. The Berlin (Nansen) Ski Jump (at 181.5 feet [55 m]) is one of the highest steel tower jumps in the United States. Berlin is just north of White Mountain National Forest. Milan Hill State Park is nearby. The city is home to the New Hampshire Vocational Technical College. Inc. town, 1829; city, 1897. Pop. (2003 est.) 10,122.

Berlin, Congress of (June 13–July 13, 1878), diplomatic meeting of the major European powers at which the Treaty of Berlin replaced the Treaty of San Stefano, which had been signed by Russia and Turkey (March 3, 1878) at the conclusion of the Russo-Turkish War of 1877–78. Officially convoked by the Austrian foreign minister, Count Gyula Andrássy, the congress met in Berlin on June 13.

Dominated by the German chancellor Otto von Bismarck, the congress solved an international crisis caused by the San Stefano treaty by revising the peace settlement to satisfy the interests of Great Britain (by denying Russia the means to extend its naval power and by maintaining the Ottoman Empire as a European power) and to satisfy the interests of Austria-Hungary (by allowing it to occupy Bosnia-Herzegovina and thereby increase its influence in the Balkans). In acting so, however, the congress left Russia humiliated by substantially reducing the gains that it had made under the San Stefano treaty. Furthermore, the congress failed to consider adequately the aspirations of the Balkan peoples themselves and, thereby, laid the foundation for future crises in the Balkans.

Berlin, Free University of, German FREIE UNIVERSITÄT BERLIN, autonomous, state-financed German university. It was founded in West Berlin in 1948, after Berlin was divided, by a group of professors and students who broke away from East Berlin's Friedrich Wilhelm (now Humboldt) University (founded 1809–10) to seek academic freedom. The Free University was restructured in 1970 and again in 1974. Its governing board includes the government, faculty, and student representatives.

Berlin, Humboldt University of, formerly (1810–1949) FRIEDRICH WILHELM UNIVERSITY, byname UNIVERSITY OF BERLIN, German HUMBOLDT-UNIVERSITÄT ZU BERLIN, coeducational state-supported institution of higher learning in Berlin. The university was founded in 1809–10 by the linguist, philosopher, and

educational reformer Wilhelm von Humboldt, then Prussian minister of education. Under Humboldt's guidance the university, originally named after Frederick William III of Prussia, developed into the largest in Germany. The University of Berlin attained world renown for its modern curriculum, its impartial and nondogmatic spirit of intellectual inquiry, and its specialized scientific research institutes, in which many basic techniques of laboratory experimentation were pioneered. The university's foremost professors in the 19th century included the philosophers G.W.F. Hegel, J.G. Fichte, and Arthur Schopenhauer; the historians Leopold von Ranke, Theodor Mommsen, and B.G. Niebuhr; the scientists Hermann von Helmholtz and Rudolf Virchow; the theologian Friedrich Schleiermacher; and the folklorists Jacob and Wilhelm Grimm.

In the 1930s the university underwent a decline when its faculty and curriculum were Nazified and many of its academic figures fled abroad. Under control of the German Democratic Republic after World War II, it was renamed Humboldt-Universität after its founder and given a Marxist-Leninist orientation in much of its curriculum.

Berlin, Irving, original name ISRAEL BALINE (b. May 11, 1888, Mogilyov, Russia [now in Belarus]—d. Sept. 22, 1989, New York, N.Y., U.S.). American composer who played a leading role in the evolution of the popular song from the early ragtime and jazz eras through the golden age of musicals. His easy mastery of a wide range of song styles, for both stage and motion pictures, made him perhaps the greatest and most enduring of American songwriters.

Irving Berlin

Israel was born to the family of a Jewish cantor that immigrated to New York City in 1893. His father died when the boy was eight years old. Having obtained only two years of formal education, he worked as a street singer and a singing waiter in New York's Lower East Side. He began writing song lyrics, and his first published song, "Marie from Sunny Italy," appeared in 1907; a printer's error on this song named him Irving Berlin, a surname that he subsequently kept. Berlin continued his writing and within a few years was a successful "song plugger," demonstrating new tunes. He was unable to read or write musical notation and learned music by ear instead. He began writing his own music as well as lyrics, and in 1911 he wrote what quickly became the preeminent hit of Tin Pan Alley's ragtime vogue, "Alexander's Ragtime Band." His first ballad, "When I Lost You," was written in 1912. Then he began contributing to numerous Broadway revues and musical entertainments, including Florenz Ziegfeld's *Follies*. In 1919 he founded the Irving Berlin Music Corporation to publish his own music.

Through the following decades Berlin wrote the scores for several musicals, one of his most popular being *Annie Get Your Gun* (1946; film, 1950). He wrote more than 800 songs, many of which became classics, including "Oh, How I Hate to Get Up in the Morning," "A Pretty

Girl Is Like a Melody," "Always" (written in 1925 as a wedding present for his second wife), "Remember," "Cheek to Cheek," "How Deep Is the Ocean," "Blue Skies," "Puttin' on the Ritz," the patriotic standard "God Bless America," "Heat Wave," and "There's No Business Like Show Business." In the era of big motion-picture musicals, Berlin was able to transfer his stage success to the screen, writing the scores for many successful films, including *Top Hat* (1935), *Follow the Fleet* (1936), *Easter Parade* (1948), *Call Me Madam* (1953), and *White Christmas* (1954). His score for the film *Holiday Inn* (1942) introduced the touching ballad "White Christmas," which became one of the most popular songs ever recorded. Altogether Berlin wrote the scores for 19 Broadway shows and 18 motion pictures.

Berlin, Sir Isaiah (b. June 6, 1909, Riga, Latvia, Russian Empire [now in Latvia]—d. Nov. 5, 1997, Oxford, Oxfordshire, Eng.). British historian and writer, noted for his writings on political philosophy.

Berlin and his family emigrated from the Soviet Union to England in 1920. He attended St. Paul's School and then, on scholarship, attended Corpus Christi College, Oxford. A brilliant student, he obtained his M.A. in 1935. In the meantime, Berlin had begun his career as a lecturer in philosophy at New College, Oxford (1932–38), where he later became a fellow (1938–50). He taught at All Souls College, Oxford, from 1950 to 1966, was Chichele professor (1957–67) there, served as president of Wolfson College (1966–75), and from 1975 was professor at All Souls College.

Berlin's most important works include *Karl Marx: His Life and Environment* (1939; rev. ed. 1959, 1963), an examination of the influences on Marx; *Historical Inevitability* (1955), which stands as a major critique of the doctrines of determinism; *The Age of Enlightenment* (1956), a discussion of 18th-century philosophers; and *Four Essays on Liberty* (1969). His political philosophy in general is concerned with the problem of liberty and free will in increasingly totalitarian and mechanistic societies. Berlin's collected writings have been published in several books, notably *Russian Thinkers* (1978), *Concepts and Categories* (1978), *Against the Current* (1979), and *Personal Impressions* (1980). He published *The Crooked Timber of Humanity: Chapters in the History of Ideas* in 1990 and *The Magus of the North: J.G. Hamann and the Origins of Modern Irrationalism* in 1993.

Berlin was knighted in 1957 and in 1971 was made a member of the Order of Merit.

Berlin, Isaiah ben Judah Loeb, also called ISIAH PICK (b. October 1725, Eisenstadt, Hungary [now in Austria]—d. May 13, 1799, Breslau, Silesia, Prussia [now Wrocław, Pol.]), Jewish scholar noted for his textual commentaries on the Talmud and other writings.

The son of a well-known Talmudic scholar, he moved to Berlin as a youth and was educated by his father and at the yeshiva of another eminent rabbi. Berlin became a member of the rabbinate late in life (1787), and in 1793 he was elected rabbi of Breslau, in which post he tried to conciliate the various opposing factions in the local Jewish community.

Berlin's writings are distinguished for their critical and historical insight. Among his works are commentaries, notes, and glosses on many early works of Jewish scholarship. His commentary on the Talmud entitled *Masoret ha-Shas* ("Talmud Tradition") supplements an earlier work by a Frankfurt rabbi and is the best known of Berlin's numerous collated texts (noting variant readings and parallel passages).

Berlin blockade and airlift, international crisis that arose from an attempt by the Soviet Union, in 1948–49, to force the Western Allied powers (the United States, the United Kingdom, and France) to abandon their post-

World War II jurisdictions in West Berlin. In March 1948 the Allied powers decided to unite their different occupation zones of Germany into a single economic unit. In protest, the Soviet representative withdrew from the Allied Control Council. Coincident with the introduction of a new Deutsche Mark in West Berlin (as throughout West Germany), which the Soviets regarded as a threat to the East German currency, the Soviet occupation forces in eastern Germany began a blockade of all rail, road, and water communications between Berlin and the West. On June 24 the Soviets announced that the four-power administration of Berlin had ceased and that the Allies no longer had any rights there. On June 26 the United States and Britain began to supply the city with food and other vital supplies from outside by air. They also organized a similar "airlift" in the opposite direction of West Berlin's greatly reduced industrial exports. By mid-July the Soviet army of occupation in East Germany had increased to 40 divisions, against 8 in the Allied sectors. By the end of July three groups of U.S. strategic bombers had been sent as reinforcements to Britain. Tension remained high, but war did not break out.

Despite dire shortages of fuel and electricity, the airlift kept life going in West Berlin for 11 months, until on May 12, 1949, the Soviet Union lifted the blockade. The airlift continued until September 30, at a total cost of \$224,000,000 and after delivery of 2,323,738 tons of food, fuel, machinery, and other supplies. The end to the blockade was brought about because of countermeasures imposed by the Allies on East German communications and, above all, because of the Western embargo placed on all strategic exports from the Eastern bloc.

Berlin-Dahlem Botanical Garden and Botanical Museum, German in full

BOTANISCHER GARTEN UND BOTANISCHES MUSEUM BERLIN-DAHLEM, oldest botanical garden in Germany. Founded in the 17th century as a royal garden for flowers, medicinal plants, vegetables, and hops (for the royal brewery), it eventually became badly neglected. In 1801 the botanist Carl Ludwig Willdenow became director and began to rehabilitate the garden; a decade later he had created what was to become one of the outstanding botanical research centres and public displays of Europe. The botanical garden and museum were nearly destroyed in World War II and had to be rebuilt.

The Berlin-Dahlem Botanical Garden has about 18,000 kinds of plants. There is also a botanical museum that has a large herbarium of about 1,850,000 reference specimens, and there is a museum library. The centre publishes two periodicals, *Willdenowia* and *Englera*.

Berlin Painter (fl. 500–460 BC), Athenian vase painter who, with Kleophrades, is considered the outstanding vase painter of the Late Archaic period. He is best known as the decorator of an amphora now in West Berlin.

Stylistically, the Berlin amphora is decorated on a new principle of design. It had been customary to frame the groups of figures on each side with pattern bands. The Berlin Painter eliminated this frame, allowing the figures to dominate. The unusually large figures stand out sharply against the amphora's black background.

Several scholars feel that the Berlin Painter was most productive and his work most original during his early period (c. 500–480 BC). Some feel, too, that his later works (c. 470–460 BC) may actually be those of a workshop or of a group of artists copying the master. More than 200 vases have been attributed to the Berlin Painter on the basis of their stylistic relationship to the Berlin amphora.

Among the vases most frequently attributed to the Berlin Painter are an amphora (now in Munich) depicting a discus thrower, made especially for the Panathenaea, a festival of games held in Athens every four years; a bell

Hermes striding past the satyr Orcimachos, the Berlin amphora by the Berlin Painter, c. 490 BC; in the Antikenmuseum, Berlin

By courtesy of the Antikenmuseum, Staatliche Museen Preussischer Kulturbesitz, Berlin, photograph, Ingrid Geske

krater, now in the Louvre, Paris, representing Zeus pursuing Ganymede; a volute krater now in the British Museum, showing Achilles in his last two victories; a hydria (water pot) in the Metropolitan Museum of Art, New York City, showing Achilles and Penthesileia; and a hydria in the Vatican, depicting Apollo traveling over the sea on a winged tripod.

BIBLIOGRAPHY. A useful study of the artist is Donna Carol Kurtz, *The Berlin Painter* (1983), with drawings by John Beazley.

Berlin Wall, German BERLINER MAUER, barrier that surrounded West Berlin and prevented access to it from East Berlin and adjacent areas of East Germany during the period from 1961 to 1989. In the years between 1949 and 1961, about 2.5 million East Germans had fled from East to West Germany, including steadily rising numbers of skilled workers, professionals, and intellectuals. Their loss threatened to destroy the economic viability

of the East German state. In response, East Germany built a barrier to close off East Germans' access to West Berlin (and hence West Germany). This barrier, the Berlin Wall, was first erected on the night of Aug. 12–13, 1961, as the result of a decree passed on August 12 by the East German Volkskammer ("Peoples' Chamber"). The original wall, built of barbed wire and cinder blocks, was subsequently replaced by a series of concrete walls (up to 15 feet [5 m] high) that were topped with barbed wire and guarded with watchtowers, gun emplacements, and mines. By the 1980s this system of walls, electrified fences, and fortifications extended 28 miles (45 km) through Berlin, dividing the two parts of the city, and extended a further 75 miles (120 km) around West Berlin, separating it from the rest of East Germany.

The Berlin Wall came to symbolize the Cold War's division of East from West Germany and of eastern from western Europe. About 5,000 East Germans managed to cross the Berlin Wall (by various means) and reach West Berlin safely, while another 5,000 were captured by East German authorities in the attempt and 191 more were killed during the actual crossing of the wall.

East Germany's hard-line communist leadership was forced from power in October 1989 during the wave of democratization that swept through eastern Europe. On November 9 the East German government opened the country's borders with West Germany (including West Berlin), and openings were made in the Berlin Wall through which East Germans could travel freely to the West. The wall henceforth ceased to function as a political barrier between East and West Germany.

Berlin ware, faience and porcelain pottery made in Berlin after 1678, when the first faience manufactory there was founded by Pieter van der Lee. Others were opened in 1699 by Cornelius Funcke and in 1756 by Karl Friedrich Lüdicke. All closed, however, by the end of the 18th century. The first porcelain factory was founded in 1751 by Wilhelm Kaspar Wegely, with the aid of an arcanist, Johann Benckengraff, from Höchst, and the patronage of King Frederick II the Great. Wegely gave up in 1757 after King Frederick occupied Saxony, became involved with the Meissen factory there, and withdrew his patronage from Wegely. This early Berlin porcelain, which is rare, is of good quality; but its enamel colours could only be made to adhere to it with difficulty, and they have often partially flaked off.

Johann Ernst Gotzkowsky acquired the porcelain formula in 1761 and started a factory that he sold to the king in 1763, when it became the Royal factory, which, in 1918, became the State factory. It is impossible to identify 18th-century Berlin porcelain with complete certainty. The best period was from

Berlin porcelain allegorical group modeled by Wilhelm Christian Meyer, c. 1775; in the Victoria and Albert Museum, London

1781 to 1786, however. *Mosäik borders*, elaborate diapered patterns of fish scales, appeared in 1763 and took a variety of forms. Vases remained popular, usually with intricately modeled applied flowers, and Berlin ware achieved a reputation for the quality of its painting that it has never lost.

In the early years of the 19th century, Berlin became noted for large vases in the Biedermeier style. It also specialized in finely painted porcelain plaques. The production of lithophanes started in 1830, and a "Majolika" ware was introduced and shown at the Paris Exposition of 1867. The factory was destroyed during World War II, but it was rebuilt and reopened soon thereafter.

Berlin West Africa Conference, a series of negotiations (Nov. 15, 1884–Feb. 26, 1885) at Berlin, in which the major European nations met to decide all questions connected with the Congo River basin in Central Africa.

The conference, proposed by Portugal in pursuance of its special claim to control of the Congo estuary, was necessitated by the jealousy and suspicion with which the great European powers viewed one another's attempts at colonial expansion in Africa. The general act of the Conference of Berlin declared the Congo River basin to be neutral (a fact that in no way deterred the Allies from extending the war into that area in World War I); guaranteed freedom for trade and shipping for all states in the basin; forbade slave trading; and rejected Portugal's claims to the Congo River estuary—thereby making possible the founding of the independent Congo Free State, to which Great Britain, France, and Germany had already agreed in principle.

Berlin woolwork, 19th-century amateur embroidery developed in Germany and based upon hand-painted charts from which cross-stitch patterns could be worked in a very soft embroidery wool, spun at Gotha and dyed in Berlin, where the charts were printed and painted. The first chart was issued in 1804, and between 1810 and 1840 no fewer than 14,000 different designs were published; by the latter year they had superseded practically all other embroidery patterns in England and the United States.

The wool for this work was dyed brilliant colours in the German taste, and these bright colours and versatility of the embroidery led to its widespread popularity. Besides the usual cross-stitch and petit point used in canvas embroidery, a raised or clipped stitch called Surrey was employed that created a thick wool pile and enhanced the colour and shading of

Berlin Wall, before 1989
Kammerer/Rumpfenhorst—Time Magazine

floral designs. Coloured glass beads were also introduced to accent the floral and scenic patterns.

Berlin Zoo, German TIERPARK BERLIN, zoological park in Berlin, known for its extensive collection. It was opened in 1955 by the municipal government of East Berlin in response to public demand. What remained of the old Berlin zoo after the devastation of World War II was in West Berlin, inaccessible to those living in the eastern sector. The Berlin Zoo occupies a 400-acre (160-hectare) estate in the area of Friedrichsfelde.

The Berlin Zoo has rapidly developed one of the world's largest animal collections, maintaining more than 5,350 specimens of about 885 species. A notable feature is the Alfred Brehm Animal House, one of the largest zoo buildings in the world. This structure houses a huge aviary containing hundreds of species of birds. The aviary is flanked by cages of wild cats and by terrariums of lizards and snakes, and the whole is overgrown by exotic tropical vegetation. The zoo also has unusually large natural, open-air enclosures for bison, camels, llama, and other ungulates, as well as for polar bears.

The Berlin Zoo publishes the scientific journals *Der zoologische Garten* ("The Zoological Garden") and *Beiträge zur Vogelkunde* ("Contributions to Ornithology"), as well as the lay-oriented *Mitu*.

Berlin Zoological Garden and Aquarium, German ZOOLOGISCHER GARTEN UND AQUARIUM BERLIN, zoo and aquarium in Berlin, containing one of the world's largest and most comprehensive animal collections. It is generally considered the oldest zoo in Germany, having been founded in 1841, when the Prussian King Frederick William IV presented his pheasantry and menagerie to the citizens. The zoological garden was officially opened in 1844 with municipal support. Many rare species, including pygmy hippopotamuses, Indian elephants, and orangutans, have been bred there. By the outbreak of World War II in 1939, 4,000 birds and mammals and 8,300 aquarium specimens were housed in the zoo. The grounds were totally destroyed during the war, however, and only 91 animals survived.

Rebuilding was begun in 1952, and by the late 20th century the Berlin Zoological Garden and Aquarium had more than 5,000 land vertebrates of nearly 1,350 species, plus an aquarium fauna of about 7,000 freshwater

and marine fishes and invertebrates. The zoo occupies about 99 acres (40 hectares), and the aquarium is housed in a four-story building. The Berlin Zoological Garden has the world's best collection of wild cattle—it was the first zoo to breed the mountain anoa—and excellent collections of birds of prey, cranes, and antelopes. The zoo also maintains the international studbooks for gaur and both black and white rhinoceroses.

Berliner, Emil, Emil also spelled EMILE (b. May 20, 1851, Hannover, Hanover [Germany]—d. Aug. 3, 1929, Washington, D.C., U.S.), German-born American inventor who made important contributions to telephone technology and developed the phonograph record disc.

Berliner immigrated to the United States in 1870. In 1877, a year after Alexander Graham Bell invented the telephone, Berliner developed a transmitter employing a loose metal contact and, while experimenting with it, made the important discovery that the device could act as a superior telephone receiver.

Berliner later added other inventions to the development of the telephone, and, in 1887, turning his attention to the problem of the phonograph, he made another contribution of major significance, the flat phonograph disc, or record, across which the stylus moved horizontally, rather than vertically (as on a cylinder), thus minimizing the distortions caused by gravity on Thomas Edison's recording stylus. He also invented a method for manufacturing records.

Berliner's interest was, further, attracted to aeronautics; in 1908 he designed a lightweight internal-combustion motor that became a widely imitated prototype for aircraft. Under his general supervision, his son, Henry Berliner, designed a helicopter that flew successfully as early as 1919. Returning to problems of sound reproduction, the elder Berliner in 1925 invented an acoustic tile for use in auditoriums and concert halls.

Berliner Ensemble, theatrical company founded in 1949 by the German playwright and poet Bertolt Brecht in East Berlin. The Berliner Ensemble originated as a branch of the Deutsches Theater, where Brecht had directed a production of his *Mutter Courage und ihre Kinder* (*Mother Courage and Her Children*) in January 1949. Originally designed as a touring company, the ensemble was composed primarily of younger members of the Deutsches Theater, with Helene Weigel, Brecht's wife, as its leading actress and codirector. The company devoted itself to works written or adapted by Brecht himself and worked in Brecht's style of epic theatre, which influenced directors throughout western Europe and the United States. In 1954 the Berliner Ensemble moved to its own theatre, the Theater am Schiffbauerdamm, where it was established as an independent state theatre.

Several tours through Europe, including two visits to Paris, with *Mother Courage* in 1954 and *Der kaukasische Kreidekreis* (*The Caucasian Chalk Circle*) in 1955, brought the Berliner Ensemble international fame and high critical esteem. After Brecht's death, in 1956, Weigel carried on as the company's director until her death in 1971.

Berlinghieri, Bonaventura (fl. 1235–44), Italian painter from Lucca, Italy, known for his poignant and detailed scenes from the life of St. Francis on the predella (base of the altarpiece) of the Church of San Francesco at Pescia.

Bonaventura was the son of the painter Berlinghiero of the Berlinghieri family of Lombardian painters. The Pescia work is one of the earliest known pictorial narratives of the saint of Assisi. Consisting of a central panel and subsidiary scenes, it shows evidence of Byzan-

tine influence. Another work of rare charm is his "St. Francis Receiving the Stigmata," to

"St. Francis and Episodes from His Life," altarpiece panel by Bonaventura Berlinghieri, 1235; in the Church of S. Francesco, Pescia, Italy

SCALA—Art Resource/EB Inc

be found in the Academy at Florence. Other works attributed to Bonaventura are not well documented.

Berlinguer, Enrico (b. May 25, 1922, Sassari, Sardinia, Italy—d. June 11, 1984, Padua), secretary general of the Italian Communist Party (Partito Comunista Italiano) from March 1972 until his death. He was a leading spokesman for "national communism," seeking independence from Moscow and favouring adaptation of Marxism to local requirements.

Berlinguer was born into a middle-class Sardinian family, his father being a socialist who became a deputy and later senator. The son became a Communist Party member in 1943 and was put in charge of the Young Communists in his hometown of Sassari. In 1944 he took part in demonstrations against Italy's Fascist regime, was arrested, and spent three months in jail. After the war he continued as an organizer of Communist youth in Milan and then Rome, becoming a member of the party's Central Committee in 1945 and of the party executive in 1948.

Berlinguer held a series of posts within the party, both in Rome and in Sardinia, before being elected assistant secretary in 1969 and secretary general in 1972. As secretary general of the largest Communist organization in western Europe, Berlinguer frequently declared his readiness to take an active part in government in what he termed a "historic compromise" between Christian Democrats and Communists. Although his proposal for such a coalition government was never fully realized, Berlinguer did wield considerable influence as a popular national figure and as leader of a party that controlled many local governments nationwide. In 1976 he was invited to serve in a formal consultative role to the prime minister—the first time in 15 years that an Italian Communist had held such a position—and in 1979 he became a member of the European Parliament.

In the late 1970s and early 1980s Berlinguer found himself increasingly at odds with the Communist government of the Soviet Union. During this period he repeatedly proclaimed his support for the North Atlantic Treaty Organization and denounced the Soviet intervention in Afghanistan.

Berlioz, (Louis-)Hector (b. Dec. 11, 1803, La Côte-Saint-André, Fr.—d. March 8, 1869, Paris), French composer, critic, and conductor of the Romantic period, known largely for his

Symphonie fantastique (1830), the choral symphony *Roméo et Juliette* (1839), and the dramatic piece *La Damnation de Faust* (1846). His last years were marked by fame abroad and hostility at home.

Early career. The birthplace of Berlioz was a village about 35 miles (56 kilometres) northwest of Grenoble in the French Alps. France was at war; the schools were disrupted; and Berlioz received his education from his father, an enlightened and cultured physician, who gave him his first lessons in music as well as in Latin. But, like many composers, Berlioz

Berlioz
The Bettmann Archive

received in his early years little formal training in music. He worked out for himself the elements of harmony and by his 12th year was composing for local chamber-music groups. With help from performers, he learned to play the flute and the guitar, becoming a virtuoso on the latter.

In 1821 his father sent him to Paris to study medicine, and for a year he followed his courses faithfully enough to obtain his first degree in science. He took every opportunity to go to the Paris-Opéra, however, where he studied, score in hand, the whole repertory, in which the works of Gluck had for him the most appeal and authority. His musical vocation had become so clear in his mind that he contrived to be accepted as a pupil of Jean-François Lesueur, professor of composition at the Paris Conservatoire. This led to disagreements between Berlioz and his parents that embittered nearly eight years of his life. He persevered, took the obligatory courses at the Conservatoire, and in 1830 won the Prix de Rome, having received second prize in an earlier competition. These successes pacified his family but were, in a sense, incidental to his career, for in the same year he had finished and obtained a performance of his first great score, which is also a seminal work in 19th-century music, the *Symphonie fantastique*.

It was in some respects unfortunate that, instead of being able to follow up this success, Berlioz was required, under the terms of his prize, to spend three years abroad, two of them in Italy. During his long Paris apprenticeship, he had experienced the "revelation" of two modern musicians, Beethoven and Weber, and of two great poets, Shakespeare and Goethe. He had meanwhile fallen in love, at a distance, with Harriet Smithson, a Shakespearean actress who had taken Paris by storm; and, on the rebound from this

rather one-sided attachment, he had become engaged to a brilliant and beautiful pianist, Camille Moke (later Mme Pleyel). In leaving Paris, Berlioz was not only leaving a flirtatious fiancée and the artistic environment that had stimulated his powers; he was also leaving the opportunity to demonstrate what his genius saw that modern French music should be. The public was content with the "Paris school," dating back to the 1780s, and there is evidence that all Europe (including the Vienna of Beethoven and Schubert) accepted the productions of André Grétry, Etienne Méhul, Luigi Cherubini, and their followers as leading the musical world.

Berlioz wanted to bring forward the work of Weber and Beethoven (including the last quartets) and add contributions of his own. He also preached, for the sake of dramatic expression in music, a return to the master of the stage, Gluck, whose works he knew by heart. These three musicians were all in some sense dramatists, and to Berlioz music must first and foremost be dramatically expressive. This doctrine he had begun to expound in his first musical reviews, as early as 1823, and, with the sharpness and strength of an early vision, it remained the artistic creed of his mature years. When one understands its intellectual and intuitive basis, one understands also the reasons for his dynamic career. What may look like self-seeking—the unceasing effort to have his music played—was, in fact, the dedication of his tremendous energies to a cause, often at the expense of his own creative work. The result of his many journeys to Germany, Belgium, England, Russia, and Austria-Hungary was that he taught the leading orchestras of Europe a new style and, through them, taught a new idiom to the young composers and critics who flocked wherever he went.

Before these "campaigns" began, however, Berlioz had his time of reflection in Italy. He wrote in his *Mémoires* (1870) how unproductive he was after the rich output of the Paris years, which had brought forth an oratorio, numerous cantatas, two dozen songs, a mass, part of an opera, two overtures, a fantasia on Shakespeare's *Tempest*, and eight scenes from Goethe's *Faust*, as well as the *Symphonie fantastique*. Even in Italy, however, Berlioz filled notebooks, met the Russian composer Mikhail Glinka, made a lifelong friend of Mendelssohn, and tramped the hills with his guitar over his shoulder, playing for the peasants and *bandidi* whose meals he shared. The impressions gathered in Italy remained a source of both musical and dramatic inspiration down to the last of his works, *Les Troyens* and *Béatrice et Bénédicte* (first performed 1862). Meanwhile, his love affair stagnating and his impatience with life at the Villa Medici in Rome becoming acute, he returned to France after 18 months and forfeited part of his prize.

Mature career. Back in Paris, he set about conquering it anew. He put together a collection of earlier pieces in a form then fashionable, the monodrama, or recitation by one actor interspersed with musical scenes. Since the *Symphonie fantastique* had ended with the death and demonic torments of the protagonist, Berlioz called his new work *Le Retour à la vie* (later *Lélio*, after the hero's name). First performed in 1832, this concoction, which contains three or four delightful pieces, enjoyed great success, and Berlioz had reason to think himself launched again.

A series of accidents brought him in touch with the actress Harriet Smithson, whom he married on Oct. 3, 1833. The marriage did not last, though for some years the couple led a peaceful existence at Montmartre in the house that Maurice Utrillo later never tired of painting. Among the visitors there were the young poets and musicians of the Romantic movement, including Alfred de Vigny and Chopin. It was there that Berlioz' only child, Louis, was born and also where he composed his

great *Requiem*, the *Grande Messe des morts* (1837), the symphonies *Harold en Italie* (1834) and *Roméo et Juliette* (1839), and the opera *Benvenuto Cellini* (Paris, 1838).

It was after the premiere of *Harold en Italie* that Berlioz had the astonishing experience of seeing the famous violin virtuoso Paganini fall at his feet and declare that he was a genius destined to carry on the new musical tradition initiated by Beethoven. The next day Berlioz received 20,000 francs with a letter from Paganini repeating this judgment. Using the money to free himself from journalistic drudgery, Berlioz composed the choral symphony *Roméo et Juliette*, dedicated to Paganini.

In Paris it was always expected that a composer, regardless of his bent, should be tested at the Opéra. Berlioz' friends intrigued to procure the assignment of a libretto. An adaptation of Benvenuto Cellini's autobiography was secured, and Berlioz finished his score in a short time. The intrigue now passed to the other side, which saw to it that the production of *Benvenuto Cellini* at the Opéra failed. From this blow the work itself and the composer's reputation in France never recovered during his lifetime. The score is a masterpiece, and the attribution of the failure to the libretto shows ignorance of the qualities of both the libretto and the music.

The *Requiem* of 1837 had been a government commission for a ceremonial occasion designed to encourage the Rome laureate. The request to compose another work for a public ceremony—the *Symphonie funèbre et triomphale* (*Funeral Symphony*) for military band, chorus, and strings, commissioned for the 10th anniversary of the July Revolution (1840)—was intended as a partial solace for the defeat of *Benvenuto Cellini*. A few years before, Berlioz' literary gifts had won him the post of music critic for the leading Paris newspaper, the *Journal des Débats*, and his employers wielded political influence. Once again, there were intrigues, but the score of the *Funeral Symphony* was ready for the inauguration of the Bastille column. Unfortunately, the music was drowned out by the drum corps, a disaster that Berlioz repaired by giving the work the following month at a concert hall. This was the score that Wagner, then seeking fame in Paris, admired so wholeheartedly.

Berlioz was able to put Wagner in the way of some musical journalism and thus began a fitful connection of 30 years between the two men whose influence on modern music still resembles a battle of ideals: Berlioz aiming at the creation of drama in and through music alone; Wagner at marriage of symphony with opera. Although Berlioz and Wagner met again in London in 1855 and found each other congenial, their philosophical differences generally kept them apart.

After 1840 Berlioz' life consisted of a series of tours across Europe. The last of these was an exhausting series of concerts in St. Petersburg and Moscow in 1867, when he was desperately ill. But it had the effect of introducing the Russian Five, notably Mussorgsky, to his style through his manuscript scores and his conducting. For Berlioz was the first of the virtuoso conductors, having made himself such in order to supply the deficiencies of men who were unable to direct the new music according to the new canon: play what is written. Moreover, the rhythmical difficulties of his scores and the unfamiliar curve of his melodies disconcerted many. The orchestras themselves had to be taught a new precision, vigour, and ensemble, and this was Berlioz' handiwork. Wagner's memoirs bear testimony to this "revelation of a new world," which he experienced at Berlioz' hands in 1839.

On orchestration itself (and, even more important, on instrumentation) Berlioz produced the leading treatise, *Traité d'instrumentation et d'orchestration modernes* (1844). Much more

than a technical handbook, it served later generations as an introduction to the aesthetics of expressiveness in music. As Albert Schweitzer has shown, its principle is as applicable to Bach as to Berlioz, and it is in no way governed by considerations of so-called program music. To this last-named genre of dubious repute, Berlioz did not contribute more than the printed "story" of his first symphony, which is intelligible as music, without any program.

Among Berlioz' dramatic works, two became internationally known: *La Damnation de Faust* (1846) and *L'Enfance du Christ* (1854). Two others began to emerge from neglect after World War I: the massive two-part drama *Les Troyens* (1855–58), based on Virgil's story of Dido and Aeneas, and the short, witty comedy *Béatrice et Bénédict*, written between 1860 and 1862 and based on Shakespeare's *Much Ado About Nothing*. For all these Berlioz wrote his own librettos. He also wrote a *Te Deum* (1849; performed 1855), which is a fitting counterpart to the *Requiem*, and between 1843 and 1856 he orchestrated his songs, including the song cycle *Les Nuits d'été* (*Summer Nights*). Among his best known overtures are *Le Roi Lear* (1831), *Le Carnaval romain* (1844), based on material from *Benvenuto Cellini*, and *Le Corsaire* (1831–52).

In Berlioz' final years he was incapacitated by illness and saddened by many deaths. His first wife, from whom he was separated but to whom he still felt a deep attachment, died in 1854; his second wife, Maria Recio, who was his companion for many years and whom he married when he became a widower, died in 1862. Finally, his son, Louis, on whom he concentrated the affection of his declining years, died of yellow fever at the age of 33.

Assessment. The outstanding characteristics of Berlioz' music—its dramatic expressiveness and variety—account for the feeling of attraction or repulsion that it produces in the listener. Its variety also means that devotees of one work may dislike others. But Berlioz also presents a particular difficulty of musicianship in being closer to the true sources of music than to its German, Italian, or French conventions; his melody is abundant and extended and is often disconcerting to the lover of four-bar phrases; his harmony may be obvious or subtle, but it is always functional and frequently depends on elements of timbre; his modulations can be harsh and may even seem harsher than they would in another composer, because he uses his effects sparingly and achieves much by small means and adroit contrasts. This is also true of his orchestration, generally light and transparent, never pasty. As George Bernard Shaw said: "Call no conductor sensitive in the highest degree to musical impressions until you have heard him in Berlioz and Mozart."

The Belgian composer César Franck once said that Berlioz' whole output is made up of masterpieces. He meant by this that each of the composer's dozen great works was the realization of a conception distinct from all the others, rather than successive efforts to attain perfection in the last or best of a series. Franck's judgment is borne out by the fact that, unlike many composers, Berlioz almost never repeats himself. Rather, he created a fresh style for each of his subjects, with the result that familiarity with one is no guaranty of ready access to another. Nothing could be less alike than the *Symphonie funèbre et triomphale* and *Roméo et Juliette*. To be sure, Berlioz' harmonic system seems the same throughout, partly because it deviates so noticeably from common expectation and partly because its nuances are only now being appreciated for what they are, instead of being looked upon as clumsy attempts to do something else. Again, his melody and free counterpoint everywhere carry his mark—the sinewy originality and dynamic equilibrium of the former, the ingeniously careless indepen-

dence of the latter. Yet, out of these characteristic elements Berlioz makes a radically different atmosphere for each of his dramas and within them for each of his dramatic personae. Only a repeated hearing of any given work discloses all the power and art that it contains. This does not mean that these works are without flaw; it does mean that they embody unique conceptions, to be taken for what they have to give and which no other composer provides.

In creating drama and atmosphere, Berlioz excels in scenes of melancholy, introspection, love, the contemplation of nature, and the tumult of crowds. His intention throughout is to combine truth with musical sensations, be they powerful or (to quote Shaw again) "wonderful in their tenuity and delicacy, unearthly, unexpected, unaccountable."

Much might be added or quoted that would show the extent to which Berlioz' music still needs careful and dispassionate study. In 1935 British musicologist Sir Donald Tovey declared that *Les Troyens* is "one of the most gigantic and convincing masterpieces of music drama." Books that date from the 19th century or echo its views, with or without a bias toward Wagner or Debussy, will mislead the student and possibly close the ears of the listener. It is easy to represent Berlioz as merely a craftsman in tone colour who helped develop the resources of the orchestra. But with the repeated performance of the major works all over the Western world, the more comprehensive judgment has come to prevail that Berlioz is a dramatic musician of the first rank. Before 1945 the Berlioz repertoire was limited to the *Symphonie fantastique* and a few brief extracts. The great works, done once and usually with insufficient preparation, produced little effect and confirmed the wisdom of letting them lie. The advent of long-playing records radically altered the situation. Audiences can now judge the interpretations that they are being given, and thus they hear Berlioz performances with a knowledge and critical attention comparable to those with which they hear other composers. (J.Ba.)

MAJOR WORKS. *Operas.* *Benvenuto Cellini* (first performed 1838); *Les Troyens*, comprising *La Prise de Troie* and *Les Troyens à Carthage* (composed 1855–58); and *Béatrice et Bénédict* (1862).

Choral works. *Huits Scènes de Faust* (1829); *Lélio ou Le Retour à la vie* (1831, sequel to *Symphonie fantastique*); *Requiem—Grand Messe des Morts* (1837); *Roméo et Juliette* (1839); *Symphonie funèbre et triomphale* (1840); *La Damnation de Faust* (1846); *L'Enfance du Christ* (1854), oratorio; *Te Deum*, p. 22 (1855).

Orchestral works. *Waverly* (1823), overture; *Les Francs-Juges* (composed c. 1827), overture; *Symphonie fantastique* (1830–31); *Le Roi Lear* (1831), overture; *Le Corsaire* (1831–52), overture; *Harold en Italie* (1834), symphony with solo viola; *Le Carnaval romain* (1844), overture.

Voice and orchestra. *La Mort de Cléopâtre* (1829); *La Captive* (1834); *Les Nuits d'été* (1843 and 1856); *La Mort d'Ophélie* (1850).

Songs with piano. *Irlande* (1829–30), five songs; *Les Nuits d'été* (original version, 1834–41); *Trente-trois Melodies* (1863).

BIBLIOGRAPHY. Hector Berlioz, *Memoirs*, trans. by David Cairns (1969), gives the story, atmosphere, and purpose of the artist's life; his *Evenings with the Orchestra*, trans. by Jacques Barzun (1956), is a sampling of Berlioz' music criticism. *The New Letters of Berlioz, 1830–1868*, ed. by Jacques Barzun (1954), provides a selection illustrative of the composer's day-to-day activities. For a judgment typical of the Wagnerian era, see Romain Rolland, "Berlioz," *Musiciens d'aujourd'hui*, 2nd ed. (1908), trans. in Barrett H. Clark (comp.), *Great Short Biographies of the World* (1929). J.G. Prod'Homme, *Hector Berlioz (1803–1869) sa vie et ses oeuvres*, 3rd ed. (1927), marks the beginning of the rehabilitation. Walter J. Turner, *Berlioz, the Man and His Work* (1934); and Tom S. Wotton, *Hector Berlioz* (1935, reprinted 1969), affirm the now accepted estimate of the man and his works. Jacques Barzun, *Berlioz and the Romantic Century*,

3rd ed., 2 vol. (1970), gives the fullest account of Berlioz' life. Cecil Hopkinson, *A Bibliography of the Musical and Literary Works of Hector Berlioz, 1803–1869*, 2nd ed., ed. by Richard MacNutt (1980), is the standard bibliography.

Berlusconi, Silvio (b. Sept. 29, 1936, Milan, Italy), media tycoon and prime minister of Italy in 1994 and from 2001 to 2006.

After graduating from the University of Milan, Berlusconi became a real estate developer, amassing a considerable fortune by the 1970s. He created a cable television firm in 1974 and founded Italy's first commercial television network in 1980. By the 1990s, he owned more than 150 businesses, including much of Italy's media. In 1994, Berlusconi founded Forza Italia, a conservative political party, and was elected prime minister. Faced with conflict of interest and other charges, he resigned in December 1994. He was later convicted for fraud and corruption, though he was acquitted of tax evasion. Despite the convictions and criticism of his control of much of the Italian media, he remained the leader of Forza Italia and again became prime minister in 2001. Berlusconi, however, continued to face allegations of corruption. He also struggled to improve the country's economy. In 2006 he left office after his centre-right alliance lost the general election.

berm, terrace of a beach that has formed in the backshore, above the water level at high tide. Berms are commonly found on beaches that have fairly coarse sand and are the result of the deposition of material by low-energy waves. They have a marked change of slope at their seaward edge and a flat or reverse-sloped platform that lies slightly higher than the mean high-water level. On broad beaches there may be three or more subparallel berms, each formed under different wave conditions. On some beaches a berm several metres wide may be laid down each summer and destroyed each winter by high storm waves.

Bermejo, Bartolomé, also called BARTOLOMÉ DE CÁRDENAS (b. Córdoba, fl. 1474–95—d. Barcelona), painter, a cultivator of the Flemish style, who was considered the finest painter in Spain before El Greco. His style was a model for many painters of his era.

Between 1474 and 1477 he worked in Aragon, where he left disciples, and between 1486 and 1495 in Catalonia, where he collaborated with Jaime Huguet, the principal master of that school. His earliest dated work, the panel of

"Pietà," by Bartolomé Bermejo, 1490; in the cathedral, Barcelona

Arquivo Mas, Barcelona

"Santo Domingo de Silos Madrid" (Prado), painted in 1474, has typical Gothic elements. Under the influence of the Flemish masters these elements gradually disappeared as he became more skilled in the use of foreshortening, in detailed depiction of accessories, and

in the resolution of difficult problems in perspective. The work that demonstrates most clearly his mastery of Renaissance techniques is the "Pietà" of 1490 in the Cathedral of Barcelona, which lacks gold in the background (present in earlier works); instead, a landscape under a stormy sky is painted very much in the manner of the Flemish master Rogier van der Weyden, rich in detail, colour, and life. The figure of the donor (Canon Luis Desplá) in this picture is considered one of the finest portraits painted in Europe in this period.

Bermejo River, Spanish RÍO BERMEJO, western tributary of the Paraguay River, south-central South America. It rises near Tarija, Bolivia and, after a rapid plunge to the Chaco lowlands at the border with Argentina, meanders southeastward in shifting channels to join the Paraguay River opposite Pilar, Paraguay. It extends some 650 miles (1,046 km). Much silt is carried in suspension by the river, thus originating its name (*bermejo*, "reddish colour"). It is navigable for small craft along its central course, which is usually referred to as the Teuco River.

Bermuda, self-governing British colony in the western North Atlantic Ocean. It is an archipelago of 7 main islands and about 170 additional (named) islets and rocks, situated about 650 miles (1,050 km) east of Cape Hatteras (North Carolina, U.S.). Bermuda is neither geologically nor spatially associated with the West Indies, which lie more than 800 miles (1,300 km) to the south and southwest. The archipelago is about 24 miles (40 km) long and averages less than 1 mile (1.6 km) in width. The main islands are clustered together in the shape of a fishhook and are connected by bridges. The largest island is referred to as Main Island (14 miles [22.5 km] long and 1 mile wide). The Peak, at 259 feet (79 m) on Main Island, is the highest point. The capital is Hamilton.

The land. The coral islands of Bermuda are composed of a layer 200 feet (60 m) thick of marine limestone that caps an extinct and submerged volcanic mountain range; the limestone surface is overlain by a shallow layer of fertile soil. The islands are fringed by coral reefs and have no lakes or rivers, but the soil is highly porous, and standing water is not a problem.

The climate is mild, humid, and equable. August is the warmest month, with an average daytime high of 86° F (30° C), and February is the coldest month, with an average nighttime low of 57° F (14° C). Mean annual precipitation is about 57 inches (1,450 mm). Occasional dry spells can be critical, as the supply of drinking water depends almost entirely on

rainfall. The vegetation is subtropical and includes flowering shrubs such as bougainvillea, Easter lilies, oleander, hibiscus, and poinsettia. Palm, pine, casuarina, and mangrove trees are found on most of the islands. A number of migratory birds visit the islands annually; other wildlife is limited to lizards and frogs.

The people. About three-fifths of the population is descended from African slaves brought to Bermuda before Britain outlawed the slave trade in 1807. Whites include the British and descendants of Portuguese labourers from Madeira and the Azores who went to Bermuda in the mid-19th century. English is the official language, but some Portuguese is also spoken. Christianity predominates, and more than one-fourth of the population is Anglican. Bermuda's rate of population growth is low by world standards, comparable to that of the United States. Less than one-fifth of the population is younger than 15 years.

Virtually all of Bermuda's larger islands are inhabited, and Main Island has the largest concentration of people. Bermuda has one of the world's highest population densities.

The economy. Bermuda has a predominantly market economy based on tourism and international finance. The gross national product (GNP) is growing more rapidly than the population, and the GNP per capita is one of the highest in the world.

Agriculture is of negligible importance in the overall economy, and most food must be imported. Fresh vegetables, bananas, citrus fruits, milk, eggs, and honey are produced locally. There is a small fishing industry. Mineral industries are limited to the production of sand and limestone for local construction. There are a few light manufacturing industries that produce paint, pharmaceuticals, electronic wares, and printed material.

Tourism and international financial services account for the major share of the GNP and employ virtually all the workforce directly or indirectly. More than 500,000 tourists visit Bermuda each year; most come from the United States. Airlines account for the majority of arrivals, but there are also dozens of calls by cruise ships each year. Bermuda has low income taxes; the government derives most of its revenues from tariffs and various taxes on real estate and tourism. As a result the colony has become an important offshore financial centre, and many insurance and investment companies have established offices there. Principal trading partners include the United States, which supplies nearly three-fourths of Bermuda's imports by value; Canada; Japan; and the Netherlands Antilles, which supplies oil imports.

Government and social conditions. Bermuda is an internally self-governing British colony with a parliamentary government. Under its 1968 constitution, the British monarch, represented by the governor, is the head of state. The governor maintains control over external affairs, defense, internal security, and the police but acts on the advice of the cabinet, led by the premier, who is head of government and of the majority party in the legislature. The bicameral legislature is composed of the House of Assembly, with 40 members elected to terms of up to five years, and the Senate, with 11 members appointed by the governor. The Supreme Court heads the judicial system. The system of local government comprises nine parishes.

Bermuda enjoys a high standard of health, as reflected in the average life expectancy of about 73 years for men and 79 years for women and in the relatively low infant-mortality rate. Social-security provisions, first enacted in 1965, include old-age, disability, and survivor pensions and compulsory hospitalization insurance for all citizens.

Nearly the entire population is literate. Education is compulsory and free between the ages of 5 and 16. There is one junior college,

and government scholarships are available for overseas study.

History. In 1511 an island named "Bermudas" was depicted on a map in Spain. The Spanish navigator Fernández de Oviedo sailed close to the islands in 1515 and attributed their discovery to his countryman Juan Bermúdez, possibly as early as 1503. A century later, about 150 British travelers were shipwrecked (1609–10) at Bermuda, which they named the Somers Isles. Bermuda was included (1612) in the third charter of the Virginia Company, and 60 English settlers were sent to colonize the islands. Indian and African slaves were transported to Bermuda by 1617, and soon the slave population outnumbered the white settlers.

In 1684 the colony became administered by the crown. The colonial capital was transferred from St. George to Hamilton on Main Island in 1815. Slavery was abolished in Bermuda and the rest of the British Empire in 1834.

During the American Civil War, Bermuda was a staging area for blockade runners to Southern ports. Rum was smuggled into the United States from the island during the Prohibition period (1919–33). In the 20th century the colony developed thriving industries in tourism and international finance. The U.S. government acquired a 99-year lease for military bases in 1941 but closed them in 1995. The British army garrison, which dated to 1797, was withdrawn in 1957, a Canadian base closed in 1993, and a small remaining Royal Navy base ceased operating in 1995.

The first Bermudian political party, the Progressive Labour Party, organized in 1963, claimed to represent the nonwhite citizens. In 1968 a new constitution gave strong powers to the elected head of the majority political party in the legislature, and the next election placed the multiracial United Bermuda Party in power with a substantial majority; the party was returned to power in subsequent elections.

Political tensions increased in 1973 when the governor, Sir Richard Sharples, was assassinated. Political unrest and rioting in 1977 led to official efforts to end de facto racial discrimination and to begin independence talks. In a referendum held in August 1995, however, nearly three-fourths of those voting opposed independence. In the 1990s economic and environmental concerns—the latter resulting in part from the high population density—and a growing traffic in illegal drugs were major political issues. Area 21 square miles (54 square km). Pop. (1995 est.) 58,000. (Pa.H./G.J.R.)

BIBLIOGRAPHY. George Rushe, *Your Bermuda* (1995), is a comprehensive, fact-filled guide. Historical works include Wilfred Brenton Kerr, *Bermuda and the American Revolution: 1760–1783* (1936, reissued 1969); and Henry C. Wilkinson, *Bermuda from Sail to Steam: The History of the Island from 1784 to 1901*, 2 vol. (1973).

Bermuda grass (*Cynodon dactylon*), perennial grass of the family Poaceae that is native to the Mediterranean region.

Bermuda grass usually is 10 to 40 cm (4 to 16 inches) tall, with short, flat leaves. The spikelets are borne in four or five slender spikes at the tips of the upright stems. Extensively creeping stolons and rhizomes (above-ground and underground horizontal stems) enable Bermuda grass to establish a dense turf. It is used in warmer parts of North America as a lawn and pasture grass and for golf greens.

Bermuda high, also called AZORES HIGH, recurring centre of high atmospheric pressure that develops over the North Atlantic Ocean.

Bermuda Race, one of the world's major ocean races for sailing yachts. Originating in 1906, it has been held biennially since 1924 (except during World War II); since 1936 it has covered the 635-nautical-mile (1,176-kilometre) distance from Newport, R.I., U.S., to Bermuda. The race is cosponsored by the

Cruising Club of America and the Royal Bermuda Yacht Club, with the winners determined by a handicapping formula. Beginning in 1986 separate awards were given to the winners of the two main divisions, or classes, of ships in the Bermuda Race—one for the fastest cruiser/racer yacht and one for the fastest grand prix racer. The yachts in these two divisions race under the rules, respectively, of the International Measurement System (formerly the Measurement Handicap System) and the International Offshore Rule. A race record was set in 1956, when the yawl *Bolero*, owned by Sven Salen of Sweden, covered the distance in 70 hours 11 minutes 37 seconds. See Sporting Record: *Yachting*.

Bermuda Triangle, section of the North Atlantic Ocean off North America in which more than 50 ships and 20 airplanes are said to have mysteriously disappeared. The area, whose boundaries are not universally agreed upon, has a vaguely triangular shape marked by the southern U.S. coast, Bermuda, and the Greater Antilles.

Reports of unexplained occurrences in the region date to the mid-19th century. Some ships were discovered completely abandoned for no apparent reason; others transmitted no distress signals and were never seen or heard from again. Aircraft have been reported and then vanished, and rescue missions are said to have vanished when flying in the area. However, wreckage has not been found, and some of the theories advanced to explain the repeated mysteries have been fanciful. Scientific searches have revealed nothing to substantiate the storied peril of the region—wherever it may be. Boaters and fliers continue to venture through the triangle without event.

Bern, also spelled *BERNE*, *canton*, west-central Switzerland. The second most populous and second largest of the Swiss cantons, it has an area of 2,335 square miles (6,049 square km), of which about 100 square miles (260 square km) are occupied by glaciers. Bordering Jura canton (until 1979 part of Bern canton) to the north, it is bounded on the west by the cantons of Neuchâtel, Fribourg, and Vaud; south by Valais; and east by Uri, Unterwalden, Luzern, and Solothurn. It is drained mainly by the Aare River and its affluents. Three physical divisions may be distinguished. The Bernese Highlands in the south includes the Alps, culminating in the Finsteraarhorn (14,022 feet [4,274 m]) and the Jungfrau (13,642 feet [4,158 m]), and the famous resorts of Interlaken, Thun, Meiringen, Grindelwald, Mür-

ren, and Kandersteg. This region is extremely mountainous and is noted for its great scenic beauty. The Midlands (Mittelland) consists of the Aare valley below Thun, the Emme River valley, the foothills of the high Alps, and the plain around the city of Bern. In the north of the canton lies the Lake Region around Lake Biel.

The canton comprises the districts acquired by the city of Bern (*q.v.*), the cantonal capital, between the 14th and the 16th century. From 1803 to 1814 the canton of Bern was one of the six directorial cantons of the Swiss Confederation. The existing constitution dates from 1893, but the direct popular election of the nine-member executive (*Regierungsrat*) was introduced in 1906.

In the Highlands the principal economic factors are the year-round tourist trade, agriculture, cattle breeding, cheese making (at the Emmental), and hydroelectric power generation. There is also wood carving at Brienz and pottery making near Thun. The Midlands is a fertile agricultural region and is also the most industrialized part of the canton. A nuclear power station is located at Mühleberg. There is vine culture around Lake Biel. The population of the canton is mainly German-speaking and Protestant. Pop. (2001) 947,100.

Bern, also spelled *BERNE*, capital of Switzerland and of Bern *canton*, west-central Switzerland. It lies along a narrow loop of the Aare River. The existence of the ancient castle of Nydegg, guarding a crossing over the Aare, probably led Berthold V, duke of Zähringen, to found Bern in 1191 as a military post on the frontier between the German-

The medieval Clock Tower, Bern, Switz., seen from the Kramgasse; in the foreground is the Zähringen fountain surmounted by a bear in armour, the city's heraldic device

Josef Muench

speaking Alamannians and the French-speaking Burgundians. After the extinction of the Zähringen dynasty (1218), Bern became a free imperial city. Gradually it extended its power by acquiring surrounding territory, becoming an independent state that in 1353 entered the Swiss Confederation, founded in 1291. It soon took the lead in the confederation. It was the scene of a disputation in 1528 between Roman Catholics and reformers that led to its acceptance and subsequent championship of Protestant doctrines. In the 18th century Bern governed 52 territories, and its patricians exercised considerable power. The whole system of Bernese patrician government was swept away by the French in 1798 and, although partially revived in 1815, ended in 1831. Bern became the political capital of the Swiss Confederation in 1848.

Old Bern, connected by several bridges to newer parts of the city on the right bank, preserves more of its medieval appearance than any other Swiss city. Old Bern is characterized by arcades, towers, and 16th-century fountains. The Gothic Münster (cathedral; 1421–1598) with its 328-foot (100-metre) spire (completed 1893) is the dominant landmark.

Also notable are the city hall (1406–16, restored 1942) and the Nydegg Church (1494). The Federal Palace (Bundeshaus; 1852–1901) houses the Swiss federal parliament; it also houses the administrative and executive offices of the federal government. The famous Clock Tower (Zeitglockenturm), with a 16th-century clock and puppets that revolve at the hour, and the Cage Tower (Käfigturm) are the two remaining towers of the old walls that once protected the city. A favourite decorative motif is the bear (Old High German: *bero*), the town's heraldic device and said to be the source of its name; perhaps the most famous Bern landmark is the bear pit, where several bears have been kept on display at the city's expense since 1513.

The University of Bern was founded in 1834 and incorporates the Theological School (founded 1528). The City and University Library contains many manuscripts and rare books. The Swiss National Library is also in Bern, as is the headquarters of the Swiss National Bank. There are historical, natural history, art, rifle, and Alpine museums.

As well as being the federal capital, Bern is the headquarters of the international postal, telegraph, railway, and copyright unions. Its industries include the manufacture of chocolate, machinery, electrical equipment, textiles, and chemical and pharmaceutical products. It is also a market for agricultural produce and a busy rail junction. The airport at Belpmoos, 6 miles (10 km) southeast, has a regular summer service linking Bern with Zürich's international airport. The population is mainly German-speaking and Protestant. Pop. (2001) 122,469.

Bernadette OF LOURDES, SAINT, original name *MARIE-BERNADE SOUBIROU* (b. Jan. 7, 1844, Lourdes, Fr.—d. April 16, 1879, Nevers; canonized Dec. 8, 1933; feast day April 16, but sometimes February 18 in France), miller's daughter whose visions led to the founding of the shrine of Lourdes.

Frail in health, Bernadette was the eldest of nine children from a poverty-stricken family. She contracted cholera in the epidemic of 1854 and suffered from asthma and other ailments throughout her life. Between February 11 and July 16, 1858, at the age of 14, she had a series of visions of the Virgin Mary, who revealed her identity with the words "I am the Immaculate Conception." Bernadette steadfastly defended the genuineness of these visions despite strong opposition from her parents, the local clergy, and civil authorities, and she faithfully transmitted Mary's messages. To escape public attention she became a boarder

in the local school run by the Sisters of Charity of Nevers. In 1866 she was granted admission into the novitiate in the mother house at Nevers. There she completed her religious instruction and passed her remaining years in prayer and seclusion, happy and loved for her kindness, holiness, and wit, despite almost constant sickness and pain. She died in agony, willingly accepting her great sufferings in faithful fulfillment of her "Lady's" request for penance. She was canonized by Pope Pius XI. Celebration of her feast is optional in the Roman calendar. The chapel of the St. Gildard convent, Nevers, contains her body.

Bernadotte, HOUSE OF, royal dynasty of Sweden, from 1818. The name derives from a family of old lineage of Béarn, France, whose earliest known member (17th century) owned an estate in Pau known as "Bernadotte."

In 1810, Jean-Baptiste-Jules Bernadotte, a celebrated marshal of France under Napoleon, was elected crown prince of Sweden, went to Stockholm, acted officially as regent during the illnesses of the aged, childless king Charles XII, and in 1818 became king, as Charles XIV John. Succeeding rulers were his son Oscar I (reigned 1844–59), Charles XV (1859–72), Oscar II (1872–1907), Gustav V (1907–50), Gustav VI Adolf (1950–73), and Charles XVI Gustav (or Carl XVI Gustaf; 1973–).

Bernadotte (af Wisborg), Folke, Greve (Count) (b. Jan. 2, 1895, Stockholm—d. Sept. 17, 1948, Jerusalem), Swedish soldier, humanitarian, and diplomat who was assassinated while serving the United Nations as mediator between the Arabs and the Israelis.

Count Bernadotte, 1945
Archiv für Kunst und Geschichte, West Berlin

A nephew of King Gustav V of Sweden, Bernadotte was commissioned in the Swedish Army in 1918. He became an official of the Boy Scout movement and during World War II he headed the Swedish Red Cross, securing the exchange of many prisoners of war and being credited with saving some 20,000 inmates of German concentration camps. His excellent reputation among all the combatant nations in Europe led the Nazi official Heinrich Himmler to employ him to transmit a fruitless offer (April 24, 1945) that Germany surrender unconditionally to the United Kingdom and the United States but not to the Soviet Union.

Appointed mediator in Palestine by the United Nations Security Council on May 20, 1948, Bernadotte obtained the grudging acceptance by the Arab states and Israel of a UN cease-fire order, effective June 11. He soon made enemies by his proposal that Arab refugees be allowed to return to their homes in what had become the nation of Israel. Following a number of threats against his life, he and André-Pierre Serot, a French Air Force colonel and UN observer, were murdered by Jewish extremists.

Bernadotte, Jean-Baptiste: see Charles XIV John under Charles (Sweden).

Bernal, John Desmond (b. May 10, 1901, Nenagh, County Tipperary, Ire.—d. Sept. 15, 1971, London), physicist and X-ray crystallographer known for his studies of the atomic structures of solid compounds, during which he made major contributions to X-ray crystallography. He was professor of physics (1938–63) and of crystallography (1963–68) of the University of London. Bernal has also conducted research into molecular biology, the origin of life, and the structure and composition of the Earth's crust.

Bernanos, Georges (b. Feb. 20, 1888, Paris—d. July 5, 1948, Neuilly-sur-Seine, Fr.), novelist and polemical writer whose masterpiece, *The Diary of a Country Priest*, established him as one of the most original and independent Roman Catholic writers of his time.

Bernanos began life as a Royalist journalist and later worked as an inspector for an insurance company. Like his predecessor, the French Catholic writer Léon Bloy, Bernanos

Bernanos
H. Roger-Viollet

was a visionary for whom the supernatural world was never far away. He was also a man of humour and humanity who abhorred materialism and compromise with evil. His vehement sincerity is seen in his political pamphlets *La Grande Peur des bien-pensants*, a polemic on the materialism of the middle classes (1931; "The Great Fear of Right-Thinking People"), and *Les Grands Cimetières sous la lune* (1938; *A Diary of My Times*, 1938), a fierce attack on Fascist excesses during the Spanish Civil War and on the church dignitaries who supported them.

As a novelist he made his theme the struggle between the forces of good and evil for the soul of man, a conflict particularly exemplified in his studies of priests. His characters, representing extremes of human behaviour from saintliness to utter depravity, are powerfully imagined and realistically drawn.

Bernanos' first novel was *Sous le soleil de Satan* (1926; *The Star of Satan*, 1939; *Under the Sun of Satan*, 1949), partly based on the experiences of the Curé d'Arçay. In 1936 Bernanos published *Journal d'un curé de campagne* (*The Diary of a Country Priest*, 1937), a story of a young priest's war against sin. It was made into a motion picture by the French director Robert Bresson in 1951. Other notable works were *La Joie* (1929; *Joy*, 1946), *Nouvelle Histoire de Mouchette* (1937; *Mouchette*, 1966), and *Monsieur Ouine* (1943; *The Open Mind*, 1945).

Political events troubled Bernanos increasingly. In July 1938 he went into self-imposed exile with his wife and six children and began an unsuccessful farming venture in Brazil. He felt acutely what he regarded as the moral degradation of the Munich Agreement ("Scandale de la vérité," 1939; "Scandal of the Truth"). In June 1940 he gave his support to his former classmate Gen. Charles de Gaulle. His broadcast messages and his *Lettre aux Anglais* (1942; *Plea for Liberty*, 1944) influenced his compatriots during World War II.

A return to France in 1945 brought disillusionment with his country's lack of spiritual renewal, and he lived thereafter in Tunis until he returned to France suffering from his final illness. Shortly before his death Bernanos completed *Dialogue des Carmélites*, a film script dealing with 16 nuns martyred during the French Revolution. An opera by Francis Poulenc was based on this work.

Bernard (personal name): see under Bernhard, or Bernardino, except as below.

Bernard DE CHARTRES (b. late 11th century, Brittany—d. c. 1130, possibly Paris), Humanist and philosopher, head of the celebrated school of Chartres, in France, whose attempt to reconcile the thought of Plato with that of Aristotle made him the principal representative of 12th-century Platonism in the West.

A teacher of logic and grammar at the cathedral school of Chartres (where his brother, Thierry de Chartres, also taught) from 1114, Bernard was elected chancellor of the school in 1119. He seems to have played some part in the movement that was to turn grammar into a field of philosophical speculation. For Bernard as grammarian, the relation of the primitive word to its derivatives was of the same sort as the relation of the Platonic Idea to its immersion in the material world. Thus, a white object, for example, immediately suggested to Bernard the source of its reality in the eternal Idea of whiteness. Apparently called to teach philosophy at Paris in 1124, he had as a student John of Salisbury, later secretary to Thomas Becket, archbishop of Canterbury, and bishop of Chartres. John's treatises are the chief sources for data on Bernard's life and thought.

According to the *Metalogicon* (1159) of John of Salisbury, Bernard wrote three works: a treatise, *De expositione Porphyrii* ("On the Interpretation of Porphyry," the 4th-century Neoplatonist logician); a verse form of the same tract; and a comparative study of Plato and Aristotle. Although only three fragments of Bernard's verse are extant, his philosophical doctrine can be determined from a résumé given in John's *Metalogicon*. Reflecting the early Platonism of the anonymous 5th-century philosopher known as Pseudo-Dionysius and his 9th-century interpreter John Scotus Erigena, Bernard proposed the basic Platonic dichotomy between the real world of eternal Ideas and the apparent world of material objects. According to Bernard, reality is composed of three invisible, immutable principles: God, Ideas, and matter. The Ideas are not coeternal with God but possess only a derived eternity. The manner of the Ideas' existence in the world of matter is that of a *forma nativa* ("begotten form"), or a projected copy of the eternal exemplar immanent in God. Immersed in matter, the "begotten form," Bernard held, constitutes sensible objects able to move. Matter of itself is immobile.

The texts of Bernard preserved in John of Salisbury's *Metalogicon* are contained in the series *Patrologia Latina*, edited by J.-P. Migne, vol. 199 (1890).

Bernard DE CLAIRVAUX, SAINT (b. 1090, probably Fontaine-les-Dijon, near Dijon, Burgundy—d. Aug. 20, 1153, Clairvaux, Champagne; canonized Jan. 18, 1174; feast day August 20), Cistercian monk and mystic, the founder and abbot of the abbey of Clairvaux and one of the most influential churchmen of his time.

Early life and career. Born of Burgundian landowning aristocracy, Bernard grew up in a family of five brothers and one sister. The familial atmosphere engendered in him a deep respect for mercy, justice, and loyal affection for others. Faith and morals were taken seri-

St. Bernard of Clairvaux, detail of an altarpiece by the Florentine School, early 15th century; in the Staatliche Museen zu Berlin

ously, but without priggishness. Both his parents were exceptional models of virtue. It is said that his mother, Aleth, exerted a virtuous influence upon Bernard only second to what Monica had done for Augustine of Hippo in the 5th century. Her death, in 1107, so affected Bernard that he claimed that this is when his "long path to complete conversion" began. He turned away from his literary education, begun at the school at Châtillon-sur-Seine, and from ecclesiastical advancement, toward a life of renunciation and solitude.

Bernard sought the counsel of the abbot of Cîteaux, Stephen Harding, and decided to enter this struggling, small, new community that had been established by Robert of Molesmes in 1098 as an effort to restore Benedictinism to a more primitive and austere pattern of life. Bernard took his time in terminating his domestic affairs and in persuading his brothers and some 25 companions to join him. He entered the Cîteaux community in 1112, and from then until 1115 he cultivated his spiritual and theological studies.

Bernard's struggles with the flesh during this period may account for his early and rather consistent penchant for physical austerities. He was plagued most of his life by impaired health, which took the form of anemia, migraine, gastritis, hypertension, and an atrophied sense of taste.

Founder and abbot of Clairvaux. In 1115 Stephen Harding appointed him to lead a small group of monks to establish a monastery at Clairvaux, on the borders of Burgundy and Champagne. Four brothers, an uncle, two cousins, an architect, and two seasoned monks under the leadership of Bernard endured extreme deprivations for well over a decade before Clairvaux was self-sufficient. Meanwhile, as Bernard's health worsened, his spirituality deepened. Under pressure from his ecclesiastical superiors and his friends, notably the bishop and scholar William of Champeaux, he retired to a hut near the monastery and to the discipline of a quack physician. It was

here that his first writings evolved. They are characterized by repetition of references to the Church Fathers and by the use of analogues, etymologies, alliterations, and biblical symbols, and they are imbued with resonance and poetic genius. It was here, also, that he produced a small but complete treatise on Mariology (study of doctrines and dogmas concerning the Virgin Mary), "Praises of the Virgin Mother." Bernard was to become a major champion of a moderate cult of the Virgin, though he did not support the notion of Mary's immaculate conception.

By 1119 the Cistercians had a charter approved by Pope Calixtus II for nine abbeys under the primacy of the abbot of Cîteaux. Bernard struggled and learned to live with the inevitable tension created by his desire to serve others in charity through obedience and his desire to cultivate his inner life by remaining in his monastic enclosure. His more than 300 letters and sermons manifest his quest to combine a mystical life of absorption in God with his friendship for those in misery and his concern for the faithful execution of responsibilities as a guardian of the life of the church.

It was a time when Bernard was experiencing what he apprehended as the divine in a mystical and intuitive manner. He could claim a form of higher knowledge that is the complement and fruition of faith and that reaches completion in prayer and contemplation. He could also commune with nature and say:

Believe me, for I know, you will find something far greater in the woods than in books. Stones and trees will teach you that which you cannot learn from the masters.

After writing a culyogy for the new military order of the Knights Templar he would write about the fundamentals of the Christian's spiritual life, namely, the contemplation and imitation of Christ, which he expressed in his sermons "The Steps of Humility" and "The Love of God."

Pillar of the church. The mature and most active phase of Bernard's career occurred between 1130 and 1145. In these years both Clairvaux and Rome, the centre of gravity of medieval Christendom, focussed upon Bernard. Mediator and counsellor for several civil and ecclesiastical councils and for theological debates during seven years of papal disunity, he nevertheless found time to produce an extensive number of sermons on the Song of Solomon. As the confidant of five popes, he considered it his role to assist in healing the church of wounds inflicted by the antipopes (those elected pope contrary to prevailing clerical procedures), to oppose the rationalistic influence of the greatest and most popular dialectician of the age, Peter Abelard, and to cultivate the friendship of the greatest churchmen of the time. He could also rebuke a pope, as he did in his letter to Innocent II:

There is but one opinion among all the faithful shepherds among us, namely, that justice is vanishing in the Church, that the power of the keys is gone, that episcopal authority is altogether turning rotten while not a bishop is able to avenge the wrongs done to God, nor is allowed to punish any misdeeds whatever, not even in his own diocese (parochia). And the cause of this they put down to you and the Roman Court.

Bernard's confrontations with Abelard ended in inevitable opposition because of their significant differences of temperament and attitudes. In contrast with the tradition of "silent opposition" by those of the school of monastic spirituality, Bernard vigorously denounced dialectical Scholasticism as degrading God's mysteries, as one technique among others, though tending to exalt itself above the alleged limits of faith. One seeks God by learning to live in a school of charity and not through "scandalous curiosity," he held. "We search in a worthier manner, we discover with greater facility through prayer than through disputa-

tion." Possession of love is the first condition of the knowledge of God. However, Bernard finally claimed a victory over Abelard, not because of skill or cogency in argument but because of his homiletic denunciation and his favoured position with the bishops and the papacy.

Pope Eugenius III and King Louis VII of France induced Bernard to promote the cause of a Second Crusade (1147-49) to quell the prospect of a great Muslim surge engulfing both Latin and Greek Orthodox Christians. The crusade ended in failure because of Bernard's inability to account for the quarrelsome nature of politics, peoples, dynasties, and adventurers. He was an idealist with the ascetic ideals of Cîteaux grafted upon those of his father's knightly tradition and his mother's piety, who read into the hearts of the crusaders—many of whom were bloodthirsty fanatics—his own integrity of motive.

In his remaining years he participated in the condemnation of Gilbert de La Porrée—a scholarly dialectician and bishop of Poitiers who held that Christ's divine nature was only a human concept. He exhorted Pope Eugenius to stress his role as spiritual leader of the church over his role as leader of a great temporal power, and he was a major figure in church councils. His greatest literary endeavour, "Sermons on the Canticle of Canticles," was written during this active time. It revealed his teaching, often described as "sweet as honey," as in his later title *doctor mellifluus*. It was a love song supreme: "The Father is never fully known if He is not loved perfectly." Add to this one of Bernard's favourite prayers, "Whence arises the love of God? From God. And what is the measure of this love? To love without measure," and one has a key to his doctrine.

St. Bernard was declared a doctor of the church in 1830 and was extolled in 1953 as *doctor mellifluus* in an encyclical of Pius XII.

(J.R.M.)

Butler, *Western Mysticism: The Teaching of Saints Augustine, Gregory and Bernard on Contemplation and the Contemplative Life* (1922), on the mystical doctrine of Bernard; Henri Daniel-Rops, *Saint Bernard et ses fils* (1962); *Bernard of Clairvaux*, 1964, a popular biography and description of the historical development of the Cistercian order; Étienne Gilson, *La Théologie mystique de Saint Bernard* (1934); *The Mystical Theology of Saint Bernard*, 1940, on the mystical doctrine of Bernard and his contemporaries; Bruno Scott James, *St. Bernard of Clairvaux* (1957), a personality study; Jean Leclercq, *L'Amour des lettres et le désir de Dieu* (1957); *The Love of Learning and the Desire for God: A Study of Monastic Culture*, 1961, indispensable for an adequate and appreciative understanding of the entire cultural context of Bernard; Denis Meadows, *A Saint and a Half: A New Interpretation of Abelard and St.*

Bernard of Clairvaux (1963), a quite thorough and readable treatment of the controversy and personalities involved; Thomas Merton, *The Last of the Fathers: Saint Bernard of Clairvaux and the Encyclical Letter, Doctor Mellifluus* (1954); and Albert Victor Murray, *Abelard and St. Bernard: A Study in Twelfth-Century Modernism* (1967), a technical and scholarly approach to the issue.

Bernard DE CLUNY, also called BERNARD DE MORLAIX (fl. mid-12th century), monk, poet, and Neoplatonic moralist whose writings condemned humanity's search for earthly happiness and criticized the immorality of the times. He is also noted for his valuable chronicle of monastic customs.

Among the scant references to Bernard's life is an unconfirmed tradition that described him as a native of England or Brittany who became a monk at the Abbey of Saint-Sauveur d'Aniane, in central France. He then transferred to the great Benedictine foundation of Cluny, near Lyon, where he studied literature and theology.

Bernard's major work, *De contemptu mundi* ("On Condemning the World"), was written about 1140 and was dedicated to Abbot Peter the Venerable. A poem of about 3,000 lines in dactylic hexameter, *De contemptu mundi* expresses the disdain for the material world characteristic of Neoplatonism, a philosophical school that ascribed reality only to the world of ideas. Decrying the transitory nature of earthly life, Bernard maintained that man's satisfaction could be found only in the spiritual existence of the next world, which could be reached most directly by a rigorous asceticism. With biting satire, he also censured the moral decay of the Western church. He concluded with a vividly apocalyptic description of heaven and hell that may have influenced Dante's *The Divine Comedy*. Notable also is Bernard's compilation of the *Consuetudines Cluniacenses* ("Customs of Cluny"), a systematic, annotated collection of the monastic principles and usages governing the Cluniac reform of the 6th-century Benedictine Rule.

Bernard's devotional verse dedicated to the Virgin Mary became widely popular in medieval piety. *De contemptu mundi* was edited by H.C. Hoskier in 1929. An edition of *Consuetudines Cluniacenses* by P.B. Albers appeared in 1905.

Bernard DE MENTHON, SAINT, also called BERNARD OF AOSTA, or BERNARD OF MONTJOUX, Italian SAN BERNARDINO DE MENTONE (d. 1081?; feast day May 28), vicar general of Aosta diocese (now in Italy) who reestablished and was patron of hospices at the summits of two Alpine passes, renamed after him the Great and Little St. Bernard passes. Also named for him in time were the hospices' St. Bernard dogs, famed for rescuing lost travelers.

Bernard became concerned for the safety of travelers, often pilgrims to Rome, who crossed the mountains by way of the two passes leading into Aosta. The rest houses that he established there were tended by clerics and laymen and welcomed all travelers. In 1923 Pope Pius XI named him patron saint of mountain climbers.

Bernard DE VENTADOUR, also called BERNARD DE VENTADORN (b. Limousin province, Aquitaine [now in France]—d. 1195?, Dalon), Provençal troubadour whose poetry is considered the finest in the Provençal language.

Bernard is known to have traveled in England in 1152–55. He lived at the court of Eleanor of Aquitaine and then at Toulouse, in later life retiring to the abbey of Dalon. His short love lyrics, 45 of which survive, express emotional power combined with lyric delicacy and simplicity. He also composed his own music; 19 of his tunes have survived.

Bernard OF PISA (pope): see Eugenius III.

Bernard, Claude (b. July 12, 1813, Saint-Julien, France—d. Feb. 10, 1878, Paris), French physiologist known chiefly for his discoveries concerning the role of the pancreas in digestion, the glycogenic function of the liver, and the regulation of the blood supply by the vasomotor nerves. On a broader stage, Bernard played a role in establishing the principles of experimentation in the life sciences, advancing beyond the vitalism and indeterminism of earlier physiologists to become one of the founders of experimental medicine. His most seminal contribution was his concept of the internal environment of the organism, which led to the present understanding of homeostasis—i.e., the self-regulation of vital processes.

Early training. Bernard's father, Pierre, was a winegrower; his mother, Jeanne Saulnier, was of peasant background. When Claude was very young, his father failed in a wine-marketing venture and tried to make ends meet by teaching school. Despite his efforts, the family never prospered, and when he died, the survivors were left in debt. Educational opportunities were scarce for a poor winegrower's son in the France of Louis XVIII. The boy studied Latin with the local priest and then was enrolled in a Jesuit-conducted school at Villefranche, where no natural science was taught. At 18 Bernard ended his secondary schooling at Thoissey without a diploma and was apprenticed to an apothecary in a Lyon suburb.

Bernard's days were spent in menial tasks relieved by errands to a veterinary school or, on his rare times off, by visits to a theatre. He wrote a playlet, *La Rose du Rhône*, now lost, and then began writing *Arthur de Bretagne*, a historical drama in five acts. His employer was

Claude Bernard, detail of a lithograph by A. Laemlein, 1858

By courtesy of the National Library of Medicine, Bethesda, Maryland

not pleased, however, and the apprenticeship came to a halt, the youth returning home in July 1833. By November 1834 he was in Paris with the completed manuscript of *Arthur de Bretagne* and a letter of introduction. The literary critic Saint-Marc Girardin read his play and advised him to try medicine instead of playwrighting.

Bernard enrolled that same winter in the Faculty of Medicine in Paris and, in due course, was admitted as an extern in the hospitals. Outwardly reserved and even shy at that time, he had an inner strength that was to overcome poverty and discouragements. Of 29 students passing the examination for the internship, Bernard ranked 26th. Serving in Paris hospitals were the celebrated doctors Pierre Rayer and François Magendie, and Bernard studied under the latter at both the Hôtel-Dieu and the Collège de France. Magendie noticed

Bernard's skillful dissections and took him on as a research assistant.

Bernard became involved in Magendie's research on spinal nerves. His first publication dealt with the chorda tympani (a branch of the facial nerve), while his medical dissertation was devoted to the function of the gastric juice in nutrition (1843). These maiden publications were prophetic, for much of his later research concerned neurology and metabolism. Failing in the examination that would have qualified him to teach in the medical school, he collaborated with others in research on digestion and on the exotic poison curare, thus treading two paths that would lead him to fame. He was rather old at the age of 31 to be content with a research assistantship, however, and resigned the position late in 1844. Left in financial straits, he turned his thoughts again toward medical practice.

To save his research career, a friend arranged a marriage of convenience for him with Marie-Françoise Martin, daughter of a Paris doctor. The marriage brought him a dowry of 60,000 francs but was destined to be painfully unhappy. Their separation was to follow his election to the French Academy late in life.

Research on the pancreas and the liver. In 1847 Bernard became Magendie's deputy at the Collège de France. This period was marked by a veritable explosion of discoveries, beginning in 1846, when Bernard solved the mystery of the carnivorous rabbits. Puzzled one day by the chance observation that some rabbits were passing clear—not cloudy—urine, just like meat-eating animals, he inferred that they had not been fed and were subsisting on their own tissues. He confirmed his hypothesis by feeding meat to the famished animals. An autopsy of the rabbits yielded an important discovery concerning the role of the pancreas in digestion: the secretions of the pancreas broke down fat molecules into fatty acids and glycerin. Bernard then showed that the principal processes of digestion take place in the small intestine, not in the stomach as was previously believed.

His work on the pancreas led to research on the liver, culminating in his second great discovery, the glycogenic function of the liver. In 1856 Bernard discovered glycogen, a white starchy substance found in the liver. He found that this complex substance was built up by the body from sugar and served as a storage reserve of carbohydrates that could be broken down to sugars as needed, thereby keeping the sugar content of the blood at a constant level. Bernard's discovery showed that the digestive system not only breaks down complex molecules into simple ones but also does the opposite, building up complex molecules from simpler ones. Simultaneously, he was nearing his third great achievement—explanation of the regulation of the blood supply by the vasomotor nerves. He discovered in this regard that the vasomotor nerves control the dilation and constriction of blood vessels in response to temperature changes in the environment. For example, in cold weather the blood vessels of the skin constrict in order to conserve heat, while in hot weather they expand to dissipate excess heat. This control mechanism, like the glycogenic functions of the liver, illustrates how the body maintains a stable internal environment in the midst of changing external conditions—a fundamental phenomenon known as homeostasis.

Bernard also conducted important studies on the effects of such poisons as carbon monoxide and curare on the body. He showed that carbon monoxide could substitute for oxygen and combine with hemoglobin, thereby causing oxygen starvation. His experiments with curare showed how this dread poison causes paralysis and death by attacking the motor nerves, while having no effect on the sensory nerves. He demonstrated that, because of this selectivity, curare could be used as an exper-

imental tool in differentiating neuromuscular from primary muscular mechanisms.

Recognition and later work. Within less than a decade, from obscurity in the shadow of Magendie, he had risen to a commanding position in science. In 1854 a chair of general physiology was created for him in the Sorbonne, and he was elected to the Academy of Sciences. When Magendie died in 1855, Bernard succeeded him as full professor at the Collège de France. No laboratory had been provided for Bernard at the Sorbonne, but the French emperor Napoleon III, after an interview with him in 1864, remedied the deficiency, at the same time building a laboratory at the Museum of Natural History of the Jardin des Plantes. In 1868 Bernard left the Sorbonne to accept a newly established professorship in general physiology at this museum.

Magendie's empirical method of conducting experiments without a guiding hypothesis was by then out of date, partly as a result of his own discoveries. Bernard's historic role was to demonstrate the experimenter's need for a guiding hypothesis to be either confirmed or refuted by the results.

For various reasons, a shift was occurring in Bernard's scientific interests. The productive researcher was turning into a philosopher of science. Failing health after 1860 led him to spend more time at Saint-Julien, less time in the laboratory. Bernard suffered apparently from chronic enteritis, with symptoms affecting the pancreas and the liver. By way of compensation, the enforced leisure left him time for reflection, out of which would come his masterpiece, *Introduction à la médecine expérimentale* (1865; *An Introduction to the Study of Experimental Medicine*).

This work was planned as a preface, if a very long one, to a work of greater magnitude, never completed. Bernard's aim in the *Introduction* was to demonstrate that medicine, in order to progress, must be founded on experimental physiology. The other points in his argument are that (1) the physical and chemical sciences provide the foundation for physiology, although it is not reducible to them; (2) the notion of "vital force" does not explain life; (3) vivisection is indispensable for physiological research; and (4) biology depends on recognizing that the processes of life are mechanistically determined by physico-chemical forces. Still germane for modern science is his presentation of the concept of the *milieu intérieur*, or "internal environment," of the body.

The book brought new honours to Bernard, notably election to the French Academy in 1868. His friends included such literary figures as Ernest Renan, Hippolyte Taine, and the Goncourts, besides such scientists as Louis Pasteur and Marellin Berthelot.

The most renowned of the students trained by Bernard were Albert Dastre, Paul Bert, and Arsène d'Arsonval. Bert succeeded Bernard in the Sorbonne when the latter transferred to the Museum of Natural History in 1868. Bernard's own experiments were taking new directions. The phenomena common to animals and plants formed the subject of lectures published posthumously. He also began research on fermentation. His findings were published after his death by Berthelot and, because they conflicted with Pasteur's views, east a cloud over the microbe hunter's memory of his late colleague.

Bernard's health had declined precipitously in the autumn of 1877. On New Year's Day he caught cold, and shortly afterward inflammation of the kidneys set in. Soon he was confined to his bed. At his death Bernard was accorded a funeral arranged and financed by the government, the first ever granted to a scientist in France.

(R.Vi./Ed.)

BIBLIOGRAPHY. J.M.D. Olmsted, *Claude Bernard, Physiologist* (1938), is the fullest biography; it may be supplemented by J.M.D. Olmsted and

E. Harris Olmsted, *Claude Bernard & the Experimental Method in Medicine* (1952, reissued 1961); Reino Virtanen, *Claude Bernard and His Place in the History of Ideas* (1960); and Frederic Lawrence Holmes, *Claude Bernard and Animal Chemistry: The Emergence of a Scientist* (1974), treating his work during the period 1842-48.

Bernard, Émile (b. 1868—d. April 16, 1941, Paris, France), French painter who is sometimes credited with founding Cloisonnism (see Pont-Aven school; Synthetism). He was noted for his friendships with such artists as Vincent van Gogh, Paul Gauguin, Odilon Redon, and Paul Cézanne.

In 1886 Bernard went to Pont-Aven, where he theorized a Cloisonnist style of painting bold forms separated by dark contours that somewhat influenced Gauguin. He also did sculpture and woodcuts and designed furniture and tapestries. As a poet and writer, he studied religious mysticism and philosophy. Part of the fame of Cézanne and Redon rests on Bernard's prophetic admiration of their early work. He toured Italy in 1894 and settled in Egypt for 10 years. Returning to France in 1904, he founded and edited the review *La Rénovation Esthétique* and published his correspondence with van Gogh, Gauguin, Redon, and Cézanne—a major contribution to the understanding of modern art.

Bernard, Henriette Rosine (actress; see Bernhardt, Sarah).

Bernard, Jean-Jacques (b. July 30, 1888, Enghien-les-Bains, France—d. Sept. 12, 1972, Paris), French playwright and chief representative of the "school of silence" (more exactly, the "art of the unexpressed"), in which the dialogue does not express the characters' real attitudes. As in *Martine* (1922), perhaps the best example of his work, emotions are implied in gestures, facial expressions, fragments of speech, and silence.

Jean-Jacques Bernard, 1963
H. Roger-Viollet

The son of the dramatist Tristan Bernard, he began writing plays before World War I. Unconscious jealousy is the theme of *Le Feu qui reprend mal* (1921; *The Sulky Fire*) and *Le Printemps des autres* (1924; *The Springtime of Others*). In *L'Âme en peine* (1926; *The Unquiet Spirit*), two characters who never meet feel an inexplicable disquiet whenever they are near one another. Included among Bernard's later plays are the more conventional *A la recherche des cœurs* (1931; "In Search of Hearts") and *Jeanne de Pantin* (1933).

Bernard's nondramatic writings include *Le Camp de la mort lente* (1944; *The Camp of Slow Death*), a description of the German concentration camp at Compiègne, in which he, as a Jew, was interned, and *Mon ami le théâtre* (1958; "My Friend the Theatre").

Bernard, Jessie, née JESSIE SHIRLEY RAVITCH (b. June 8, 1903, Minneapolis, Minn., U.S.—d. Oct. 6, 1996, Washington, D.C.), American sociologist who provided insights into women, sex, marriage, and the interaction of the family and community.

Bernard attended the University of Minnesota (B.A., 1923; M.A., 1924) and married

the sociologist Luther Lee Bernard in 1925. After obtaining her Ph.D. at Washington University, St. Louis, Mo., in 1935, she worked as a social science analyst for the U.S. Bureau of Labor Statistics in the late 1930s. She began her teaching career at Lindenwood College for Women, St. Charles, Mo. (1940-47), and was professor of sociology at Pennsylvania State University (1947-64).

Bernard's writings include *American Family Behavior* (1942; reprinted 1973), a seminal work that laid the groundwork for her later studies; *American Community Behavior* (1949; reprinted 1962); and *Academic Women* (1964; reprinted 1974). *Marriage and Family Among Negroes* (1966) is a work that examines the effects of racism on black culture. Her later works, which reflect her more pronounced feminism, include *The Sex Game* (1968; reprinted 1972), *Women and the Public Interest* (1971), *The Future of Marriage* (1972; reprinted 1973), *The Future of Motherhood* (1974), and *The Female World* (1981).

Bernard, Samuel, COMTE (count) DE COUBERT (b. Oct. 29, 1851, Sancerre, France—d. Jan. 18, 1939, Paris), French financier who became a symbol of Protestant banking. He had the same name as his father, a well-known painter.

Bernard started off in business selling gold brocade and jewelry, but he soon went into banking, assisted by refugee Protestants in other countries. He had renounced Protestantism in 1876, but it was a device that fooled no one.

By 1895 Bernard was considered the greatest banker in Europe. Louis XIV, although never comfortable with Bernard's religious affiliations, overlooked them in order to have Bernard mobilize the capital of Europe to finance the French military campaigns. Bernard, at Louis XIV's request, lent France 11,000,000 francs in 1697 and another 19,000,000 in 1708. For these services, Louis gave him a title of nobility with the unusual stipulation that Bernard remain in commerce so the state could always depend on him. Notorious for his flattery to the king, Bernard was made count de Coubert (1725) and counselor of state (1730). Bernard's wealth was made through war profiteering and speculation, and many felt that he aggrandized his own fortune at the expense of the country. He died leaving an estate of 33,000,000 francs.

Bernard, Tristan, pseudonym of PAUL BERNARD (b. Sept. 7, 1866, Besançon, France—d. Dec. 7, 1947, Paris), French playwright, novelist, journalist, and lawyer who wrote for the *théâtre de boulevard*, a genre meant to entertain middle-class Parisian audiences on Sunday afternoons.

Bernard's merit consisted in limiting his literary ambitions to his capabilities. His works were characterized by a tone of light cynicism and a cross fire of lively dialogue, together with a keen insight into the foibles of his bourgeois audiences. Among Bernard's most successful plays were *L'Anglais tel qu'on le parle* (1899; "English As It Is Spoken"), *Triplepatte* (1905, written in collaboration with André Godfernaux and adapted by Clyde Fitch as *Toddles*), and *Monsieur Codomat* (1907). He also wrote several humorous novels, including *Les Mémoires d'un jeune homme rangé* (1899; "Memoirs of a Proper Young Man") and *La Féeerie bourgeoise* (1924; "The Bourgeois Fairyland").

Bernard's son Jean-Jacques Bernard, also a playwright, wrote a memoir, *Mon père Tristan Bernard* (1955).

Bernardin de Saint-Pierre, Jacques-Henri (b. Jan. 19, 1737, Le Havre, France—d. Jan. 21, 1814, Éragny), French writer who is best

remembered for *Paul et Virginie*, a short novel about innocent love.

Bernardin's army service as an engineer on the island of Mauritius in the Indian Ocean provided him with material for *Voyage à l'Île de France* (1773), with which he opened his literary career. The work brought him to the attention of Jean-Jacques Rousseau, whose friendship did much to mold the views expressed in Bernardin's *Études de la nature*

Bernardin de Saint-Pierre, detail of an engraving by J.-F. Ribault, 1805, after a drawing by L. Lafitte

J.E. Bulloz

(1784; "Studies of Nature"). To the third edition of *Études* (1788) he appended *Paul et Virginie*, the story of two island children whose love for each other, begun in their infancy, thrives in an unspoiled natural setting but ends tragically when civilization interferes. In a later work, *La Chaumière indienne* (1790; "The Indian Cottage"), a traveler finds wisdom in the cottage of an Indian outcast. Cultural primitivism, which Bernardin was one of the first to celebrate, became one of the central ideas of the Romantic movement.

Bernardine: see Cistercian.

Bernardine OF SIENA, SAINT, Italian SAN BERNARDINO DA SIENA (b. Sept. 8, 1380, Massa Marittima, Siena [Italy]—d. May 20, 1444, L'Aquila, Kingdom of the Two Sicilies; canonized 1450; feast day May 20), Franciscan theologian and preacher of great eloquence who, with Saints John of Capistrano and James of the March, led the growth of the Observants, a strict branch of the Franciscan order that subsequently spread throughout Europe.

Of noble birth, Bernardine was orphaned early. He completed his education in Siena, where he then served the sick in hospitals (1400), contracting and nearly dying of plague. In 1402 he entered the Observants.

Bernardine became a priest in 1404 but did not begin his renowned preaching tours through Italy until 1417. Appalled by the breakdown in morals, the lawlessness, and the civil strife that resulted from the Great Western Schism, he strove to restore morals by inculcating a deep personal love of Jesus Christ.

He took part in the Council of Florence in 1439, furthering the short-lived union of the Greek church with Rome. The centre of his movement was Il Gesù, a small chapel in Rome, which was later given to St. Ignatius of Loyola. Numerous miracles are said to have occurred at his tomb.

Bernart DE VENTADORN (troubadour): see Bernard de Ventadour.

Bernays, Edward L. (b. Nov. 22, 1891, Vienna, Austria—d. March 9, 1995, Cambridge, Mass., U.S.), pioneer American publicist who is generally considered to have been the first to develop the idea of the professional public relations counselor—i.e., one who draws on

the social sciences in order to motivate and shape the response of a general or particular audience.

Bernays was a year old when his parents moved to New York City from Austria, where his uncle, the psychoanalyst Sigmund Freud, was beginning his work. His mother was Freud's sister, Anna, and his father was a successful grain merchant. After graduating from high school at age 16, Bernays attended Cornell University, where, to placate his father, he earned a degree in agriculture in 1912. He abandoned farm products after a brief obligatory sally into the grain market and found work editing a medical review. This brought to his attention a play, *Damaged Goods*, whose would-be producer found popular taboos against the subject—venereal disease—insuperable. Bernays organized a scheme to muster endorsements of the play by civic leaders, and as a result the play was produced successfully and Bernays had found his true calling.

After World War I, Bernays and Doris Fleischman (d. 1980), whom he later married, opened their own public relations office. Their first clients included the U.S. War Department, which wanted to persuade businesses to hire returning war veterans, and the Lithuanian government, which was lobbying for recognition by the United States. For one client, Venida hair nets, Bernays publicized the danger of women workers wearing long, loose hair in factories and restaurants. As a result, several U.S. states passed laws requiring factory workers and female food-service employees to wear hair nets. He organized soap-carving competitions for the Ivory soap of his client Procter and Gamble.

A vigorous spokesman and advocate for public relations into his 90s, Bernays was the author of many books, among the most influential of which were *Crystallizing Public Opinion* (1923), *Public Relations* (1952), and the work in which his oft-quoted definition of public relations appears in the title, *The Engineering of Consent* (1955).

Bernays, Paul, in full PAUL ISAAK BERNAYS (b. Oct. 17, 1888, London, Eng.—d. 1977, Zürich, Switz.), Swiss mathematician and logician who is known for his attempts to develop a unified theory of mathematics.

After obtaining his doctorate from the University of Göttingen (1912), Bernays taught at the University of Zürich (1912–17), the University of Göttingen (1917–33), and the Swiss Federal Institute of Technology in Zürich (1934–59). It was at Göttingen that he formed his association with the prominent mathematician David Hilbert, who was his teacher, mentor, and collaborator. They wrote what is regarded as a classic work on mathematics, *Grundlagen der Mathematik*, 2 vol. (1934–39; reissued 1968–70; "Foundations of Mathematics"), based on Hilbert's earlier version. In 1956 Bernays revised a work of Hilbert's, *Grundlagen der Geometrie* (1899; *The Foundations of Geometry*), which went through several editions. Influenced by Hilbert's belief that the entire underlying structure of mathematics could be brought together into a single coherent entity, Bernays delved into the realm of set theory, trying to develop a set of axioms on which such a unifying system could be based. He wrote a series of articles under the title "A System of Axiomatic Set Theory" (published in the *Journal of Symbolic Logic*, 1937–54), from which the principal theses were published as *Axiomatic Set Theory* (1958). Here he simplified and organized the work of the logician John von Neumann on logic and set theory; these modifications would be further developed by the mathematician Kurt Gödel.

Bernbach, William (b. Aug. 13, 1911, New York, N.Y., U.S.—d. Oct. 2, 1982, New York City), American advertising executive

and copywriter, a pioneer of the subtle, low-pressure advertising that became a hallmark of the agency he helped found, Doyle Dane Bernbach, Inc. The firm quickly became one of the most influential in the business, and Bernbach's approach to advertising copy was widely adopted.

Bernbach was the son of a clothing designer, and as a boy he was interested in art and wrote verse. He was educated in New York public schools and earned a B.A. degree from New York University. His first job was in the mail room of Schenley Distillers. While there, he wrote an advertisement for Schenley and sent it unsolicited to the advertising department. In due course the ad was recognized as having merit, but its origin had been lost. It was inserted—verbatim—in *The New York Times*. Bernbach saw the ad and quickly claimed authorship to Schenley's chairman, Lewis Rosenstiel, who gave him an immediate salary increase and transferred him to the advertising department. He worked for other agencies and began to develop an interest in advertising graphics.

After U.S. Army service in World War II, Bernbach joined Grey Advertising as a copywriter, and it was there that he met Ned Doyle. The two joined forces with Maxwell Dane in 1949 to form Doyle Dane Bernbach. Their first account was a bargain department store in need of a new image. Bernbach's campaign created a fashionable, sophisticated image and made the store's name, Ohrbach's, a watchword. One of his most successful campaigns was for Volkswagen automobiles: "Think small." He turned the Avis car rental company's second rank in its industry into an asset by claiming that Avis "tries harder." A writer from the start, Bernbach was in charge of the agency's creative activities, aiming always to create advertising that was fresh and original. For years he alone approved each campaign before it was presented to a client.

After stepping down as president of Doyle Dane Bernbach in 1967, Bernbach assumed the position of chairman of the board, and later chairman of the executive committee, a position he held at his death in 1982. When he started the firm, its billings were \$1,000,000; when he died it approximated \$1,000,000,000. He was a leader in the affairs of the American Association of Advertising Agencies.

Bernburg, city, Saxony-Anhalt *Land* (state), central Germany, on the Saale River at the mouth of the Wipper River, south of Magdeburg. First mentioned in 961, it was important in the Middle Ages for its position on an old trade route. Its castle, probably dating from the 10th century and later converted into a Renaissance-style chateau, was the residence of the dukes when the town was the capital of the duchy of Anhalt-Bernburg (1251–1468, 1603–1863). Bernburg consisted of two almost completely separate and independent communities; both were chartered in 1311 and

The castle at Bernburg, Ger., overlooking the Saale River

Wolfgang Krammisch—Bruce Coleman Inc.

were united in 1561. The hill settlement (now called Bergstadt) became a town in 1457 and was incorporated with Bernburg in 1825.

There are important potash and rock-salt mines, a large soda plant, sugar refineries, and machinery plants. A school of agriculture was established in 1961. Pop. (2002) 34,400.

Berne (canton and city, Switz.): see Bern.

Berne Convention, Berne also spelled BERN, formally INTERNATIONAL CONVENTION FOR THE PROTECTION OF LITERARY AND ARTISTIC WORKS, international copyright agreement adopted by an international conference in Bern (Berne) in 1886 and subsequently modified several times (Berlin, 1908; Rome, 1928; Brussels, 1948; Stockholm, 1967; and Paris, 1971). Signatories of the Convention constitute the Berne Copyright Union.

The core of the Berne Convention is its provision that each of the contracting countries shall provide automatic protection for works first published in other countries of the Berne union and for unpublished works whose authors are citizens of or resident in such other countries.

Each country of the union must guarantee to authors who are nationals of other member countries the rights that its own laws grant to its nationals. If the work has been first published in a Berne country but the author is a national of a nonunion country, the union country may restrict the protection to the extent that such protection is limited in the country of which the author is a national. The works protected by the Rome revision of 1928 include every production in the literary, scientific, and artistic domain, regardless of the mode of expression, such as books, pamphlets, and other writings; lectures, addresses, sermons, and other works of the same nature; dramatic or dramatico-musical works, choreographic works and entertainments in dumb show, the acting form of which is fixed in writing or otherwise; musical compositions; drawings, paintings, works of architecture, sculpture, engraving, and lithography; illustrations, geographical charts, plans, sketches, and plastic works relative to geography, topography, architecture, or science. It also includes translations, adaptations, arrangements of music, and other reproductions in an altered form of a literary or artistic work, as well as collections of different works. The Brussels revision of 1948 added cinematographic works and photographic works. In addition, both the Rome and Brussels revisions protect works of art applied to industrial purposes so far as the domestic legislation of each country allows such protection.

In the Rome revision the term of copyright for most types of works became the life of the author plus 50 years, but it was recognized that some countries might have a shorter term. Both the Rome and the Brussels revisions protected the right of making translations; but the Stockholm Protocol and the Paris revision somewhat liberalized the rights of translation, in a compromise between developing and developed countries.

Berners-Lee, Sir Tim (b. June 8, 1955, London, Eng.), British computer scientist, generally credited as the inventor of the World Wide Web. He was the winner of the inaugural Millennium Technology Prize (€1 million), given by the Finnish Technology Award Foundation, in 2004, the same year he was knighted.

After graduating in 1976 from the University of Oxford, Berners-Lee held several positions in the computer industry. In 1980 he was a software engineering consultant at CERN, the European particle physics laboratory in Geneva, where he developed a program for himself that could store information in files that contained "links" both within and among separate files—a technique that became known as hypertext. In 1989 he drew up a proposal for cre-

ating a global hypertext document system that would use the Internet (*q.v.*) to provide researchers with the ability to share their results, techniques, and practices without having to exchange e-mail constantly. Instead, researchers would place such information "online," where their peers could retrieve it anytime. Berners-Lee wrote the software for the first Web server (the central repository for the files to be shared) and the first Web client, or "browser" (the program to access and display files from the server), between 1990 and 1991. The first "killer application" of the Web at CERN was the laboratory's telephone directory.

From 1991 to 1993 Berners-Lee evangelized the Web. In 1994 he established the World Wide Web Consortium (W3C) at the Massachusetts Institute of Technology's Laboratory for Computer Science. The W3C lends oversight to the Web and the development of standards. In 1999 Berners-Lee became the first holder of the 3Com Founders chair at the Laboratory for Computer Science. Berners-Lee is the author, along with Mark Fischetti, of *Weaving the Web: The Original Design and Ultimate Destiny of the World Wide Web* (2000).

Bernese Alps, also called BERNESE OBERLAND, German BERNER ALPEN, or BERNER OBERLAND, French ALPES BERNOISES, segment of the Central Alps lying north of the Upper Rhône River and south of the Brienzer and Thunersee (lakes) in Bern and Valais cantons of southwestern Switzerland. The moun-

Mürren, in the Bernese Alps, Switzerland, with (left to right) the Eiger, Mönch, and Jungfrau peaks

Willi Burkhardt—De Wys Inc.

tains extend east-northeastward from the bend of the Rhône near Martigny-Ville to Grimsel Pass and Haslital (valley of the upper Aare River). Many peaks rise to more than 12,000 feet (3,660 m); Finsteraarhorn (14,022 feet), Jungfrau, and Aletschhorn are among the highest. Of the numerous glaciers in the range, the Aletsch is one of the longest in the Alps. The Bernese Alps are crossed by the Lötschen, Gemmi, and Pillon passes and the Lötschberg (railway) Tunnel. The magnificent Alpine scenery has helped establish the nearby resorts of Interlaken, Grindelwald, Mürren, Wenger, Kandersteg, Leukerbad, and Gstaad. Mountain climbing has long been a popular activity in the region.

Bernese mountain dog, breed of Swiss working dog brought to Switzerland over 2,000 years ago by invading Romans. The breed was widely used in Switzerland to pull carts and to drive cattle to and from their pastures. The Bernese mountain dog is noted for its hardiness. It has a broad chest, hanging, V-shaped ears, and a long, silky, black coat with brown

spots on the chest and forelegs and over the eyes and, sometimes, white on the chest, nose, feet, and tail tip. The Bernese mountain dog

stands 21 to 28 inches (53 to 70 cm) and weighs 50 to 70 pounds (23 to 32 kg).

Bernhard (Danish, Dutch, German, etc., personal name): see under Bernard, except as below.

Bernhard (b. Aug. 16, 1604, Weimar, Saxe-Weimar—d. July 18, 1639, Neuenburg, Breis-

gau), duke of Saxe-Weimar (Sachsen-Weimar), a politically ambitious Protestant general during the Thirty Years' War (1618–48). One of the most successful field commanders of his age, he won a number of important victories over the forces of the Austrian Habsburgs.

Having served in the armies of the Rhenish Palatinate, Baden, and Denmark (1622–31), Bernhard joined Gustavus II Adolphus, the Swedish king, in 1631. An able officer, he had progressed from colonel of the King's guards to general by 1632, and, on Gustavus' death at the Battle of Lützen (now in Germany; Nov. 16, 1632), he took command and decided the battle against the forces of the Habsburg emperor Ferdinand II. He and the Swedish general Gustav Horn then invaded southern Germany. He was awarded the duchy of Franconia for victories that helped bring about the downfall of the Emperor's general Albrecht Wenzel von Wallenstein.

Quarrelling with Horn and Swedish chancellor Count Axel Oxenstierna, both of whom advocated a defensive strategy, Bernhard lost

his newly acquired territories after his and Horn's defeat at the decisive Battle of Nördlingen (Sept. 5–6, 1634). In 1635 he pledged himself to the French crown in return for the landgraviate of Alsace and the bailiwick of Hagenau. Operating in southwestern Germany, he captured Rheinfelden, Freiburg, and the key fortress of Breisach (Dec. 17, 1638), effectively breaking the Austrian and Spanish stranglehold around France. When he died suddenly of smallpox or typhoid, Cardinal de Richelieu took over his army and territories for France.

Bernhard, Prince of the Netherlands, Prince of Lippe-Biesterfeld, Dutch in full BERNHARD LEOPOLD FREDERIK EVERHARD JULIUS COERT KAREL GODFRIED PIETER, PRINS DER NEDERLANDEN, PRINS VAN LIPPE-BIESTERFELD (b. June 29, 1911, Jena, Ger.—d. Dec. 1, 2004, Utrecht, Neth.), prince of The Netherlands, who, during World War II, served as liaison between the Dutch government-in-exile and the British armed forces and commanded The Netherlands Forces of the Interior (1944–45).

Bernhard was the son of Prince Bernhard Casimir and nephew of Leopold IV, the last reigning prince of Lippe-Biesterfeld. He was educated at the universities of Lausanne, Munich, and Berlin, where he studied political science. Following the majority of German princelings after 1933, he joined the Reiter SS Corps. In 1936 he met Crown Princess (later Queen) Juliana, and on Jan. 7, 1937, they were married. Bernhard, who took Dutch citizenship and received the title of Prince of The Netherlands, opposed Germany's invasion of The Netherlands. After taking his family to safety in England (May 12, 1940), he immediately returned to lead Dutch troops in battle against the Germans; after the Dutch surrender (May 14, 1940), he fled to England with the remnants of his troops.

After being appointed, in August 1940, a captain in the Dutch navy and a colonel in the army, Prince Bernhard assumed increased responsibilities and, by 1944, as commander of The Netherlands Forces of the Interior, he directed all Dutch armed forces. Also serving as Dutch liaison officer with the British armed forces, Bernhard became a pilot and flew with the Royal Air Force (1942–44). He led the Dutch troops during the Allied offensive in The Netherlands and was present during the armistice negotiations and German surrender at Wageningen (in The Netherlands) on May 5, 1945. After World War II and Juliana's accession in 1948, he served as The Netherlands' goodwill ambassador, encouraging international trade and cultural activities, and in 1954 initiated the annual Bilderberg Conference, a meeting of influential bankers, economists, and politicians. In 1961 he helped found the World Wildlife Fund and served as its first president.

In 1976 he was implicated in a bribery scandal involving the Lockheed Aircraft Corporation. After initial revelations in the U.S. Congress, a special Dutch commission found that Prince Bernhard had accepted large sums of money from Lockheed for promoting Dutch purchases of aircraft manufactured by the company. The scandal precipitated a constitutional crisis that temporarily tarnished the monarchy.

Bernhard, Thomas (b. Sept. 11 or Feb. 9/10, 1931, Cloister Heerland, Neth.—d. Feb. 12, 1989, Gmunden, Austria), Austrian writer, who explored death, social injustice, and human misery in controversial literature that was deeply pessimistic about modern civilization in general and Austrian culture in particular.

Bernhard was born in a Holland convent, where his Austrian unwed mother had retreat-

ed to give birth. After a year, she returned to her parents in Vienna, where her writer-father, Johannes Freumbichler (1881–1949), became the major influence on Bernhard. After surviving a life-threatening coma and repeated hospitalizations (1948–51) in tuberculosis sanatoriums, Bernhard studied music and drama in Salzburg and Vienna.

He achieved little success with several collections of poetry in the late 1950s, but in 1963 he gained notoriety with his first novel, *Frost*. In such novels as *Verstörung* (1967; "Derangement," Eng. trans. *Gargoyles*), *Das Kalkwerk* (1970; *The Lime Works*), and *Korrektur* (1975; *Corrections*), he combined complex narrative structure with an increasingly misanthropic philosophy. In 1973 Bernhard withdrew his drama *Die Berühmten* ("The Famous") from the prestigious Salzburg Festival because of a controversy over staging. In 1984 his novel *Holzfällen* (*Woodcutters*) was seized by police for allegedly criticizing a public figure. Even before its premier in November 1988, Bernhard's last play, *Heldenplatz* ("Heroes' Square"), a bleak indictment of anti-Semitism in contemporary Austria, provoked violent protests. Bernhard's memoirs were translated in *Gathering Evidence* (1985), a compilation of five German works published between 1975 and 1982.

Bernhardt, Sarah, original name HENRIETTE-ROSINE BERNARD, byname THE DIVINE SARAH, French LA DIVINE SARAH (b. Oct. 22/23, 1844, Paris, France—d. March 26, 1923, Paris), celebrated French actress, who performed throughout Europe and in America and became one of the best-known figures in the history of the stage. She was made a member of the Legion of Honour in 1914.

Sarah Bernhardt, photograph by Napoleon Sarony, 1880

Early life and training. Bernhardt was the illegitimate daughter of Julie Bernard, a notorious Dutch courtesan who had established herself in Paris (the identity of the father is uncertain). As the presence of a baby interfered with her mother's life, Sarah was brought up at first in a *pension* and, later, in a convent. A difficult, willful child of delicate health, she wanted to become a nun, but one of her mother's lovers, the duke de Morny, Napoleon III's half brother, decided that she should be an actress and, when she was 16, arranged for her to enter the Conservatoire, the government-sponsored school of acting. She was not considered a particularly promising student, and, although she revered some of her teachers, she regarded the Conservatoire's methods as antiquated.

Sarah Bernhardt left the Conservatoire in 1862 and, thanks to the duke de Morny's in-

fluence, was accepted by the national theatre company, the Comédie-Française, as a beginner on probation. Her contract with the Comédie-Française was canceled in 1863 after she had slapped the face of a senior actress, who had been rude to her younger sister. For a time she found employment at the Théâtre du Gymnase-Dramatique. After playing the role of a foolish Russian princess, she entered a period of soul-searching, questioning her talent for acting. During these critical months she became the mistress of Henri, prince de Ligne, and gave birth to her only child, Maurice. (Later, Bernhardt was married to a Greek military officer turned actor, Jacques Damala, but the marriage was short-lived, he dying of drug abuse. Throughout her life she had a series of affairs or liaisons with famous men, allegedly including the writer Victor Hugo, the actor Lou Tellegen, and the Prince of Wales, the future Edward VII.)

In 1866 Bernhardt signed a contract with the Odéon theatre and, during six years of intensive work with a congenial company there, gradually established her reputation. Her first resounding success was as Anna Damby in the 1868 revival of *Kean*, by the novelist and playwright Alexandre Dumas père. Bernhardt's greatest triumph at the Odéon, however, came in 1869, when she played the minstrel Zanetto in the young dramatist François Coppée's one-act verse play *Le Passant* ("The Passerby")—a part that she played again in a command performance before Napoleon III.

During the Franco-German War in 1870, she organized a military hospital in the Odéon theatre. After the war, the reopened Odéon paid tribute to France's great 19th-century writer Victor Hugo with a production of his verse-play *Ruy Blas*. As Queen Maria, Bernhardt charmed her audiences with the lyrical quality of her voice. It was then that Hugo coined the phrase "golden voice," though her critics usually called her voice "silvery," as resembling the tones of a flute.

In 1872 she left the Odéon and returned to the Comédie-Française. One of her remarkable successes there was in the title role of Voltaire's *Zaïre* (1874); generally, however, she received only minor parts. Eventually, she was given the chance to play the title role in Jean Racine's *Phèdre*, a part for which the critics supposed she lacked the resources needed to portray violent passion. Her performance, however, made them revise their estimate and write enthusiastic reviews. In Hugo's *Hernani*, her portrayal of Doña Sol was said to have brought tears to the author's eyes.

In 1879, when the Comédie-Française appeared in London, Bernhardt played in the second act of *Phèdre* and triumphed in spite of a violent attack of stage fright. Critics, however, still refused to succumb to her spell; the novelist Henry James commented on the "admirable delicacy and grace" with which she had handled the plaintive passages but added that "in the violent scenes she forces her note beyond all reason, and becomes painfully shrill and modern." Her success with London audiences made Bernhardt overbearing and led to fits of bad temper in the sedate halls of the Comédie-Française.

International success. In 1880 Bernhardt formed her own traveling company and soon became an international idol. She appeared fairly regularly in England but extended her itinerary to the European continent, the United States, and Canada. New York City saw her for the first time on Nov. 8, 1880. Eight visits to the United States followed. In 1891–93 Bernhardt undertook a world tour that included Australia and South America. Aside from her appearances as *Phèdre*, there were two parts that audiences all over the world clamoured to see her act: Marguerite Gautier, the redeemed courtesan in *La Dame aux Camélias* ("The Lady of the Camellias") of Alexandre Dumas fils, and the title role of

the popular playwright Eugène Scribe's *Adrienne Lecouvreur*.

In the 1880s a new element had entered her artistic life with the emergence of Victorien Sardou as chief playwright for melodrama. With Bernhardt in mind, Sardou wrote *Fédora* (1882), *Théodora* (1884), *La Tosca* (1887), and *Cléopâtre* (1890). Sardou, directing his own plays in which she starred, taught her a broad, flamboyant style of acting, relying for effect on lavish decors, exotic costumes, and pantomimic action.

In 1905, during a South American tour, she injured her right knee when jumping off the parapet in the last scene of *La Tosca*. By 1915 gangrene had set in, and her leg had to be amputated. Carried about in a litter chair the patriotic Bernhardt insisted on visiting the soldiers at the front during World War I. In 1916 she began her last tour of the United States. Her indomitable spirit sustained her during 18 grueling months on the road. In November 1918 she arrived back in France but soon set out on another European tour, playing parts she could act while seated. New roles were provided for her by the playwrights Louis Verneuil, Maurice Rostand, and Sacha Guitry. She collapsed during the dress rehearsal of the Guitry play *Un Sujet de roman* ("A Romantic Subject") but recovered again sufficiently to take an interest in the Hollywood motion picture *La Voyante* ("The Clairvoyant"), which was being filmed in her own house in Paris at the time of her death.

In 1920 Bernhardt published a novel, *Petite idole*, that is not without interest since the actress-heroine constitutes an idealization of its author's own career and ambitions. Facts and fiction are difficult to disentangle in her autobiography, *Ma Double Vie: Mémoires de Sarah Bernhardt* (1907; "My Double Life: Memoirs of Sarah Bernhardt"), written in part to counteract the slanderous and scabrous *Les Mémoires de Sarah Barnum* (1883) by Marie Colombier, who had capitalized on the actual and alleged eccentricities of the actress' private life. Bernhardt's treatise on acting, *L'Art du théâtre* (1923), is revealing in its sections on voice training: the actress had always considered voice as the key to dramatic character.

(A.M.N.)

BIBLIOGRAPHY. Louis Verneuil, *The Fabulous Life of Sarah Bernhardt* (1942, reissued 1972), is an intimate biography by a dramatist who provided Bernhardt with two acting vehicles. Cornelia Otis Skinner, *Madame Sarah* (1966, reprinted 1988), is a successful, primarily biographical attempt at separating facts from fiction. William Emboden, *Sarah Bernhardt* (1976), is primarily a pictorial biography. Elaine Aston, *Sarah Bernhardt: A French Actress on the English Stage* (1989), analyzes her acting technique. Arthur Gold and Robert Fizdale, *The Divine Sarah* (1991), includes research based on previously unavailable materials.

Berni, Francesco (b. 1497/98, Lamporecchio, Tuscany [Italy]—d. May 26, 1535, Florence), poet and translator important for his

Tuscan version of Matteo Boiardo's epic poem *Orlando innamorato* (1483) and for the distinctive style of his Italian burlesque, which was called *bernesco* and imitated by many poets.

Berni spent his early years in Florence. In 1517 he entered the service of Cardinal Bernardo da Bibbiena and Bibbiena's nephew,

Bernina Peak, in the Bernina Alps of Switzerland

Photo Research International

Angelo Dovizi, and then went to Verona to serve as secretary to its bishop, Matteo Giberti. When he returned to Florence, Berni became enmeshed in court intrigues and, according to some sources, was poisoned for refusing to cooperate in a plan to kill Cardinal Giovanni Salviati.

Berni's agile Tuscan translation of *Orlando innamorato* was for a long time preferred to Boiardo's original, which had been written in the difficult and less popular Ferrarese dialect. His *La Catrina* (1567), a lively rustic farce, was also highly regarded, though his fame rests squarely on his burlesque poetry. Most of this work appears in one of two forms: the tailed sonnet, to which he frequently gave three-line extensions; or the *capitolo*, a lengthy satiric poem written in terza rima. Some poems are savagely satirical, including those against his contemporaries the poet Pietro Aretino and Popes Adrian VI and Clement VII. His most masterly *capitoli*, however, are rollicking exaggerations on unimportant subjects (peaches, thistles, and a friend's shorn beard), which mock the lofty tone of contemporary Petrarchan verse.

Bernicia, in British history, a northern Anglo-Saxon kingdom that by the last quarter of the 7th century had become permanently united with its neighbour Deira to form the kingdom of Northumbria. Bernicia stretched northward from perhaps as far south as the River Tees, ultimately reaching the Firth of Forth and beyond the Solway Firth. It had a royal residence at Bamburgh on the coast and another at Yeaveering, about 20 miles (32 km) inland, where excavation has revealed an impressive group of buildings.

The first recorded king of Bernicia was Ida, who acceded in 547. His grandson Aethelfrith, who reigned from 593 to 616, united Bernicia and Deira, and Aethelfrith's successor, King Edwin of Deira, ruled both kingdoms. Aethelfrith's son Oswald also ruled both kingdoms, but, following Oswald's death in 641, his brother succeeded in Bernicia, while other kings were chosen by the Deirans and ruled independently until 678.

Bernina Alps, part of the Rhaetian Alps in eastern Switzerland along the Italian border, lying southeast of the Engadin (valley of the Upper Inn River). The scenic range rises to Bernina Peak (13,284 feet [4,049 m]), which was first ascended in 1850 by the Swiss climber Johann Coaz. Bernina Pass (7,638 feet [2,328

m]), generally closed by snow from November to May, lies 10 miles (16 km) southeast of Saint Moritz and is crossed by a railway and a highway. Part of the range extends north-east into the Swiss National Park. Mountain

climbing and winter sports are popular activities.

Bernini, Gian Lorenzo (b. Dec. 7, 1598, Naples, Kingdom of Naples [Italy]—d. Nov. 28, 1680, Rome, Papal States), Italian artist who was perhaps the greatest sculptor of the 17th century and an outstanding architect as well. Bernini created the Baroque style of sculpture and developed it to such an extent that other artists are of only minor importance in a discussion of that style.

Early years. Bernini's career began under his father, Pietro Bernini, a Florentine sculptor of some talent who ultimately moved to Rome. The young prodigy worked so diligently that he earned the praise of the painter Annibale Carracci and the patronage of Pope Paul V and soon established himself as a wholly independent sculptor. He was strongly influenced by his close study of the antique Greek and Roman marbles in the Vatican, and he

Berni, detail of an oil painting, early 16th century; in a private collection
Mannelli-Alinan from Art Resource

also had an intimate knowledge of High Renaissance painting of the early 16th century. His study of Michelangelo is revealed in the "St. Sebastian" (c. 1617), carved for Cardinal Maffeo Barberini, who was later Pope Urban VIII and Bernini's greatest patron.

Bernini's early works attracted the attention of Cardinal Scipione Borghese, a member of the reigning papal family. Under his patronage, Bernini carved his first important life-size sculptural groups. The series shows Bernini's progression from the almost haphazard single view of "Aeneas, Anchises and Ascanius Fleeing Troy" (1619; Borghese Gallery, Rome) to strong frontality in "Pluto and Proserpina" (1621–22; Borghese Gallery) and then to the hallucinatory vision of "Apollo and Daphne" (1622–24; Borghese Gallery), which was intended to be viewed from one spot as if it were a relief. In his "David" (1623–24; Borghese Gallery), Bernini depicts the figure casting a stone at an unseen adversary. Several portrait busts that Bernini executed during this period, including that of Cardinal Robert Bellarmine (1623–24), show a new awareness of the relationship between head and body and display an ability to depict fleeting facial expressions with acute realism. These marble works show an unparalleled virtuosity in carving that obdurate material to achieve the delicate effects usually found only in bronze sculptures. Bernini's sensual awareness of the surface textures of skin and hair and his novel sense of shading broke with the tradition of Michelangelo and marked the emergence of a new period in the history of Western sculpture.

Patronage of Urban VIII. With the pontificate of Urban VIII (1623–44), Bernini entered a period of enormous productivity and artistic development. Urban VIII urged his protégé to paint and to practice architecture. His first architectural work was the remodeled Church of Santa Bibiana in Rome. At the same time, Bernini was commissioned to build a symbolic structure over the tomb of St. Peter in St. Peter's Basilica in Rome. The result is the famous immense gilt-bronze baldachin executed between 1624 and 1633. Its twisted columns derive from the early Christian columns that had been used in the altar screen of Old St. Peter's. Bernini's most original contribution to the final work is the upper framework of crowning volutes flanked by four angels that supports the orb and cross. The baldachin is perfectly proportioned to its setting, and one hardly realizes that it is as tall as a four-story building. Its lively outline moving upward to the triumphant crown, its dark colour heightened with burning gold, give it the character of a living organism. An unprecedented fusion of sculpture and architecture, the baldachin is the first truly Baroque monument. It ultimately formed the centre of a programmatic decoration designed by Bernini for the interior of St. Peter's.

Bernini next supervised the decoration of the four piers supporting the dome of St. Peter's with colossal statues, though only one of the latter, "St. Longinus," was designed by him. He also made a series of portrait busts of Urban VIII, but the first bust to achieve the quality of his earlier portraits is that of his great patron, Cardinal Scipione Borghese (1632; Borghese Gallery). The cardinal is shown in the act of speaking and moving, and the action is caught at a moment that seems to reveal all the characteristic qualities of the subject.

Bernini's architectural duties increased after the death of Carlo Maderno in 1629, when Bernini became architect of St. Peter's and of the Palazzo Barberini. By this time he was not only executing works himself but also having to rely on assistance from others as the num-

ber of his commissions grew. He was successful in organizing his studio and planning his work so that sculptures and ornamentations produced by a team actually seem to be all of a piece. Bernini's work, then and always, was also shaped by his fervent Roman Catholicism (he attended mass every day and took communion twice a week). He would agree with the formulations of the Council of Trent (1545–63) that the purpose of religious art was to teach and inspire the faithful and to serve as propaganda for the Roman Catholic church. Religious art should always be intelligible and realistic, and, above all, it should serve as an emotional stimulus to piety. The development of Bernini's religious art was largely determined by his conscientious efforts to conform to those principles.

Under Urban VIII Bernini began to produce new and different kinds of monuments—tombs and fountains. The tomb of Urban VIII (1628–47; St. Peter's, Rome) shows the pope seated with his arm raised in a commanding gesture, while below him are two white marble figures representing the Virtues. Bernini also designed a revolutionary series of small tomb memorials, of which the most impressive is that of Maria Raggi (1643). But his fountains are his most obvious contribution to the city of Rome. His first, the "Barcaccia" in the Piazza di Spagna (1627–29), is analogous to the baldachin in its fusion of sculpture and architecture. The Triton Fountain in the Piazza Barberini (1642–43) is a dramatic transformation of a Roman architectonic fountain—the superposed basins of the traditional geometric piazza fountain appearing to have come alive. Four dolphins raise a huge shell supporting the sea god, who blows water upward out of a conch.

Bernini's early architectural projects, however, were not invariably successful. In 1637 he began to erect campaniles, or bell towers, over the facade of St. Peter's. But, in 1646, when their weight began to crack the building, they were pulled down, and Bernini was temporarily disgraced.

Patronage of Innocent X and Alexander VII. Bernini's most spectacular public monuments date from the mid-1640s to the 1660s. The Fountain of the Four Rivers in Rome's Piazza Navona (1648–51) supports an ancient Egyptian obelisk over a hollowed-out rock, surmounted by four marble figures symbolizing four major rivers of the world. This fountain is one of his most spectacular works.

The greatest single example of Bernini's mature art is the Cornaro Chapel in Santa Maria della Vittoria, in Rome, which completes the evolution begun early in his career. The chapel, commissioned by Cardinal Federigo Cornaro, is in a shallow transept in the small church. Its focal point is his sculpture of "The Ecstasy of St. Teresa" (1645–52), a depiction of a mystical experience of the great Spanish Carmelite reformer Teresa of Avila. In representing Teresa's vision, during which an angel pierced her heart with a fiery arrow of divine love, Bernini followed Teresa's own description of the event. The sculptured group, showing the transported saint swooning in the void, covered by cascading drapery, is revealed in celestial light within a niche over the altar, where the architectural and decorative elements are richly joined and articulated. At left and right, in spaces resembling opera boxes, numerous members of the Cornaro family are found in spirited postures of conversation, reading, or prayer. The Cornaro Chapel carries Bernini's ideal of a three-dimensional picture to its apex. The figures of St. Teresa and the angel are sculptured in white marble, but the viewer cannot tell whether they are in the round or merely in high relief. The natural daylight that falls on the figures from a hidden source above and behind them is part of the group, as are the gilt rays behind. "The Ecstasy of St. Teresa" is not sculpture in

the conventional sense. Instead, it is a framed pictorial scene made up of sculpture, painting, and light that also includes the worshiper in a religious drama.

In his later years, the growing desire to control the environments of his statuary led Bernini to concentrate more and more on architecture. Of the churches he designed after completing the Cornaro Chapel, the most impressive is that of Sant'Andrea al Quirinale (1658–70) in Rome, with its dramatic high altar, soaring dome, and unconventionally sited oval plan. But Bernini's greatest architectural achievement is the colonnade enclosing the piazza before St. Peter's Basilica. The chief function of the large space was to hold the crowd that gathered for the papal benediction on Easter and other special occasions. Bernini planned a huge oval attached to the church by a trapezoidal forecourt—forms that he compared to the encircling arms of the mother church. The freestanding colonnades were a novel solution to the need for a penetrable enclosure. The piazza guides the visitor toward the church and counterbalances the overly wide facade of St. Peter's. Bernini's oval encloses a space centred on the Vatican obelisk, which had been moved before the church by Sixtus V in 1586. Bernini moved an older fountain by Maderno into the long axis of the piazza and built a twin on the other side to make a scenographic whole. The analogies to Bernini's oval plan of Sant'Andrea al Quirinale are fascinating, as are the differences in meaning and function.

Francesco I d'Este, duke of Modena, marble portrait bust by Gian Lorenzo Bernini, 1650–51; in the Este Gallery and Museum, Modena, Italy

Alinari/Art Resource, New York City

Bernini's most spectacular religious decoration is the Throne of St. Peter, or the Cathedra Petri (1657–66), a gilt-bronze cover for the medieval wooden throne (cathedra) of the pope. Bernini's task was not only to make a decorative cover for the chair but also to create a meaningful goal in the apse of St. Peter's for the pilgrim's journey through the great church. The seat is seemingly supported by four imposing bronze figures representing theological doctors of the early church: Saints Ambrose, Athanasius, John Chrysostom, and Augustine. Above, a golden glory of angels on clouds and rays of light emanates from the Dove of the Holy Spirit, which is painted on an oval window. The cathedra was produced about the same time as the piazza, and the contrast between these two works shows Bernini's versatility. Both works were done for the Chigi pope, Alexander VII (1655–67), who was one of Bernini's greatest patrons. The tomb that Bernini designed for Alexander VII (1671–78; St. Peter's) was largely executed by his pupils.

In addition to his large works, Bernini continued to produce a few portrait busts. The first of these, of Francesco I d'Este, duke of

Modena (1650–51; Este Gallery and Museum, Modena), culminates his revolution in portraiture. Much of the freedom and spontaneity of the bust of Cardinal Scipione Borghese is kept, but it is united with a heroic pomp and grandiose movement that portray the ideals of the Baroque age as much as the man.

Trip to France. Bernini went to Paris in 1665, in what was his only prolonged absence from Rome. The trip was made in response to invitations that for many years had been extended to him by King Louis XIV, and the purpose was the design of a new French royal residence. By this time, Bernini was so famous that crowds lined the streets of each city along the route to watch him pass. His initial reception in Paris was equally triumphant, but he soon offended his sensitive hosts by imperiously praising the art and architecture of Italy at the expense of that of France. His statements made him unpopular at the French court and were to some degree responsible for the rejection of his designs for the Louvre. The only relic of Bernini's visit to France is his great bust of Louis XIV, a linear, vertical, and stable portrait, in which the Sun King gazes out with godlike authority. The image set a standard for royal portraits that lasted 100 years.

Later years. Bernini's late works in sculpture are inevitably overshadowed by his grandiose projects for St. Peter's, but a few of them are of outstanding interest. For the Chigi Chapel in the Church of Santa Maria del Popolo in Rome, he carved two groups, "Daniel in the Lions' Den" and "Habakkuk and the Angel" (1655–61). These works show the beginnings of his late style: elongation of the body, expressive gesture, and simplified yet emphatic emotional expression. The same characteristics are already found in the figures supporting the Throne of St. Peter and culminate in the moving "Angels" for the Sant'Angelo Bridge in Rome, which Bernini redecorated with the help of assistants between 1667 and 1671. Pope Clement IX (1667–69) so prized the "Angels" carved by Bernini that they were never set up on the bridge and are now in the church of Sant'Andrea delle Fratte in Rome.

The redecorated Sant'Angelo Bridge leading across the Tiber forms an introduction to the Vatican, and Bernini's other works—the piazza, Scala Regia, and the baldachin and cathedra within St. Peter's—form progressively more powerful expressions of papal power to support and inspire Roman Catholic pilgrims to the site. Bernini completed one more decoration in St. Peter's in his last years: the altar of the Santissimo Sacramento Chapel (1673–74). The pliant, human adoration of the angels contrasts with the timeless architecture of the bronze tabernacle that they flank and typifies Bernini's late style. In his last years he seems to have found the inexorable laws of architecture a consoling antithesis to the transitory human state.

Bernini's greatest late work is the simple Altieri Chapel in San Francesco a Ripa (c. 1674) in Rome. The relatively deep space above the altar reveals a statue representing the death of the Blessed Ludovica Albertoni. Bernini consciously separated architecture, sculpture, and painting for different roles, reversing the process that culminated in the Cornaro Chapel. In that sense, the Altieri Chapel is more traditional, a variation on his church interiors of the preceding years. Instead of filling the arched opening, the sculpted figure of Ludovica lies at the bottom of a large volume of space, and is illuminated by a heavenly light that plays on the drapery gathered over her recumbent figure. Her hands weakly clutching her breast make explicit her painful death.

Bernini died at the age of 81, after having served eight popes, and when he died he was widely considered not only Europe's greatest artist but also one of its greatest men. He was

the last of Italy's remarkable series of universal geniuses, and the Baroque style he helped create was the last Italian style to become an international standard. His death marked the end of Italy's artistic hegemony in Europe. The style he evolved was carried on for two more generations in various parts of Europe by the architects Mattia de' Rossi and Carlo Fontana in Rome, J.B. Fischer von Erlach in Austria, and the brothers Cosmas and Egid Quirin Asam in Bavaria, among others.

(H.Hi./Ed.)

BIBLIOGRAPHY. The earliest and most authoritative life of Bernini is Filippo Baldinucci, *The Life of Bernini* (1966), a translation of a 17th-century work. Scholarly introductions to Bernini's work, life, and times are Howard Hibbard, *Bernini* (1965, reissued 1976); and Charles Scribner III, *Gianlorenzo Bernini* (1991). George C. Bauer (ed.), *Bernini in Perspective* (1976); and Irving Lavin (ed.), *Gianlorenzo Bernini: New Aspects of His Art and Thought* (1985), are collections of interpretive essays. Bernini's epoch-making visit to France in 1665 is detailed in Cecil Gould, *Bernini in France* (1981). The basic catalog of sculpture, with bibliography, is Rudolf Wittkower, *Gian Lorenzo Bernini: The Sculptor of the Roman Baroque*, 3rd ed. (1981).

Bernini, Pietro (b. 1562, Tuscany [Italy]—d. 1629, Rome), Italian late Mannerist sculptor who was invited to Rome in 1605/06 to work for Pope Paul V (1605–21) on the decorations of the Paolina (Borghese) Chapel in the Basilica of Santa Maria Maggiore, where he carved the coronation of Clement VIII (1612–13), as well as the marble relief "Assumption of the Virgin" (1607–10) in the baptistery, Santa Maria Maggiore. For the Barberini Chapel in Sant'Andrea della Valle, he made St. John the Baptist (1616).

Although he was trained in Tuscany, Bernini worked in Naples (1584) until he was called to Rome. His son, the great Baroque figure Gian Lorenzo Bernini, was born in Naples. In that city, Pietro made three statues—"Charity" in the Church of Monte di Pietà, "St. Matthew" in the Church of Gesù Nuovo, and the "Virgin" in the National Museum of San Martino (reworked by Cosimo Fanzago). He also carved the Medina Fountain in San Martino. His son was taught marble cutting by his father, and the father's patrons, the powerful Borghese and Barberini families, offered the younger man early commissions.

Bernis, François-Joachim de Pierre de (b. May 22, 1717, Saint-Marcel d'Ardèche, France—d. Nov. 3, 1794, Rome, Papal States [Italy]), French statesman and cardinal who played an important part in the diplomatic revolution of 1756–57, in the suppression of the Society of Jesus (Jesuits) by the papacy in 1773, and in the unsuccessful negotiations in 1790–91 between the French Revolutionary government and Pius VI for the recognition of the Revolution's ecclesiastical reforms.

Born of aristocratic parentage, Bernis was trained for the church and did not become prominent in French politics until 1745, when he became a member of the entourage of Mme Le Normant, later known as Mme de Pompadour. Diplomatic experience acquired as ambassador to Venice between 1752 and 1755, together with the favour of Mme de Pompadour, caused his nomination as confidential and secret intermediary to discuss with the Austrian ambassador in Paris Austria's proposals for a French alliance (August 1755). Strongly supported by Louis XV himself, these negotiations resulted in the first (defensive) treaty of Versailles between France and Austria (May 1, 1756) and then to the second (offensive) treaty of Versailles (May 1, 1757). This alliance with France's old enemy and the abandonment of the former alliance with Prussia formed the diplomatic prelude to the Seven Years' War.

Bernis held office as French foreign minister

from June 17, 1757, until December 1758, when his fall was precipitated by French military reverses, by his desire to reform the financial system, and by the hostility of Mme de Pompadour. He became a cardinal in 1758 and archbishop of Albi in 1764. Though he used his influence with Pope Clement XIV to promote the suppression of the Jesuits, he exercised a moderating influence on French policy and did not approve of the drastic pressure exerted on the papacy by Charles III of Spain.

Between 1769 and 1794 he acted as French ambassador to Rome. Hostile to the ecclesiastical reforms of the French Revolution, which affected his status and income as a prelate, he was in touch with the French émigré princes and played an ambiguous part in helping to crystallize papal opposition to the Civil Constitution of the Clergy.

Bernkastel-Kues, city, Rhineland-Palatinate Land (state), western Germany. It lies along the Moselle (Mosel) River, northeast of Trier. Formerly two separate towns, Bernkastel lies on the river's left bank and Kues on the right. Bernkastel belonged to the electors of Trier from 1280 and was chartered in 1291. The ruined electoral fortress of Landshut is nearby, and the Renaissance city hall (1608) is notable. Kues was the birthplace (1401) of Nicholas of Cusa (Nicolaus Cusanus), and the hospital that he founded (1447) still stands. Bernkastel-Kues is noted for Moselle wine and champagne (*Sekt*). Pop. (1992 est.) 7,026.

Bernoises, Alpes (Switzerland): *see* Bernese Alps.

Bernoulli, Daniel (b. Feb. 8 [Jan. 29, Old Style], 1700, Groningen, Neth.—d. March 17, 1782, Basel, Switz.), the most distinguished of the second generation of the Bernoulli family of Swiss mathematicians. He investigated not only mathematics but also such fields as medicine, biology, physiology, mechanics, physics, astronomy, and oceanography. Bernoulli's theorem (*q.v.*), which he derived, is named after him.

Daniel Bernoulli was the second son of Johann Bernoulli, who first taught him mathematics. After studying philosophy, logic, and medicine at the universities of Heidelberg, Strasbourg, and Basel, he received an M.D. degree (1721). In 1723–24 he wrote *Exercitationes quaedam Mathematicae* on differential equations and the physics of flowing water, which won him a position at the influential Academy of Sciences in St. Petersburg, Russia. Bernoulli lectured there until 1732 in medicine, mechanics, and physics, and he researched the properties of vibrating and rotating bodies and contributed to probability theory. In that same year he returned to the University of Basel to accept the post in anatomy and botany. By then he was widely esteemed by scholars and also admired by the public throughout Europe.

Daniel's reputation was established in 1738 with *Hydrodynamica*, in which he considered the properties of basic importance in fluid flow, particularly pressure, density, and velocity, and set forth their fundamental relationship. He put forward what is called Bernoulli's principle, which states that the pressure in a fluid decreases as its velocity increases. He also established the basis for the kinetic theory of gases and heat by demonstrating that the impact of molecules on a surface would explain pressure and that, assuming the constant, random motion of molecules, pressure and motion increase with temperature. About 1738 his father published *Hydraulica*; this attempt by Johann to obtain priority for himself was another instance of his antagonism toward his son.

Between 1725 and 1749 Daniel won 10 prizes from the Paris Academy of Sciences for work on astronomy, gravity, tides, magnetism, ocean currents, and the behaviour of ships at sea. He also made substantial contributions in probability. He shared the 1735 prize for work on planetary orbits with his father, who, it is said, threw him out of the house for thus obtaining a prize he felt should be his alone. Daniel's prizewinning papers reflected his success on the research frontiers of science and his ability to set forth clearly before an interested public the scientific problems of the day. In 1732 he accepted a post in botany and anatomy at Basel; in 1743, one in physiology; and in 1750, one in physics.

Bernoulli, Jakob (b. Jan. 6, 1655 [Dec. 27, 1654, old style], Basel, Switz.—d. Aug. 16, 1705, Basel), first of the Bernoulli family of Swiss mathematicians. He introduced the first principles of the calculus of variation. The Bernoulli number ($q.v.$), which he developed, was named after him.

The scion of a family of drug merchants, Jakob Bernoulli was compelled to study theology but became interested in mathematics

Jakob Bernoulli, oil painting by Nikolaus Bernoulli, 1687; in a private collection

despite his father's opposition. His travels led to a wide correspondence with mathematicians. Refusing a church appointment, he accepted a professorial chair of mathematics at the University of Basel in 1687; and, following his mastery of the mathematical works of John Wallis, Isaac Barrow (both English), René Descartes (French), and G. W. Leibniz, who first drew his attention to calculus, he embarked upon original contributions. In 1690 he became the first to use the term integral in analyzing a curve of descent. His 1691 study of the catenary, or the curve formed by a cord suspended between its two extremities, was soon applied in the building of suspension bridges. In 1695 he also applied calculus to the design of bridges. During these years, he often engaged in disputes with his brother Johann Bernoulli ($q.v.$) over mathematical issues.

Jakob Bernoulli's pioneering work *Ars Conjectandi* (published posthumously, 1713; "The Art of Conjecturing") contained many of his finest concepts: his theory of permutations and combinations; the so-called Bernoulli numbers, by which he derived the exponential series; his treatment of mathematical and moral predictability; and the subject of probability—containing what is now called the Bernoulli law of large numbers, basic to all modern sampling theory. His works were published as *Opera Jacobi Bernoullii*, 2 vol. (1744).

Bernoulli, Johann (b. Aug. 6 [July 27, old style], 1667, Basel, Switz.—d. Jan. 1, 1748, Basel), major member of the Bernoulli family

of Swiss mathematicians. He investigated the then new mathematical calculus, which he applied to the measurement of curves, to differential equations, and to mechanical problems.

Johann Bernoulli, oil painting by Johann Jakob Meyer, 1720; in a private collection

By courtesy of the Öffentliche Bibliothek der Universität, Basel, Switz

The son of a pharmacist, Johann studied medicine and obtained his doctor's degree in Basel in 1694, with a thesis on muscular contraction. However, he turned to mathematics despite his father's opposition. In 1691–92 he wrote two texts, not published until later, on differential and integral calculus. In 1692 he taught calculus to the mathematician Guillaume-François-Antoine de L'Hospital, who agreed to pay him for mathematical discoveries. From 1695 to 1705 he taught mathematics at Groningen, Neth., and, on the death of his elder brother, Jacob, assumed a professorship at Basel.

Johann exceeded his brother in the number of contributions he made to mathematics. He applied calculus to the determination of lengths and areas of curves, such as the isochrone, along which a body will fall at constant speed, and the tautochrone, which was found to be important in clock construction. He also made contributions to the theory of differential equations, the mathematics of ship sails, and optics. Johann sent to L'Hospital in Paris a method or rule for solving problems involving limits that would apparently be expressed by the ratio of zero to zero, now called L'Hospital's rule on indeterminate forms because it was included in L'Hospital's influential textbook of 1696, *Analyse des infiniment petits* ("Analysis of the Infinitely Small").

The Bernoulli brothers often worked on the same problems, but not without friction. Their most bitter dispute concerned finding the equation for the path followed by a particle from one point to another in the shortest time, if the particle is acted upon by gravity alone, a problem originally discussed by Galileo. In 1697 Jakob offered a reward for its solution. Accepting the challenge, Johann proposed the cycloid, the path of a point on a moving wheel, pointing out at the same time the relation this curve bears to the path described by a ray of light passing through strata of variable density. A protracted, bitter dispute then arose when Jakob challenged the solution and proposed his own. The dispute marked the origin of a new discipline, the calculus of variations.

Ardent in his friendships and keen in his resentments, Johann zealously defended the cause of G.W. Leibniz in the dispute with Isaac Newton over who had originated calculus. His text in integral calculus appeared in 1742 and his differential calculus shortly afterward. During his last years he worked mainly on the principles of mechanics. His works were published in *Opera Johannis Bernoullii*, 4 vol. (1742).

Bernoulli's theorem, in fluid dynamics, relation among the pressure, velocity, and elevation in a moving fluid (liquid or gas), the compressibility and viscosity (internal friction) of which are negligible and the flow of which is steady, or laminar. First derived (1738) by the Swiss mathematician Daniel Bernoulli, the theorem states, in effect, that the total mechanical energy of the flowing fluid, comprising the energy associated with fluid pressure, the gravitational potential energy of elevation, and the kinetic energy of fluid motion, remains constant. Bernoulli's theorem is the principle of energy conservation for ideal fluids in steady, or streamline, flow.

Bernoulli's theorem implies, therefore, that if the fluid flows horizontally so that no change in gravitational potential energy occurs, then a decrease in fluid pressure is associated with an increase in fluid velocity. If the fluid is flowing through a horizontal pipe of varying cross-sectional area, for example, the fluid speeds up in constricted areas so that the pressure the fluid exerts is least where the cross section is smallest. This phenomenon is sometimes called the Venturi effect, after the Italian scientist G.B. Venturi (1746–1822), who first noted the effects of constricted channels on fluid flow.

Bernoulli's theorem is the basis for many engineering applications, such as aircraft-wing design. The air flowing over the upper curved surface of an aircraft wing moves faster than the air beneath the wing, so that the pressure underneath is greater than that on the top of the wing, causing lift.

Bernstein, Eduard (b. Jan. 6, 1850, Berlin—d. Dec. 18, 1932, Berlin), Social Democratic propagandist, political theorist, and historian, one of the first Socialists to attempt a revision of Karl Marx's tenets, such as abandoning the ideas of the imminent collapse of the capitalist economy and the seizure of power by the proletariat. Although he was not a dis-

Eduard Bernstein, c. 1918

Archiv für Kunst und Geschichte, West Berlin

tinguished theoretician, Bernstein, called "the father of revisionism," envisaged a type of social democracy that combined private initiative with social reform.

Bernstein was born into a Jewish family that had come to the capital of Prussia from Danzig. His father was a railroad engineer,

and his uncle Aaron Bernstein was the editor of the *Berliner Volks-Zeitung*, a newspaper widely read in progressive working-class circles. It was thus not surprising that at a young age Eduard shared the aspirations of many educated Germans for national unity and democracy. Of an engaging and candid disposition, he retained the goodwill of his superiors when, in 1872, as a young bank clerk, he announced that he had joined the Social Democratic Party. The turbulent years after Prussia's 1871 defeat of France also contributed to the formation of his political beliefs. Yet the ever-genial Bernstein tended to be attracted more to socialism of an undogmatic, pragmatic kind than to radical Marxism. He preferred the democratic and pacifist Social Democrats to the somewhat authoritarian Allgemeiner Deutscher Arbeiterverein ("General German Workers' Association").

In joining the party, he became associated with the German socialist organ, *Die Zukunft* ("The Future"). The economic crisis of 1873, which continued into the 1890s, reinforced his belief in the fragility of capitalism. It was, however, Chancellor Otto von Bismarck's anti-socialist laws that finally impelled him toward a more radical position. Exiled from Germany, he emigrated to Switzerland, abandoning the "ethical socialism" of Karl Höchberg, the wealthy patron of *Die Zukunft*. With Marx's consent, he became the editor of the Zürich edition of *Der Sozialdemokrat*, a periodical that was the rallying centre of the underground socialist party. Expelled from Switzerland at the request of Bismarck in 1888, Bernstein continued the publication of the periodical in London. There he became a close friend of Friedrich Engels, Marx's collaborator and patron, and also came to know intimately the leaders of the influential Fabian Society, which advocated a gradualist development of socialism. Bernstein set forth his revised views in a series of articles and in a letter to the Social Democratic Party meeting at Stuttgart in 1898. In the following year he published *Die Voraussetzungen des Sozialismus und die Aufgaben der Sozialdemokratie* ("The Postulates of Socialism and the Lessons of Social Democracy"; Eng. trans., *Evolutionary Socialism*).

When Bernstein returned to Germany, in 1901, he became the theoretician of the growing revisionist school of the reformist labour movement. He held that socialism is the final result of the liberalism inherent in human aspiration, not the mere product of a revolt against the capitalist middle class. He no longer believed in capitalism's imminent collapse, nor did he any longer regard the bourgeoisie as exclusively parasitic and oppressive. He also believed that the concentration of productive industry was not taking place in all fields as thoroughly or as fast as Marx had predicted. Citing such reforms as factory legislation and the freeing of labour unions from legal restrictions, he pointed out that, under pressure from the socialist movement, a reaction had set in against the exploitive inclinations of capital. Thus, he argued, the prospects for lasting success lay in steady advance rather than violent upheaval.

In 1902 Bernstein was elected a member of the Reichstag, or Parliament, to which he was reelected several times. He remained a member of the Reichstag up to 1928. Eventually revisionism became Social Democratic ideology, while the dogmatic Marxism of the socialist theoretician Karl Kautsky and the eclectic Marxism of the German labour leader August Bebel faded into the background. Bernstein, however, who was opposed to violence between nations as well as between classes, lent his voice to that of the left to fight against militarism. During World War I, although a leading member of his party's right wing, he sided with the Independent Socialists (Unabhängige Sozialdemokratische Partei Deutsch-

lands; USPD) to protest his party's support of the war. As soon as peace was restored, however, he returned to his old party and opposed those who wanted to transform the political revolution of November 1918 into a social revolution. He believed that the establishment of the parliamentary republic opened the way to uninterrupted progress, and after the war he served as secretary of state for economy and finance in 1919.

Social Democracy had finally become the great popular and reformist movement he had desired for more than 20 years, and, as an adviser respected by his party, he inspired much of its program. If he helped to discourage the Germans from following the Russian example of 1917, he could not dissuade them from imitating the Italian fascist model of 1922. He regarded the bloody outrages of the Nazis and their predecessors as the thoughtless actions of unbalanced minds; he was unable to comprehend the nature of National Socialism and remained powerless to prevent its seizure of power. Less than six weeks after his death, the democratic state on which he had set all his hopes was to give way to the dictatorship of Adolf Hitler. (P.R.A.)

BIBLIOGRAPHY. Peter Gay, *The Dilemma of Democratic Socialism: Eduard Bernstein's Challenge to Marx* (1952, reissued 1983).

Bernstein, Henry (-Léon-Gustave-Charles) (b. Jan. 20, 1876, Paris, Fr.—d. Nov. 27, 1953, Paris), French playwright, initially popular for a series of sensational melodramas, who later turned to more serious themes, experimented with new forms, and campaigned against anti-Semitism and Nazism.

Son of a wealthy Jewish banker, Bernstein attended the University of Cambridge and later inherited a fortune from his mother. His first play, *Le Marché* ("The Market"), was produced in 1900 at the Théâtre-Libre in Paris. A comedy, *Frère Jacques* (1904; "Brother Jacques"), written with Pierre Vêber, increased his reputation; it was later translated and presented in the United States. His *La Rafale* (1905; "The Whirlwind"), *La Griffe* (1906; "The Claw"), and *Samson* (1907), quick-moving and violent, emphasized character study. *Israël* (1908; "Israel") and *Après moi* (1911; "After Me") denounced anti-Semitism in France; riots followed the premiere of *Après moi* and forced its closing.

In *Le Secret* (1913; *The Secret*), he stressed unconscious motivation. The influences of Sigmund Freud, founder of psychoanalysis, and Luigi Pirandello, the innovative Italian playwright, are obvious in *La Galerie des glaces* (1924; "The Gallery of Mirrors") and other plays written in the 1920s. Experimenting with the dramatic form, Bernstein copied film techniques in *Mélo* (1929) and those of the novel in *Le Voyage* (1937). In 1940 his anti-Nazi *Elvire* was produced; it played in Paris until the city fell to the Germans. Bernstein escaped to the United States, where he campaigned against the Nazis and the collaborationist Vichy government. After the war, he returned to Paris and continued writing plays until a year before his death.

Bernstein, Jeremy (b. Dec. 31, 1929, Rochester, N.Y., U.S.), American physicist, educator, and writer widely known for the clarity of his writing for the lay reader on the major issues of modern physics.

After graduation from Harvard University (Ph.D., 1955), Bernstein worked at Harvard and at the Institute of Advanced Studies at Princeton, N.J. In 1962 he became an associate professor of physics at New York University. He became a professor of physics at Stevens Institute of Technology in Hoboken, N.J., in 1967, a position he continued to hold. He was also on the staff of *The New Yorker* magazine and held a variety of appointments throughout the United States and in Switzerland, France, and Pakistan.

In interpreting science for the general public, Bernstein illuminated topics ranging from cosmology to the origins of the computer. He published a number of books on such topics and also wrote a column entitled "Out of My Mind" for a journal called *The American Scholar*. His autobiographical memoir, *The Life It Brings*, was published in 1986.

Bernstein, Leonard (b. Aug. 25, 1918, Lawrence, Mass., U.S.—d. Oct. 14, 1990, New York, N.Y.), American conductor and composer noted for his accomplishments in both classical and popular music, for his flamboyant conducting style, and for his pedagogical flair, especially in concerts for young people.

Bernstein played piano from the age of 10, attended Boston Latin School and Harvard University (A.B., 1939), and studied at the Curtis Institute of Music, Philadelphia (1939–41). He studied conducting with Fritz Reiner and Serge Koussevitzky. In 1943 Bernstein

Leonard Bernstein

Lauterwasser, courtesy Deutsche Grammophon

was appointed assistant conductor of the New York Philharmonic; his first signal success came on Nov. 14, 1943, when he was summoned unexpectedly to substitute for the conductor Bruno Walter. His technical self-assurance under difficult circumstances and his interpretive excellence made an immediate impression and marked the beginning of a brilliant career. He subsequently conducted the New York City Center orchestra (1945–47) and appeared as guest conductor in the United States, Europe, and Israel. In 1953 he became the first American to conduct at La Scala in Milan. From 1958 to 1969 Bernstein was conductor and musical director of the New York Philharmonic, sometimes, as piano soloist, conducting from the keyboard. With this orchestra he made several international tours in Latin America, Europe, the Soviet Union, and Japan. His popularity increased through his appearances on television not only as conductor and pianist but also as a commentator and entertainer. After 1969 he continued to write music and to perform as a guest conductor with several symphonies throughout the world.

As a classical composer, Bernstein has made skillful use of diverse elements ranging from Jewish liturgical themes, as in the *Jeremiah Symphony* (1942) and the oratorio *Kaddish* (1963), to jazz rhythms, as in the *Age of Anxiety* (after W.H. Auden), for piano and orchestra (1949). For Christian liturgy he wrote *Chichester Psalms* (1965). His *Mass*, written especially for the occasion, was performed at the opening of the John F. Kennedy Center for the Performing Arts in Washington, D.C.,

in September 1971. Three of his works were premiered in 1977: *Slava! (A Political Overture)*, three *Meditations* for cello and orchestra, and *Songfest*, a cycle for six vocalists and orchestra. His other works include musicals—among them *On the Town* (1944), *Wonderful Town* (1953), *Candide* (1956), and the very popular *West Side Story* (1957; film version 1961)—and the scores for the ballets *Fancy Free* (1944), *Facsimile* (1946), and *Dybbuk* (1974). He also composed the music for the film *On the Waterfront* (1954). He published a collection of lectures, *The Joy of Music* (1959); *Young People's Concerts, for Reading and Listening* (1962, rev. ed. 1970); *The Infinite Variety of Music* (1966); and *The Unanswered Question* (1976), taken from his Charles Eliot Norton lectures at Harvard (1973).

Bernstorff, Albrecht, Count (Graf) von (b. March 22, 1809, Dreilützow, Mecklenburg [Germany]—d. March 26, 1873, London, Eng.), Prussian statesman known for his charm and diplomatic skill.

A widely traveled career diplomat, Bernstorff was dispatched to Vienna during the Revolution of 1848 and quickly distinguished himself as a conservative opponent of the then current schemes for German unification. Gradually, however, he came to accept the idea of German unity, though under Prussian rather than Austrian leadership. Bernstorff's subsequent opposition to the German policy of the Austrian prime minister, Prince Felix zu Schwarzenberg, prompted his diplomatic recall. Sent to head the Prussian embassy in London shortly before the outbreak of the Crimean War (1854–56), he enlisted his considerable charm to promote good Anglo-Prussian relations.

In 1861 Bernstorff left his London post to become Prussia's foreign minister, but his designs for a Prussian-led German union were undercut by the mistrust of both liberal and conservative elements. Displaced from his ministry by Otto von Bismarck in 1862, he thereafter repeatedly criticized the Machiavellian policies of his successor. Bernstorff soon was reassigned to the London embassy, where he remained as Prussian (and, after 1871, as German imperial) ambassador until his death.

Bernstorff, Andreas Peter, Count (Graf) von, Danish GREVE AF BERNSTORFF (b. Aug. 28, 1735, Hannover, Hanover [Germany]—d. June 21, 1797, Copenhagen, Den.), statesman who maintained the neutrality of Denmark during the last quarter of the 18th century and who took a leading part in Danish domestic reform.

In 1758 Bernstorff joined the Danish Foreign Office, from which he was dismissed in 1770. He returned to the office in 1772 and became foreign minister the next year. On Aug. 12, 1773, he concluded a partly defensive and partly anti-Swedish treaty of alliance between Denmark and Russia.

During the American Revolution, Bernstorff sympathized with Great Britain despite that country's assertion of its right to search for "contraband of war" on the high seas, and in 1779 he favoured the British proposal for a triple alliance among Great Britain, Denmark-Norway, and Russia. The Danish court, however, favoured the Russian proposal for an armed league of all the neutral powers to protect neutral shipping. Bernstorff, fearing that the Russian proposal was aimed exclusively against Great Britain, unwillingly acceded to it on July 9, 1780, after having reached a separate agreement with Britain five days earlier on what constituted "contraband of war." Russian resentment over his action forced Bernstorff's resignation on November 13.

Recalled to office in April 1784, Bernstorff, until his death, served as foreign minister in

a moderate liberal government. He supported a series of reform measures including the regulation of landlord-peasant relations and the emancipation of the serfs. In foreign affairs, Bernstorff carefully pursued a policy of neutrality. When the French Revolution broke out, he condemned any interference in the

Andreas Peter, Count von Bernstorff, oil painting by Jens Juel; in Frederiksborg Castle, Denmark

By courtesy of Det Nationalhistoriske Museum paa Frederiksborg, Denmark

domestic affairs of France and avoided every anti-French coalition. In March 1794 he negotiated a neutrality treaty with Sweden for protecting the merchant shipping of both countries by combined squadrons.

Bernstorff's foreign policy won him the respect of European diplomats; his domestic policy gained him such popularity among the Danes that his death was regarded as a national calamity.

Bernstorff, Christian Günther, Count (Graf) von, Danish GREVE AF BERNSTORFF (b. April 3, 1769, Copenhagen, Den.—d. March 28, 1835, Berlin, Prussia [Germany]), Danish diplomat who was foreign minister (1818–32) of Prussia and an architect of the German customs union (*Zollverein*).

The son of the diplomat Andreas Peter, Count von Bernstorff, he served as Danish ambassador in Stockholm from 1794 to May 1797 and in June succeeded his father as foreign minister. In 1812 he was appointed Danish ambassador to Austria and strove to obtain favourable peace conditions for Denmark (which was allied with Napoleon) from the Allies. He was present at the signing of the Treaty of Paris in May 1814 and represented Denmark at the Congress of Vienna. In 1816 he became Danish ambassador to Berlin, and in 1818 at the invitation of Prince Hardenberg he entered Prussian service.

Bernstorff attended the Congress of Aix-la-Chapelle (October 1818) as a Prussian diplo-

Christian Günther, Count von Bernstorff, oil painting by Joseph-Friedrich-August Darbès, 1794; in Frederiksborg Castle, Denmark

mat and returned to Berlin that year as foreign minister. He was by nature opposed to the principles of the French Revolution, and as foreign minister he is accused of having subordinated the interests of Prussia to the European policy of Prince von Metternich and the Holy Alliance. But, although he supported the Carlsbad Decrees (1819), the Vienna Final Act, and Metternich's policy at the congresses of Laibach (Ljubljana, Slovenia), Troppau (Opava, Czech Republic), and Verona, Italy, he was also one of the founders of the *Zollverein* (1834), which became the basis of Prussian hegemony in Germany. He supported Russia's war against Turkey over the Greek question in 1828, and in the crisis of 1830 he did much to confine the troubles in Poland and Belgium to those countries.

Bernstorff, J.H.E., Count (Graf) von, in full JOHANN HARTWIG ERNST, COUNT VON BERNSTORFF (b. May 13, 1712, Hannover, Hanover [Germany]—d. Feb. 18, 1772, Holstein), Danish statesman who as foreign minister preserved Denmark's neutrality during the Seven Years' War and strengthened the rights of the Danish crown against Russia in the duchy of Holstein.

Bernstorff was introduced into the Danish diplomatic service in 1733 by relatives holding ministerial appointments under King Christian VI. His first post was as Danish envoy to Saxony, where he remained until he was appointed ambassador to France in 1744. In

J.H.E., Count von Bernstorff, detail of a portrait by Louis Tocqué, 1758; in Frederiksborg Castle, Denmark

By courtesy of Det Nationalhistoriske Museum paa Frederiksborg, Denmark

1751 he became foreign minister, and for the next 19 years his opinion was decisive in the Danish council of state. His most important accomplishment, for which he was created a count, was his negotiation of a treaty (April 1767) with the empress Catherine II of Russia whereby Catherine renounced certain of her claims to parts of the duchy of Holstein. With the accession (1766) of the mentally unstable Christian VII, however, Bernstorff's position became increasingly precarious; he was dismissed from office on Sept. 15, 1770, and retired to his estates in Holstein.

Bernstorff, Johann-Heinrich, Count (Graf) von (b. Nov. 14, 1862, London, Eng.—d. Oct. 6, 1939, Geneva, Switz.), German diplomat who represented his country in London and Cairo and, as ambassador, in Washington, D.C. (1908–17).

The son of the Prussian diplomat Count Albrecht von Bernstorff, he entered the diplomatic service in 1899, was secretary of legation successively at Belgrade, Dresden, St. Petersburg, and Munich, and (1902–06) was councillor of the embassy in London. He then went as consul-general to Cairo, whence he proceeded as German ambassador in 1908 to Washington, D.C., where he remained until America's declaration of war against Germany in April 1917. During World War I he made great efforts to facilitate mediation of that conflict by President Woodrow Wilson, but he did not receive the support he expected from authoritative quarters in Berlin. On the American declaration of war, he returned to

Germany and was sent as ambassador to Constantinople, where he was employed until 1918.

In various publications, and in his reminiscences on his term as ambassador in Washington, he endeavoured to prove that Germany, if it had followed the proper policy, could have avoided war with America. This statement of his views excited much controversy in his own country. When the revolution broke out in 1918, Bernstorff left the diplomatic service, but he was later active in parliamentary politics as a member of the Democratic Party in the Reichstag and also maintained a close connection with international affairs, as chairman of the German League of Nations Union until 1933. After Hitler's advent he went into exile in G eneva.

Beroea (Greece): see V eroia.

Berosus, also spelled BEROSSUS, BEROSSOS, or BEROSUS, Akkadian BEL-USUR (fl. c. 290 BC), Chaldean priest of Bel in Babylon who wrote a work in three books (in Greek) on the history and culture of Babylonia; it was widely used by later Greek compilers, whose versions in turn were quoted by religious historians such as Eusebius and Josephus. Thus Berosus, though his work survives only in fragmentary citations, is remembered for his passing on knowledge of the origins of Babylon to the ancient Greeks.

In his first book Berosus described the land of Babylonia, to which the half man-half fish Oannes and other divinities coming out of the sea brought civilization, and told the story of the creation according to the native legend, which led to his account of Chaldean astrology. The second and third books contained the chronology and history of Babylonia and of later Assyria, beginning with the "ten kings before the flood," then the story of the flood itself, followed by the restoration of kingship with a long line of kings "after the flood," then "five dynasties," and finally the late age of history under the Assyrians, the last Babylonian kingdom, and the Persians. Cuneiform texts written in the Akkadian (Assyro-Babylonian) language have corroborated several elements of Berosus' account. The original names of seven of Berosus' bringers of civilization (Oannes and his brethren) are included in a late-Babylonian tablet found at Uruk (modern Warka). His scheme of chronology and history, although imperfectly preserved in quotations, has been elaborately investigated by modern scholars and compared with the cuneiform literature.

Berr, Henri (b. Jan. 31, 1863, Lun eville, Fr.—d. Nov. 19, 1954, Paris), French historian and philosopher who founded a series of Parisian institutes and journals dedicated to the synthesis of historical and scientific scholarship.

Educated at the  cole Normale Sup erieure in Paris (1881–84), Berr taught for several years in Douai and Tours and between 1896 and 1925 was a professor at the Lyc ee Henri IV in Paris, meanwhile earning his doctorate in 1899 with a thesis on philosophy and history. In 1900 he founded the *Revue de synth ese historique*, a journal devoted to the integration of history and the social sciences, and in 1924 he founded the Centre International de Synth ese in Paris. Meanwhile, he undertook the enormous task of editing a cooperative enterprise entitled *L' volution de l'humanit e*, 100 vol. (65 published between 1920 and 1954), a series of historical monographs intended as a synthetic survey of civilization from prehistory to the present.

Berr himself developed a rather complicated theory of historical synthesis based on a distinction of three types of causal relations: the succession of facts, constant relations or necessity, and the internal or rational connection of facts. His other contributions included

the establishment of another journal, *Science*, in 1936; a series of books on the question of Alsace-Lorraine and Germany; and a philosophical novel, *L'Hymne   la vie* (1942; "Hymn to Life").

Berra, Yogi, byname of LAWRENCE PETER BERRA (b. May 12, 1925, St. Louis, Mo., U.S.), American professional baseball player, manager, and coach, who established catcher's records for most home runs (313), most consecutive errorless games (148), and most consecutive chances accepted (950).

As a boy in the Italian district of St. Louis, Berra played softball, baseball, soccer, football, and roller hockey. He first played organized baseball with a Y.M.C.A. team and later played American Legion baseball. He batted left-handed and threw right-handed. In 1942 he signed a contract with the American League New York Yankees. After a season in the minor leagues, he served in the U.S. Navy during World War II (1943–46) and played minor league baseball again in 1946. He came up to the New York Yankees toward the end of that season and played with them as their regular catcher through 1963. At first his catching was erratic, and he played mostly in the outfield until 1949. From then on he hit 20 or more home runs a season through 1958. He was named the American League's Most Valuable Player, an honour seldom bestowed on catchers, in 1951, 1954, and 1955. He played in 14 World Series (1947, 1949–53, 1955–58, 1960–63), catching in more series games (75) than any other catcher. He hit a home run in his first World Series appearance; 12 in all.

After retiring as a player, Berra managed the Yankees in 1964, winning the pennant and losing the World Series, and was fired. He was a coach for the National League New York Mets (1965–72). He managed the Mets (1972–75) and thereafter was a coach with the Yankees. In 1983 he was once again made manager of the Yankees but was fired during the 1985 season. He was elected to the Baseball Hall of Fame in 1972.

Berrighen, Claes Pietersz(oon) (Dutch painter): see Berchem, Claes Pietersz(oon).

Berruguete, Alonso (b. c. 1488, Paredes de Nava, Valladolid, Castile [now in Spain]—d. 1561, Toledo, Castile), the most important Spanish sculptor of the Renaissance, who is known for his intensely emotional Mannerist sculptures of figures portrayed in spiritual torment or in transports of religious ecstasy.

After studying under his father, the painter Pedro Berruguete, Alonso went to Italy (c. 1504/08). Most of his sojourn was spent in Florence and Rome, where he was influenced by the works of Michelangelo and such examples of Hellenistic sculpture in the Vatican collections as the "Laoc oon." Berruguete's painting of "Salome" (Uffizi Gallery, Florence) suggests that his Italian paintings were in the early Mannerist style of Jacopo Pontormo and Rosso Fiorentino.

Berruguete returned to Spain in about 1517, and in 1518 he was made court painter to Charles V and settled at Valladolid. Because he did not follow the emperor to Germany in 1520, however, he received no royal commissions for paintings. Berruguete turned, therefore, to sculpture and architecture, and in the period 1518–21 executed sculpture for the tomb of Juan Selvagio in the church of Santa Engracia at Zaragoza, carved the relief of the "Resurrection" in the cathedral of Valencia (c. 1517), and submitted plans in 1521 for the Capilla Real (Royal Chapel) in Granada, which, not meeting with official approval, were never realized. Among his major sculpture commissions of the Valladolid period were the retables, or altarpieces, for the monastery of La Mejorada at Olmedo (1526), for San Benito at Valladolid (1527–32), for

the Colegio de los Irlandeses at Salamanca (1529–32), and for the Church of Santiago at Valladolid (1537).

In 1539 the great Spanish humanist and art patron Cardinal Tavera asked Berruguete to Toledo to execute the choir stalls on the epistle side of the Toledo cathedral (1539–43), as well as the alabaster "Transfiguration" at the west end of the choir (1543–48). These carvings are somewhat more moderate and classical in feeling than his earlier works. At the time of his death Berruguete was working on the tomb for Cardinal Tavera (1552–61) in the Hospital de San Juan de Bautista at Toledo. Berruguete's use of a rather rich and extravagant but delicate ornamentation in his church decorations is typical of Spain's Plateresque style.

Berruguete, Pedro, also called PEDRO ESPA NOL, or PIETRO SPAGNUOLO (b. mid-15th century, Paredes de Nava, Valladolid, Castile [now in Spain]—d. Jan. 6, 1504, Avila, Castile), the first great Renaissance painter in Spain, and the father of Alonso Berruguete, the greatest Spanish sculptor of the 16th century.

Berruguete is believed to have studied in Naples under Colantonio and to have worked in 1477 at the ducal palace in Urbino. He returned to Spain to produce works for the cathedral in Toledo (1483–99) and then moved to Avila to work on the cathedral there until his death.

Berruguete's paintings are marked by elegance and dignity combined with a profound

"St. Dominic Presiding at an Auto-da-fe," panel by Pedro Berruguete, c. 1503; in the Prado, Madrid
Archo Mas Barcelona

feeling for space and atmosphere. The style is often eclectic, a mixture of Flemish, Spanish Gothic, and Italian Renaissance, but it is never imitative. This combination of influences may be seen in his masterpiece, the main altarpiece in the convent of San Tom s in Avila (1499–1503). In these panels, representing scenes from the life of St. Thomas of Avila, there is a combination of luxurious ornament and gold decoration with a simplicity and ease of depiction.

Berry, historic and cultural region encompassing the central French *d partements* of Indre and Cher, and coextensive with the former province of Berry.

The province of Berry encompassed the *départements* of Cher (corresponding roughly to Upper Berry) and Indre (Lower Berry). The home of a people called the Bituriges Cubi in

The gouvernement of Berry in 1789

Roman times, the country later passed to the Visigoths (AD 475), the Franks (c. 507), and the Carolingians. The chief authority in Berry eventually passed to the viscounts of Bourges, who, while recognizing the royal suzerainty, preserved a certain independence until 1101, when the fief was sold to the crown. When Aquitaine was acquired by Henry II of England, Berry became a matter of dispute between England and France. After 1360 it was held as an appanage of the French crown, usually by a member of the royal family. Jean de France, duc de Berry (1340–1416), was an important patron of the arts, for whom a number of famous illuminated manuscripts were produced (notably the Limburg brothers' *Très Riches Heures du duc de Berry*).

In 1601 on the death of Henry III's widow, Louise of Lorraine, the country was finally reabsorbed into the royal domain. The title duc de Berry was subsequently granted to Louis XIV's grandson Charles (1686–1714) and to Louis XVI's nephew Charles-Ferdinand (1778–1820).

Physically Berry is an upland adjoining France's Massif Central on the northwest. It is a region of bocage (mixed small forests and pastures), wheat fields, orchards, and vineyards. The pastures support extensive herds of sheep.

The population is predominantly Roman Catholic, although there are small Calvinist parishes in Cher, at Bourges and Sancerre. The population is largely of Celtic origin, but numerous immigrants from Poland, Italy, and Spain have been assimilated since 1950.

The regional dialect is derived from French and closely resembles the dialects of Bourbonnais (which borders Berry to the east) and Touraine (west). The dialect of Berry is distinguished by numerous words of late Latin origin and continues to be spoken in Cher around Sancergues, Sancerre, and Sancoins and in Indre around La Châtre. The *Noëls berriards* (1898) and *Bestiaire berrichon* (1919) of Hughes Lapaire helped to revive the folkloric literature of Berry. Folkloric traditions show strong Celtic influences from Auvergne, Brittany, Scotland, and Ireland. La Borne in Cher and Verneuil-sur-Igneraie in Indre continue to produce traditional pottery.

Regional cuisine is simple and relies on local produce. Dishes are usually cooked over a low fire. Soups of vegetables, pickled pork, or bread are simmered in a crock and served with cream. *Poulet en barbouille* is chicken cooked in brandy and served with a sauce

made from blood, cream, yolk, and chopped liver. Wines from Quincy and Sancerre in Cher and Reuilly in Indre are produced from Sauvignon vines and have a flinty taste.

berry, simple, fleshy fruit that usually has many seeds, such as the banana, tomato, and cranberry. The middle and inner layers of the fruit wall often are not distinct from each other. Any small, fleshy fruit is popularly called a berry, especially if it is edible. Raspberries, blackberries, and strawberries are not true berries but aggregate fruits—fruits that consist of a number of smaller fruits. The date is a one-seeded berry whose stone is hard nutritive tissue. The leathery-rinded berry of citrus fruits is called a hesperidium, and the elongated, tough-skinned berrylike fruits of the watermelon, cucumber, and gourds are referred to as pepos.

Berry, DUKES OF, titled French nobility, royal princes of the blood, grouped below chronologically and indicated by the symbol ●.

● **Berry, Jean de France, duc de** (duke of) (b. Nov. 30, 1340, Vincennes, Fr.—d. June 15, 1416, Paris), third son of King John II the Good of France and a leading patron of the arts; he controlled at least one-third of the territory of France during the middle period of the Hundred Years' War.

Count of Poitiers from 1356, he was appointed king's lieutenant (1358) for Auvergne, Languedoc, Périgord, and Poitou while his father was in captivity in England. It was thus that he came to control so much of France, despite the opposition of his brother, the dauphin Charles. Berry and Auvergne, newly raised to the rank of duchies, were granted to him by his father in 1360.

After 1364, during his brother Charles V's reign, Berry heavily taxed his lands for the defense of the kingdom. His oppressive policies eventually led to a peasants' revolt (1381–84) after Charles's death (Sept. 16, 1380). Acting as a member of the regency council of young Charles VI from 1380 to 1388, he shared royal powers while Charles was too young to rule. Berry maintained power by serving on a Council of 12 that he helped create to aid in the administration of France. On the council, Berry worked for peace with England by negotiating with John of Gaunt, duke of Lancaster, calling for papal mediation, and by helping to postpone an attack on England.

Initially arranging a temporary reconciliation in 1405 between the conflicting factions of John the Fearless, duke of Burgundy, and his own brother Louis, duc d'Orléans, Berry allied himself in 1410 with the Orléanist, later called the Armagnac, faction. After he was attacked by the Burgundians (1412), he resumed his role as mediator in the peace of Auxerre in 1412 and of Pontoise in 1413. Berry also helped deliver Charles VI's unsuccessful cession plan (the retirement of two rival popes for the election of a single pope) to the antipope Benedict XIII in Avignon.

Throughout his life, Berry had spent lavishly to promote the arts, and at his death there was not enough money to pay for his funeral. He had invested fortunes on the treasures that remain as his monument—paintings, tapestries, jewelry, and illuminated manuscripts (including the world-famous *Très riches heures du duc de Berry*).

● **Berry, Louis-Auguste, duc de** (duke of) *see* Louis XVI *under* Louis (France).

● **Berry, Charles-Ferdinand de Bourbon, duc de** (duke of) (b. Jan. 24, 1778, Versailles, Fr.—d. Feb. 14, 1820, Paris), French prince whose murder by the fanatic Louvel marked a turning point in the history of the Restoration monarchy (1814–30). His death hastened the downfall and replacement of the Decazes government and the polarization into liberal and royalist groups.

Taken abroad by his father, the Comte d'Artois (afterward Charles X of France), at the outbreak of the French Revolution (1789), he served in the Prince de Condé's army (1792–97) and went with Condé to Russia, where the tsar Paul gave him a cavalry regiment. From 1801 to 1814, however, he lived in England. There he began a liaison with an Englishwoman, Emma (Amy) Brown, by whom he had two daughters (afterward Baronne de Charette and Comtesse de Faucigny-Lucinge). Having returned to France in 1815, Berry retired to Ghent during the Hundred Days, but returned again to Paris at the Second Restoration. On June 17, 1816, he married Caroline, eldest daughter of Francis I of the Two Sicilies (by whom he had one daughter, Louise, later duchess and regent of Parma). On Feb. 13, 1820, as he was leaving the Paris Opéra, he was mortally wounded by a saddler, Louis-Pierre Louvel. He died the next day.

His posthumous son, the Duc de Bordeaux (later Comte de Chambord), represented the last hope for the Bourbon dynasty.

Berry, Marie-Caroline de Bourbon-Sicile, duchesse de (duchess of) (b. Nov. 5, 1798, Caserta, Italy—d. April 16, 1870, Brunnes, Austria), daughter of Francis I of the Two Sicilies, who in 1832 staged a brief rebellion in western France against the king, Louis-Philippe, in a vain attempt to gain the crown for her son, Henri Dieudonné, comte de Chambord. Her husband, the Duc de Berry, a son of Charles X of France, had been assassinated in 1820. When Charles was overthrown in 1830, she tried to secure the succession for her son but was forced into exile. In 1832, disguised as a peasant, she crossed the French border from Italy and made her way to the Vendée, where she succeeded in instigating a brief but abortive insurrection (June 1832). She was arrested in Nantes November 7 and imprisoned at Blaye but was freed in July 1833 with the discovery of her recent marriage to an obscure Italian nobleman, Count Ettore Lucchesi-Palli, an act that exempted her from the French throne. She lived in Austria and Italy until her death.

Berry, Chuck, byname of CHARLES EDWARD ANDERSON BERRY (b. Oct. 18, 1926, St. Louis, Mo., U.S.), U.S. songwriter and singer, one of the first and best to shape big-beat blues into what came to be called rock and roll and to achieve widespread popularity with white audiences.

In his youth, Berry served a three-year term in reform school for attempted burglary. His early musical interest was in country music. While working at various daytime jobs in the early 1950s, he led a blues trio that played in black nightclubs in the St. Louis area. In 1955, armed with a number of songs he had written, he travelled to Chicago, where a remarkable congregation of outstanding black musicians had made the South Side the legendary blues capital of the world. Berry made his first record, "Maybellene," in that year. It was an immediate sensation among teenagers. As the novelty evolved into a popular genre, took the name rock and roll, and attracted a huge following among the young, Berry remained for some years at the forefront of popularity as a composer and performer with such songs as "Roll Over, Beethoven," "School Days," "Sweet Little Sixteen," "Rock and Roll Music," "Johnny B. Goode," and "Memphis," all of which combined the standard heavy beat and melodic patterns with the composer's own singular brand of ironic lyrics. He also appeared in four films.

In 1959 he was convicted under the Mann Act for transporting a woman across state lines for immoral purposes and served a two-year sentence. Released in 1964, he prospered both as a performer and a recording artist into the 1970s. In 1979 he pled guilty to a charge of income tax evasion and was sentenced to

four months imprisonment and 1,000 hours of community service doing benefit concerts.

Berryman, John (b. Oct. 25, 1914, McAlester, Okla., U.S.—d. Jan. 7, 1972, Minneapolis, Minn.), U.S. poet whose importance was assured by the publication in 1956 of the long poem *Homage to Mistress Bradstreet*.

Berryman was brought up a strict Roman Catholic in the small Oklahoma town of Anadarko, moving at 10 with his family to Tampa, Fla. When the boy was 12, his father killed himself. Berryman attended a private school in Connecticut and graduated from Columbia University, where he was influenced by his teacher, the poet Mark Van Doren. After study at the University of Cambridge in 1938, he returned to the U.S. to teach at Wayne State University, Detroit, beginning a career that included posts at Harvard, Princeton, and the University of Minnesota.

He began to publish in little magazines during the late 1930s, and in 1940 *Five Young American Poets* contained 20 of his poems. Two other volumes of poetry—*Poems* (1942) and *The Dispossessed* (1948)—followed. A

Berryman
By courtesy of the University of Minnesota

richly erotic autobiographical sequence about a love affair, *Berryman's Sonnets*, appeared in 1967. Berryman was a versatile man of letters: "The Lovers" appeared in *The Best American Short Stories of 1946*, and his story "The Imaginary Jew" (1945) is often anthologized. His biography of Stephen Crane was published in 1950.

Homage to Mistress Bradstreet is a monologue that pays tribute to Anne Bradstreet, the first American woman poet: sometimes her voice is heard, sometimes Berryman's, and throughout a loving and intimate grasp of the details of American history is manifest. His new technical daring was also evident in *77 Dream Songs* (1964), augmented to form a sequence of 385 "Dream Songs" by *His Toy, His Dream, His Rest* (1968). Berryman's work bears some relation to the "confessional" school of poetry that flourished among many of his contemporaries, but in his case bursts of humour sporadically light up the troubled interior landscape. This autobiographical note continued to be sounded in *Love & Fame* (1970), in which he conveys much in a deceptively offhand manner.

Berryman committed suicide by jumping from a bridge onto the ice of the Mississippi River. *Recovery*, an account of his struggle against alcoholism, was published in 1973.

berserker, Norwegian *BERSERK*, Old Norse *BESERKR* ("bearskin"), in premedieval and medieval Norse and Germanic history and folklore, a member of unruly warrior gangs that worshipped Odin, the supreme Norse deity, and attached themselves to royal and noble courts as bodyguards and shock troops.

The berserkers' savagery in battle and their animal-skin attire contributed to the development of the werewolf legend in Europe.

It is unclear whether the berserker warriors wore bear and wolf skins into battle or fought naked; tapestries and other sources represent both possibilities. The berserkers were in the habit of raping and murdering at will in their host communities (thus going "berserk"), and indeed in the Norse sagas they were often portrayed as villains. Berserkers are known to have formed the household guard of Norway's king Harald I Fairhair (reigned 872–930).

Bert, Paul (b. Oct. 17, 1833, Auxerre, Yonne, Fr.—d. Nov. 11, 1886, Hanoi), French physiologist, politician, and diplomat, founder of modern aerospace medicine, whose research

Bert
BBC Hulton Picture Library

into the effects of air pressure on the body helped make possible the exploration of space and the ocean depths. While professor of physiology at the Sorbonne (1869–86), he found that the illness suffered by animals at high altitudes is caused mainly by the low oxygen content of the sparse atmosphere.

Bert also made a study of decompression sickness, suffered by deep-sea divers (who know its agonizing pain as "the bends") when they are brought too quickly to the surface from the great pressures of the depths. Bert demonstrated that high external pressures force large quantities of atmospheric nitrogen to dissolve in the blood. During rapid decompression the nitrogen forms gas bubbles that obstruct capillaries. His classic *La Pression barométrique, recherches de physiologie expérimentale* (1878; *Barometric Pressure: Researches in Experimental Physiology*, 1943) was of fundamental importance to aviation medicine during World War II and to aerospace research in general.

An anticlerical leftist, Bert represented Yonne in the Chamber of Deputies (1872–86) and served as minister of education (1881–82) in Léon Gambetta's Cabinet. He was a proponent of French colonial policy in Indochina and was appointed governor general in Annam and Tonkin (1886). Despite his short tenure, his impact in Indochina was considerable. He took steps to liberalize French rule in the region, increasing the administrative role of the Vietnamese court and lessening the influence of the military in civil affairs. His various political and social reforms eased tensions in the area and served as a model for later French administrators.

Bertani, Agostino (b. Oct. 19, 1812, Milan—d. April 10, 1886, Rome), physician who collaborated with Mazzini and Garibaldi in the movement for Italian liberation.

Bertani took part in the March insurrection in Milan in 1848, organized an ambulance service for the republicans during their defense of Rome in 1849, and distinguished himself by his service in Genoa with Mazzini during the cholera epidemic of 1854. He was a surgeon in Garibaldi's corps in the Austro-Sardinian War of 1859. In 1860 he was one of the strategists of the attack on Sicily and Naples known as the March of the Thousand. He became Garibaldi's secretary general after the occupation of Naples (September 1860), in which office he reorganized the police and planned the suppression of the religious orders

and the sanitary reconstruction of the city. In 1862 he treated Garibaldi's wounds received at Aspromonte. In the war against Austria (1866), he organized the medical service for Garibaldi's 40,000, and in 1867, during Garibaldi's march on Rome, he fought in the Battle of Mentana although he was opposed to the campaign.

Entering the new Italian Parliament in 1861, Bertani became the leader of the chamber's extreme left. In 1866 he founded *La Riforma*, a journal advocating social reforms. When the left came to power in 1876 with Premier Agostino Depretis, who introduced a system known as transformism in which he built up his following by taking ministers from both right and left, Bertani, hostile to the system, remained in opposition.

Berthelier, Philibert (b. c. 1465, Virieu-le-Grand, Burgundy—d. Aug. 23, 1519, Geneva), political martyr and leader of the Genevese anti-Savoyard faction (Eidgenots) that struggled against the powerful duke of Savoy, Charles III, to maintain the independence of Geneva.

Though no more than a minor public official, Berthelier took an active part in Geneva's political controversies. In 1508 he championed the rights of military corporations against the city council, and in 1509 his protests led to the dismissal of the incumbent *vidomne*, the episcopal official charged with civil and criminal jurisdiction. He opposed the installation of a Savoyard puppet, John, as bishop and temporal lord of Geneva (1513) and in 1515 formed a league of patriots, the *Enfants de Genève*, to resist the Bishop's encroachments on citizen's rights. Further opposition to the Bishop and his Savoyard connection led to Berthelier's arraignment on a charge of *lèse-majesté* (March 16, 1518); and, although acquitted by the citizens' committees (*syndics*), he was nonetheless summarily arrested and executed. His struggles against Savoyard influence in Geneva were continued and ultimately brought to a successful conclusion under the leadership of his friend Bezanson Hugues.

Berthelot, (Pierre-Eugène-) Marcellin (b. Oct. 27, 1827, Paris—d. March 18, 1907, Paris), French organic and physical chemist, science historian, and government official whose creative thought and work significantly influenced the development of chemistry in the latter part of the 19th century.

Berthelot began his career as a staff assistant to Antoine-Jérôme Balard at the Collège de France, Paris (1851). His doctoral thesis, based on a continuation and amplification of Michel-Eugène Chevreul's work with glycerol, established his reputation. Appointed professor of organic chemistry at the École Supérieure de Pharmacie, Paris (1859), he accepted a chair in organic chemistry created for him at the Collège de France (1865). Inspector of higher education (1876), he continued an ac-

Marcellin Berthelot, engraving by Philippe-Auguste Cattelain
H Roger-Viollet

tive interest in educational problems. He was elected a life senator in 1881. He was also minister of public instruction (1886–87) and of foreign affairs (1895–96).

Berthelot did important research in alcohols and carboxylic acids, in the synthesis of hydrocarbons (including acetylene), and in reaction velocities. As a result of his work on explosives, he discovered the detonation wave. He discredited the generally held contention that the formation of organic substances requires the involvement of life processes. He also held that chemical phenomena are not governed by any laws peculiar to themselves but are explicable in terms of the laws of mechanics in operation throughout the universe. He introduced the terms exothermic and endothermic and rediscovered the action of microorganisms in the fixation of nitrogen in soils. His writings in the history of alchemy and chemistry are classics in the field.

Berthelot published some 1,600 books and papers on various aspects of chemistry. His other works include translations of Greek, Syriac, and Arabic treatises on alchemy and chemistry. He also contributed many articles to *La Grande Encyclopédie*, which he helped to establish. The final period of his work was devoted to agricultural chemistry as well as to his historical writing. In 1889 he succeeded Louis Pasteur as secretary of the Académie des Sciences, Paris.

Berthelot, Philippe (-Joseph-Louis) (b. Oct. 9, 1866, Sèvres, Fr.—d. Nov. 22, 1934, Paris), French diplomat who in his long ca-

Philippe Berthelot

By courtesy of the Bibliothèque Nationale, Paris

reer in the Ministry of Foreign Affairs played an influential role in international relations during World War I and in the postwar administrations of Aristide Briand.

Son of the famous chemist Marcellin Berthelot, the young Philippe was reared in the society of illustrious literary and scientific figures. He began his diplomatic career in 1889, serving in China from 1902 to 1904, when he entered the Ministry of Foreign Affairs. At the outbreak of World War I, he was active in Balkan negotiations and served in inter-Allied liaison. After participating in the Versailles Peace Conference, he was appointed in 1919 as the director of political and commercial affairs and counsellor of state, one of the highest positions in the ministry. In September 1920 the post of secretary general was created expressly for him. In 1921 he resigned after being accused of using his influence improperly in connection with the affairs of the Industrial Bank of China, of which his brother was a director. Reappointed secretary general in 1925, he accompanied Briand to Locarno and to London and conducted negotiations for resuming Franco-Russian relations. From then until 1932 he virtually controlled the internal organization of the ministry, following a policy that he described as one of "close union with England and of rapprochement with Germany." Ill health forced his resignation in 1932, and he died of a heart attack two years later.

Berthier, Louis-Alexandre, PRINCE DE WAGRAM (b. Nov. 20, 1753, Versailles, Fr.—d. June 1, 1815, Bamberg, Bavaria), French soldier and the first of Napoleon's marshals. Though Berthier was not a distinguished commander, Napoleon esteemed him highly as chief of staff of the Grande Armée from 1805. Responsible for the operation of Napoleon's armies, he was called by the Emperor "the man who has served me longest and has never failed me."

The son of an ennobled court works surveyor, Berthier gained military experience in the American Revolution, serving with Lafayette, and then in the French Revolution as survey and staff officer and finally as chief of staff (1791–92). Sent to fight the royalists in western France in March 1793, he was recalled, as a noble, after four months' dangerous service and driven underground by the Revolutionary Terror. He reappeared as general of division and chief of staff in the Army of the Alps and of Italy. Commanding in Italy, he occupied Rome in February 1798 but later joined Napoleon in Egypt.

As chief of staff of the Grande Armée, Berthier directed a staff of six generals and eight colonels. His duties included dispatching direct orders from Napoleon to his marshals. In spite of his professed impersonality in carrying out Napoleon's orders, a certain amount of friction developed between Berthier and the marshals as the power of the chief of staff grew. Napoleon recognized his loyalty by making him sovereign prince of Neuchâtel in 1806 and gave him the French title of prince de Wagram in 1809.

Berthier remained with Napoleon in Russia to the end of the retreat in 1812 and, after the Emperor's departure, struggled devotedly to preserve order in the army. After Napoleon's abdication Berthier submitted to Louis XVIII and, as captain of his guards, escorted him out of France when Napoleon returned from Elba for the Hundred Days. He then retired to Bavaria, where he soon died from a fall. There were stories of suicide or murder, but the accident was probably due to illness.

Berthold von Henneberg, also called **BERTHOLD VON MAINZ** (b. 1442, Germany—d. Dec. 21, 1504, Germany), archbishop-elect of Mainz, imperial chancellor and reformer,

Berthold von Henneberg, detail from his tomb monument attributed to Hans Backoffen; in Mainz Cathedral, Ger.

By courtesy of the Bischöfliches Dom und Diözesanmuseum, Mainz, Ger.

who worked unsuccessfully for an increase in the powers of the clerical and lay nobility at the expense of the Holy Roman emperor.

Berthold was elected archbishop of Mainz in 1484 and played a leading role in securing the election of Maximilian I, a Habsburg, as king of the Romans (prospective successor to the Holy Roman emperor) in 1486. With his appointment as imperial chancellor in 1493, he pursued a policy of internal reform for the next decade. The reform program presented to Maximilian by the nobility at the Diet of Worms (1495), almost certainly Berthold's work, prescribed the establishment of a permanent high court for the Reich and a 17-member aristocratic council of government.

Maximilian, trying to reestablish imperial authority, opposed the formation of a council, even though the Diet threatened to cut off funds for his war efforts; but, having granted the court in 1495, he finally granted the council also, in 1500. Because neither court nor council members were paid as promised, however, both soon dispersed, and these bodies in effect ceased to exist.

Berthold, Ernst Kuno (German philosopher); see Fischer, Kuno.

Bertholet, Alfred (b. Nov. 9, 1868, Basel, Switz.—d. Aug. 24, 1951, Münsterlingen), Protestant Old Testament scholar, who also wrote on the phenomenology of religion.

After serving as pastor of the German-Dutch church at Leghorn (Livorno) for 18 months, he took his doctorate in Basel (1895) and taught there (1896–1912) and later in Tübingen (1913), Göttingen (1914), and Berlin (1928–39). In biblical criticism he moved progressively toward the school of comparative religion.

His *Apokryphen und Pseudepigraphen* (1906; "Apocrypha and Pseudepigraphia") was an important contribution to Jewish literary history, and the second volume of *Biblische Theologie* (1911; "Biblical Theology"), conceived as a history of Old Testament religion, broke new ground. His works on the history of religion, such as *Dynamismus und Personalismus in der Seelenauffassung* (1930; "Dynamism and Personalism in the Knowledge of the Soul"), *Götterspaltung und Göttervereinigung* (1933; "The Division and the Unification of Gods"), and *Das Geschlecht der Gottheit* (1934; "Sex in Godhood"), also are marked by immense care in the collection of material and by the skill with which problems are laid bare and solutions to them offered.

Berthollet, Claude-Louis, Comte (Count) (b. Dec. 9, 1749, Talloires, near Annecy, Fr.—d. Nov. 6, 1822, Arcueil), French chemist who was the first to note that the completeness of chemical reactions depends in part upon the masses of the reacting substances; he thus came close to formulating the law of mass action. Though he incorrectly concluded that elements unite in all proportions, his resulting controversy with the chemist Joseph-Louis Proust led to the establishment of the law of definite proportions.

Educated in medicine at Turin, Italy, Berthollet later became associated with Antoine Lavoisier, whom he assisted in reforming chemical nomenclature. His researches with hydrocyanic (prussic) acid and hydrogen sulfide led him to disagree with Lavoisier's contention that oxygen was an essential element in all acids. Berthollet discovered the composition of ammonia (1785) and introduced chlorine as a bleaching agent.

During the French Revolution he served on many scientific committees and became a commissioner of the national mint (1792). Appointed commissioner of agriculture and professor at the polytechnic and normal schools (1794), he helped reorganize the academy as the Institut National (1795) and in 1796 headed a commission sent to Italy to select

choice ancient and modern artworks for the national galleries of Paris. He accompanied Napoleon on his expedition to Egypt (1798), where he helped to form an institute modelled on the Institut National and first presented his ideas on chemical equilibria in his book *Essai de statique chimique* (1803).

During the Napoleonic Wars he determined how to obtain iron from ore and convert it into steel. Though his preparation of potassium chlorate did not provide the substitute for saltpetre in gunpowder that he had intended, it did make possible the manufacture of coloured fireworks. Berthollet was also a senator and a grand officer of the Legion of Honour and became a count under the French empire. In retirement he maintained a laboratory and sponsored meetings of distinguished scientists, whose discussions were published between 1807 and 1817.

Berthoud, Ferdinand (b. March 19, 1727, Plancemont, Switz.—d. June 20, 1807, Groslay, Fr.), outstanding horologist and author of extensive treatises on timekeeping.

Berthoud was apprenticed to his brother, a clockmaker at Plancemont, and he subsequently studied in Paris. His indefatigable inventiveness and many publications soon made him influential in horological circles, and he became involved in the attempt to solve the problem of determining longitude at sea.

Berthoud's major achievement was his development of an accurate and practical marine clock, or chronometer. Such an instrument had previously been constructed in expensive and delicate prototypes by Pierre Leroy of France and John Harrison of England. Berthoud's improvements to the chronometer have been largely retained in present-day designs.

He was succeeded in his work by his nephew Pierre-Louis Berthoud (1754–1813), a celebrated chronometer maker in his own right.

Bertillon, Alphonse (b. April 23, 1853, Paris—d. Feb. 13, 1914, Münsterlingen, Switz.), chief of criminal identification for the

Alphonse Bertillon, photograph by Nadar

Archives Photographiques—J.P. Ziolo

Paris police (from 1880) who developed an identification system known as anthropometry, or the Bertillon system, that came into wide use in France and other countries.

The younger brother of the statistician and demographer Jacques Bertillon, Alphonse Bertillon in 1882 introduced his system of identification, which incorporates a series of refined bodily measurements, physical description, and photographs. The Bertillon system was superseded by fingerprinting as the primary method of identification, though it remains an excellent means of furnishing a minutely descriptive portrait, valuable to investigators. Bertillon wrote extensively on his method, one work being *La Photographie judiciaire* (1890). A biography by H.T.F. Rhodes, *Alphonse Bertillon: Father of Scientific Detection*, was published in 1954.

Bertillon, Jacques (b. Nov. 11, 1851, Paris—d. July 7, 1922, Valmondois, Fr.), French

statistician and demographer whose application of quantitative methods to the analysis of a variety of social questions gave impetus to the increased use of statistics in the social sciences.

Though educated as a physician, Bertillon in the 1870s turned to the analysis of statistics, publishing articles on comparative divorce and suicide rates among nations; in 1883 he succeeded his father, Louis-Adolphe Bertillon, as head of the Paris bureau of vital statistics. Over the next 30 years, the bureau, under his direction, increased the kinds of data gathered and developed more elaborate kinds of analysis.

Bertillon worked to establish uniform international statistical standards and saw his "Bertillon classification" of causes of deaths come into use in a number of nations. To facilitate the collection of data in French government offices, he wrote an elementary course in administrative statistics (1895). Increased alcoholism in France and a decline in French population growth relative to the rates in other countries were problems that particularly interested Bertillon. These questions gave rise to several works, including *L'Alcoolisme et les moyens de le combattre jugés par l'expérience* (1904; "Alcoholism and Ways of Combatting It Judged from Experience") and *La Dépopulation de la France* (1911; "The Depopulation of France").

Bertinoro, Obadiah (ben Abraham Yare) of (b. c. 1450, Bertinoro, Papal States—d. before 1516), Italian rabbinic author whose commentary on the Mishnah (the codification of Jewish Oral Law), incorporating literal explanations from the medieval commentator Rashi and citing rulings from the philosopher Moses Maimonides, is a standard work of Jewish literature and since its first printing in 1548 has been published in almost every edition of the Mishnah.

Bertinoro is also remembered as the author of three celebrated letters describing his three-year journey (1486–88) to Jerusalem and containing invaluable descriptions of the people and customs of the Jewish communities he visited on the way, from Italy to Palestine. The letters, written to Bertinoro's father and brother during the period 1488–90, have been published under the titles *Darkhei Zivyon* and *HaMassa le-Erez Yisrael* and translated into several languages. He lived in Jerusalem almost continuously after 1488, acting as spiritual head of the Jewish community there.

Bertoia, Harry (b. March 10, 1915, San Lorenzo, Udine, Friuli-Venezia Giulia, Italy—d. Nov. 6, 1978, Barto, Pa., U.S.), Italian-born American sculptor and designer, best known for his monumental architectural sculptures and his classic Bertoia chair.

The Diamond chair designed by Harry Bertoia, 1952
By courtesy of Knoll International

Bertoia attended the Cranbrook Academy of Art in Bloomfield Hills, Mich., and taught painting and metalworking there from 1937 to 1943. He worked in California with designer Charles Eames (*q.v.*) before joining Knoll Associates in New York City in 1950. His achievements there included the Diamond chair (more commonly known as the Bertoia chair), made of polished steel wire, sometimes vinyl coated, and covered with cotton or with elastic Naugahyde upholstery.

Bertoia claimed that his sculpture evolved when the jewelry he was designing "kept getting larger and larger." Some of his later works, the "sound sculptures," were designed to be activated by the wind or by hand to produce pleasing metallic or airy sound patterns. His numerous major works for public areas include huge decorative flow-welded metal "Sculpture Screens" for major corporations and educational institutions, a large copper and bronze fountain, "Waves," for the Philadelphia Civic Center; the bronze sculpture "View of Earth from Space" at Dulles International Airport near Washington, D.C.; and a "sounding" fountain piece for the sunken outdoor plaza of the Standard Oil building in Chicago.

Bertoldo di Giovanni (b. 1420—d. 1491, Poggio a Caiano, Republic of Florence), Italian Renaissance sculptor and medallist who was a student of Donatello and a teacher of Michelangelo.

He and Bartolomeo Bellano of Padua were the two bronze specialists associated with Donatello, and Bertoldo's earliest known work was executed between 1460 and 1470 on the San Lorenzo pulpits, which had been left unfinished by Donatello. He had the major responsibility for the frieze and also executed work on the relief of the entombment.

Bertoldo produced for his friend Lorenzo de' Medici a battle relief influenced by a Greco-Roman sarcophagus found at Pisa. Toward the end of his life, he was selected as curator of the antiquities collection belonging to Lorenzo de' Medici and as director and teacher in the painting and sculpture school that de' Medici had established in his gardens near San Marco; Michelangelo studied at the school for several years. Other notable works produced by Bertoldo include a relief of "The Crucifixion with Attending Saints," and a bronze statuette of Orpheus and one of Apollo. As a sculptor Bertoldo is notable for his energetic, anatomically precise figures grouped in dynamic compositions.

Bertolucci, Bernardo (b. March 16, 1940, Parma, Italy), Italian film director best known for his film *Last Tango in Paris* (1972), the erotic content of which created an international sensation.

Bertolucci was raised in an atmosphere of comfort and intellectualism. His father—a poet, anthologist, teacher of art history, and film critic—was a strong early influence. Bertolucci's early childhood interest in films came as a result of attending frequent screenings with his father. His first two films, shorts about children, were filmed when Bertolucci was 15 years old. His first book, *In cerca del mistero* (1962; "In Search of Mystery") won the Premio Viareggio, one of Italy's top literary awards. A short time later he embarked on his film career as assistant director to Pier Paolo Pasolini. After his work on Pasolini's *Accattone* (1961) Bertolucci left the University of Rome without graduating and set off on an independent study of film.

Bertolucci made his feature film *La commare secca* (1962; *The Grim Reaper*), which he filmed on location in Rome. The film brought him recognition as a promising young director but was a box office failure. His second feature, *Prima della rivoluzione* (1964; *Before*

the Revolution), fared no better commercially but won notice at the Cannes Film Festival. He won to obtain financial backing for his film projects, Bertolucci directed documentary films and worked with Julian Beck and his Living Theatre on *Agonia* ("Agony"), *Amore e rabbia* (*Love and Rage*), and other productions. His next film, *La strategia del ragno* (1970; *The Spider's Stratagem*), reflects an increasing interest in the interior life of his characters. His *Il conformista* (1970; *The Conformist*) is the film in which Bertolucci attained full maturity as a director. The film's protagonist is a young civil servant who attempts to deal with his own inadequacies through conformity to the prevailing social order in Fascist Italy under Benito Mussolini. *Ultimo tango a Parigi* (*Last Tango in Paris*), released two years later, portrayed a level of eroticism previously considered taboo in general-release films in its study of an affair between a middle-aged widower (Marlon Brando) and a young actress.

Bertolucci's later films included the grandly scaled *Novecento* (1976; *1900*), the intimate *Luna* (1979; "Moon"), and *La tragedia di un uomo ridicolo* (1981; *The Tragedy of a Ridiculous Man*). He scored a notable critical success with *The Last Emperor* (1987), an epic portrayal of the tragic life of P'u-i (Pu Yi), the deposed last emperor of China; the film won nine American Academy Awards, including those for best film and best direction (by Bertolucci).

Bertran DE BORN (b. c. 1140, Viscounty of Limoges, Fr.—d. 1212–15, Abbey of Dalon), French soldier and celebrated medieval troubadour.

Viscount of Hautefort and lord of vast domains, Bertran twice warred with his brother Constantin for sole possession of the family heritage. Their liege lord, Richard the Lion-Heart, Duke of Aquitaine, initially favoured Constantin, successfully besieging Bertran's fortress of Hautefort and expelling him (1183). Later, however, lord and vassal were reconciled; and Bertran, restored to his lands, abetted Richard and his brothers in their rebellions against their father, Henry II of England. After Richard became king of England (1189), Bertran accompanied him on the crusade to Palestine. After returning to France, he wrote violently militant poetry, egging on Richard in his wars with Philip II of France.

Bertran produced some of the most serene and beautiful poetry—as well as some of the most militaristic—in Provençal literature, 45 pieces of which are extant. He is represented in Dante's *Inferno*, in which he carries his severed head before him like a lantern and is compared with the biblical Achitophel, who also incited royal sons against their father (David).

Bertrand DU GUESCLIN (French soldier): see Guesclin, Bertrand du.

Bertrand, Henri-Gratien, Comte (Count) (b. March 28, 1773, Châteauroux, Fr.—d. Jan. 31, 1844, Châteauroux), French military engineer and general, friend of Napoleon I and his companion in exile, first at Elba (1814–15), then at St. Helena (1815–21). His diary is considered invaluable for its frank account of Napoleon's character and life in exile. It was decoded, annotated, and published by P. Fleuriot de Langle as *Cahiers de Sainte-Hélène, 1816–21*, 3 vol. (1949–59, "Notebooks from St. Helena").

Bertrand entered the army at age 19 as an engineer. After service in Italy (1797), where he first met Napoleon, he was sent to Egypt (1798–99) and directed the fortification of Alexandria. He was appointed brigadier general in 1800. Named aide-de-camp to

Napoleon in 1804, he further distinguished himself during the Austrian campaign. The bridges he built for the French crossing of the Danube at Wagram in 1809 were described by Napoleon as the finest since the Romans. Bertrand was created a count in 1808. Appointed grand marshal of the palace in 1813, he later accompanied Napoleon into exile.

Comte Bertrand, detail from a lithograph by F. Cereghetti, c. 1827
By courtesy of the Bibliothèque Nationale, Paris

After Napoleon's death in 1821, Bertrand returned to France, where a death sentence that had been passed on him in absentia (1817) was annulled. In 1840, with the Prince de Joinville, he escorted Napoleon's body from St. Helena to France for its final burial.

Bertrand, Joseph(-Louis-François) (b. March 11, 1822, Paris, Fr.—d. April 5, 1900, Paris), French mathematician and educator remembered for his elegant applications of differential equations to analytical mechanics, particularly in thermodynamics, and for his work on statistical probability and the theory of curves and surfaces.

Bertrand graduated from the École Polytechnique in 1839 with a doctorate in thermodynamics and continued his work in engineering at the École Nationale Supérieure des Mines while teaching at the Collège Saint-Louis. He later also taught at the École Normale Supérieure and the Collège de France.

The author of several mathematical textbooks, Bertrand gave his name to curves with a linear relationship between first and second curvature. In 1899 Bertrand's research on infinitesimal analysis led to his important work, *Calcul des probabilités* ("Calculus of Probabilities"), which introduced a problem in continuous probabilities known as Bertrand's paradox. Bertrand was a member of the French Academy of Sciences and, in 1884, became a member of the Académie Française.

Bertrand, Louis(-Jacques-Napoléon), also called ALOYSIUS BERTRAND (b. April 20, 1807, Ceva, Piedmont [Italy]—d. April 29, 1841, Paris, Fr.), writer whose *Gaspard de la nuit* ("Gaspard of the Night") introduced the prose poem into French literature and was a source of inspiration to the Symbolist poets.

After his family settled in Dijon, Fr., in 1815, Bertrand developed a consuming interest in the ancient Burgundian capital, joining the Société d'Études and collecting historical material, some of which he used in early poems published under the title *Volupté* ("Voluptuousness"). His contributions to a local newspaper, of which he was manager, won the favourable notice of the writers Victor Hugo and Charles-Augustin Sainte-Beuve, and he was drawn to Paris, but he found no suitable employment there. Returning to Dijon, he wrote for a liberal newspaper until its suspension by the ordinances of Charles X against freedom of press and speech that provoked the Revolution of 1830. For three years after the Revolution, he edited the revolutionary *Le Patriote de la Côte d'Or* ("The Gold Coast Patriot").

In 1836 Bertrand sold *Gaspard de la nuit*,

which deals with medieval Dijon, to a publisher, who later decided that the manuscript ran counter to current interest in classicism and failed to publish it. Bertrand died of tuberculosis aggravated by starvation.

Published posthumously in 1842, *Gaspard* at first aroused slight interest; but, discovered a few years later by the poets Charles-Pierre Baudelaire and Stéphane Mallarmé, it secured for its author a place in literary history.

Bertrand, Marcel-Alexandre (b. July 2, 1847, Paris, Fr.—d. Feb. 13, 1907, Paris), French geologist who introduced the theory that certain mountains, in particular the Alps, were formed by folding of the Earth's crust.

In 1886, two years after he first proposed his theory of mountain building, Bertrand became instructor at the École Nationale Supérieure des Mines. During summers he did fieldwork for the French Geological Survey and also attempted to determine how the European mountain chains were created. In 1887 he developed a wave concept of mountain building, postulating successive periods of massive folding of the Earth's crust during which the Caledonian, Hercynian, and Alpine orogenies gradually built up the European system of mountains. Later he introduced a fourth period, the Huronian orogeny, of the Precambrian time.

His work and publications established modern tectonic research, especially in the Alps, but his publications were few and his ideas were spread chiefly by his students. He was elected to the Academy of Sciences in 1896.

Bérulle, Pierre de (b. Feb. 4, 1575, Séréilly, near Troyes, Fr.—d. Oct. 2, 1629, Paris), cardinal and statesman who founded the French Congregation of the Oratory, reforming clerical education in France.

Educated in theology by the Jesuits and at the Sorbonne, Bérulle was ordained in 1599.

Bérulle, detail of a portrait by Philippe de Champaigne
Graudon—Art Resource/EB Inc.

In 1604 he went to Spain. He returned with seven nuns who established the reformed Order of the Discalced Carmelites in France.

As a result of his interest in the clerical reforms that had been proposed by the Council of Trent (1545–63), Bérulle founded the French Oratory (1611), modeled after but independent of the Oratory of St. Philip Neri. The Oratorians, a congregation of priests with no binding vows, founded new seminaries, improved preaching, promoted theological studies, and ultimately caused a general revival of the French clergy. Bérulle's Oratory served as a model for those new congregations of priests that characterize the religious history of 17th-century France—the Lazarists, the Sulpicians, and the Eudists. He exercised a decisive influence on the religious development of the Abbé de Saint-Cyran and so, through him, on Port-Royal, the centre of Jansenism and of literary activity in 17th-century France.

Bérulle unsuccessfully opposed the Cardinal de Richelieu, Louis XIII's minister, and his anti-Spanish policy. He expressed his personal spirituality in a series of devotional writings, the best known of which is the *Discours de l'état et des grandeurs de Jésus* (1623; "Dis-

course on the State and Greatnesses of Jesus"). His interest in meditation and prayer also found its way into his educational policies and became a major part of the clerical reform.

Beruni (India): see *Bārūni*.

Berwald, Franz (Adolf) (b. July 23, 1796, Stockholm, Swed.—d. April 3, 1868, Stockholm), most important Swedish composer of the 19th century.

Born into a renowned family of musicians, Berwald studied violin with his father and composition with J.B.E. Du Puy. He lived in Berlin (1829–41) and Vienna (1842), returned to Sweden, and in 1846–49 was in Paris and Vienna. Unable to earn a living by music, from 1850 to 1858 he managed a glassworks in Angermanland. After teaching at the Stockholm Academy (1864–67), he became professor of composition at the Stockholm Conservatory.

Berwald is considered the founder of musical Romanticism in Sweden and was the first important Swedish symphonist. His music, somewhat influenced by Louis Spohr and Carl Maria von Weber, is highly original in formal construction and use of harmonic resources. His works include six symphonies (1820–45; the fourth was lost) of which the G minor (*Sérieuse*) and the C major (*Singulière*) are particularly esteemed; an opera, *Estrella di Soria*; five cantatas; and concerti for violin, bassoon, and piano.

Berwick-upon-Tweed, town and district, county of Northumberland, England. The northernmost district of England, it has an area of 376 square miles (974 square km).

From the 12th century, when the River Tweed became the Anglo-Scottish boundary, the border town of Berwick was long disputed between English and Scots but, after changing hands 13 times, was finally surrendered to England in 1482. Its ramparts were originally built by Edward I, who gave the town its first English charter in 1302; rebuilt by Elizabeth I, they are in good repair, but little remains of the Norman castle, which was already in ruins when its site was encroached upon to make way for the railway station. The parish church (1648–52) is noteworthy as one of the few built during the Commonwealth. The oldest of the three bridges that cross the Tweed near Berwick dates from 1634; the modern road bridge was built in 1928. Upstream, the Royal Border Bridge, a striking viaduct 126 feet (38 m) high with 28 arches, built by Robert Stephenson in 1847–50, carries the railway.

The district extends southeastward along the North Sea coast, including Holy Island and the Farne Islands (*qq.v.*), and southwestward to the Cheviot Hills. Pop. (1981) town, 12,989; (1986 est.) district, 26,500.

Berwick-upon-Tweed, James Fitzjames, Duke of, EARL OF TINMOUTH, BARON OF BOSWORTH, DUC (duke) DE FITZ-JAMES (b. Aug. 21, 1670, Moulins, Fr.—d. June 12, 1734, Philippsburg, Württemberg [Germany]), English nobleman and marshal of France who was a leading military commander in the French service in the earlier wars of the 18th century.

Fitzjames was the illegitimate son of James, Duke of York (later King James II of England) and Arabella Churchill, the sister of John Churchill, later 1st Duke of Marlborough. Educated in France, he was created Duke of Berwick-upon-Tweed (usually abbreviated to Duke of Berwick) by James II in 1687 and appointed governor of Portsmouth the following year, but he fled to France when James was deposed. Berwick nominally commanded an army of his father's supporters against Marlborough in Ireland and was present at the Battle of the Boyne in 1690. In 1693 he accepted a commission as lieutenant general in the French army.

In 1701 the dispute over the succession to the Spanish throne brought France and Spain to war with the British, the Austrians, and the Dutch. After brief service in Spain in

Duke of Berwick-upon-Tweed, engraving, 17th century

By courtesy of the Bibliothèque Nationale Paris

1704, Berwick held a command against the Huguenot insurgents (Camisards) in Languedoc. By capturing Nice from Eugene of Savoy (1706), he earned the title marshal of France. Returning to Spain, he recaptured Madrid from the Allies, and on April 25, 1707, he decisively defeated the British at the Battle of Almanza, compelling them to evacuate Aragon and enabling the Bourbon king Philip V to maintain his crown. Although Louis XIV made him Duke de Fitz-James in 1710, Berwick received only secondary commands for the duration of the war. On Sept. 11, 1714, he stormed Barcelona, the last stronghold of Catalan resistance to Philip V.

Berwick's invasion of Spain in 1719 put an end to Philip V's pretensions to regency in France. Berwick was killed by a cannon shot while besieging Philippsburg during the War of the Polish Succession.

BIBLIOGRAPHY. Charles Petrie, *The Marshal Duke of Berwick* (1953), examines his life and actions.

Berwickshire, also called **BERWICK**, former county, southeastern Scotland, on the North Sea. Since the reorganization of 1975, its territory (457 square miles [1,184 square km]) has been distributed among the Berwickshire, Roxburgh, and Ettrick and Lauderdale (*qq.v.*) districts of Borders region.

Roman and early British camps were established in various parts of Berwickshire. During the Saxon period the area formed part of Northumbria, and in the 6th and 7th centuries Christianity was introduced. The Dances were also present from the year 886. After the Battle of Carham (1016 or 1018), the area was annexed to Scotland. In 1296 Edward I of England crossed the River Tweed at Coldstream prior to the siege of the town of Berwick-upon-Tweed, which, after years of border warfare, was finally ceded to England in 1482. Duns became the county town. Coldstream became the headquarters of the army in Scotland, and it was there, in the 17th century, that General George Monck's regiment of foot was organized and renamed the Coldstream Guards.

The southern, lowland two-thirds of the old Berwickshire was called the Merse (March, or borderland) and supported considerable agriculture—especially, from the 18th century onward, extensive sheep farming.

Berwickshire, district, Borders region, southeastern Scotland. Created by the reorganization of 1975, it includes most of the former county of Berwickshire. The district, area 338 square miles (875 square km), extends from the Lammermuir Hills in the north to the wide valley of the Merse in the south, where

the River Tweed marks the border with England; on the east, cliffs front the North Sea. The upland moors support sheep and grouse, and the Whiteadder and Blackadder are trout streams running into the fertile Merse. Duns is the seat of the district authority, and Eyemouth is the chief fishing harbour. Pop. (1986 est.) 18,600.

Berwiński, Ryszard Wincenty (b. Feb. 28, 1819, Polwica Poznań, Pol.—d. Nov. 9, 1879, Constantinople, Ottoman Empire [now Istanbul, Tur.]), Polish poet and writer, best known for his *Poezje* (1844; "Poems"), which marked him as a poet of social radicalism.

In his *Studia o literaturze ludowej* (1854; "Studies on Folk Literature"), Berwiński took an international view of folk traditions, stressing their universality and challenging nationalist interpretations popular at the time. Unlike many of his colleagues, he had a university education, having studied in Germany as a young man. A committed and unsentimental revolutionary, he was twice imprisoned, first by the Austrians and later by the Prussians. The Revolution of 1848 freed him, and he became a Polish deputy to the Prussian Parliament, a post he left to travel to Crimea, where he aided a Polish poet, Adam Mickiewicz, in organizing a Polish armed force. After the war the Prussians refused to let him return home; he continued his work in Constantinople, a lonely and forgotten man.

Consult the INDEX first

beryl, mineral composed of beryllium aluminum silicate, $\text{Be}_3\text{Al}_2(\text{SiO}_3)_6$, a commercial source of beryllium. It has long been of interest because several varieties are valued as gemstones. These are aquamarine (pale blue-green); emerald (deep green); heliodor (golden yellow); andmorganite (pink). Beryl is a minor constituent of many granitic rocks and associated pegmatite dikes, in gneisses, and in mica schists. The gem varieties (other than emerald) commonly are found in cavities in pegmatites. Emeralds occur in mica schist and in bituminous limestone. Common beryl of nongem quality is present in many pegmatites, usually disseminated in small crystals. Large crystals, however, have been found: a 200-ton crystal was found in Brazil; a crystal 5.8 m (19 feet) long and 1.5 m (5 feet) in diameter was discovered in the Black Hills, S.D., U.S.; and a radiating group of large crystals, the largest (18 tons) with a length of 5 m and a diameter of 1 m, was discovered in Albany, Maine, U.S. Beryl is not common in detrital deposits. For detailed physical properties, see silicate mineral (table); see also aquamarine; emerald; morganite.

Before 1925 beryl was used only as a gemstone. Thereafter, many important uses were found for beryllium, and common beryl has been widely sought as the ore of this rare element. No large deposits have been found, and much of the production is a by-product in the mining of feldspar and mica. Although the amount of beryl mined fluctuates from year to year, it has increased rather steadily since 1930. Brazil became the major producer; others are Zimbabwe, South Africa, Namibia, and the United States.

berylliosis, systemic industrial disease caused by poisoning with beryllium, usually involving the lungs but occasionally affecting only the skin. There are two forms: an acute illness occurring most frequently in workers extracting beryllium metal from ore or manufacturing beryllium alloys, and a slow-developing chronic disease occurring in scientific and industrial workers who are exposed to beryllium-containing fumes and dust.

The acute disease involves both skin and lungs, causing a burning rash, eye irritation, nasal discharge, a cough, and chest tightness. The skin disease is caused by direct contact with beryllium salts and the lung disease by inhalation of metal dust or beryllium compounds. Most of those affected by acute berylliosis recover within a few months, but a small number of patients develop a highly fatal inflammation of the lung within 72 hours after a brief, massive exposure to beryllium. The chronic disease may occur more than 15 years after exposure, although the later it develops, the milder it is likely to be. It generally causes shortness of breath, especially after exercise, exhaustion, and a dry cough and can produce a permanent, though moderate, disability.

beryllium (Be), formerly (until 1957) **GLUCINIUM**, chemical element, one of the alkaline-earth metals of Group IIa of the periodic table, used in metallurgy as a hardening agent and in many space and nuclear applications. Beryllium was discovered (1798) as the oxide by Louis-Nicolas Vauquelin in beryl and in emeralds, and was isolated (1828) as the metal independently by Friedrich Wöhler and A.-A.-B. Bussy by the reduction of its chloride with potassium.

Properties, occurrence, and uses. Beryllium is a steel-gray metal, quite brittle at room temperature. It does not occur free in nature. Beryllium is estimated to occur in the Earth's igneous rocks to the extent of 0.0006 percent. The minerals beryl (a beryllium aluminum silicate) and bertrandite (a beryllium silicate) have been found in sufficient quantities to constitute commercial ores from which beryllium hydroxide is industrially extracted. The metal itself is industrially produced from beryllium fluoride by reduction with magnesium and from beryllium chloride by electrolysis.

Beryllium is the only stable light metal with a relatively high melting point. These properties, coupled with its excellent electrical conductivity, high heat capacity and conductivity, good mechanical properties at elevated temperatures, oxidation resistance, and very high modulus of elasticity (one-third greater than that of steel), make it of interest for structural and thermal applications as well as for nuclear reactors. Beryllium transmits X-rays 17 times as well as aluminum and has been extensively used in making windows for X-ray tubes. Beryllium is fabricated into gyroscopes, accelerometers, and computer parts for inertial guidance instruments and other devices for missiles, aircraft, and space vehicles, and heavy-duty brake drums and similar applications where a good heat sink is important.

Much beryllium is used as a low-percentage component of hard alloys, especially with copper as the main constituent but also with nickel- and iron-based alloys, for products such as springs. Beryllium-copper is made into tools where sparking might be dangerous, as in powder factories. Beryllium itself contributes nothing to the reduction of sparking but strengthens the copper, which does not form sparks upon impact. Small amounts of beryllium added to oxidizable alloys generate protecting surface films, reducing inflammability in magnesium and tarnishing in silver alloys.

Neutrons were discovered (1932) by Sir James Chadwick as particles ejected from beryllium bombarded by alpha particles. Since then beryllium mixed with an alpha emitter such as radium has been used as a neutron source; for example, by Enrico Fermi to trigger in uranium the first controlled-fission chain reaction (1942).

The only naturally occurring isotope is the stable beryllium-9. Artificial isotopes have been produced, such as beryllium-10 (2,700,-

000-year half-life) and beryllium-8 (which spontaneously fissions into two alpha particles in less than 10^{-15} second).

Compounds. Beryllium has an exclusive +2 oxidation state in all of its compounds. The compounds are generally colourless and have a distinctly sweet taste from whence came the element's former name glucinum. Soluble compounds in the form of solutions, dry dust, or fumes are toxic; they may produce dermatitis or, when inhaled, acute effects similar to those caused by the poison gas phosgene.

The oxygen compound beryllium oxide (BeO) is a high-temperature refractory material characterized by an unusual combination of high electrical resistance and dielectric strength with high thermal conductivity. It has various applications, as in making ceramic ware used in high-temperature nuclear devices. The chlorine compound beryllium chloride (BeCl₂) catalyzes the Friedel-Crafts reaction and is used in cell baths for electro-winning or electrorefining beryllium. Basic beryllium carbonate [BeCO₃ · xBe(OH)₂] precipitated from ammonia (NH₃) and carbon dioxide (CO₂), is utilized as a starting material for synthesis of beryllium salts. Basic beryllium acetate [Be₂O(C₂H₃O₂)₆] is used for the same purpose. Beryllium forms organic coordination compounds and bonds directly with carbon in several organometallic compounds (e.g., beryllium alkyls and aryls).

Berzelius, Jöns Jacob (b. Aug. 20, 1779, near Linköping, Swed.—d. Aug. 7, 1848, Stockholm), Swedish scientist, one of the

Berzelius, detail of an oil painting by Olof Johan Södermark, 1843; in the Royal Swedish Academy of Sciences, Stockholm

By courtesy of Svenska Porträttarkivet, Stockholm

founders of modern chemistry. He is especially noted for his determination of atomic weights, the development of modern chemical symbols, his electrochemical theory, the discovery and isolation of several elements, the development of classical analytical techniques, and his investigation of isomerism and catalysis, which were both given their names by him. He was a strict empiricist and insisted that any new theory be consistent with the sum of chemical knowledge.

As a boy Berzelius developed an interest in chemistry. Except for his fine performance in physics, however, he nearly failed in his medical studies at Uppsala, but he did receive an M.D. degree (1802) and became assistant professor of medicine, botany, and pharmacy at Stockholm. A full professor by 1807, he was elected to the Stockholm Royal Academy of Science the following year and became permanent secretary in 1818. Professor of chemistry at the Royal Caroline Medico-Chirurgical Institute in Stockholm (1815-32), he was made a baron by Charles XIV in 1835.

About 1807 Berzelius began his analysis of the composition of chemical compounds. Working in his spare time and with meagre kitchen laboratory facilities and techniques of his own improvisation and development, he studied about 2,000 compounds over a 10-year period. He used oxygen as the basis of reference for the atomic weights of other elements and was guided by the law of multiple proportions, atomic theory, the principles of isomorphism, and Gay-Lussac's law of combining volumes. His resulting table of combining proportions and atomic weights, published in 1818 and revised in 1826, attained a remarkable degree of accuracy.

In the meantime Berzelius had begun experiments on the electrolysis of various solutions. This work led to his dualistic electrochemical theory that compounds are made up of two electrically different (positively and negatively charged) components. In attempting to extend his hypothesis to include organic as well as inorganic compounds, he contributed to the founding of radical theory.

Berzelius discovered the elements cerium (1803), selenium (1817), and thorium (1828). He isolated silicon (1823), zirconium (1824), and titanium (1825); classified minerals on a chemical basis; and made detailed studies of the compounds of tellurium, vanadium, molybdenum, tungsten, uranium, and other elements. Sometimes called the father of gravimetric analysis, he introduced the use of the water bath, desiccator, wash bottle, filter paper, rubber tubing, and improved blowpipe technique.

He published more than 250 original papers, mostly in Swedish, in the *Transactions* of the Stockholm Academy. His progress reports on chemistry and physics and his textbook of chemistry, which went through five editions and was translated into German and French, greatly influenced the development of chemistry in his time.

Berzsenyi, Dániel (b. May 7, 1776, Egyházashetye, Hung.—d. Feb. 24, 1836, Nikla), poet who first successfully introduced classical metres and themes in Hungarian poetry.

Berzsenyi was a country squire who lived far from any town and was for many years unconnected with any literary circle. His activity as a poet was discovered by chance, and he became known through the efforts of Ferenc Kazinczy, a leading advocate of reform in Hungarian prosody. His only volume of poetry was published in 1813. In 1817 Ferenc Kölcsey, another Hungarian poet of the period, made an unduly severe judgment on Berzsenyi's work. Deeply hurt, Berzsenyi thereafter virtually ceased to write poetry. This loss to Hungarian literature Kölcsey himself, in a moving funeral oration on Berzsenyi, deplored bitterly.

Berzsenyi was imbued with the spirit of the classics. The influence of Latin poetry, partic-

Berzsenyi, engraving by Miklós Barabás, 1859

Interfoto MTI Hungary

ularly that of Horace, is noticeable not only in the form of his poems but also in his vocabulary, his choice of subjects, and his philosophy. The grandeur of his thought and the concise vigour of his expression are impressive. His love of Hungary and his attachment to the ideals dictated by an uncompromising moral rectitude are the source of several splendid odes. One of these, "A magyarokhoz" ("To the Hungarians"), bitterly castigates the decadence of his compatriots.

Bes, a minor god of ancient Egypt, represented as a dwarf with large head, goggle eyes, protruding tongue, bowlegs, bushy tail, and usually a crown of feathers. The name Bes is now used to designate a group of deities of similar appearance with a wide variety of ancient names. The god's figure was that of a grotesque mountebank and was intended to inspire joy or drive away pain and sorrow, his hideousness being perhaps supposed to scare

Bes represented as a dwarf, statue; in the Louvre
Giraudon—Art Resource

away evil spirits. He was portrayed on mirrors, ointment vases, and other personal articles. He was associated with music and with childbirth and was represented in the "birth houses" devoted to the cult of the child god. Contrary to the usual rule of representation, Bes was commonly shown full-faced rather than in profile, since full-faced figures were marginal to the normal, ordered world.

Besançon, city, capital of Doubs *département*, Franche-Comté *région*, eastern France. It lies astride a horseshoe meander of the Doubs River, 45 miles (75 km) east of Dijon. It early became the chief town (Vesontio) of the Sequani Gauls and in 58 BC was taken by Julius Caesar. Besançon became the seat of an archbishopric in the 2nd century, and its prelates eventually acquired considerable temporal power. In 1184 the Holy Roman emperor Frederick Barbarossa made it a free imperial city. During the 14th century it fell to the dukes of Burgundy, from whom it passed to the Habsburg emperor Maximilian I through his marriage to Mary of Burgundy. During the ensuing period of Austro-Spanish domination (1477–1674), Besançon became prosperous and superseded Dole as the virtual capital of the region of Franche-Comté. The town became an object of dispute between Spain and France and was finally ceded to Louis XIV of France in 1674.

Besançon formally became the capital of Franche-Comté province in 1676, at which time the regional parliament, university, and mint were transferred there from Dole. The town was fortified by the great French military engineer Sébastien le Prestre de Vauban, and the citadel he designed still stands 387 feet (118 m) high on a rock behind the town, on the site of the former Roman castrum. Besançon was bombarded by the Austrians in 1814

and was damaged by the Germans in World War II.

The Roman remains at Besançon include a triumphal arch (Porte Noire), a theatre or amphitheatre, and an aqueduct. In addition, one of the modern bridges spanning the Doubs incorporates part of a Roman bridge. The city's Cathedral of Saint-Jean has been reconstructed several times since its founding in the 4th century. The Palais Granvelle (1534–40) occupies an arcaded courtyard in the centre of town. The Grande Rue is the city's main street, with many notable buildings; Victor Hugo was born at No. 140. The old city is separated from newer residential and industrial districts by a main road. The Doubs River is bordered by fine quays and shady promenades as it winds around three sides of the city. Besançon's industrial suburbs lie across the river to the north.

The watch- and clockmaking trades were introduced to Besançon by Swiss refugees in the late 18th century, and the city is still France's chief centre for these industries. Textile and leather works are also located in Besançon, which is the capital of the Franche-Comté economic-planning region. Pop. (1990) 119,194.

Besant, Annie, née Wood (b. Oct. 1, 1847, London, Eng.—d. Sept. 20, 1933, Adyar, Madras [now in Tamil Nādu, India]), British social reformer, sometime Fabian socialist, theosophist, and Indian independence leader.

Besant had been the wife of an Anglican clergyman. They separated in 1873, and Besant became associated for many years with the atheist and social reformer Charles Bradlaugh. She was an early advocate of birth control, and in the late 1880s she became a prominent Fabian socialist under the influence of George Bernard Shaw. Finally, in 1889, she was converted to the doctrines of the Russian-born religious mystic Helena Blavatsky, a cofounder of the Theosophical Society. The teachings of the society emphasized human service, a spiritual evolutionism drawn from both Eastern and Western esoteric philosophy, and the role of suprahuman masters of wisdom. Besant plunged vigorously into theosophical work, lecturing and writing widely. Her numerous books and articles are still considered among the best expositions of theosophical belief. She was international president of the Theosophical Society from 1907 until her death, residing principally at its headquarters in Madras. She was active in educational and humanitarian work in India and became involved in the Indian independence movement, establishing the Indian Home Rule League in 1916. She promoted her protégé, Jiddu Krishnamurti, whom she believed to be a potential world teacher, in the years before his renunciation of formal theosophy in 1929.

Besant, Sir Walter (b. Aug. 14, 1836, Portsmouth, Hampshire, Eng.—d. June 9, 1901, London), English novelist and philanthropist, whose best work describing social evils in London's East End helped set in motion movements to aid the poor.

From 1861 to 1867 Besant taught at the Royal College, Mauritius, and in 1868 he became secretary to the Palestine Exploration Fund. In 1871 he began a literary collaboration with James Rice, editor of *Once a Week*, which lasted until Rice's death (1882). During that time they produced 14 romantic, improbable, and verbose novels.

In 1882 Besant published his first independent novel, entitled *All Sorts and Conditions of Men* and based on his impressions of the East London slums, which he saw as joyless rather than vicious places. The "Palace of Delights" that he projected in his book became a reality when the People's Palace was founded

(1887) in Mile End Road, London, in an attempt to provide education and recreation to the slum dwellers of the area; Besant cooperated in its establishment. His book *Children of Gibeon* (1886) also described slum life.

Walter Besant, engraving by G. Kruell

Besant wrote 32 novels in the 19 years after Rice's death, including *Dorothy Forster* (1884) and *Armored of Lyonnesse* (1890). His biographies include *Rabelais* (1879), and he also wrote a long series of historical and topographical studies (1902–12) of London. He helped to found the Society of Authors in 1884 and edited its journal until his death. Besant was knighted in 1895.

Beskid Mountains, Czech BESKYDY, Polish BESKIDY, discontinuous series of forested mountain ranges lying in the eastern Czech Republic, northwestern Slovakia, and southern Poland. The Czech sections at the western end of the Carpathian Mountains lie south and east of the Moravian Gate and are identified locally by smaller units. The Moravian-Silesian Beskid Mountains, which extend from the eastern Czech Republic into southern Poland, are made up of the Radhošť and Lysá mountain groups. Around this central section are grouped the Těšínské Beskidy, to the north; the Hlóstýnské Mountains, southwest; the Vsatské, or Vsetínské, Mountains, south; and, further south, along the Czech-Slovak border, the Javorníky. The Slovak Beskidy lie to the east along the Slovakian side of the frontier with Poland. The highest points in the Beskid Mountains are Mount Babia (5,659 feet [1,725 m]) in Poland and Mount Pilsko (5,108 feet [1,557 m]) in Slovakia. Iron deposits in the northwest foothills of the Beskidy led to the establishment of the iron and steelworks of the Ostrava district in what is now the Czech Republic.

The Beskid group has a mountain climate: dry summers are suitable for pasture and sheep breeding, and the ample snow encourages winter sports centred on Frncštát and Vsetín.

bess beetle, also called **BESS-BUG**, **BETSY BUG**, or **HORNED PASSALUS BEETLE** (family Passalidae), any of approximately 800 species of insects found mainly in the tropics but also in North America (e.g., *Passalus cornutus*) and characterized by their large size, ranging between 30 and 40 mm (1.2 and 1.6 inches) in length. Because of their shiny black wing covers (elytra), they are sometimes called patent-leather beetles. They are rather flat and squarish with a horn that points forward on the top of the head.

Bess beetles live together under the bark of decaying logs in a primitive social organization. Both the male and female process the food (decaying wood) and feed it to the larvae. Similar sharing of work between males and females occurs only in termite societies. Bess beetle adults and larvae communicate by

Bess beetle (*Popilius disjunctus*)

Richard Parker

sounds that are audible to humans. The adult rubs its wings across rough patches on the abdomen, and the larva rubs its vestigial (degenerate) hind pair of legs against its middle legs.

Bessa Luís, Maria Agustina (b. Oct. 15, 1922, Vila Meã, Port.), novelist and short-story writer influenced by Marcel Proust and Franz Kafka whose fiction diverged from the predominantly neorealistic regionalism of mid-20th-century Portuguese literature to incorporate elements of surrealism.

Of the more than a dozen novels Bessa Luís had published by the late 20th century, the best known was *A Sibila* (1954; "The Sybil"), which won the Eça de Queirós prize and in which the boundary between physical, psychological, and ironic reality is tenuous and the characters gain an almost mythic quality. In Bessa Luís's fiction, notions of time and space become vague, and planes of reality flow together, dimming the sense of a logical order of events. Her prose has been called "metaphysical" and "ultra-psychological," and Kafkaesque elements may be distinguished in the fictional world she creates. Other well-known novels of Bessa Luís include *Os Incuráveis* (1956; "The Incurables"), *A Muralha* (1957; "The Stone Wall"), *O Susto* (1958; "The Fright"), *O Manto* (1961; "The Mantle"), and *O Sermão de Fogo* (1963; "The Sermon of Fire").

Bessa Victor, Geraldo, Victor also spelled **VÍTOR** (b. Jan. 20, 1917, São Paulo de Luanda, Angola), Angolan lyric poet whose work expresses the dream of racial harmony and the need to recapture the openness and purity of childhood.

Bessa Victor's poetry in Portuguese includes *Ecos dispersos* (1941; "Scattered Echoes"), *Ao som das marimbas* (1943; "To the Sound of the Marimbas"), *Mucanda* (1946), *Debaixo do céu* (1949; "Under the Sky"), *Cubata abandonada* (1958; "The Abandoned Hut"), and *Monandengue* (1973; "Child"). A selection of his work was translated into French by Gaston-Henry Aufrère and published as *Poèmes africains* (1967; "African Poems"). A controversial poet, Bessa Victor has been crit-

icized for his exoticism and his failure to articulate the rage of oppressed Africans; others have praised his vision, the musicality of his verse, and his capacity to see the best in both African and European civilizations.

Bessa Victor was also the author of a collection of short stories, *Sanzala sem Batuque* (1967; "The Slave House with Gaiety"), as well as of books on Kimbundu proverbs, Angolan history, and African literary themes. In *Quinjangô no folclore angolense* (1970), he described and analyzed the folklore of Angola. He continued the Angolan tradition of the poet-scholar that has been prominent since the late 19th century. In all his writings, there was a warmth of tone and a gentleness of expression. Bessa Victor resided for a number of years in Lisbon.

Bessarabia, Russian **BESSARABIYA**, Romanian **BASARABIA**, Turkish **BESARABYA**, region in eastern Europe that passed successively, from the 15th to 20th century, to Moldavia, the Ottoman Empire, Russia, Romania, the Soviet Union, and Ukraine and Moldova. It is bounded physically by the Prut River on the west, the Dniester River on the north and east, the Black Sea on the southeast, and the Kiliya (Chilia) arm of the Danube River delta on the south.

Although the early history of Bessarabia is obscure, it is known that Greek colonies were founded along its Black Sea coast (7th century BC) and that it was probably included in the kingdom of Dacia (2nd century AD). The Slavs began to enter the area in the 6th century, but their settlement was interrupted by invasions of other peoples from the east (ending with the Mongol invasion in the 13th century).

Bessarabia

At the end of the 14th century the southern portion of the region became part of Walachia (the name Bessarabia probably is derived from the Walachian dynasty Basarab); and in the 15th century the entire province was incorporated into the principality of Moldavia. Shortly thereafter the Turks invaded and captured Akkerman and Chilia (1484) and annexed the southern portion of Bessarabia, dividing it into two *sancaks* (districts) of the Ottoman Empire. The remainder of Bessarabia fell under Turkish domination when Moldavia submitted to the Turks in the 16th century. The region remained under Turkish control until the 19th century.

Then Russia, whose interest in the area had developed during the 18th century (it had occupied the region five times between 1711 and 1812), acquired Bessarabia and half of Moldavia (Treaty of Bucharest, 1812). The name Bessarabia was applied to the entire region. Russia retained control of the region until World War I (with the exception of a strip of southern Bessarabia, which was in Moldavia's possession from 1856 to 1878). During the beginning of the 19th century, Russia granted Bessarabia autonomy (1818–28) and allowed it a Moldavian governor and archbishop. But

by the end of the century, Russification in both the civil and ecclesiastical administrations was the dominant policy.

A nationalist movement developed in Bessarabia after the Russian Revolution of 1905; and, in November 1917 (after the Russian revolutions of 1917), a council (*sfatul țarei*) was established. It declared Bessarabia's independence on Jan. 24, 1918, and voted to unite with Romania in December. The Treaty of Paris (Oct. 28, 1920) confirmed this union, but the Soviet Union never recognized Romania's right to the province. After the German-Soviet Nonaggression Pact was signed (Aug. 23, 1939), the Soviet Union demanded (June 26, 1940) that Romania cede Bessarabia and the northern portion of Bukovina. The Romanian government complied; Soviet troops entered the region on June 28. In August 1940 Moldavia, or the Moldavian Soviet Socialist Republic, was created out of the central districts of Bessarabia and a strip of Ukrainian territory on the other side of the Dniester River. Kishinyov (now Chisinau) became Moldavia's capital. The northern region of Bessarabia (Khotin) and the coastal plain from the Danube to the Dniester were incorporated into Ukraine, or the Ukrainian S.S.R. During World War II, Romanians occupied Bessarabia and temporarily reorganized it as part of Romania. The Soviet Union seized it in 1944, and the territorial arrangements of 1940 were reestablished. Bessarabia remained divided after Ukraine and Moldavia (now Moldova) declared independence in 1991.

Bessarabia contains much of archaeological interest, including mounds and barrows of early epochs, remains of a wall built by the Roman emperor Trajan, some traces of Greek and Roman towns, and some forts along the Dniester built by the Genoese in the 14th century. Bessarabia is a favoured area for agriculture, chiefly for cereals, fruit, and wine. *See also* Moldova.

Bessarion, John, original name **BASIL BESSARION** (b. Jan. 2, 1403, Trebizond, Trebizond empire [now Trabzon, Tur.]—d. Nov. 18, 1472, Ravenna [Italy]), Byzantine humanist and theologian, later a Roman cardinal, and a major contributor to the revival of letters in the 15th century.

Bessarion was educated at Constantinople (Istanbul) and became a monk in 1423. In 1437 he was made archbishop of Nicaea (now Iznik, Tur.) by the Byzantine emperor John VIII Palaeologus. He accompanied John to Italy in order to negotiate a union between the Byzantine and Western churches as a means of mobilizing assistance against the Turks, who had invaded the Balkan Peninsula and threatened Constantinople.

At the councils held in the Italian cities of Ferrara and Florence, Bessarion supported union, which was unacceptable to others in the Byzantine church. Bessarion, however, remained in communion with Rome and gained the favour of Pope Eugenius IV, who made him a cardinal in 1439. Thereafter, he lived in Italy. At Rome he contributed to the development of the Roman Academy of History and of Archaeology, and, with his former teacher Gemistus Plethon, the celebrated Neoplatonist, he attracted a circle of philosophers devoted to the study of Plato. From 1450 to 1455 he served as papal governor of Bologna and was sent on embassies to various foreign princes, including King Louis XI of France in 1471.

One of the most learned scholars of his time, Bessarion spread knowledge of Greek language and learning by building a personal library that included a large collection of Greek manuscripts, by his patronage of scholars, and by his writing. He later donated his library to the Senate of Venice. Bessarion was made patriarch of Constantinople in 1463. His most important work is considered to be

In calumniatorem Platonis, a treatise defending Plato against the fervid Aristotelianism of George of Trebizond. His attempts to reconcile the two philosophies influenced Italian philosophy, which assimilated the Byzantine philosophical tradition after the fall of Constantinople in 1453.

Bessel, Friedrich Wilhelm (b. July 22, 1784, Minden, Brandenburg [now in Germany]—d. March 17, 1846, Königsberg, Prussia [now Kaliningrad, Russia]), German astronomer whose measurements of positions for about 50,000 stars allowed the first accurate determination of interstellar distances; he was the first to measure the distance of a star other than the Sun.

Life and accomplishments. Bessel was born in Westphalia, the son of a poor government employee. At the age of 15, he entered an export-import firm. During his apprentice-

Bessel, engraving by E. Mandel after a painting by Franz Wolf

The Bettmann Archive

ship, dreaming of travel, he studied languages, geography, the habits of distant peoples, and the principles of navigation, which led him to astronomy and mathematics. Working at night, in 1804 he wrote a paper on Halley's Comet in which he calculated the orbit from observations made in 1607. He sent it to the astronomer Wilhelm Olbers, who was so impressed that he arranged its publication in *Monatliche Correspondenz* (x, 1804) and proposed Bessel as assistant at the Lilienthal observatory of the celebrated lunar observer J.H. Schröter. Bessel, who was liked and appreciated by his commercial firm, was obliged to choose between a position of relative affluence if he remained in it and poverty and the stars if he left it. He decided for the latter.

After Bessel had spent only four years at Lilienthal, the Prussian government charged him with the construction at Königsberg of the first big German observatory. In 1810 he was appointed professor of astronomy at the University of Königsberg, where he worked assiduously on the reconstruction of the whole science of astronomical observations, directing the observatory from the date of its completion in 1813 until the end of his life.

In geodesy, Bessel's contributions include a correction in 1826 to the seconds pendulum, the length of which is precisely calculated so that it requires exactly one second for a swing. During 1831–32 he directed geodetical measurements of meridian arcs in East Prussia, and in 1841 he deduced a value of $1/299$ for the ellipticity of the Earth—i.e., the amount of elliptical distortion by which the Earth's shape departs from a perfect sphere. He was the first to make effective use of the heliometer, an instrument designed for measuring the apparent diameter of the Sun. He introduced corrected observations for the so-called personal equation, a statistical bias in measurement characteristic of the observer himself that must be eliminated before results can be

considered reliable, and he made a systematic study of the causes of instrumental errors. His own corrected observations were more accurate than any previous ones, and his methods offered the way to great advances in the field.

The later achievements of Bessel were possible only because he first established the real framework of the universe by making accurate measurements of the positions and motions of the nearest stars, making corrections for various measuring errors caused by imperfections in his telescopes and by disturbances in the atmosphere. He reduced, or systematized, the observations of the English astronomer James Bradley, correcting for the effects of instrumental errors in the mean positions of 3,222 stars and publishing the results in *Fundamenta Astronomiae* (1818); this work marked the beginning of modern astrometry (positional astronomy). The uniform system of reduction that Bessel established in *Tabulae Regiomontanae* (1830) long remained standard. Having established exact positions for thousands of individual stars at his observatory in Königsberg, he was ready to observe exceedingly small but highly significant motions, relative to one another, among them. Choosing 61 Cygni, a star barely visible to the naked eye and known to possess a relatively high velocity in the plane of the sky, Bessel showed that, after correcting for this, the star apparently moved in an ellipse every year. This back and forth motion, called parallax, he said could only be interpreted as being caused by the motion of the Earth around the Sun. Calculation indicated a distance from Earth to 61 Cygni of 10.3 light-years. (The nearest star known is Alpha Centauri, 4.3 light-years away.) Olbers, presented with these conclusions on his 80th birthday, thanked Bessel and said the gift "put our ideas about the universe for the first time on a sound basis." Bessel was honoured for this achievement by the Royal Astronomical Society of London and others.

Another major discovery by Bessel was that the two bright stars Sirius and Procyon execute minute motions that could be explained only by assuming that they had invisible companions disturbing their motions. The existence of such bodies, now named Sirius B and Procyon B, was confirmed with more powerful telescopes after Bessel's death. An important share in the discovery of the planet Neptune also belongs to Bessel. In a paper read in 1840, he called attention to exceedingly small irregularities in the orbit of Uranus, which he had observed and concluded were caused by an unknown planet beyond.

Assessment. Bessel was a scientist whose works laid the foundations for a better determination than any previous method had allowed of the scale of the universe and the sizes of stars, galaxies, and clusters of galaxies. In addition, he made fundamental contributions to accurate positional astronomy, the exact measurement of the positions of celestial bodies; to celestial mechanics, dealing with their movements; and to geodesy, the study of the Earth's size and shape. Further, he enlarged the resources of pure mathematics by his introduction and investigation of what are now known as Bessel functions, which he used first in 1817 to investigate the very difficult problem of determining the motion of three bodies moving under mutual gravitation. Seven years later he developed Bessel functions more fully for the treatment of planetary perturbations. Much credit for the final establishment of a scale for the universe in terms of solar system and terrestrial distances, which depends vitally on accurate measurement of the distances of the nearest stars from the Earth, must go to Bessel.

BIBLIOGRAPHY. Additional biographical information may be found in the *Dictionary of Scientific Biography*, ed. by Charles C. Gillispie, vol. 2, pp. 97–102 (1970), and in works on astronomy, such as Henry S. Williams, *The Great Astronomers*

(1930); and Agnes M. Clerke, *A Popular History of Astronomy During the Nineteenth Century*, 4th ed. rev. (1902).

Bessel function, also called **CYLINDER FUNCTION**, any of a set of mathematical functions systematically derived around 1817 by the German astronomer Friedrich Wilhelm Bessel during an investigation of solutions of one of Kepler's equations of planetary motion. Particular functions of the set had been formulated earlier by the Swiss mathematicians Daniel Bernoulli, who studied the oscillations of a chain suspended by one end, and Leonhard Euler, who analyzed the vibrations of a stretched membrane.

After Bessel published his findings, other scientists found that the functions appeared in mathematical descriptions of many physical phenomena, including the flow of heat or electricity in a solid cylinder, the propagation of electromagnetic waves along wires, the diffrac-

Bessel functions

Encyclopædia Britannica, Inc.

tion of light, the motions of fluids, and the deformations of elastic bodies. One of these investigators, Lord Rayleigh, also placed the Bessel functions in a larger context by showing that they arise in the solution of Laplace's equation ($\nabla^2 v$) when the latter is formulated in cylindrical (rather than Cartesian or spherical) coordinates.

Specifically, a Bessel function is a solution of the differential equation

$$x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} + (x^2 - n^2) y = 0,$$

which is called Bessel's equation. For integral values of n , the Bessel functions are

$$J_n(x) = \frac{x^n}{2^n n!} \left[1 - \frac{x^2}{2(2n+2)} + \frac{x^4}{2 \cdot 4(2n+2)(2n+4)} - \dots \right].$$

The graph of $J_0(x)$ looks like that of a damped cosine curve, and that of $J_1(x)$ looks like that of a damped sine curve (see Graph).

Certain physical problems lead to differential equations analogous to Bessel's equation; their solutions take the form of combinations of Bessel functions and are called Bessel functions of the second or third kind.

Bessemer, city, Jefferson county, north-central Alabama, U.S. Named for Sir Henry Bessemer, it was founded on the site of Fort Jonesboro in 1887 by Henry F. DeBardeleben, a local coal baron who built the first steel plant in the area. Bessemer's Bell furnace produced the first basic iron in Alabama. In 1922 an explosion at the nearby dolomite mine killed 100 persons. The city was planned as a steel centre, and its manufactures included railroad cars, pipe, structural materials, chemicals, and explosives. Service industries now dominate the city's economy. Inc. 1887. Pop. (1994 est.) 31,822.

Bessemer, Sir Henry (b. Jan. 19, 1813, Charlton, Hertfordshire, Eng.—d. March 15,

1898, London), inventor and engineer who developed the first process for manufacturing steel inexpensively (1856), leading to the development of the Bessemer converter. He was knighted in 1879.

Bessemer, detail of an oil painting by Rudolf Lehmann; in the Iron and Steel Institute, London

Bessemer was the son of an engineer and typesetter. He early showed considerable mechanical skill and inventive powers. After the invention of movable stamps for dating deeds and other government documents and the improvement of a typesetting machine, he went to the manufacture of "gold" powder from brass for use in paints. The florid decoration of the time demanded great quantities of such material, and Bessemer's secret process soon brought him great wealth.

He developed other inventions, notably sugarcane-crushing machinery of advanced design, but he was soon devoted to metallurgy. In his time there were but two iron-based construction materials: cast iron made by the treatment of iron ore with coke in the blast furnace and wrought iron made from cast iron in primitive furnaces by the laborious manual process of "puddling" (stirring the melted iron to remove carbon and raking off the slag). Cast iron was excellent for load-bearing purposes, such as columns or bridge piers, and for engine parts, but for girders and other spans, and particularly for rails, only wrought iron was suitable. Puddling removed carbon, which makes cast iron brittle, and produced a material that could be rolled or forged, but only in "blooms," or large lumps of 100–200 pounds, and that was full of slag. The blooms had to be laboriously forged together by steam hammers before they could be rolled to any useful length or shape. The only material known as steel was made by adding carbon to pure forms of wrought iron, also by slow and discontinuous methods; the material was hard, would take an edge, and was used almost entirely for cutting tools.

During the Crimean War, Bessemer invented an elongated artillery shell that was rotated by the powder gases. The French authorities with whom he was negotiating, however, pointed out that their cast-iron cannon would not be strong enough for this kind of shell. He thereupon attempted to produce a stronger cast iron. In his experiments he discovered that the excess oxygen in the hot gases of his furnace appeared to have removed the carbon from the iron pigs that were being preheated—much as the carbon is removed in a puddling furnace—leaving a skin of pure iron. Bessemer then found that blowing air through melted cast iron not only purified the iron but also heated it further, allowing the purified iron to

be easily poured. This heating effect is caused by the reaction of oxygen with the carbon and silicon in the iron. Utilizing these new techniques, which later became known as the Bessemer process (*q.v.*), he was soon able to produce large, slag-free ingots as workable as any wrought-iron bloom, and far larger; he invented the tilting converter into which molten pig iron could be poured before air was blown in from below. Eventually, with the aid of an iron-manganese alloy, which was developed at that time by Robert Forester Mushet, Bessemer also found how to remove excess oxygen from the decarburized iron.

His announcement of the process in 1856 before the British Association for the Advancement of Science in Cheltenham, Gloucestershire, brought many ironmasters to his door, and many licenses were granted. Very soon, however, it became clear that two elements harmful to iron, phosphorus and sulfur, were not removed by the process—or at least not by the fireclay lining of Bessemer's converter. It was not until about 1877 that the British metallurgist Sidney Gilchrist Thomas developed a lining that removed phosphorus and made possible the use of phosphoric ores of the Continent.

Bessemer had, unknown to himself, been using phosphorus-free iron, but the ironmasters were not so lucky. Their iron was perfectly satisfactory for the puddling process, in which phosphorus is removed because the temperatures are lower, but it could not be used in the Bessemer process. Bessemer was forced to call in his licenses and find a phosphorus-free source of iron in northwestern England; thus he was able to enter the steel market on his own. Once the phosphorus problem was recognized and solved, he became a licensor once again, and vast profits flowed in. It became clear that "mild steel"—as it was known to distinguish it from the hard tool steels—could more clearly and reliably be used in place of wrought iron for ship plate, girders, sheet, rods, wire, rivets, and other items. The invention of the open-hearth (Siemens-Martin) process in the late 1860s eventually outstripped that of the Bessemer process. This has now yielded place, in great measure, to oxygen steelmaking, which is a further development and refinement of the Bessemer process.

In his later years—the process had not become a clear success until he was nearing 70—Bessemer continued to invent and make discoveries. The solar furnace he built was more than a successful toy; he designed and built an astronomical telescope for his own amusement; and he developed a set of machines for polishing diamonds that helped to reestablish that trade in London.

Apart from his knighthood, he received many honours, such as the Fellowship of the Royal Society. Bessemer's *An Autobiography* (1905), with a concluding chapter by his son, Henry Bessemer, is the only comprehensive biography and the source of most material written about him since. (J.P.S.)

Bessemer process, the first method discovered for mass-producing steel. Though named after Sir Henry Bessemer of England, the process evolved from the contributions of many investigators before it could be used on a broad commercial basis. It was apparently conceived independently and almost concurrently by Bessemer and by William Kelly of the United States. As early as 1847, Kelly, a business-scientist of Pittsburgh, Pa., began experiments aimed at developing a revolutionary means of removing impurities from pig iron by an air blast; Kelly theorized that not only would the air, injected into the molten iron, supply oxygen to react with the impurities, converting them into oxides separable as slag, but that the heat evolved in these reactions would increase the temperature of the mass, keeping it from solidifying during the operation. After

several failures, he succeeded in proving his theory and rapidly producing steel ingots.

In 1856 Bessemer, working independently in Sheffield, developed and patented the same process. Whereas Kelly had been unable to perfect the process owing to a lack of financial resources, Bessemer was able to develop it into a commercial success. Another Englishman, Robert Forester Mushet, found that adding an alloy of carbon, manganese, and iron after the air-blowing was complete restored the carbon content of the steel while neutralizing the effect of remaining impurities, notably sulfur. A Swedish ironmaster, Goran Goransson, redesigned the Bessemer furnace, or converter, making it reliable in performance. The end result was a means of mass-producing steel. The resultant volume of low-cost steel in Britain and the United States soon revolutionized building construction and provided steel to replace iron in railroad rails and many other uses.

The Bessemer converter is a cylindrical steel pot approximately 6 m (20 feet) high, originally lined with a siliceous refractory. Air is blown in through openings (tuyeres) near the bottom, creating oxides of silicon and manganese, which become part of the slag, and of carbon, which are carried out in the stream of air. Within a few minutes an ingot of steel can be produced, ready for the forge or rolling mill.

The original Bessemer converter was not effective in removing the phosphorus present in sizable amounts in most British and European iron ore. The invention in England, by Sidney Gilchrist Thomas, of what is now called the Thomas-Gilchrist converter, which was lined with a basic material such as burned limestone rather than an (acid) siliceous material, overcame this problem. Another drawback to Bessemer steel, its retention of a small percentage of nitrogen from the air blow, was not corrected until the 1950s. The open-hearth process, which was developed in the 1860s, did not suffer from this difficulty, and it eventually outstripped the Bessemer process to become the dominant steelmaking process until the mid-20th century. The open-hearth process was in turn replaced by the basic oxygen process, which is actually an extension and refinement of the Bessemer process.

Bessey, Charles E., in full CHARLES EDWIN BESSEY (b. May 21, 1845, near Milton, Ohio, U.S.—d. Feb. 25, 1915, Lincoln, Neb.), botanist who introduced to the United States

Bessey, c. 1910

the systematic study of plant morphology and the experimental laboratory for botanical instruction on the college level. His arrangement of angiosperm (flowering plant) taxa, emphasizing the evolutionary divergence of primitive forms, is considered by many as the system most likely to form the basis of a modern, comprehensive taxonomy of the plant kingdom. Because of its emphasis on North American species, however, Bessey's taxonomy in its original form, representing 23 years of development (1893–1915), has found

application only in the north-central region of the United States.

At Iowa State Agricultural College, Ames, where he taught botany (1870–84), Bessey established a European laboratory method of undergraduate instruction with rudimentary facilities that included a single compound microscope. By 1884, when he accepted the chair of botany at the University of Nebraska (which he held until 1915), he had so developed the experimental study of plant morphology that the recently founded university immediately became one of the nation's outstanding centres for botanical research.

Bessey's works include *Botany for High Schools and Colleges* (1880), *The Essentials of Botany* (1884), and *Essentials of College Botany* (1914), all widely popular textbooks that dominated botanical instruction in the United States for more than half a century.

Bessières, Jean-Baptiste, DUC (duke) D'ISTRIE (b. Aug. 6, 1768, Prayssac, Fr.—d. May 1, 1813, Rippach, Saxony [Germany]). French soldier and, as one of Napoleon's marshals, commander of the imperial guard after 1804. His appointment as marshal signaled Napoleon's intention to develop the imperial guard.

In 1792 Bessières joined Louis XVI's constitutional guard as a private. After serving in Catalonia as a captain, he was chosen to command Napoleon's escort in Italy in 1796. He fought bravely at Aboukir, Egypt, in 1798 and two years later commanded 800 men of the consular guard at the Battle of Marengo (June 14). In 1805, with 9,000 guards, he led the famous charge against the Russian guard cavalry at Austerlitz (December 2).

Bessières, engraving

By courtesy of the Bibliotheque Nationale, Paris

In Spain Bessières's victory at Medina de Ríoseco (1808) enabled Napoleon's brother Joseph to reach Madrid and establish himself as king of Spain. Commanding the cavalry corps against Austria in 1809, Bessières led charges to cover the retreat in the Battle of Aspern-Essling (May 22) and to gain time at the Battle of Wagram (July 5–6), where he was severely wounded. Yet he was soon sent to end the British Walcheren expedition in Flanders. In 1809 he was created duke of Istria. Sent back to Spain in command of 50,000 men to hold the north, he was unable to bring more than a few of his cavalry to join André Masséna for the Battle of Fuentes de Oñoro (May 3, 1811). In 1812 Bessières led the guard cavalry to Russia and lost them almost without fighting. On the day before the Battle of Lützen (May 2), he was killed in a clash at nearby Rippach while on reconnaissance.

Besson, Jacques (b. 1540, Grenoble, Fr.—d. 1576, Orléans), engineer whose improvements in the lathe were of great importance in the development of the machine-tool industry and of scientific instrumentation.

Besson's designs, published in his illustrated treatise *Theatrum instrumentorum* (1569), introduced cams and templates (patterns used to guide the form of a piece being made) to the screw-cutting lathe, thus increasing the

operator's mechanical control of tool and workpiece and permitting the production of more accurate and intricate work in metal. He also improved the drive and feed mechanism of the ornamental lathe and described a more efficient form of waterwheel, considered a prototype of the water turbine.

Bessus (d. c. 329 BC), Achaemenid satrap (governor) of Bactria and Sogdiana under King Darius III of Persia. In 330, after Alexander the Great had defeated Darius in several major battles, Bessus murdered Darius and assumed the kingship as Artaxerxes IV. He then attempted to continue resistance against Alexander in the eastern part of the empire but was captured and killed for his regicide.

Best, Charles H(erbert) (b. Feb. 27, 1899, West Pembroke, Maine, U.S.—d. March 31, 1978, Toronto, Ont., Can.), physiologist who, with Sir Frederick Banting, was the first to

Best

By courtesy of the University of Toronto, photograph, Ashley & Crippen, Toronto

obtain (1921) a pancreatic extract of insulin in a form that controlled diabetes in dogs. Successful use of insulin in treating human patients followed. Because Best did not receive his Doctor of Medicine degree until 1925, he did not share the Nobel Prize for Physiology or Medicine awarded to Banting and J.J.R. Macleod in 1923 for their role in the work. Best also discovered the vitamin choline and the enzyme histaminase. He was the first to introduce anticoagulants in treatment of thrombosis (blood clots).

In May 1921, while still an undergraduate, Best became a laboratory assistant to Banting at the University of Toronto. He continued as research associate in the Banting and Best Department of Medical Research, created at the university in 1923, and succeeded Banting as director (1941–67). With Banting he wrote *Internal Secretions of the Pancreas* (1922).

Best Friend of Charleston, first locomotive built in the United States for regular railway service. A vertical boiler mounted on a

four-wheel carriage, the *Best Friend* was built by the West Point Foundry of New York and put into service on a broad-gauge line from Charleston to Hamburg, S.C., by the South Carolina Canal and Rail Road Company on Dec. 25, 1830. The line later became part of the Southern Railway System.

best of all possible worlds, in the philosophy of the 17th- and 18th-century philosopher Gottfried Wilhelm Leibniz, the present world of monads (infinitesimal psychophysical entities) coordinated in preestablished harmony. Among all possible worlds that God could have created, his actual choice of one over the others required a "sufficient reason," which, for Leibniz, was the fact that this world was the "best"—despite the existence of evident evils; for any other "possible world" would have had evils of its own sort of even greater magnitude. Had it lacked a sufficient reason to explain its existence (and implicitly its contingency), the world for Leibniz would have existed of necessity. Voltaire's *Candide* (1759) was a satirical rejection of Leibniz' optimistic view of the world.

best-seller, book that, for a time, leads all others of its kind in sales, a designation that serves as an index of popular literary taste and judgment. *Bookman*, an American magazine of literature and criticism, began running best-seller lists in 1895, when it began publication. The list was compiled from reports of sales at bookstores throughout the country. Similar lists began to appear in other literary magazines and in metropolitan newspapers. The lists most commonly considered authoritative in the United States are those of *Publishers Weekly* and *The New York Times*. The practice spread from the United States; the British list generally considered most authoritative is that of *The Sunday Times* (London), reprinted in *Bookseller*.

Such lists are obviously of greatest use to publishers and booksellers. From the beginning there has been a tendency among both critics and the general public to suppose that because a book is a best-seller it cannot have literary merit. This is not necessarily true.

Students of popular literary taste point out that the leading categories of books, in terms of sales, are religious and "inspirational" books, books of advice for self-improvement, romantic and semihistorical novels, and novels of sex and sensationalism.

Excluded from such lists are the works of William Shakespeare, the Bible, and direct-mail and book-club sales. The all-time best-seller in the English-speaking world—said to be unequaled in sales—is the Bible. Indeed,

Best Friend of Charleston locomotive, replica, built in 1928 from the original plans

By courtesy of the Southern Railway System

in the United States, in the period since 1895, the only book that has outsold it in a given month is Margaret Mitchell's *Gone with the Wind* (1936), a historical novel set in the South during the American Civil War and Reconstruction periods.

Other all-time best-selling titles, such as Charles Sheldon's *In His Steps* (an estimated 8,000,000 copies since 1897), Lloyd C. Douglas' *The Robe* (1942), and Henry Morton Robinson's *The Cardinal* (1950), reveal the popularity of books with religious themes. Also highly popular among American readers are books of self-improvement or self-help, such as Dale Carnegie's *How to Win Friends and Influence People* (1937), Benjamin Spock's *The Common Sense Book of Baby and Child Care* (1946), and Thomas Harris' *I'm O.K., You're O.K.* (1969).

The advent of the mass-produced paperback, which began in the late 1930s, resulted in separate paperback best-seller lists, beginning in 1976. Other categories that are highly successful are cookbooks (*Better Homes and Gardens Cook Book* has sold more than 18,000,000 copies since 1930) and crime—both fiction and nonfiction (e.g., Mario Puzo's *The Godfather* [1969] and Carl Bernstein and Robert Woodward's *All the President's Men* [1974]). The taboo against sexual explicitness that earlier resulted in censorship or moral disapproval had disappeared by the second half of the 20th century, so that Jacqueline Susann's novel *Valley of the Dolls* (1966) and David Reuben's *Everything You Always Wanted to Know about Sex but Were Afraid to Ask* (1969) were both among the top 20 all-time best-sellers.

bestiary, literary genre in the European Middle Ages consisting of a collection of stories, each based on a description of certain qualities of an animal, plant, or even stone. The stories presented Christian allegories for moral and religious instruction and admonition.

The numerous manuscripts of medieval bestiaries ultimately are derived from the Greek *Physiologus*, a text compiled by an unknown author before the middle of the 2nd century AD. It consists of stories based on the "facts" of natural science as accepted by someone called Physiologus (Latin: "Naturalist"), about whom nothing further is known, and from the compiler's own religious ideas.

Decorated initial for the story about the unicorn in a late 12th-century Latin bestiary (Harley MS. 4751, folio 6v); in the British Library

Reproduced by permission of the British Library Board

The *Physiologus* consists of 48 sections, each dealing with one creature, plant, or stone and each linked to a biblical text. It probably originated in Alexandria and, in some manuscripts, is ascribed to one or other of the 4th-century bishops Basil and Epiphanius, though it must be older. The stories may derive from popular fables about animals and plants. Some Indian influence is clear—for example, in the introduction of the elephant and of the Peridexion tree, actually called Indian in the *Physiologus*. India may also be the source of the story of the unicorn, which became very popular in the West.

The popularity of the *Physiologus*, which circulated in the early Middle Ages only less widely than the Bible, is clear from the existence of many early translations. It was translated into Latin (first in the 4th or 5th century), Ethiopian, Syriac, Arabic, Coptic, and Armenian. Early translations from the Greek also were made into Georgian and into Slavic languages.

Translations were made from Latin into Anglo-Saxon before 1000. In the 11th century an otherwise unknown Thetbaldus made a metrical Latin version of 13 sections of the *Physiologus*. This was translated, with alterations, in the only surviving Middle English *Bestiary*, dating from the 13th century. It, and other lost Middle English and Anglo-Norman versions, influenced the development of the beast fable. Early translations into Flemish and German influenced the satiric beast epic. Bestiaries were popular in France and the Low Countries in the 13th century, and a 14th-century French *Bestiaire d'amour* applied the allegory to love. An Italian translation of the *Physiologus*, known as the *Bestiario toscano*, was made in the 13th century.

Many of the medieval bestiaries were illustrated; the manuscript of the earliest known of these is from the 9th century. Illustrations accompanying other medieval manuscripts are often based on illustrations in the *Physiologus*, as are sculptures and carvings (especially in churches) and frescoes and paintings well into the Renaissance period.

The religious sections of the *Physiologus* (and of the bestiaries that were derived from it) are concerned primarily with abstinence and chastity; they also warn against heresies. The frequently abstruse stories to which these admonitions were added were often based on misconceptions about the facts of natural history: e.g., the stag is described as drowning its enemy, the snake, in its den; and the ichneumon as crawling into the jaws of the crocodile and then devouring its intestines. Many attributes that have become traditionally associated with real or mythical creatures derive from the bestiaries: e.g., the phoenix's burning itself to be born again, the parental love of the pelican, and the hedgehog's collecting its stores for the winter with its prickles. These have become part of folklore and have passed into literature and art, influencing the development of allegory, symbolism, and imagery, though their source in the bestiary may be frequently overlooked.

Bestuzhev-Ryumin, Aleksey Petrovich, Count (Graf) (b. June 1 [May 22, Old Style], 1693, Moscow, Russia—d. April 21 [April 10], 1766, Russia), diplomat and statesman who controlled Russia's foreign affairs during the reign of the empress Elizabeth.

Sent by Peter the Great to Copenhagen and Berlin for his education, Bestuzhev began his diplomatic career in the service of the Elector of Hanover at the Congress of Utrecht, which met in 1712 to end the War of the Spanish Succession. He subsequently went to London when the elector became George I of England, and he then served briefly in the court of Anna (Duchess of Courland and future empress of Russia). In 1721 he became the Russian minister at Copenhagen. The death

of Peter (1725), however, prevented Bestuzhev's further advancement until 1740, when he was recalled to Russia by Ernst J. Biron, the empress Anna's chief adviser.

After a brief period of imprisonment following Biron's fall from power (1740), Bestuzhev was appointed vice chancellor by the new empress Elizabeth (1741). He soon became convinced that Russia's interests conflicted with those of France and Prussia and sought to ally Russia with Austria and Great Britain. Despite opposition within Elizabeth's court, Bestuzhev, aided by his brother, the diplomat Mikhail Petrovich, concluded an Anglo-Russian defensive alliance in December 1742.

His opponents subsequently prevented Bestuzhev from forcing Sweden (which was France's ally) to cede all of Finland to Russia, despite Russia's victory in the Russo-Swedish War of 1741–43, and they also concluded a Russo-Prussian defensive alliance (March 1743). But Bestuzhev, appointed chancellor in 1744, continued to prepare for an alliance with Austria, which, after much court intrigue, he finally concluded on May 22, 1746.

After the War of the Austrian Succession (1740–48), in which Russia fought from 1746 as the ally of Austria and Great Britain against France and Prussia, Bestuzhev tried to maintain his alliance system. In 1756, however, Prussia and Great Britain allied against France and Austria, and, in response, Bestuzhev's Council of Ministers proposed in March 1756 that Russia enter an alliance with Austria, France, and Poland against Prussia and Great Britain. Bestuzhev, stubbornly opposed to any Russian alliance with France, refused to support the proposal. Instead, he plotted with the grand duchess Catherine (future Catherine II the Great) to gain her support for his policies in return for his future support in making her regent when Elizabeth died. These intrigues only further weakened his influence, which already was insufficient to stop his opponents from concluding an alliance with France (Dec. 31, 1756) and drawing Russia into the Seven Years' War (1756–63).

In 1758 Bestuzhev was accused of engaging in treasonous activities, arrested, and condemned to death; in April 1759 his sentence was commuted to banishment to his estate at Goretovo. Despite his public exoneration when Catherine ascended the throne (1762), he never resumed a leading role in public affairs.

Besztercebánya (Slovakia): *see* Banská Bystrica.

Bet Alfa, also spelled BEIT ALPHA, or BEIT ALFA, ancient site in northeastern Israel, noted for the remains of a synagogue (founded 6th century AD) that was discovered in 1928 by kibbutz workers digging drainage ditches. The kibbutz was founded in 1922 by Polish Jewish immigrants, who revived the historical name of Bet Alfa for their settlement.

Little remains of the synagogue building (which was thoroughly excavated in 1929) except the floor and wall outlines. The mosaic floor, in three panels, depicts Noah's Ark, the signs of the zodiac, and the sacrifice of Isaac. The building was probably destroyed by an earthquake in the 6th century.

bet din, also spelled BETH DIN (Hebrew: "house of judgment"), plural BATTE DIN, Jewish tribunal empowered to adjudicate cases involving criminal, civil, or religious law. The history of such institutions goes back to the time the 12 tribes of Israel appointed judges and set up courts of law (Deuteronomy 16:18).

During the period of the Second Temple of Jerusalem (516 BC–AD 70), three types of *batte din* operated side by side. The highest court, called Great Bet Din, or Sanhedrin, consisted of 70 or 71 members and convened on the Temple grounds to legislate and interpret Jewish Law. Its powers included the right

to appoint judges for the two types of lower courts; the higher of these was called the Small Sanhedrin, had 23 members, presided over criminal cases, and functioned in virtually every town of 120 or more male inhabitants. The smallest of the *batte din* had three judges each.

Historically, the functions and power of *batte din* varied according to the social and political conditions of the Jewish communities under their jurisdiction. Thus, in Spain, because of its large Jewish population, the king granted the *bet din* jurisdiction over criminal cases, and in Poland, Jews had recourse to a *bet din* as a court of last appeal until 1764. Elsewhere the powers of *batte din* were sometimes restricted to questions of ritual only.

Batte din still operate throughout the modern world under the direction of rabbinic scholars who adjudicate questions affecting their Jewish communities. In Israel all questions of personal status (e.g., divorce and marriage) are resolved by religious courts. In countries where civil law requires that all divorces be granted by civil courts, Orthodox and Conservative Jews are nonetheless required to obtain a religious divorce before remarriage from either a *bet din* or a rabbi who is competent to preside over affairs of divorce.

Bet Lehem (Israeli-occupied Jordan): see Bethlehem.

Bet She'an, also spelled BETH-SHAN, Arabic BAYSĀN, or BEISĀN, town, northeastern Israel, principal settlement in the low Emeq Bet She'an (*emeq*, "valley"), site of one of the oldest inhabited cities of ancient Palestine. It is about 394 ft (120 m) below sea level.

Roman amphitheatre, Bet She'an, Israel
A. Riwkin—Ostman Agency

Overlooking the town to the north is Tel Bet She'an (Arabic Tall al-Huṣṣān), one of the most important stratified mounds in Palestine. It was excavated in 1921–33 by University of Pennsylvania archaeologists, who found that the lowest strata date from the late Chalcolithic period in the country (c. 4000–3000 BC) and progress successively upward to Byzantine times (c. AD 500). A series of buildings, including temples and administrative buildings, span the Egyptian period—the earliest from the time of Thutmose III (ruled 1504–1450 BC), and the latest dating to Ramses III (1198–66 BC). The local Canaanite deity Mekal was especially venerated. Important stelae (stone monuments) tell of the conquests of Pharaoh Seti I (1318–04 BC) and of the worship of the goddess Astarte. It was to the temple of this goddess that King Saul's armour was brought after his death, and his body was hung from the city wall (1 Sam. 31:10). Later, the town's Jewish community is mentioned in rabbinic literature.

During the Hellenistic period, the city was called Scythopolis; it was taken by the Romans in 64 BC and given the status of an

imperial free city by Pompey. In 1960 a finely preserved Roman amphitheatre, with a seating capacity for about 5,000, was uncovered. The city was an important centre of the Decapolis (a league of 10 Hellenistic cities) and under Byzantine rule was the capital of the northern province of Palaestina Secunda. It declined after the Arab conquest (AD 636).

Although an Arab town for centuries, Bet She'an long had a Jewish settlement; in the Middle Ages the topographer Ashtori ha-Parḥi settled there and completed his work *Kaṭṭor wa-ferah*, the first Hebrew book on the geography of Palestine (1322).

In modern times the town was one of the centres of Arab terrorism, 1936–39. Part of the territory allocated to Israel by the United Nations partition plan of November 1947, it was taken by the Haganah, the Jewish defense forces, on May 12, 1948, three days before the proclamation of Israel's statehood. The Arab population fled; after the Arab–Israeli War (1948–49), the town was resettled with new immigrants, including many refugees from Arab countries. Bet She'an is a centre of Israel's chief cotton-growing region, and many of its residents work in the neighbouring kibbutzim. Local industries include a textile mill and clothing factory. Pop. (1982 est.) 13,400.

Bet She'arim, agricultural cooperative settlement (moshav) and archaeological site in northern Israel, near the western end of the Plain of Esdraelon. Ancient Bet She'arim (Hebrew: House [of the] Gates), about 3 mi (5 km) east-northeast of the modern settlement (founded in 1936), is frequently mentioned in rabbinic sources. These recount that Rabbi Judah ha-Nasi (c. AD 135–220) presided over the Sanhedrin, or supreme Jewish rabbinical tribunal there, and that upon his death his remains were transferred to Bet She'arim for burial. In the following two centuries the town became the central necropolis of Jewry. The bodies of prominent Jews who died abroad were brought to Bet She'arim for burial. Destroyed in the 4th century, the site lay forgotten for centuries, until rediscovered in 1875. Excavations, begun in 1936 under the auspices of the Jewish Palestine Exploration Society, revealed the ruins of one of the largest synagogues of ancient Palestine (now partially restored), destroyed in 352.

Burial at Bet She'arim was in elaborate catacombs, of which more than 20 have been discovered. The sarcophagi there and the catacomb walls have funerary inscriptions in Hebrew, Aramaic, and Greek and are a valuable primary source for Jewish history of the Talmudic period. The presence of many decorative motifs on the sarcophagi, contrary to the Mosaic Law, shows strong Hellenistic influence among the Jews of the period. Bet She'arim is frequently called Sheikh Abreiq in archaeological literature. Pop. (1982 est.) 370.

Bet Yerah: see Beth Yerah.

beta-aminoisobutyric acid excretion, also called BAIB excretion, a metabolic process under simple genetic control in human beings and the higher primates, the significance of which is not currently fully understood. Beta-aminoisobutyric acid (BAIB), an amino acid end product of pyrimidine metabolism, is excreted in trace quantities into the urine in almost all human beings, but the excretion of relatively large quantities of BAIB appears to be the result of a simple autosomal recessive allele. Although excretion of amino acids in the urine is frequently a symptom of a metabolic disorder, often genetic in nature, the excretion of high levels of BAIB does not appear to be deleterious, but neither is its adaptive significance yet clear. It has been observed that women excrete increased amounts of BAIB during pregnancy, an example of a nongenetic high BAIB excretion.

The number of persons showing high levels

of BAIB excretion (i.e., the frequency of the recessive allele governing the trait) has a racial distribution: Europeans, Australian Aborigines, and Indic peoples rarely show it (fewer than 12 percent of the population); it is moderately common among Asians and American Indians (45–50 percent); and it is quite common in Melanesians (about 85 percent).

beta blocker, in full BETA-ADRENERGIC BLOCKING AGENT, any of a group of synthetic drugs used to treat a wide range of diseases and conditions of the sympathetic nervous system.

Stimulation by adrenalin of beta-type receptor sites, which predominate in cells of the heart and are present in vascular and other smooth muscle, results in excitation of the sympathetic nervous system. The administering of a beta blocker diminishes reaction at the beta receptor sites, thereby preventing or decreasing excitation. The drugs are prescribed to control anxiety and hypertension and to treat a variety of cardiac conditions, including anginal pain and cardiac arrhythmias. The drugs have proved to be successful in reducing a patient's risk of a second heart attack.

Beta Centauri, 11th brightest star in the night sky, a visual binary star with apparent magnitude of 0.61. It is the second brightest star (after Alpha Centauri) in the southern constellation Centaurus and is about 300 light-years from the Earth.

beta decay, any of three processes of radioactive disintegration by which some unstable atomic nuclei spontaneously dissipate excess energy and undergo a change of one unit of positive charge without any change in mass number. The three processes are called electron emission, positron (positive electron) emission, and electron capture. Beta decay was named (1899) by Ernest Rutherford when he observed that radioactivity was not a simple phenomenon. He called the less penetrating rays alpha and the more penetrating rays beta. Most beta particles are ejected at speeds approaching that of light.

All atoms heavier than ordinary hydrogen have a nucleus consisting of neutrons and protons (neutral and positively charged particles), surrounded by negative electrons; these orbital electrons are not involved in electron emission. In electron emission, also called negative beta decay (symbolized β^- -decay), an unstable nucleus ejects from itself an energetic electron (of relatively negligible mass) and an antineutrino (with no rest mass), and a neutron in the nucleus becomes a proton that remains in the product nucleus. Thus, negative beta decay results in a daughter nucleus, the proton number (atomic number) of which is one more than its parent but the mass number (total number of neutrons and protons) of which is the same. For example, hydrogen-3 (atomic number 1, mass number 3) decays to helium-3 (atomic number 2, mass number 3). The energy lost by the nucleus is carried away by the ejected electron and the antineutrino, so that beta particles from a radioactive material have energy ranging from zero to a distinct maximum, characteristic of the unstable parent.

In positron emission, also called positive beta decay (β^+ -decay), a proton in the parent nucleus decays into a neutron that remains in the daughter nucleus and ejects a positron, which is a positive particle like an ordinary electron in mass but of opposite charge, along with a neutrino, which has no mass. Thus, positive beta decay produces a daughter nucleus, the atomic number of which is one less than its parent and the mass number of which is the same. Positron emission was first observed by Irène and Frédéric Joliot-Curie in 1934.

In electron capture, an electron orbiting around the nucleus combines with a nuclear proton to produce a neutron, which remains in the nucleus, and a neutrino, which is ejected. Most commonly the electron is captured from the innermost, or *K*, shell of electrons around the atom; for this reason, the process often is called *K*-capture. As in positron emission, the nuclear positive charge and hence the atomic number decreases by one unit, and the mass number remains the same.

Each chemical element consists of a set of isotopes the nuclei of which have the same number of protons but differ in the number of neutrons. Within each set the isotopes of intermediate mass are stable or at least more stable than the rest. For each element, the lighter isotopes, those deficient in neutrons, generally tend toward stability by positron emission or electron capture, whereas the heavier isotopes, those rich in neutrons, usually approach stability by electron emission.

In comparison with other forms of radioactivity, such as gamma or alpha decay, beta decay is a relatively slow process. Half-lives for beta decay are never shorter than a few milliseconds.

Beta Lyrae, eclipsing binary star, the two component stars of which are so close together that they are greatly distorted by their mutual attraction; they exchange material and share a common atmosphere. Beta Lyrae is of about third magnitude and lies in the northern constellation Lyra.

The variable character of Beta Lyrae was discovered in 1784 by the English amateur astronomer John Goodricke. Its period of about 13 days is increasing by about 10 seconds per year, probably because the stars are steadily losing mass to a continually expanding gaseous ring surrounding them.

beta particle, electron (unit negative charge) or positron (unit positive charge) spontaneously emitted by certain unstable atomic nuclei in the radioactive disintegration process of beta decay (*q.v.*).

Betancourt, Rómulo (b. Feb. 22, 1908, Guatiré, Miranda, Venezuela—d. Sept. 28, 1981, New York City), left-wing, anti-Communist politician who, as president of Venezuela, pursued policies of agrarian reform, industrial development, and popular participation in government.

Betancourt
Lee Matig

While a student at the University of Caracas, Betancourt was jailed (1928) for his activities against the dictatorial regime of Juan Vicente Gómez. Released after a few weeks, he continued to demonstrate against Gómez and was exiled, remaining abroad until 1936. During this period he wrote a book about his experiences and briefly joined the Communist Party in Costa Rica.

He returned to Venezuela in 1937 but was again exiled in 1939; he was permitted to return in 1941, in which year he helped

found Acción Democrática, a left-wing anti-Communist party that came to power in 1945 following a coup against the government of Gen. Isaías Medina Angarita.

Appointed provisional president after the coup, Betancourt established a new constitution and inaugurated a program of moderate social reform, providing land for the peasants and exercising greater control over the petroleum industry. He resigned in 1948 to permit the election of a successor, but a coup a few months later, led by Marcos Pérez Jiménez, drove him once again into exile.

Betancourt spent the next 10 years in the United States, Cuba, Puerto Rico, and Costa Rica, directing the remnants of the outlawed Acción Democrática. Jiménez was overthrown in 1958, and Betancourt returned to Venezuela and was elected president. Harassed by pro-Cuban Communists on one side and frightened conservatives on the other, he steered a middle course, passing an agrarian law to expropriate large estates, initiating an ambitious program of public works, and fostering industrial development to prevent complete dependence on petroleum revenues. He retired as president in 1964 and lived for eight years in self-imposed exile in Switzerland, finally returning to Venezuela in 1972 and campaigning unsuccessfully for reelection to the presidency in 1973. At the time of his death he was visiting New York City.

betatron, device that accelerates electrons (beta particles) to high speeds in a circular orbit. The first successful betatron was completed in 1940 at the University of Illinois, Champaign-Urbana, under the direction of the American physicist Donald W. Kerst, who had deduced the detailed principles that govern the operation of such a device.

The betatron consists of an evacuated tube formed into a circular loop and embedded in an electromagnet in which the windings are parallel to the loop. Alternating electric current in these windings produces a varying magnetic field that periodically reverses in direction. During one quarter of the current cycle, the direction and strength of the magnetic field at the orbit, as well as the rate of change of the field inside the orbit, all assume the values needed to accelerate electrons in one direction.

The acceleration is brought about by two forces, one acting in the direction of the electrons' motion and the other at right angles to that direction. The force in the direction of the motion is exerted by the electric field induced along the circle by the strengthening of the magnetic field within the circle. The perpendicular force arises as the electrons move through the magnetic field at the orbit.

At the beginning of the proper quarter-cycle, electrons are injected into the betatron, where they traverse hundreds of thousands of orbits, gaining energy all the while. At the end of the quarter-cycle, the electrons are deflected to a target to produce X rays or other phenomena. Large betatrons have produced electron beams with energies greater than 340 MeV (million electron volts) for use in research. Weight problems become severe with high-energy betatrons; the electromagnet of a 340-MeV unit weighs about 330 tons. X rays generated by betatron beams of about 20 MeV are widely used in industrial radiography.

betel, also called ARECA NUT, PINANG, or PENANG, either of two different plants whose fruit is used in combination for chewing, or masticatory, purposes throughout wide areas of southern Asia and the East Indies. Betel chewing is a habit of an estimated one-tenth of the world's population. The betel nut is the seed of the areca, or betel palm (*Areca catechu*), family Palmae, and the betel leaf is from the betel pepper, or pan plant (*Piper betle*), family Piperaceae.

The areca palm, cultivated in India, Sri

Lanka, Thailand, Malaysia, and the Philippines, has a slender, unbranched trunk reaching 12 or 15 metres (40 or 50 feet) high and about 45 centimetres (18 inches) in circumference and is topped by a crown of six to nine very large, spreading, pinnate fronds. The fruit is about the size of a small hen's egg. Within its fibrous rind is the seed, or nut, the albumen of which is hard and has a mottled gray and brown appearance.

The betel nut, seed of the areca palm (*Areca catechu*)

Wayne Lukasz-Group IV—The National Audubon Society Collection/Photo Researchers

The fruits of the areca palm, gathered between August and November, before they are quite ripe, are husked, boiled in water, cut into slices, and dried in the sun, becoming dark brown or black.

For chewing, a small piece of the areca palm's fruit is wrapped in a leaf of the betel pepper, along with a pellet of shell lime or chunam to cause salivation and release the stimulating alkaloids. In some cases cardamom, turmeric, or another aromatic is added for flavour and stimulation. Chewing results in a copious flow of brick-red saliva, which may temporarily dye the mouth, lips, and gums orange brown. Contrary to general belief, the teeth of habitual chewers are not blackened by the betel juice, but chewers often artificially stain the teeth black. Betel nuts are a source of inferior catechu (*q.v.*); its chief alkaloid is arecoline, a drug used by veterinarians as a worming agent.

Betelgeuse, also called ALPHA ORIONIS, brightest star in the constellation Orion, marking the eastern shoulder of the hunter. Its name is derived from the Arabic word *bat al-dshauzâ*, which means "the giant's shoulder." Betelgeuse has an apparent magnitude of 0.4 and is one of the most luminous stars in the night sky. Though modern astronomers have detected little or no variability in its brightness, the English astronomer John Herschel claimed to have detected a small, irregular variability in 1836. Betelgeuse is easily discernible to even the casual observer, not only because of its brightness and position in the brilliant Orion but also because of its deep-reddish colour. The star is approximately 310 light-years from the Earth.

Betelgeuse is one of the largest stars known. It is classified as a red supergiant; its diameter varies between 430 and 625 times the diameter of the Sun over a period of 5.8 years. For comparison, Mars's orbit around the Sun has a diameter that is 328 times that of the Sun.

beth din (Judaism): *see* bet din.

Beth-Shan (Israel): *see* Bet She'an.

Beth Yerah, also spelled BET YERAH, Arabic KHIRBET KERAK, ancient fortified settlement located at the southern tip of the Sea of Galilee. Beth Yerah was settled in the Early Bronze Age (c. 3100–2300 BC) and was also populated from the Hellenistic to the Arab periods (c. 2nd century BC to 12th century AD). Archaeological findings suggest that it may be the location of Philoteria, a town built by Ptolemy II of Philadelphus, and Sennabris, identified

by Josephus as the northernmost point of the Jordan valley.

Among the important archaeological finds at Beth Yerah are a Roman fort and bath, a synagogue, and a Christian basilica built in the 5th century AD and destroyed in the 7th century. A type of black and red Early Bronze Age pottery of Anatolian origin was discovered there and named Khirbet Kerak ware.

Bethanie, also spelled BETHANIEN, village, southern Namibia. Bethanie is situated at the site of a spring in an arid region; the region edges into the extremely arid Namib Desert on the west. It lies at an elevation of 3,773 feet (1,150 m), 19 miles (31 km) north of a station on the country's main rail line, 165 miles (265 km) inland from the Atlantic fishing port of Lüderitz.

In 1814 Heinrich Schmelen, a missionary of the London Missionary Society, established at Bethanie the first mission station in southwestern Africa. The mission was set up for the Nama (local Khoekhoe) and the Oorlams (people of white and Khoekhoe ancestry who arrived with Schmelen from the Cape Colony). His home at Bethanie is believed to be the oldest European dwelling in Namibia. Although abandoned shortly thereafter, the mission was reopened in the early 1840s by Hans Christian Knudsen, a Norwegian missionary of the Rhenish (German Lutheran) Missionary Society. Schmelen and Knudsen made the earliest (independent) attempts at putting the difficult Nama (Khoisan) language into written form. German colonial troops were stationed at Bethanie in 1894. The region surrounding Bethanie has long been one of the principal Karakul (Persian lamb) ranching areas in Namibia, and Bethanie is the area's most important local market centre. Pop. (latest estimate) 4,400.

Bethany, Arabic AL-'AYZARIYYAH, small village and biblical site on the eastern slopes of the Mount of Olives, just outside Jerusalem. It was under Jordanian control from 1949 to 1967. After the Six-Day War of 1967, it became part of the West Bank territory under Israeli occupation. It came under control of the Palestinian Authority in the wake of the 1993 Oslo Accords.

Bethany is mentioned frequently in the New Testament. It was the home of Mary and Martha and their brother Lazarus, and the miracle of Lazarus's resurrection took place there (John 11). The Arabic name al-'Ayzariyyah is derived from the name Lazarus. Bethany was also the home of Simon the Leper (Matthew 26; Mark 14). Jesus lodged there after his entry into Jerusalem (Matthew 21:17), and it was from the village that he parted from his disciples (Luke 24:50–51). There are many traditional holy sites in Bethany, including the crypt of Lazarus, who is revered locally. Although churches have been built there from at least the 3rd century AD, most of them are now in ruins, and the traditional sites are ascribed to differing Gospel accounts. Bethany is widely visited by Christian pilgrims. Pop. (1997) 12,807.

Bethany, city, Oklahoma county, central Oklahoma, U.S., immediately west of Oklahoma City. It was established in 1909 as a religious colony, centred on Southern Nazarene University, which was established as Oklahoma Holiness College in 1909 but later merged with the Texas Holiness University. Until the mid-1990s pool halls, dance halls, movie theatres, beauty salons, and the use of alcoholic beverages were prohibited by local blue laws. Bethany's industry, like that of Oklahoma City, is based on the manufacture of aviation equipment and the processing of agricultural products. Inc. 1931. Pop. (2004 est.) 19,871.

Bethe, Hans Albrecht (b. July 2, 1906, Strassburg, Ger. [now Strasbourg, France]—d.

March 6, 2005, Ithaca, N.Y., U.S.), German-born American theoretical physicist, who helped to shape classical physics into quantum physics and increased the understanding of the atomic processes responsible for the properties of matter and of the forces governing the structures of atomic nuclei. He received the Nobel Prize for Physics in 1967 for his work on the production of energy in stars. Moreover, he was a leader in emphasizing the social responsibility of science.

Bethe studied physics at the University of Frankfurt and did research in theoretical physics at the University of Munich, where he obtained the doctorate in 1928. His doctoral thesis, on the theory of electron diffraction, remains of fundamental value in understanding

Bethe

By courtesy of Cornell University, Ithaca, New York

observational data. In 1931 he worked with Enrico Fermi in Rome. He returned to Germany and served as a lecturer at the University of Tübingen until 1933, when Adolf Hitler came to power. Because Bethe's mother was Jewish, he was dismissed from his university position along with all others of Jewish ancestry. After a stay in Manchester, Eng., he emigrated to the United States and became, in 1934, a lecturer at Cornell University in Ithaca, N.Y., which remained his home. He was a professor there from 1937 to 1975, when he became professor emeritus.

In 1939 Bethe calculated the Sun's energy production, which results from the fusion of four hydrogen atoms (each of mass 1.008) into one helium atom (mass 4.0039). No direct fusion is possible, but Bethe showed that the probabilities of the four steps of the "carbon cycle" can account for the energy output. A carbon isotope of mass 12 reacts successively with three hydrogen nuclei (protons) to form the nitrogen isotope of mass 15; energy is produced through the fusion of a fourth hydrogen nucleus to release a helium nucleus (alpha particle) and the original carbon isotope.

Bethe became a U.S. citizen in 1941. At the beginning of World War II, Bethe had no U.S. clearance for military work. But, after reading in the *Encyclopædia Britannica* that the armour-piercing mechanism of grenades was not well understood, he formulated a theory that became the foundation for research on the problem. His work, unpublished except in classified reports, illustrated his faculty for developing highly mathematical theories to the point that their numerical results could be compared with the actual measurements.

After working at the Massachusetts Institute of Technology on the development of radar, Bethe headed the Theoretical Physics Division of the Manhattan Project in Los Alamos, N.M. The development of the atomic bomb and the dropping of it on Hiroshima and Nagasaki created a strong feeling of social responsibility in Bethe and other Los Alamos physicists. He was one of the organizers and original contributors to *The Bulletin of the Atomic Scientists*. Moreover, he lectured and wrote on the nuclear threat in order to increase public awareness of it.

Bethe was awarded the Max Planck Medal in 1955 and the U.S. Atomic Energy Commission's Enrico Fermi Award in 1961. He became, in 1957, a foreign member of the Royal Society of London, as well as a member of the National Academy of Sciences in Washington, D.C.

The discovery of neutron stars led Bethe back to fundamental research in astrophysics in 1970. Although his main interest was in the rapidly developing subjects of atomic and nuclear processes, he also applied classical mathematical methods to the calculation of electron densities in crystals, the order-disorder states in alloys, the operational conditions of reactors, the ionization processes in shock waves, and the detection of underground explosions from seismographic records.

Bethe's later works include *Elementary Nuclear Theory* (1948), a discussion of the experimental evidence concerning the forces acting inside the atomic nucleus, and *Intermediate Quantum Mechanics*, 2nd ed. (1968), a theoretical description of atomic structure.

(P.P.E./Ed.)

BIBLIOGRAPHY. Jeremy Bernstein, *Hans Bethe, Prophet of Energy* (1980), describes Bethe's life and scientific research and examines America's energy problems. R.E. Marshak (ed.), *Perspectives in Modern Physics* (1966), a collection of essays written in Bethe's honour, contains a bibliography of his work.

Bethel, ancient city of Palestine, located just north of Jerusalem. Originally called Luz and in modern times Baytin, Bethel was important in Old Testament times and was frequently associated with Abraham and Jacob. Excavations, carried out by the American School of Oriental Research and the Pittsburgh-Xenia Theological Seminary, suggest that Bethel may have been the actual scene of the events described in the Old Testament as having taken place at Ai during the Israelite conquest of Canaan.

After the division of Israel, Jeroboam I (10th century BC) made Bethel the chief sanctuary of the northern kingdom (Israel), and the city was later the centre for the prophetic ministry of Amos. The city apparently escaped destruction by the Assyrians at the time of the fall of Samaria (721 BC), but it was occupied by Josiah of Judah (reigned c. 640–c. 609 BC).

Béthencourt, Jean de (b. c. 1360—d. 1422, Grainville, France), Norman-French explorer, known as the conqueror of the Canary Islands.

Béthencourt set out for the Canaries from La Rochelle, France, on May 1, 1402, in a joint expedition with Gadifer de La Salle. Soon after their arrival (June), Béthencourt, by agreement with Gadifer, departed for Spain to seek help. He returned after about 18 months, with the title of king, bestowed upon him by Henry III of Castile, and with a bull from the antipope Benedict XIII recognizing the conquest. Béthencourt's title caused a quarrel with Gadifer, who had explored and taken possession of the islands. The associates sought the arbitration of the king of Castile; he decided in Béthencourt's favour and Gadifer returned to France. Béthencourt then profited from Gadifer's efforts to colonize the Canaries with Norman peasants. Béthencourt entrusted the kingdom to his nephew, Maciot de Béthencourt, and returned to France in 1406.

Bethesda–Chevy Chase, northwestern suburbs of Washington, D.C., in Montgomery county, Maryland, U.S. It is not an incorporated entity but a group of communities that, prior to 1949, were governed by county commissioners and thereafter came mostly under the jurisdiction of a chartered, popularly elected council. The district takes its name from the Bethesda Presbyterian Church, built

in 1820 on the Georgetown–Frederick Pike (Old National Road), and Chevy Chase village (incorporated 1910). Residential development greatly increased after World War II. Government installations accounted for much of the expansion, which began in 1935 with the

National Naval Medical Center, Bethesda, Md.
Mitt and Joan Mann from CameraMann

National Cancer Institute, followed by the National Institutes of Health, the National Naval Medical Center (1942), and various research institutes. Industrial facilities are oriented toward federal agencies. Pop. (1990) Bethesda, 62,936; Chevy Chase, 8,559.

Bethlehem, Arabic BAYT LAHM (“House of Meat”), Hebrew BET LEHEM (“House of Bread”), town in ancient Judah, central Palestine. It is situated in the Judean Hills, 5 miles (8 km) south of Jerusalem. Bethlehem was the site of the nativity of Jesus Christ according to the Gospels (Matthew 2; Luke 2); Christian theology has linked this with the belief that his birth there fulfills the Old Testament prophecy of Israel’s future ruler coming from Bethlehem Ephrathah (Micah 5:2). Some modern New Testament scholars believe parts of the Gospel accounts to be later accretions and hold that Jesus was born in Nazareth, his childhood home, but normative Christian belief has sanctified Bethlehem as Jesus’ birthplace for almost two millennia.

In modern times, Bethlehem was in the Palestine mandate (1923–48); after the Arab–Israeli War of 1948–49, it was in the territory annexed by Jordan in 1950 and placed in al-Quds (Jerusalem) *muhāfazah* (governorate). Since the Six-Day War (1967), it has been in the West Bank (Judaea and Samaria) territory under Israeli administration.

In the Old Testament, the city is often referred to as Bethlehem Ephrathah, or Bethlehem–Judah. An ancient settlement, it is possibly mentioned in the Amarna Letters (14th-century-bc diplomatic documents found at Tell el-Amarna, Egypt), but the reading there is uncertain. Bethlehem is first mentioned in the Bible in connection with Rachel, who died on the wayside near there (Genesis 35:19). It is the setting for most of the Book of Ruth and was the presumed birthplace, and certainly the home, of her descendant, King David; there he was anointed king of Israel by the prophet Samuel (I Samuel 16). The town was fortified by Rehoboam, David’s grandson and first king of Judah after the division of the state between Israel and Judah (II Chronicles 11). During the Jewish return to Palestine after the Babylonian Captivity (516 bc and following), the town was repopulated; later, a Roman garrison was there during the Second Jewish Revolt led by Bar Kokhba (AD 135).

The site of the Nativity of Jesus was identified by St. Justin Martyr, a 2nd-century Chris-

tian apologist, as a manger in “a cave close to the village”; the cave, now under the nave of the Church of the Nativity in the heart of the town, has been continuously venerated by Christians since then. St. Helena (c. 248–c. 328), mother of the first Christian Roman emperor (Constantine I), had a church built over the cave; later destroyed, it was rebuilt in substantially its present form by Emperor Justinian (reigned 527–565). The Church of the Nativity is thus one of the oldest Christian churches extant. Frequent conflicts have arisen over the jurisdiction of various faiths at the sacred site, often incited by outside interests; thus, for example, the theft, in 1847, of the silver star marking the exact traditional locus of the Nativity was an ostensible factor in the international crisis over the Holy Places that ultimately led to the Crimean War (1854–56). The church is now divided between the Greek Orthodox, Roman Catholic, and Armenian Orthodox faiths.

The town has been a monastic centre for centuries; St. Jerome built a monastery there and, with the aid of Palestinian rabbis, translated the Old Testament into Latin from the original Hebrew (5th century AD). This, together with the New Testament, which he had translated from the Greek before coming to Palestine, constitutes the Vulgate, the standard Latin translation of the Bible used by the Roman Catholic Church.

Modern Bethlehem is an agricultural market and trade town that is closely linked to nearby Jerusalem. For a long time the town has been important as a pilgrim and tourist centre, and its trade has sharply increased since the abolition of the artificial armistice line between it and Israel (including western Jerusalem) as a result of the 1967 war. The manufacture of religious articles, chiefly of mother-of-pearl, is a traditional industry, as is the carving of olive-wood. The town forms a conurbation with adjoining Bayt Jālā, to the northwest, and Bayt Sāhūr, to the southeast. Bethlehem and its suburbs have many churches, convents, schools, and hospitals, supported by Christian denominations the world over. A large proportion of the town’s population is Christian. A university was established in Bethlehem in 1973 and offers instruction in both Arabic and English. Pop. (1984 est.) Bethlehem proper

(not counting 1,874 in refugee camp), 20,000; (1980 est.) Bethlehem, Bayt Jālā, and Bayt Sāhūr, 58,819.

Bethlehem, town, northeastern Orange Free State, South Africa, located near the northernmost point of Lesotho, at an elevation of 5,368 feet (1,636 m). Founded in 1860, it was

named Bethlehem (“House of Bread”), after its Biblical counterpart, because wheat thrived in the region. The river flowing through the town (since dammed to form Lake Athlone) was named Jordaan. Bethlehem was the temporary seat of the government of the Orange Free State in 1900 during the South African War. The town has railway workshops, cold-storage plants, flour mills, a dairying and malting industry, furniture-manufacturing plants, and textile mills. It is a centre for the distribution of agricultural produce and has major rail, air, and road links. The Pretorius Valley Bird Sanctuary has been created where the Jordaan River passes through Pretorius Valley, and Lake Athlone is a recreation area. Pop. (1984 est.) mun., 54,100.

sides of the Lehigh River (bridged); with Allentown and Easton it forms an urban industrial complex. Founded in 1741 by Moravian missionaries, it received its name from a carol about Jesus Christ’s traditional birthplace, sung at Christmas Eve services (1741) attended by the group’s German patron, Count Nikolaus Zinzendorf. During the Revolutionary War wounded Americans were treated in the old Colonial Hall and British prisoners were quartered in the town. For a short time the Sun Inn was the refuge for members of the Continental Congress including George Washington, Benjamin Franklin, and John Hancock.

One of the first pumped waterworks in North America started operations in Bethlehem on June 27, 1755. Industrialization began with the opening of the Lehigh Canal (1829) and its resulting traffic in coal. Bethlehem became a station on the Lehigh Valley Railroad (1855), and the Saucona Iron Company (now Bethlehem Steel) was formed April 8, 1857. The north bank borough of Bethlehem (inc. 1845) and South Bethlehem (inc. 1865) were united in 1917.

The economy, dominated by the Bethlehem Steel Corporation, has diversified to include textiles, cement, foundry, machine, and hand metal products, furniture, and chemicals.

The city is the seat of Lehigh University (1865), Moravian College (1742), and

Northampton County Area Community College (1967). It has gained a national reputation as a music centre; the first performance in America (1888) of J.S. Bach's *St. John Passion* has given rise to an annual Bach Festival in May. Moravian traditions are annually observed in the city's Christmas festivities. The tannery (1761) and waterworks (1762) at the colonial industrial area (Historic Bethlehem) have been restored. The Lost River Caverns are nearby. Pop. (1991 est.) city, 71,904; Allentown-Bethlehem-Easton MSA, 690,981.

Bethlehem, Star of, celestial phenomenon mentioned in the Gospel According to Matthew as leading "wise men from the East" to the birthplace of Jesus Christ. Natural events that might well have been considered important omens and described as stars include exploding stars (novae and supernovae), comets (Halley's Comet was visible in 12 and 11 bc), meteors, and planetary conjunctions—*i.e.*, apparent close approaches of two or more planets to each other.

The year of Jesus' birth is uncertain but can be narrowed down to probably between 6 and 4 bc. The biblical account indicates two sightings of the star, one before the wise men began their journey (probably from Babylonia or Persia) and the other near their journey's end, when the omen "came and stood over where the young child was." A celestial object near the horizon of any given observer might be considered by him as pointing out some spot on Earth below.

Chinese annals record novae in 5 bc and 4 bc; in the early 17th century, Johannes Kepler advanced the view that the Star of Bethlehem may have been a nova occurring in or near some conjunction of bright planets.

Several striking planetary conjunctions also took place within 10 years of the chronological point now taken as the beginning of the Christian era. A triple conjunction in early 6 bc, in which Mars, Jupiter, and Saturn stood at the points of a triangle, has often been mentioned as a possible explanation of the star. Prior to that, in 7 bc, Jupiter and Saturn were for eight months within three degrees of each other and three times within that period passed within one degree. Several years later, on June 17, 2 bc, the bright planets Venus and Jupiter would have appeared to observers in Babylon to have merged just before setting in the general direction of Bethlehem to the west.

Bethlehem Steel Corporation, American corporation first incorporated on Dec. 10, 1904, for the purpose of consolidating Bethlehem Steel Company (of Pennsylvania), the Union Iron Works (with shipbuilding facilities in San Francisco), and a few other smaller companies. The corporation was newly incorporated on July 1, 1919. Headquarters are in Bethlehem, Pa.

The company's history traces to 1857, when a group of railroaders and investors of the city of Bethlehem founded the Saucona Iron Company, which four years later was renamed Bethlehem Iron Company; the works was designed principally to turn out wrought-iron railroad rails. In 1899 the facilities were acquired by a newly formed enterprise, the Bethlehem Steel Company.

The major founder of the corporation in 1904–05 was Charles M. Schwab, who had earlier been one of the major figures in the creation of United States Steel Corporation (1901). In August 1901 he had bought control of Bethlehem Steel Company, only to see it fail in a financial scandal. Schwab borrowed and invested heavily to save the company's assets, absorb other companies, and launch the Bethlehem Steel Corporation. The corporation thrived, partly as a result of the expanding

orders for guns, munitions, and naval vessels from European powers both before and during World War I. In the first four decades of its existence, the corporation absorbed a number of iron-ore, coal, and steel-producing properties from coast to coast. During World War II and the postwar years, it continued to expand. Like other U.S. steel companies, Bethlehem began to diversify during the 1970s in the face of strong competition from foreign steelmaking companies; its other activities include the production of plastics and related chemical products and the mining of nonferrous ores.

Bethlen, Gábor, in full GÁBOR IKTÁRI BETHLEN, German GABRIEL BETHLEN VON IKTÁR (b. 1580—d. Nov. 15, 1629, Gyulafehérvár, Transylvania [now Alba Iulia, Rom.]). Calvinist prince of Transylvania and briefly titular king of Hungary (August 1620 to December 1621), in opposition to the Catholic emperor Ferdinand II.

Born into a leading Protestant family of northern Hungary, Bethlen as a young man was sent to the court of Prince Sigismund Báthory of Transylvania. Later he helped István Bocskay gain the throne of Transylvania and supported his successor, Gábor Báthory. Differences between Bethlen and Báthory, however, forced Bethlen to take refuge with

Bethlen, engraving by E. Sadeler, 1620

By courtesy of the Magyar Nemzeti Múzeum, Budapest

the Turks. The Ottoman sultan Ahmed I, suzerain of Transylvania, provided Bethlen with an army and proclaimed him prince of Transylvania. When Báthory was driven from power, Bethlen was proclaimed prince by a Diet at Kolozsvár in 1613. Bethlen did much to promote the arts and sciences in Transylvania and founded the Academy of Weissemburg (Karlsburg).

During the Thirty Years' War (1618–48), while the Holy Roman emperor Ferdinand II was occupied with the Bohemian revolt of 1618, Bethlen took over most of northern Hungary, captured Pozsony (now Bratislava, Slovakia), and seized the crown of St. Stephen. After the collapse of negotiations between Bethlen and Ferdinand, the Diet at Besztercebánya elected Bethlen king of Hungary (Aug. 20, 1620). Realizing that Hungary's Roman Catholic nobles would never accept a Protestant king, however, he refused to be crowned. At this point war between Bethlen and Ferdinand broke out. After the Bohemians, who were supporters of Frederick (the Protestant contender to the Bohemian throne), were defeated at White Mountain in 1620, Bethlen concluded peace with Ferdinand, and the following year he agreed to renounce the Hungarian throne and return the crown of St. Stephen. Ferdinand II agreed to reaffirm the 1606 Treaty of Vienna and guarantee liberty of worship to Hungary's Protestants; he also promised to summon the national Diet within six months. Bethlen became a prince of the Holy Roman Empire and secured for himself seven counties in northeastern Hungary.

Bethlen did not, however, give up his aim

of expelling Ferdinand from Hungary and restoring his Protestant friend Frederick to the Bohemian throne. He renewed war against Ferdinand in 1623 and, while successful in Bohemia, was unable to continue the war after the defeat of the Protestant forces in Germany. The 1624 Treaty of Vienna that followed essentially reaffirmed the provisions of the 1621 treaty with Ferdinand.

Plans for an eastern alliance aimed at completely expelling the Turks from Hungary and Europe then engaged Bethlen. Hoping to gain aid from Ferdinand, he sought to marry one of Ferdinand's daughters but was rejected. He then joined the German princes and again occupied Habsburg Hungary in 1626, but victories by Catholic and imperial armies forced him to come to terms once more with Ferdinand in the Treaty of Pozsony in 1626. Although Bethlen subsequently became involved in negotiations with the Poles and with King Gustavus II Adolphus of Sweden, his declining health precluded further military action.

Bethlen, István, Count (Gróf) (b. Oct. 8, 1874, Gernyeszeg, Transylvania, Austria-Hungary [now Gornești, Rom.]—d. Oct. 5, 1946, Moscow?), statesman and Hungarian prime minister from 1921 to 1931, who maintained the old order in Hungary after World War I.

Born into an old aristocratic Transylvanian family, Bethlen was elected to Parliament as a Liberal (1901). Later he joined the national opposition and became active in the counter-revolutionary movement against Béla Kun's communist regime (1918–19). When Kun fell, Bethlen returned to the Hungarian Parliament and, in April 1921, became prime minister with the hope of establishing a strong conservative regime.

Bethlen's domestic policy was authoritarian. He tried to preserve the old feudal aristocratic privileges, ended land redistribution, reintroduced a system of public voting in the non-urban areas, and restricted suffrage.

His foreign policy aimed ultimately at a revision of the Treaty of Trianon (1920; which alienated territory from Hungary), but he realized the necessity of first gaining internal security and the right friends abroad. Meanwhile, he negotiated Hungary's admission to the League of Nations, obtained a reconstruction loan, and facilitated the influx of private capital from abroad. In 1927 he broke through the encirclement of the Little Entente (a triangular coalition of Czechoslovakia, Yugoslavia, and Romania against Hungary) to sign a treaty of friendship with Italy.

Hungary's economic and political gains were shattered by the world economic crisis of 1929. Unable to cope with the financial situation, Bethlen resigned in 1931. He retained some political significance as the leader of the forces opposing the new right-wing radicals. After the German occupation (March 1944) of Hungary, Bethlen went into hiding, but the Russians captured him in 1945 and took him to Moscow, where he was reported to have died.

Bethmann Hollweg, Theobald von, in full THEOBALD THEODOR FRIEDRICH ALFRED VON BETHMANN HOLLWEG (b. Nov. 29, 1856, Hohenfinow, Prussia [now in Germany])—d. Jan. 1, 1921, Hohenfinow, Ger.), German imperial chancellor before and during World War I who possessed talents for administration but not for governing.

A member of a Frankfurt banking family, Bethmann Hollweg studied law at Strassburg, Leipzig, and Berlin and entered the civil service. He was appointed Prussian minister of the interior in 1905 and state secretary in the Imperial Office of the Interior in 1907. He succeeded Prince Bernhard von Bülow, who resigned as chancellor on July 14, 1909.

Bethmann's domestic policies were mildly liberal for their time and place, but he almost invariably yielded to persons more extreme and more forceful than himself. In foreign policy, his negotiations with the British over reduction of naval armaments (March 1909 and February 1912) came to nothing because of the opposition of Admiral Alfred von Tirpitz, supported by the emperor William II. Bethmann's secretary of state, Alfred von Kiderlen-Wächter, created the Moroccan (Agadir) crisis of July–November 1911, in which Germany backed down before France and Great Britain. Bethmann and Sir Edward Grey, the British foreign secretary, worked successfully to prevent the expansion of the Balkan Wars into a major conflict between Austria-Hungary and Russia; this was probably Bethmann's greatest success in foreign affairs.

At home, the enactment of his legislation for enlarging the army did not reduce anxiety about Germany's international situation. Although he believed that a democratic monarchy based on a Reichstag majority was inevitable, he was not an enthusiast of parliamentary government, and his half-hearted electoral reforms were largely ineffective.

Having no desire for war, Bethmann nonetheless is thought to have initiated the July crisis of 1914 with the "blank check" to Austria-Hungary for measures against Serbia. Subsequent German warnings to Austria-Hungary and its prospective opponent Russia could not prevent the outbreak of war. Bethmann capitulated to the German general staff, which wanted war immediately.

It is no longer universally thought that Bethmann then simply worked for a negotiated peace, with no idea of German annexations, although this was doubtless his own preference. He made more concessions to nationalist-expansionist feeling and to military demands than were once supposed. In 1916, however, he tried to secure the mediation of the United States, and, realizing that U.S. entry into the war would be decisive, he resisted the advocates of unrestricted submarine warfare.

On April 7, 1917, Bethmann further angered military leaders and civilian conservatives by his promise of electoral reforms in Prussia. In

Bethmann Hollweg, detail from a portrait by Brant, 1909

Archiv für Kunst und Geschichte, Berlin

the debates on the peace resolution that was passed by the Reichstag in July 1917, Bethmann was forced to resign; he was replaced by Georg Michaelis on July 13. In retirement he wrote *Betrachtungen zum Weltkrieg* (two parts, 1919–21; Eng. trans. of Part I, *Reflections on the World War*).

Béthune, town, Pas-de-Calais *département*, Nord-Pas-de-Calais *région*, northern France, at the confluence of the Lawe River and the Aire Canal, southwest of Lille. Founded in the 12th century, Béthune was an independent

The 14th-century belfry, Béthune, Fr.

Editions "La Cigogne"—Hachette

county until 1248. Thereafter held successively by the counts of Artois and Flanders, the dukes of Burgundy, and the Habsburgs, it was ceded to France by the Treaty of Nijmegen (1678). Badly damaged in World Wars I and II, Béthune is still dominated by its 14th-century belfry. Its traditional coal mining has been supplanted by the automobile industry. Pop. (1999) 27,808.

Bethune, Louise Blanchard, née JENNIE LOUISE BLANCHARD (b. July 21, 1856, Waterloo, N.Y., U.S.—d. Dec. 18, 1913, Buffalo, N.Y.), first professional woman architect in the United States.

Blanchard took a position as a draftsman in the Buffalo, N.Y., firm of Richard A. Waite in 1876. In October 1881 she opened her own architectural office in partnership with Robert A. Bethune, whom she married in December. The firm of R.A. and L. Bethune designed several hundred buildings in Buffalo and throughout New York state, specializing in schools. They also designed hotels, apartment houses, churches, factories, and banks, many of them in the Romanesque Revival style popular in the late 19th century. Among their major commissions were Lockport High School, the East Buffalo Live Stock Exchange, and the Hotel Lafayette in Buffalo.

Louise Bethune helped organize the Buffalo Society of Architects in 1886; it later became the Buffalo chapter of the American Institute of Architects. She also promoted a licensing law for architects, as well as equal pay for women in the field. In 1888 she became the first woman elected to the American Institute of Architects.

Bethune, Mary McLeod (b. July 10, 1875, Mayesville, S.C., U.S.—d. May 18, 1955, Daytona Beach, Fla.), American educator who was active nationally in African American affairs and was a special adviser to President Franklin D. Roosevelt on the problems of minority groups.

McLeod was the daughter of former slaves. She graduated from Scotia Seminary (now Barber-Scotia College) in Concord, N.C., in 1893 and from the Moody Bible Institute in Chicago in 1895. She married Albertus L. Bethune in 1898, and until 1903 she taught in a series of small Southern schools. In 1904 Bethune opened the Daytona Normal and Industrial Institute for Negro Girls in Daytona, Fla. Having virtually no tangible assets, she worked tirelessly to solicit help and contributions. In 1923 the school merged with the Cookman Institute for Men, then in Jacksonville, Fla., to form what became known as Bethune-Cookman College in Daytona Beach. Bethune was president of the school until 1942

and again from 1946 to 1947. Under her administration the college won full accreditation and grew to an enrollment of more than 1,000.

In 1936 President Roosevelt appointed Bethune administrative assistant for Negro affairs (a title later changed to director of the division of Negro affairs) of the National Youth Administration, a post she held until 1944. She also advised Roosevelt on minority affairs and assisted the secretary of war in selecting officer candidates for the U.S. Women's Army Corps. From 1940 to 1955 she was vice president of the National Association for the Advancement of Colored People.

Beti, Mongo, also called EZA BOTO, pseudonyms of ALEXANDRE BIYIDI (b. June 30, 1932, Mbalmayo, Cameroon—d. Oct. 8, 2001, Douala), African novelist and political essayist. An essential theme of Beti's early novels, which advocate the removal of all vestiges of colonialism, is the basic conflict of traditional modes of African society with the system of colonial rule.

Beti's first important novel, *Le Pauvre Christ de Bomba* (1956; *The Poor Christ of Bomba*), satirizes the destructive influence of missionary activities in Cameroon through his character Father Drumont, who, after having served the church for many years in Africa, is finally forced to realize that under a colonial system the missionary becomes the involuntary servant of the administration. *Mission terminée* (1957; also published as *Mission to Kala* and *Mission Accomplished*), which was awarded the Prix Sainte-Beuve, attacks the French policy through a young man who, upon returning to his village with some hesitation because he has failed his college examinations, discovers himself to be not only revered by the villagers for his achievements but also alienated from their way of life.

Preoccupied with family, politics, and doctoral studies, Beti stopped writing for more than a decade. *Main basse sur le Cameroun* (1972; "Rape of Cameroun"), a book explaining the emplacement of a neocolonial regime in his homeland, was immediately banned in France and in Africa. Two years later a pair of novels appeared, *Perpétue et l'habitude du malheur* (*Perpetua and the Habit of Unhappiness*) and *Remember Ruben*. *Perpetua* is a mystery story of the murder of a young woman by the combined forces of backward traditions and neocolonial evils. *Remember Ruben* chronicles the lives of several revolutionaries who are driven into the bush to take up guerrilla war against the new French-backed regime. A sequel to *Remember Ruben* presents the success of the guerrillas' countryside campaign: *La Ruine presque cocasse d'un polichinelle* (1979; "The Nearly Comical Ruin of a Puppet"). *Les Deux Mères de Guillaume Ismaël Dzewatama, futur camionneur* (1983; "The Two Mothers of Guillaume Ismaël Dzewatama, Future Truckdriver") was the first of a series of novels concerning mixed marriage. Beti's later works include *La France contre l'Afrique* (1993; "France Against Africa") and the novel *Trop de soleil tue l'amour* (1999; "Too Much Sun Kills Love").

In 1978 Beti launched *Peuples Noirs/Peuples Africains* ("Black Peoples/African Peoples"), a political and cultural bimonthly periodical devoted to the exposure and defeat of neocolonialism in Africa. Beti lived in exile in France from the late 1950s until the early 1990s, when he returned to Cameroon.

Betjeman, Sir John (b. Aug. 28, 1906, London, Eng.—d. May 19, 1984, Trebetherick, Cornwall), British poet known for his nostalgia for the near past, his exact sense of place, and his precise rendering of social nuance, which made him widely read in England at a time when much of what he wrote about was rapidly vanishing. The poet, in near-Tennysonian rhythms, satirized lightly the promoters of empty and often destructive "progress"

and the foibles of his own comfortable class. As an authority on English architecture and topography, he did much to popularize Victorian and Edwardian building and to protect what remained of it from destruction.

The son of a prosperous businessman, Betjeman grew up in a London suburb, where T.S. Eliot was one of his teachers. He later studied at Marlborough College (a public school) and Magdalen College, Oxford. The years from early childhood until he left Oxford were detailed in *Summoned by Bells* (1960), blank verse interspersed with lyrics.

Betjeman's first book of verse, *Mount Zion*, and his first book on architecture, *Ghastly Good Taste*, appeared in 1933. Churches, railway stations, and other elements of a townscape figure largely in both books. Four more volumes of poetry appeared before the publication of *Collected Poems* (1958). His later collections were *High and Low* (1966), *A Nip in the Air* (1974), *Church Poems* (1981), and *Uncollected Poems* (1982). Betjeman's celebration of the more settled Britain of yesteryear seemed to touch a responsive chord in a public that was suffering the uprootedness of World War II and its austere aftermath.

Betjeman's prose works include several guidebooks to English counties; *First and Last Loves* (1952), essays on places and buildings; *The English Town in the Last Hundred Years* (1956); and *English Churches* (1964; with Basil Clarke). He was knighted in 1969, and in 1972 he succeeded C. Day-Lewis as poet laureate of England.

Betpaqdala, also spelled BETPAK-DALA, also called SEVERNAYA GOLODNAYA STEPPE, desert in eastern Kazakhstan, situated west of Lake Balkhash. It has an area of about 29,000 square miles (75,000 square km) and an average elevation of 1,000–1,150 feet (300–350 m). The desert is generally flat or gently undulating but is more hilly in the east. It receives a total annual precipitation of only 4–6 inches (100–150 mm), and its average temperatures range from 7° F (–14° C) in January to 79° F (26° C) in July. The Betpaqdala has many shallow, mostly salty lakes. The western portion is clayey, wormwood desert, whereas the eastern part is stony. Almost uninhabited, it is used only for spring and autumn pasture.

betrotal, promise or engagement between a man and a woman that they will be married. In societies in which premarital sexual relations are condoned or in which consensual union is common, betrothal may be unimportant. In other societies, however, betrothal is actually part of the marriage process, and a change of intention by one of the partners after he or she is betrothed is a serious matter, subject in some instances to a fine or other penalty.

Marriage has historically been so frequently a matter of alliance between kinship groups that mate selection has been more often than not removed from the hands of the participants and negotiated by important or assigned representatives of each kinship group. In many, but by no means all, such cases, betrothal has been marked by various forms and degrees of mutual visits and gift exchange between the two families. Sometimes, especially when two potentially hostile groups are concerned, child betrothal may be adopted to ensure continuing social, economic, or political harmony.

Betsileo, a Malagasy people living in the central highlands of south-central Madagascar. They speak a dialect of Malagasy, the West Austronesian language that is common to all Malagasy peoples. River valleys inhabited and farmed by Betsileo are separated from one another by dense montane forest.

The Betsileo were initially divided into a great many autonomous clans. They were conquered by the expanding Merina kingdom to the north in the early 19th century, after

which they came under French colonial administration. They are efficient and productive cultivators of rice on painstakingly irrigated and terraced hillsides. They also grow cassava, corn (maize), yams, bananas, and sugarcane. Many others have become carpenters, bricklayers, or other skilled craftsmen or have settled in other areas of Madagascar to work as merchants or government employees.

Betsimisaraka, a Malagasy people living along the east-central and northeastern coast of Madagascar. The Betsimisaraka speak a dialect of Malagasy, the West Austronesian language that is common to all Malagasy peoples. The Betsimisaraka ("Inseparable Multitude") live along the narrow eastern coastal strip; away from the coast their land rises into dense montane forest. They raise rice, cassava, and corn (maize) by burning off the natural vegetation and planting in the ash-enriched soil. Many Betsimisaraka have turned to growing coffee, vanilla, cloves, and other export crops on their small farms.

The Betsimisaraka kingdom was founded in the early 18th century by Ratsimilaho. He united the various chiefdoms along a 400-mile (650-kilometre) stretch of the coast and gave the Betsimisaraka their name, but the kingdom collapsed on the death of the dynasty's third ruler in 1791. Most of the Betsimisaraka then fell under the rule of the expanding Merina kingdom to the west until the advent of French colonial rule in the 1890s.

The Betsimisaraka have been historically known as sailors and pirates. In the past, using large canoes that could seat 50 or more, they sailed in fleets of several thousand men and pillaged the Comoro Islands (modern Comoros) northwest of Madagascar. Comoro Islanders were brought back and incorporated into Betsimisaraka society; several clans now trace their ancestry to these captives. The Betsimisaraka were also ardent fishermen and whalers and served as sailors on European vessels from an early date.

betsy bug: see bess beetle.

Bettelheim, Bruno (b. Aug. 28, 1903, Vienna, Austria—d. March 13, 1990, Silver Spring, Md., U.S.), Austrian-born American psychologist known for his work in treating and educating emotionally disturbed children.

Bettelheim worked in his family's lumber business in Vienna, but after the Nazi takeover of Austria in 1938 he was placed in German concentration camps at Dachau and Buchenwald because he was Jewish. After his release in 1939, he immigrated to the United States, where he became a research associate with

Bettelheim

By courtesy of the University of Chicago

the Progressive Education Association at the University of Chicago. Later he served as an associate professor at Rockford (Ill.) College (1942–44). In October 1943 he wrote an article that won wide and immediate recognition, "Individual and Mass Behaviour in Extreme Situations." Based on his observations and experiences at Dachau and Buchenwald, this pioneer study examined human adaptability to the stresses of concentration-camp life and

considered the effects of Nazi terrorism on personality.

By this time Bettelheim claimed to have earned a doctorate at the University of Vienna. In 1944 he was appointed both assistant professor of psychology at the University of Chicago and head of the university's Sonia Shankman Orthogenic School, a residential laboratory school for 6- to 14-year-old children with serious emotional problems, which became the centre of his work with autistic children. An associate professor from 1947 and professor from 1952, he concerned himself with applying psychoanalytic principles to social problems, especially in relation to the upbringing of children. His writings stem from his work with children and include the books *Love Is Not Enough* (1950) and *Truants from Life* (1954). He retired from teaching and the directorship of the school in 1973.

In his writings and research Bettelheim tried to determine what can be done therapeutically to relieve the emotional suffering and turmoil of disturbed children and to help them function in socially useful capacities. His writings also provided many insights for dealing effectively with normal children. His other works include *The Informed Heart* (1960); *The Empty Fortress* (1967), on autistic children; *Children of the Dream* (1967), treating the communal rearing of children in Israeli kibbutzim; and *The Uses of Enchantment* (1976), in which Bettelheim argued for the importance of fairy tales in child development.

Bettelheim died a suicide, depressed after the death of his wife in 1984 and after suffering a stroke in 1987. His reputation was subsequently clouded by revelations that he had invented his Viennese academic credentials and that he had abused and misdiagnosed a number of the children under his care at the Orthogenic School.

Better Business Bureau, any of several American and Canadian organizations formed to protect communities from unfair, misleading, or fraudulent advertising and selling practices.

Early in the 20th century, advertising executives realized that fraudulent practices by some advertisers were bringing advertising into public disfavour. In response, they established a National Vigilance Committee to police the industry, with subsidiary organizations formed at the local level. The local organizations became known as Better Business Bureaus, and they coordinated their functions through the national Association of Better Business Bureaus. Today, sponsored by all segments of the business community, they investigate and set standards for business practices, receive complaints of improper practices, and conduct educational campaigns alerting the public to methods of deceit and fraud in advertising and selling.

Betterton, Thomas (b. c. 1635, London, Eng.—d. April 28, 1710, London), leading English actor of the Restoration and author of several popular adaptations.

Betterton made his debut in 1660 and in 1661 was hired by Sir William Davenant for the Duke's Company, which played successfully at the Lincoln's Inn Fields Theatre and at Dorset Garden. After the collapse of the rival King's Men, the two companies merged (1682), and the joint companies, with Betterton as the artistic leader, played at Drury Lane until 1695, when Betterton and the older players revolted against Christopher Rich, the spokesman for the patentees. Betterton led the secession of the players who moved into Lincoln's Inn Fields Theatre and later into the new Haymarket. He was survived by his wife, the former Mary Saunderson (d. 1712), an actress who had made her mark in

Shakespearean parts. As a couple they were known for their encouragement and training of younger performers.

Betterton's range of characters was extremely wide. He created about 130 new roles, aside from such leading parts in the older dramas as Hamlet, Macbeth, Henry VIII, Mercutio,

Betterton, detail from an engraving
By courtesy of the Victoria and Albert Museum, London

King Lear, Othello, Brutus, and Hotspur. His Hamlet and Sir Toby Belch were said to be equally credible. Contemporary observers agree that Betterton used restraint in his acting.

Betterton-Kroll process, method widely used for removing bismuth from lead by adding calcium and magnesium to a molten lead-bismuth bath. Compounds are formed with bismuth that have higher melting points and lower densities than lead and thus can be separated as a solid dross. Bismuth may then be recovered from the calcium and magnesium by treatment with chlorine. The method, developed for the American Smelting and Refining Company in the 1930s, is sometimes called the Asarco process.

Betti, Enrico (b. Oct. 21, 1823, Pistoia, Tuscany [Italy]—d. Aug. 11, 1892, Pisa, Kingdom of Italy), mathematician who wrote a pioneering memoir on topology, the study of surfaces and space, and wrote the first rigorous exposition of the theory of equations developed by the noted French mathematician Évariste Galois (1811–32).

Betti studied at the University of Pisa, where he obtained a chair of mathematics in 1857. His early work was in the theory of equations and algebra. He extended and furnished proofs for Galois's work, which had previously been stated in part without demonstrations or proofs. Betti was the first to resolve integral functions of a complex variable into their primary factors.

His later work was decisively affected by the arrival in Pisa of the German mathematician Bernhard Riemann in 1863. They became close friends, and Riemann awakened Betti's interest in mathematical physics, in particular potential theory and elasticity, and inspired his memoir on topology.

Betti, Ugo (b. Feb. 4, 1892, Camerino, Italy—d. June 9, 1953, Rome), the foremost internationally known Italian playwright, after Luigi Pirandello, in the first half of the 20th century.

Educated for the law, Betti fought in World War I and while imprisoned (1917–18) by the Germans wrote a volume of poems, *Il re pensieroso* (1922; "The Thoughtful King"). After the war he became a magistrate in Rome in 1920, rose to a judgeship in 1930, and became librarian at the Ministry of Justice in 1944. His

legal career was interspersed with the writing of two more volumes of poetry, three books of short stories, a novel, much miscellaneous writing, and, most important, 26 plays.

His first play, *La padrona* (first performed 1927; "The Landlady"), drew mixed reactions, but later successful plays include *Frana allo scalo Nord* (first performed 1933; Eng. trans., *Landslide*, 1964), the story of a natural disaster and collective guilt; *Delitto all'Isola delle Capre* (first performed 1950; Eng. trans., *Crime on Goat Island*, 1960), a violent tragedy of love and revenge; *La regina e gli insorti* (first performed 1951; Eng. trans., *The Queen and the Rebels*, 1956), a strong argument for compassion and self-sacrifice; and *La fuggitiva* (first performed 1953; Eng. trans., *The Fugitive*, 1964), a story presenting legal courts as a symbol of world salvation. *Corruzione al palazzo di giustizia* (first performed 1949; Eng. trans., *Corruption in the Palace of Justice*, 1962) depicts an unscrupulous judge who, having clawed his way to the presidency of the Supreme Court, realizes his own guilt and gives himself up for trial.

International attention, offsetting lukewarm popular and critical acclaim in Italy, came with Paris productions in the early 1950s of his plays, which were then translated into English.

Bettiah, city, northwestern Bihār state, northeastern India. An agricultural trade centre, it also manufactures brass, metalware, and leather goods. The headquarters of the Bettiah Raj estate, established in the 17th century, it contains the maharaja's palace. There is a Roman Catholic mission, established in 1740. Constituted a municipality in 1869, Bettiah has a college affiliated with the University of Bihār. Just north, at Lauriya Nandangarh, lie an Aśokan pillar and funeral mounds said to be the only indisputably Vedic monuments identified in India. Pop. (1991 prelim.) 92,583.

Betty, William Henry West, byname THE YOUNG ROSCIUS, also called MASTER BETTY (b. Sept. 13, 1791, Shrewsbury, Shropshire, Eng.—d. Aug. 24, 1874, London), English actor who won instant success as a child prodigy.

Betty's debut was in Belfast, before he was 12, in an English version of Voltaire's *Zaïre*. He was successful in Dublin, Glasgow, and Edinburgh. In 1804, when he first appeared at Covent Garden, London, troops were called out to preserve order, so great was the crush to obtain admittance. Later he played the great tragic roles of Shakespeare at Covent Garden and Drury Lane, where he received an unprecedented salary. George III presented him to the Queen, and William Pitt on one occasion adjourned the House of Commons so that members could see Master Betty's performance as Hamlet. In 1808 he made his final appearance as a boy actor and entered Christ's College, Cambridge. His attempt in 1812 to perform again was ill received. He retired completely in 1824 and lived off his fortune.

Betty, detail from an engraving by J. Lewis, 1804

Betul, city, south-central Madhya Pradesh state, central India. It is a major road and agricultural trade centre; sawmilling, oilseed milling, essential-oil distilling, and silk growing are its chief industries. Formerly called Badnur, Betul was constituted a municipality in 1867; it has a government college affiliated with the University of Saugar. A weekly cattle mart is held. The ruined 14th-century Kherla fortress, just to the northeast, was the seat of a major Goṅḍ dynasty. Pop. (1991 prelim.) 63,489.

Betulaceae, birch family of flowering plants, usually placed in the order Fagales; some authorities, however, have placed the family in the order Betulales. The family contains six genera and 120–150 species. It can be divided into two tribes: the Betuleae, with the genera *Betula* (birch) and *Alnus* (alder); and the Coryleae, with the genera *Carpinus* (hornbeam), *Corylus* (hazel, or filbert), *Ostrya*, and *Ostryopsis*. Some systems have recognized these tribes as separate families; the widely accepted classification system proposed by Arthur Cronquist recognizes a third tribe, Carpineae.

Young leaves, male catkins, and (top centre) female flowers of paper birch (*Betula papyrifera*)
Cy Coleman

The genus *Betula*, with approximately 60 species, is the largest in the family. Members of the family are distributed in temperate and subarctic areas of the Northern Hemisphere, where some reach the northern limit of woody plants; in tropical mountains; and in South America through the Andes as far south as Argentina.

The Betulaceae have simple, serrate, alternate leaves. Male and female flowers are borne on the same plant, appearing before or with the leaves. The male flowers are borne in long, pendulous catkins; the female in shorter, pendulous or erect catkins. The fruit is usually a small nut or a short-winged samara.

The birches and alders produce timber of considerable economic importance. *Corylus* is the source of the filbert, or hazelnut. Oil of betula, obtained from birch twigs, smells and tastes like wintergreen and is used in tanning Russian leather. A number of species are valued as ornamentals.

Betwa River, Sanskrit VETRAVATI ("Containing Reeds"), river in northern India, rising in the Vindhya Range just north of Hoshangabād. It flows generally northeast through Madhya Pradesh and Uttar Pradesh states and empties into the Yamuna just east of Hamirpur after a 380-mile (610-kilometre) course. Nearly one-half of its course, which is not navigable, runs over the Mālwa Plateau before it breaks into the up-

land of Bundelkhand. The Jamni and Dhasan rivers are the main tributaries. The Betwa is dammed at Dukwān and Deogarh.

Beust, Friedrich Ferdinand, Graf von (count of), also called (until 1868) **FREIHERR** (baron) **VON BEUST** (b. Jan. 13, 1809, Dresden, Saxony [Germany]—d. Oct. 24, 1886, Schloss Altenberg, near Vienna), prime minister and foreign minister of Saxony (1858–66) and of the Austrian Empire (1867–71), who negoti-

Beust, engraving by Joseph Anton Bauer

By courtesy of the Bild-Archiv, Österreichische Nationalbibliothek Vienna

ated the *Ausgleich*, or “Compromise” (1867), establishing the Austro-Hungarian monarchy, and who also helped restore the Habsburgs’ international position.

A descendant of the Saxon line of an ancient aristocratic family, Beust was the youngest son of Karl Leopold von Beust, a high-ranking member of the law administration. After attending the Kreuzschule in Dresden, he studied law at Göttingen and Leipzig. Relatively progressive, he was inclined toward liberal constitutionalism and devoted himself also to the study of philosophy, history, and politics. Having finished his studies in 1830, he began his diplomatic career, which led him first to Saxon missions in Berlin and Paris; he became head of missions in Munich, London, and, in 1848, Berlin. By that time he had acquired a remarkable practical knowledge of constitutional matters and of important political personalities, among them Otto von Bismarck.

The Saxon king, Frederick Augustus II, favoured the movement for German unity developing out of the revolutions of 1848 but not its tendencies toward democracy. In 1849 he called for Beust, whom he thought to be a stabilizing influence, and appointed him his new minister for foreign affairs. Beust called in Prussian troops to suppress the popular uprisings in Dresden in May and negotiated a conservative alliance of Saxony, Prussia, and Hanover later the same month. He thus proved from the outset to be the dominant force in the Cabinet. As minister of the interior (from 1853) he sought to expand the Saxon economy through a policy of moderate internal reforms. In his foreign policy he aimed at setting up the smaller German states as a third force between Austria and Prussia. Although Saxony’s economic interests naturally gravitated toward Prussia, Beust’s foreign policy increasingly drew him nearer to Austria, thus forcing him into an ever sharpening opposition to Bismarck.

After Prussia’s victory over Austria and its Saxon ally in 1866, Beust had to give up his office under pressure from Bismarck. Beust, who in Saxony had felt like a “horse harnessed to a perambulator,” unexpectedly found a wider field of activity. In October 1866 the emperor Francis Joseph appointed him Austrian minister for foreign affairs and in February 1867 imperial chancellor of the Habsburg monarchy (minister president in June 1867). Although a foreigner, Beust, optimistic as usual, did not hesitate to accept this difficult office. His diplomatic experience, political imagination,

and a certain cynicism helped him to master his new tasks quickly. He restored constitutional government and temporarily solved the most difficult internal problem by bringing about the compromise with Hungary, allotting to the Hungarians hegemony in the eastern part of the monarchy. Nevertheless, Beust’s attempt to regain German popular sympathy for Austria by establishing a model liberal regime was doomed to failure. In the long run he was not able to harmonize the status of the Germans—the dominant group within the western part of the empire—with the claims of the other nationalities subjected to Habsburg rule, particularly the Czechs.

Beust’s foreign policy was finally defeated by national ambitions whose force he underrated. Neither Francis Joseph nor Beust was willing to accept the consequence of Prussia’s defeat of Austria in 1866—namely, Austria’s enforced exclusion from Germany. Beust was dominated by the idea of revenge, by his rivalry with Bismarck, and by his fear lest Prussia lay hands upon the Habsburgs’ German territories. He therefore tried first to prevent the southern German states from uniting with Prussia; he wanted to create the preconditions for later reestablishing Austria’s old hegemony, though in an improved form. In pursuing his plan for an alliance with France and Italy to corner Prussia in the east, he proved to be a formidable adversary of Bismarck, much superior to Napoleon III of France in political skill and cleverness. Although his policy moved on the brink of a new war between Austria and Prussia, he was realistic enough to abstain from any attempt to involve Austria-Hungary in the Franco-German War.

Beust was denied the ultimate realization of his political aims; in 1871 he had to recognize that the German *Reich* under Prussian leadership, excluding Austria, had become a historical reality. Francis Joseph, who had raised him to the rank of count in 1868, dismissed him from his post as chancellor in October 1871. Beust continued to serve the Habsburg monarchy as ambassador in London and, after 1878, in Paris until his retirement in 1882.

(H.P.)

BIBLIOGRAPHY. An adequate biography is still lacking. General information may be found in Arthur James May, *The Hapsburg Monarchy, 1867–1914* (1951, reissued 1968); and A.J.P. Taylor, *The Struggle for Mastery in Europe, 1848–1918* (1954, reissued 1987).

Beuve-Méry, Hubert (b. Jan. 5, 1902, Paris—d. Aug. 6, 1989, Fontainebleau, near Paris), French publisher and editor who directed *Le Monde* from the paper’s founding in 1944 until 1969. Under his direction, *Le Monde* became an independent, self-supporting, and highly prestigious daily with a large national and international readership.

From 1928 to 1939 Beuve-Méry was the director of the legal and economic section of the Institut Français in Prague; meanwhile, he served between 1935 and 1938 as diplomatic correspondent for the newspaper *Le Temps*. When *Le Temps* and other French papers failed to react against Adolf Hitler’s actions, Beuve-Méry was openly critical and gave up his post for *Le Temps*. During World War II he worked with the Resistance. In 1944 President Charles de Gaulle asked Beuve-Méry to create a national free press that would replace *Le Temps*, which had been suppressed for collaboration with the Nazis. For the guarantee of complete independence, Beuve-Méry accepted and founded *Le Monde*. For many years he wrote columns of commentary under the pen name “Sirius.” He became a critic of, among other issues, French foreign policy in regard to the United States, Indochina, and Algeria; as a result, *Le Monde* was itself suppressed on many occasions. Yet the newspaper under Beuve-Méry’s guidance gained a respected position in France and the world at large.

In addition to his work as a journalist, Beuve-Méry wrote a number of books, among them *Vers la plus grande Allemagne* (1939; “Toward a Greater Germany”), *Réflexions politiques* (1951; “Political Reflections”), *Le Suicide de la IV^e République* (1958; “The Suicide of the Fourth Republic”), and *Onze ans de règne: 1958–1969* (1974; “An Eleven-Year Reign: 1958–1969”).

Beuys, Joseph (b. May 12, 1921, Krefeld, Ger.—d. Jan. 23, 1986, Düsseldorf), German avant-garde sculptor and performance artist whose works, characterized by unorthodox materials and ritualistic activity, stirred much controversy.

Beuys was educated in Rindern, Ger., and served in the German air force throughout World War II. In 1943 his plane crashed in the frozen Crimea. Those who found him tried to restore his body heat by wrapping him in fat and an insulating layer of felt; these substances would later become recurring motifs in his sculptural works. From 1947 to 1951 he studied art in Düsseldorf, and in 1961 he was appointed professor of sculpture at the Staatliche Kunstakademie in Düsseldorf. Beuys was also involved in German politics.

Beuys worked in the mid-1960s with the international avant-garde art group known as Fluxus. During this period he began to stage “actions,” events at which he would perform acts of a ritual nature. For one of his best-known actions, *How to Explain Pictures to a Dead Hare* (1965), Beuys covered his head with honey and gold leaf, wore one shoe soled with felt and one with iron, and walked through an art gallery for about two hours, quietly explaining the art therein to a dead hare he carried. His art was compared by some critics to that of the German Expressionists, both for its obsessive and unsettling qualities and for its linking of artistic revolution and social revolution.

Bevan, Aneurin, byname **NYE BEVAN** (b. Nov. 15, 1897, Tredegar, Monmouthshire, Eng.—d. July 6, 1960, Chesham, Buckinghamshire), controversial figure in post-World War II British politics and one of the finest orators of the time. To achieve mastery as a speaker, he had first to overcome a speech

Bevan
Elliott and Fry

impediment. He was the architect of the national health service and leader of the left-wing (Bevanite) group of the Labour Party.

The son of a miner, Bevan became a collier’s helper at 13 but had to leave the mines in a few years because of eye disease. After two years at Central Labour College, London, he entered politics and in 1929 was elected to the House of Commons as Labour member from Ebbw Vale. Throughout World War II he was a vigorous critic of Winston Churchill’s coalition government but was equally critical of his own party. From 1940 to 1945 he was editor of the independent Socialist *Tribune*.

As minister of health in Clement Attlee’s

Labour government of 1945, he was responsible for developing housing programs and for establishing the national-health service. He became minister of labour in January 1951 but resigned from the government the following April in protest against the rearmament program, which necessitated sharp cutbacks in social expenditures. For the next few years Bevan was the centre of controversy within the Labour Party and involuntarily gave his name to the party's radical wing.

A colourful public personality and a brilliant spontaneous debater, he had great personal charm but was sometimes so rude to opponents that Churchill once called him a "merchant of discourtesy." After his defeat as party leader by Hugh Gaitskell (1955), he accepted his party's policies and became shadow foreign secretary. His autobiography, *In Place of Fear*, appeared in 1952.

bevel siding: see clapboard.

Beveridge, Albert J., in full ALBERT JEREMIAH BEVERIDGE (b. Oct. 6, 1862, Highland County, Ohio, U.S.—d. April 27, 1927, Indianapolis, Ind.), orator, U.S. senator, and historian.

Beveridge was admitted to the Indiana bar in 1887 and began the practice of law in Indianapolis. He first attracted national attention by his eloquent speeches defending the increasing power of the federal government and advocating U.S. territorial expansion overseas. In 1899 he was elected as a Republican to the U.S. Senate, where (1900–12) he supported the progressive legislation sponsored by President Theodore Roosevelt. Breaking with the conservative wing of his party, he served as chairman and keynote speaker of the emotion-packed convention that organized the Progressive Party and nominated Roosevelt for president in 1912.

Beveridge never again held public office, devoting much time after 1912 to the writing of history. His *The Life of John Marshall*, 4 vol. (1916–19), was widely acclaimed and won a Pulitzer Prize. At the time of his death he had completed two volumes of a biography of Abraham Lincoln, published in 1928.

Beveridge (of Tuggal), William Henry Beveridge, 1st Baron (b. March 5, 1879, Rangpur, India—d. March 16, 1963, Oxford, Oxfordshire, Eng.), economist who helped shape Great Britain's post-World War II welfare state policies and institutions through his *Social Insurance and Allied Services* (1942), also known as the Beveridge Report.

The son of a British civil servant in India, Beveridge was educated at Balliol College, Oxford. His lifelong interest in the causes and cure of unemployment began in 1903 with his appointment as subwarden of Toynbee Hall, a London settlement house. After serving as director of Labour Exchanges (1909–16), he became permanent secretary of the Ministry of

Lord Beveridge, photograph by Yousuf Karsh
Camera Press

Food in 1919. He directed the London School of Economics and Political Science from 1919 to 1937, when he was elected master of University College, Oxford. He was knighted in 1919 and was created a baron in 1946.

In his *Unemployment: A Problem of Industry* (1909), Beveridge argued that unemployment was in large measure caused by the organization of industry. His revised views, set forth in *Full Employment in a Free Society* (1944), were strongly influenced by Keynesian economics. Beveridge's crowning achievement came during World War II, when, at the invitation of the government, he helped work out the blueprints of the new British welfare state. His other works include *Insurance for All* (1924), *British Food Control* (1928), *Planning Under Socialism* (1936), *Pillars of Security* (1948), *Power and Influence* (1953), and *A Defence of Free Learning* (1959).

Beverley (England): see East Yorks Borough of Beverley.

Beverly, city, Essex county, northeastern Massachusetts, U.S., on Beverly Harbor, an inlet of the Atlantic Ocean, just north of Salem. Settled about 1626, it was named for Beverley, Eng., when incorporated as a town (township) in 1668. It early developed as a shipping centre, and the schooner *Hannah*, claimed to be the first ship of the U.S. Navy, was commissioned (Sept. 5, 1775) at Glover's Wharf in Beverly by George Washington. One of New England's first successful cotton-weaving mills was built (1789) there, and the city now has one of the nation's largest shoe-machinery factories; the electronics industry and summer tourism are also important economically. Historic buildings include Hale House (1694), the Cabot House (1781), and the Balch House (1636). Beverly is also the seat of Endicott College for women (1939). Inc. city, 1894. Pop. (1992 est.) 38,077.

Beverly Hills, city, western Los Angeles county, California, U.S., completely surrounded by the city of Los Angeles. The site originated in the 19th century as the Rancho Rodeo de las Aguas. In 1906 it was organized as a residential area called Beverly; in 1912

Mary Pickford and Douglas Fairbanks at their estate, Pickfair, in Beverly Hills, Calif.

Security Pacific Collection/Los Angeles Public Library

the Beverly Hills Hotel was erected, and in 1914, with a population of about 500, the town was incorporated. In 1919 the film stars Mary Pickford and Douglas Fairbanks built their estate, Pickfair, which began the fashion among Hollywood celebrities and executives to build lavish homes in Beverly Hills.

The city is transected east-west by three main boulevards: north of Sunset Boulevard are foothills containing the Beverly Hills Hotel (with its famous Polo Lounge and pink bungalows) and luxurious mansions among the winding drives; south of Sunset Boulevard are the flatlands, containing other expensive homes and, between Santa Monica Boulevard

and Wilshire Boulevard, many chic shops, boutiques, and department stores; the most exclusive of these are on the old Rodeo Drive and the newer Two Rodeo Drive, a multi-level shopping street in mock Mediterranean style. There is also some light manufacturing south of Wilshire. The area of Beverly Hills—5.7 square miles (14.8 square km) overall—contains seven parks and is profusely planted in trees, shrubbery, and lawns. The city is bordered to the southwest by the studios of Twentieth Century-Fox, whose lots, however, have now been largely converted into Century City, a shopping mall, office-building centre, and theatre complex. Pop. (1992 est.) 33,159.

Bevin, Ernest (b. March 9, 1881, Winsford, Somerset, Eng.—d. April 14, 1951, London), British trade unionist and statesman, one of the most powerful British union leaders in the

Bevin, 1945
Bassano and Vandyk

first half of the 20th century. He also proved to be a forceful minister of labour and national service during World War II and foreign secretary in the immediate postwar period.

Bevin was reared in a poor family and left school at the age of 11. After holding a series of jobs, he found regular employment on a mineral-water delivery route in Bristol. In 1905 he became the unpaid secretary of the Bristol Right to Work Committee, and in 1910 he formed a carters' branch of the Dockers' Union in that city. By the end of World

War I he was functioning as the union's assistant general secretary, though the post was not formally created until May 1920. In 1921 he amalgamated several unions into the Transport and General Workers' Union, of which he was general secretary until 1940 and which became the largest trade union in the world. From 1925 he was a member of the general council of the Trades Union Congress (TUC) and in 1937 was elected its chairman. He was prominent in organizing the British general strike of May 3–12, 1926, and was also instrumental in settling it.

During the early years of the Great Depression he criticized Ramsay MacDonald's sec-

ond Labour Party government (1929–31) for failing to enact radical measures to relieve unemployment, and he refused to support MacDonald's national coalition ministry (1931–35). Through the 1930s he advocated British rearmament and a firm foreign policy to counteract the growing threat of Nazi Germany and Fascist Italy. In May 1940, when Winston Churchill formed his wartime coalition government, Bevin was appointed minister of labour and national service and was included in the War Cabinet.

When Clement Attlee formed his Labour Party government on July 26, 1945, Bevin was chosen as foreign secretary. Quickly losing his optimism about the Soviet Union, he argued (autumn 1945) against recognition of new Soviet-sponsored governments in the Balkans. To facilitate the economic and defensive rebuilding of western Europe, which was then the main theatre of the Cold War, he helped establish the Brussels Treaty alliance of the United Kingdom, France, Belgium, The Netherlands, and Luxembourg (March 17, 1948) and the Organisation for European Economic Co-operation (April 16, 1948). These agreements were followed by the signing of the North Atlantic Treaty (April 4, 1949, in Washington, D.C.). His plans (1947–48) for a federal Jewish-Arab nation or other partition of Palestine collapsed in the face of the Arab-Israeli conflict. On Jan. 6, 1950, the United Kingdom offered recognition to the People's Republic of China, contrary to United States policy. Before ill health forced his resignation on his 70th birthday, March 9, 1951, Bevin initiated the Colombo Plan (effective June 30, 1951) for economic development of South and Southeast Asia. For the last five weeks of his life he was lord privy seal.

Bewa (Liberia): see Mano River.

Bewcastle Cross, runic monument in Cumbria, Eng., dating from the late 7th or early 8th century. Although the top of the cross has been lost, a weather-beaten, 15-foot (4.5-metre) shaft remains, showing on one face a figure of Christ trampling on the heads of beasts, a runic inscription underneath, and, above Christ's figure, a falconer, possibly St. John the Evangelist with his eagle. On another side elaborate carvings depict a tree, branches, roots, leaves, fruit, birds, and animals. The half-obliterated inscription suggests that the monument was a memorial to Alchfrith, son of Oswiu of Northumbria, and his wife Cyneburh (Cyniburug). The sophistication, artistry, and spirit of the cross link it to the same period and school as the Ruthwell Cross.

Bewick, Thomas (b. Aug. 12, 1753, Cheryburn, Northumberland, Eng.—d. Nov. 8, 1828, Gateshead, Durham), printmaker and illustrator important for reviving the art of wood engraving and establishing it as a major printmaking technique.

Bewick, a precocious youth, was apprenticed to a local metal engraver when he was 14 years old. He progressed rapidly and, after his apprenticeship, entered into a partnership with his former master in Newcastle, where he remained for most of his life.

Bewick was a brilliant technical innovator, but he did not invent wood engraving as is sometimes claimed. Instead, he rediscovered the technique, which consists of incising a design into endwood with a cutting tool called a burin. Using parallel lines instead of cross-hatching, he achieved a wide range of tones and textures. Moreover, he revived the practice of white-line printing, a method of printing white lines on a dark ground by making impressions from ink rolled onto the surface of the engraved relief instead of from ink held in its furrows. He also discovered that if the

area of the block forming the background of the scene were lowered, it would receive less pressure during printing. Consequently, the background would print gray, heightening the effect of atmosphere and space.

THE TAWNY OWL.

COMMON BROWN EYE OWL, OR HOWLE.

From *Natural History of the British Museum*, 1797–1804.

"The Tawny Owl," wood engraving by Thomas Bewick, from his *History of British Birds*, 1797–1804

By courtesy of the trustees of the British Museum, photograph, J.R. Freeman & Co. Ltd.

Bewick's most important works are illustrations for such books as *A General History of Quadrupeds* (1790) and *A History of British Birds* ("Land Birds," 1797, and "Water Birds," 1804). A bird watcher and amateur naturalist, Bewick based his illustrations on his own watercolour studies made from nature.

Bexhill, also called BEXHILL-ON-SEA, TOWN, Rother district, county of East Sussex, England, just west of Hastings on the English Channel. The coastal resort dates from the 1880s, but the old village inland on the cliff top is built around its ancient parish church. A central feature of the resort area is the De la Warr Pavilion, built in the mid-1930s by Bauhaus architects Erich Mendelsohn and Serge Chermayeff. There is an annual music festival. Pop. (1991) 38,905.

Bexley, outer borough of Greater London, Eng., covering an area of 23 square miles (61 square km). It lies on the southern bank of the River Thames and extends to the borough of Bromley in the south, where it rises to about 150 feet (45 m) overlooking the valley of the River Cray.

The history of Bexley goes back as far as the Paleolithic Period, and deneholes (ancient underground chambers) have been found in the area. Evidence of Roman settlement has been found at Joyden's Wood, and it is thought that the Battle of Creccanford (AD 457), when indigenous Britons were defeated by invading Saxons, took place there. Erith was granted a charter as early as the 7th century, later developing as a royal dockyard.

The most rapid development of the borough has been since the 19th century, when Bexley grew as a residential area near London. It has benefited from the presence of a number of parks and open spaces, notably Danson Park and Lessness Abbey Woods, some of which are associated with historic buildings, such as the ruined Lessness Abbey (an Augustinian house) and the 16th-century Hall Place manor. St. Paulinus Church, Crayford, is the oldest local church, with parts dating from the 11th century; St. Mary's, Bexley, was built in the 13th century.

Industries, based on imported raw materials or on the vast local supplies of water, are concentrated along the Cray valley and along the Thames at Erith. They include oil-seed processing and the manufacture of paper, plastics, and chemicals, with engineering remaining the dominant occupation. Pop. (1998 est.) 217,800.

bey, Turkish BEY, Old Turkish BEG, Arabic BAY, or BEY, title among Turkish peoples traditionally given to rulers of small tribal groups, to members of ruling families, and to important officials. Under the Ottoman Empire a bey was the governor of a province, distinguished by his own flag (*sancak, liwa*). In Tunis after 1705 the title became hereditary for the country's sovereign. Later "bey" became a general title of respect in Turkish and Arab countries, added after a personal name and equivalent to "esquire" (or "sir" in conversation) in English. In the 20th-century Turkish republic, bey, though surviving in polite conversation, was replaced by *bay* before the name (equivalent to "Mr.").

Bey, Enver (Ottoman general): see Enver Paşa.

Beyer, Absalon Pedersøn (b. 1528, Sogn, Nor.—d. 1575), Lutheran humanist scholar, one of the most advanced thinkers in Norway in his day.

Born on a farm, Beyer was adopted by a bishop and educated at the universities of Copenhagen and Wittenberg, where he studied under the famous Protestant Reformation scholar Philipp Melancthon. Beyer was a lecturer at the Bergen Cathedral School. In an age when Norway was subject to Denmark, his principal work, *Om Norgis rige* ("Concerning the Kingdom of Norway"), written in 1567 and published in 1781, displays an interest in Norway's past and embodies the first stirrings of nationalistic sentiment. His diary, valuable as a historical source, was published in a critical edition in 1963.

Beyers, C.F., in full CHRISTIAAN FREDERIK BEYERS (b. Sept. 23, 1869, near Stellenbosch, Cape Colony [now in Cape Province, S.Af.]—d. Dec. 7, 1914, Orange Free State, S.Af.), attorney, politician, and general in the South African War (1899–1902).

A graduate of Victoria College (now Stellenbosch University), Beyers migrated to the Transvaal, where he was naturalized and practiced as a lawyer. Joining the Boer forces in 1899, he rose rapidly to the rank of general and commanded the forces in the northern Transvaal. A staunch Afrikaner, Beyers joined

Beyers

Archiv für Kunst und Geschichte, Berlin

Louis Botha's party, Het Volk ("The People"), after the war and was elected speaker of the Transvaal Parliament (1907).

The Union of South Africa was formed in 1910, and when the Union Defence Force was established two years later, Beyers was made the commandant general. Beyers always objected to Botha's conciliatory policy toward Britain. With the outbreak of World War I, when Botha's government decided to aid the British by conquering German South West Africa, Beyers resigned (Sept. 15, 1914). Botha and his defense minister, Jan Smuts, failed to mollify Beyers and other Afrikaner nationalists, who then resorted to armed protest. While trying to elude government forces during the

short-lived rebellion, Beyers drowned in an effort to cross the Vaal River.

Beyla, town, southeastern Guinea, western Africa, in the Guinea Highlands. The town was founded by Dyula traders in the early 13th century as a collecting point for slaves and kola nuts and is now the chief trading centre for rice, cattle, tobacco, coffee, and palm oil and kernels. It is connected by road with Nzérékoré (south) and Kankan (north). Beyla is the site of a hospital and a tobacco and match factory. There is some alluvial diamond mining west of the town around Bounoudou. The region is mainly inhabited by the Muslim Malinke-Konianke people. The nearby Simandou Mountains contain iron-ore deposits. Pop. (1983 prelim.) 10,970.

Beyrouth (Lebanon): see Beirut.

Beza, Theodore, French THÉODORE DE BÈZE (b. June 24, 1519, Vézelay, Fr.—d. Oct. 13, 1605, Geneva), author, translator, educator, and theologian who assisted and later suc-

Beza, portrait by an unknown master of the French school, 1605

Archiv für Kunst und Geschichte, Berlin

ceeded John Calvin as a leader of the Protestant Reformation centred at Geneva.

After studying law at Orléans, Fr. (1535–39), Beza established a practice in Paris, where he published *Juvenilia* (1548), a volume of amorous verse that earned him a reputation as a leading Latin poet. On recovering from a serious illness, he underwent a conversion experience and in 1548 traveled to Geneva to join Calvin, then deeply involved with his theocratic reforms of Swiss political and educational institutions. A year later Beza became a professor of Greek at Lausanne, where he wrote in defense of the burning of the anti-Trinitarian heretic Michael Servetus (d. 1553). For several years Beza traveled throughout Europe defending the Protestant cause. He returned to Geneva in 1558.

There, in 1559, with Calvin, he founded the new Geneva academy, destined to become a training ground for promotion of Calvinist doctrines. As its first rector, Beza was the logical successor to Calvin upon the reformer's death in 1564. Beza remained the chief pastor of the Geneva church for the rest of his life, contributing numerous works that influenced the development of Reformed theology.

In most matters he reiterated Calvin's views, though with greater stress on ecclesiastical discipline and rigid obedience to authority. Beza's sermons and commentaries were widely read in his time; his Greek editions and Latin translations of the New Testament

were basic sources for the Geneva Bible and the King James Version (1611). His *De jure magistratum* (1574), defending the right of revolt against tyranny, grew out of the St. Bartholomew's Day Massacre (1572), from which many surviving French Protestants were welcomed by Beza in Geneva. Beza's book overthrew the earlier Calvinist doctrine of obedience to all civil authority and subsequently became a major political manifesto of Calvinism. In 1581 Beza donated to the University of Cambridge from his library the celebrated Codex Bezae (D), an important manuscript from about the 5th century bearing Greek and Latin texts of the Gospels and Acts and supplemented by Beza's commentary based on the Calvinist viewpoint. Other works among Beza's own writings include anti-Catholic tracts, a biography of Calvin, and the *Histoire ecclésiastique des Églises réformées au royaume de France* (1580; "Ecclesiastical History of the Reformed Church in the Kingdom of France"). Both as a theologian and as an administrator, despite occasional charges of intolerance made against him, Beza is considered not only Calvin's successor but also his equal in securing the establishment of Calvinism in Europe.

Bezborodko, Aleksandr Andreyevich, Knyaz (Prince) (b. March 25 [March 14, Old Style], 1747, Glukhovo, Ukraine, Russian Empire—d. April 17 [April 6], 1799, St. Petersburg, Russia), Russian foreign minister who was closely linked with the major diplomatic affairs of Catherine II the Great, including her idea of reestablishing the Byzantine Empire under her grandson Constantine.

Recommended to Catherine by Count P.A. Rumyantsev, with whom he had served in the Russo-Turkish War of 1768–74, Bezborodko was appointed secretary of petitions in 1775. He later became postmaster general and "plenipotentiary of all negotiations" in the Foreign Office, and in 1786 he was promoted to the Senate, wherein he became Catherine's spokesman. In 1792 he concluded the Treaty of Jassy with the Turks, extending Russia's frontier to the Dnestr River. He also advised Catherine on the second and third partitions of Poland (1793 and 1795).

After Catherine's death (1796) Bezborodko was made a prince of the Russian Empire and imperial chancellor by Paul I, who, despite their disagreement concerning Russia's

Bezborodko, portrait by an unknown artist, 18th century; in the State Historical Museum, Moscow

attitude toward France, regarded Bezborodko with favour.

Béziers, city, Hérault *département*, Languedoc-Roussillon *région*, southern France, 9 miles (14 km) from the Mediterranean Sea, on a hilly site overlooking the Orb River where it is intersected by the Canal of the Midi, southwest of Montpellier. There are remains

of an arena from the Roman colony *Beterrae*. In the 12th century it was a stronghold of the viscounts of Carcassonne. In 1209 Simon de Montfort, sent by the pope to extirpate the Catharist heresy of good and evil as creators of the next world and this one, massacred the inhabitants; and the Roman-Gothic Church of La Madeleine was a scene of great bloodshed. The city walls, rebuilt in 1289, were destroyed in 1632. The former Cathedral of Saint-Nazaire, dominating the old town, is a typical ecclesiastical fortification of the 13th–14th centuries. The street named for Paul

The old fortified cathedral of Saint-Nazaire on the Orb River, Béziers, Fr.

Riquet, who built the Canal of the Midi, separates the old town (west) from the modern.

Béziers distills alcohol and makes artificial fertilizers and spray chemicals for the vineyards. The city is an important railway junction and has a major service facility for the French national railway system. Its principal trade has been in the *vin ordinaire* of Languedoc, notably Muscat, said to have been introduced by the Romans, but this has diminished owing to the centralization of the wine industry in Montpellier. Pop. (1990) 72,362.

Bezique, card game, a forerunner of Pinochle. The game is for two players using a 64-card deck consisting of two 52-card decks in which the deuces through sixes have been removed; the cards rank in descending order: ace, 10, king, queen, jack, 9, 8, 7. Eight cards are dealt, three, two, and three cards at a time. The remaining cards are placed face down and form the stock, the top card of which is turned up to establish the trump suit.

The play is in two stages. First the nondealer plays a card face up; the dealer may follow suit, not follow suit, or trump as he pleases. The highest card of the suit led or a trump wins the trick. Players score points either by taking aces and 10s in tricks (each is called a *brisque* and counts 10 points) or by melding (declaring various combinations of cards that they hold) after a trick is won, as follows:

Marriage (king, queen of same suit, except trump)	20
Royal marriage (king, queen of trump)	40
Sequence (ace through jack of trump)	250
Bezique (queen of spades and jack of diamonds)	40
Double bezique	500
Any four aces	100
Any four kings	80
Any four queens	60
Any four jacks	40

A card used and scored in one combination cannot be counted in another lower combination in the same class (classes are sequences, beziques, and quartets). After declaring, the highest declarer draws the top card of the

stock, as does the other player, and then leads from his hand or from one of his declarations on the table. The winner of the last trick when the stock is down below two cards takes the last card and the loser takes the trump card.

When the stock is exhausted, the second stage of play begins, and each player takes his tabled declarations into his hand. In the ensuing play of tricks, the leader's opponent must follow suit if able and must win the trick if able, either by playing a higher card of the suit led or by trumping. Game is usually 1,000 or 1,500 points.

Rubicon Bezique has, with Six-Pack Bezique (also called Chinese Bezique), supplanted the original game in popularity. In both Rubicon and Six-Pack, scoring combinations may be declared and scored, broken up during play, restored by adding equivalent cards, and scored again. Any four 32-card decks are used, and players receive 9 cards in Rubicon Bezique; six decks are used in Six-Pack Bezique, and players are dealt 12 cards. In both, the first marriage establishes trump.

Bezruč, Petr, pseudonym of VLADIMÍR VAŠEK (b. Sept. 15, 1867, Opava, Silesia, Austrian Empire [now in Czech Republic]—d. Feb. 17, 1958, Kostelec, Czech.), one of the finest and most individual Czech poets.

Bezruč studied in Prague and became a postal official in Moravia until his retirement in 1927. His literary reputation rests on a remarkable series of poems written during 1899 and 1900 and published in the periodical *Cas* between 1899 and 1903. The subject of almost all these poems is the people of Czech Silesia, whom Bezruč saw as a dying race, doomed to denationalization at the hands of German industrialists and Polish priests. From this local theme he created a poetry of national and, indeed, universal validity. The 32 poems of the Silesian issue of *Cas* (1903) had swelled to 88 by the last edition of the collected *Slezské písně* (1956; "Silesian Songs").

Bhadrabāhu I (d. 298 BC, India), Jaina leader and philosopher who, after a 12-year famine, led an exodus from the Jaina stronghold in northeastern India to Srāvana-Belgola in Mysore, southwestern India, in 310 BC.

Bhadrabāhu was a monk who became the spiritual head of the Jains. He founded a community in Mysore that gave rise to the Digambara sect, whose members lived entirely naked. Bhadrabāhu is believed to have been the author of three of the Jaina sacred books as well as of *Niryuktis*, short commentaries on 10 of the 12 original sacred books. Some authorities say that, after the famine, Bhadrabāhu retired in seclusion to Nepal; others say he remained in Mysore. He is reputed to have died by realizing the Jaina ideal of starving to death.

Bhadracaryā-praṇidhāna (Sanskrit: "Vows of Good Conduct"), also called SAMANTA-BHADRA-CARYĀ-PRANIDHĀNA ("Practical Vows of Samantabhadra"), a Mahāyāna ("Greater Vehicle") Buddhist text that has also made an important contribution to the Tantric Buddhism of Tibet. Closely related to the *Avataṃśaka-sūtra* ("Discourse on the Adornments of the Buddha") and sometimes considered its final section, the *Bhadracaryā-praṇidhāna* presents a universe of totally interdependent phenomena manifesting the Buddha. But its main emphasis is on entering into the full realization of such a universe—or into the Pure Land of Amitābha—through actions conforming to the 10 great vows of the bodhisattva (buddha to be) Samantabhadra.

These 10 vows, understood as the essence of the vows and deeds of all past and future buddhas, came to be used as daily lessons in

Chinese monasteries. In Tibet they were incorporated as utterances in a number of rites, thus influencing the development of Tantric ritualism.

Briefly summarized, the vows include: inexhaustible service to all buddhas; the learning and obedience of all teachings of all buddhas; the plaint for all buddhas to descend into the world; the teaching of the dharmas (universal truths) and the paramitas (transcendental virtues) to all beings; the embracing of all universes; the bringing together of all Buddha's lands; the achievement of Buddha's wisdom and powers to help all beings; the unity of all bodhisattvas; and the accommodation of all sentient beings through the teaching of wisdom and Nirvāṇa.

Bhadrāvati, city, central Karnāṭaka (formerly Mysore) state, southern India. It lies along the Bhadra River, near the Bāba Budan Range. The proximity of iron, manganese, and limestone deposits, along with the Bhadrā hydropower project, have made the site an ideal location for steelmaking and other industrial enterprises. Bhadrāvati has become a planned modern city with accompanying road and rail services. Auxiliary industries produce charcoal, tar products, cement, paper, bricks, wood alcohol, and sandalwood oil. Pop. (1991 prelim.) city, 55,413; metropolitan area, 149,131.

*A list of the abbreviations used
in the MICROPAEDIA will be found
at the end of this volume*

Bhāgalpur, city, eastern Bihār state, north-eastern India, just south of the Ganges River. The city has major road and rail connections and trades in agricultural produce and cloth. Major industries include rice and sugar milling and woolen weaving. Bhāgalpur is also noted for its silk production. A sericulture institute and an agricultural-research station have been established, and the city is the seat of Bhāgalpur University (1960). Formerly called Sujāganj, Bhāgalpur was constituted a municipality in 1864.

The surrounding region includes an alluvial plain in the north and forested uplands of the Choṭa Nāgpur Plateau to the south. The Ganges and Chāndan rivers drain the area. Grains and oilseeds are the principal crops; china clay, fireclay, and mica deposits are worked. Pop. (1991 prelim.) 254,993.

Bhagavadgītā (Sanskrit: "Song of God"), one of the greatest and most beautiful of the Hindu scriptures. It forms part of Book VI of the Indian epic the *Mahābhārata* ("Great Epic of the Bharata Dynasty") and is written in the form of a dialogue between the warrior Prince Arjuna and his friend and charioteer, Krishna, who is also an earthly incarnation of the god Vishnu. The *Bhagavadgītā* is of a later date than the major parts of the *Mahābhārata* and was probably written in the 1st or 2nd century AD. The poem consists of 700 Sanskrit verses divided into 18 chapters.

The dialogue takes place on the field of battle, just as the great war between the Pāṇḍavas and the Kauravas is about to begin. The two armies stand opposing each other, and, on seeing many of his friends and kinsmen among those lined up on the other side, Prince Arjuna hesitates. He considers whether it would not be better to throw down his arms and allow himself to be slain by the enemy rather than to engage in a just, but cruel, war. He is recalled to his sense of duty as a warrior by Krishna, who points out to him that the higher way is the dispassionate discharge of his duty, performed with faith in God, and without selfish concern for personal triumph or gain.

The *Bhagavadgītā* goes far beyond the ethical question with which it begins, to consider

broadly the nature of God and the means by which man can know him. The greatness of the scripture lies in its description of both the end and the means. It gives a synopsis of the religious thought and experience of India through the ages. Because it is a predominantly theistic work, it often describes the ultimate reality as a personal god, identified with Krishna. However, it also quite frequently refers to the supreme as the immanent spirit, as the transcendent absolute, and, finally, as the state of one's own awakened soul. The three paths of the Hindu religious tradition leading to mystic union with God are all described as different aspects of a single way of approach.

The popularity of the *Bhagavadgītā* is evident from the many commentaries, glossaries, and expository books written on it in both ancient and modern times. The earliest commentary that has come down is that of the great philosopher Śaṅkara. Other important commentaries of ancient times are those of Bhāskara, Rāmānuja, Madhva, Nilakaṇṭha, Śrīdhara, and Madhusūdana; and outstanding modern commentaries are those of B.G. Tilak, Śrī Aurobindo, Mahatma Gandhi, and Sarvepalli Radhakrishnan. The *Bhagavadgītā* has been translated into many languages.

Bhāgavata (Sanskrit: "One Devoted to Bhagavat [Lord]"), member of the earliest Hindu sect of which there is any record, representing the beginnings of theistic, devotional worship and of modern Vaiṣṇavism (worship of the Lord Vishnu); the term is commonly used today to refer to a Vaiṣṇava, or devotee of Vishnu.

The Bhāgavata sect originated among the Yādava people of the Mathura area in the centuries preceding the beginning of the Christian era. From there it spread as the tribes migrated to western India and the northern Deccan. It was introduced into South India at an early date. The sect continued to be prominent within Vaiṣṇavism until at least the 11th century, when bhakti (devotional worship) was revitalized by the great theologian Rāmānuja.

The Bhāgavata system was a highly devotional faith centred upon a personal god, variously called Vishnu, Vāsudeva, Krishna, Hari, or Nārāyaṇa. The school was known as *ekāntika-dharma* ("religion with one object," i.e., monotheism). The religious poem the *Bhagavadgītā* (1st–2nd century AD) is the earliest and finest exposition of the Bhāgavata system. By the time of the Gītā Vāsudeva (Krishna), the hero of the Yādava clan was identified with the Vedic Lord Vishnu. Later, the deified sage Nārāyaṇa, whose followers were originally called Pāncarātras, was assimilated, and, still later, the pastoral and amorous Krishna was added to the multiplicity of traditions.

The Bhāgavatas believed in simple rites of worship and condemned Vedic sacrifices and penances. The sect may have been largely responsible for the spread of image worship among orthodox, upper-class Hindus. Few early Vaiṣṇava images are still extant, but those that have survived are mainly from the Mathura area, perhaps the earliest being the image of Balarāma, the half brother of Krishna, which is attributed to the 2nd–1st century BC.

Bhāgavata-Purāṇa (Sanskrit: "Ancient Stories of the Lord"), the most celebrated text of a variety of Hindu sacred literature in Sanskrit that is known as the *Purāṇas*, and the specific text that is held sacred by the Bhāgavata sect. Scholars are in general agreement that the *Bhāgavata-Purāṇa* was probably composed about the 10th century, somewhere in the Tamil country of South India; its expression of bhakti (religious

devotion) is akin in its emotional fervour to that of the South Indian devotional poets, the Ālvārs. The *Purāṇa* is made up of some

The child Krishna stealing butter, painting from the *Bhāgavata-Purāṇa*, Kāgra school, 1790–1800; in the F.F. Wadia Collection
The F.F. Wadia Collection, Pune, India

18,000 stanzas divided into 12 books; but it is book 10, which deals with Krishna's childhood and his years spent among the cowherds of Vr̥ndāvana, that accounts for its immense popularity with Vaiṣṇavas throughout India. The attempts on Krishna's life made by his wicked uncle Kamsa, the childhood pranks he played on his foster mother Yaśodā, his love for the *gopīs* (the wives and daughters of the cowherds) and their passionate abandonment to him are treated with endearing charm and grace, even while transfused with deep religious significance. The *Bhāgavata-Purāṇa*, in translation and in inspiration, has resulted in an enormous body of related vernacular literature. Its scenes have been carved in stone on temple walls and have been illustrated in beautiful miniatures by Rajasthani and Pahari painters of the 17th and 18th centuries.

Bhāgirathi River, river in West Bengal state, northeastern India, forming the western boundary of the Ganges (Gaṅgā) Delta. A tributary of the Ganges, it leaves that river just northeast of Jangipur, flows south, and joins the Jalangi at Nabadwip to form the Hooghly River after a total course of 120 miles (190 km). Until the 16th century, when the Ganges shifted eastward to the Padma, the Bhāgirathi formed the original bed of the Ganges. Its banks sheltered the great ancient capitals of Bengal, and the river is held sacred by the Hindus.

Bhāi Jethā (Sikh Gurū): see Rām Dās.

bhāiband (Hindi), Urdu-Persian BERĀDARĪ ("brotherhood"), important instrument of caste self-government in India; the *bhāiband* is the council formed by the heads of families that belong to the same lineage in a particular area, thus constituting an exogamous (those who do not intermarry) unit within the endogamous (those who do intermarry) caste group. One of their concerns, in addition to questions arising as a result of their common lineage, is the securing of exogamous alliances and safeguards against lineage inbreeding. Often the local *bhāiband* may be coterminous with the panchayat, or governing council, of a particular caste section.

Bhaiṣajya-guru (Sanskrit), Tibetan SMAN-BLA-RGYAL-PO, Chinese YAO-SHIH-FO, Japanese YAKUSHI NYORAI, the healing Buddha, widely worshiped in Tibet, China, and

Japan. According to popular belief in those countries, some illnesses are effectively cured by merely touching his image or calling out his name. More serious illnesses, however, require the performance of complex ritual acts, as described in the principal scripture of the

Bhaiṣajya-guru cult. Bhaiṣajya-guru is associated with the "self-born," eternal Buddha, Akṣobhya (and by some Japanese sects with another eternal Buddha, Vairocana), and rules over the Eastern Paradise.

In Japan the worship of Bhaiṣajya-guru reached a peak during the Heian Period (794–1185), and he is especially venerated by the Tendai, Shingon, and Zen sects. In Japan he is often represented in the garb of a blue-skinned Buddha with his medicine bowl in one hand. In Tibet he often holds the medicinal myrobalan fruit. He has in his retinue 12 divine *yakṣa*, or nature spirit, generals who protect true believers. Chinese Buddhists, in a later phase, connected these generals with the 12 hours of the day and the 12 years of the Chinese calendar's cycle.

The *Bhaiṣajyaguru Sūtra* had four Chinese translations, the earliest from the Eastern Chin (AD 317–420), and two Tibetan versions.

Bhaktapur, also called BHATGAON, or BHĀDGAON, town, central Nepal, in the Nepal Valley, southeast of Kāthmāndu. Said to have been founded by Rājā Ananda Malla in 865, it was for 200 years the most important settlement in the valley. The old palace in Durbar

The Golden Gate to Bhaktapur Palace, Nepal
J Allan Cash—EB Inc

Square, built in 1700, is well preserved and has beautifully carved woodwork and a finely worked gilt gateway. Opposite, on a stone pillar, is the copper-gilt figure of King Bhūpatindra Malla. There are other temples in the square.

To the south is another square with the 18th-century Najatapola Dewai, or five-tiered temple, and a temple to Bhairava, guarded by two copper-gilt *singhas* (mythical lions). A local museum is devoted to the conservation of examples of fine woodwork of the past. Pop. (2000 est.) mun., 73,945.

bhakti (from Sanskrit *bhaj*, "to allot," "to revere"), in Hinduism, a devotional movement emphasizing the intense emotional attachment and love of a devotee toward his personal god. Bhakti assumes a dualistic relationship between the devotee and god, in contrast to the monistic ideal of Advaita Vedānta philosophy. The way of bhakti (*bhakti-marga*) is contrasted with other means of achieving salvation, such as knowledge (*jñana-marga*), ritual and good works (*karma-marga*), and ascetic disciplines of the body; it is claimed by its supporters to be a superior way, as well as one open to all, irrespective of the sex, class, or caste status into which they were born.

Though each of the major divinities of Hinduism—Vishnu, Śiva, and Śakti—has its own devotional cults, the bhakti movement most characteristically developed around darshan Vishnu, principally in his two earthly incarnations as Rāma and Krishna.

An emotional attraction toward a personal god began to be expressed in the early centuries of the Christian Era. It was an attitude furthered by the Indian epics—the *Mahābhārata* and the *Rāmāyaṇa*—and by the *Purāṇas*, encyclopaedic texts that recount legends of the various incarnations and appearances of the deities, their genealogies, and devotional practices accorded them. These practices included the recitation of God's name, singing of hymns in praise of him, wearing his emblem, undertaking pilgrimages to sacred places associated with him, and serving him in a variety of ways.

The devotional fervour of the 7th–10th-century hymnists of South India, the Ālvārs and the Nāyaṇārs, also traveled north, until in time bhakti became an extremely widespread and popular form of Hindu religious life, inspiring a substantial quantity of superb religious poetry and art.

During the medieval period (12th to mid-18th century), the various possible relationships of the worshiper to God—based on the analogy of human sentiments, such as that felt by a servant toward his master, friend toward a friend, parent toward a child, child toward a parent, and woman toward her beloved—were explored in separate schools. In Bengal the 15th–16th-century mystic Caitanya stressed the passionate yearning of a woman for her beloved, while his contemporary Vallabha delighted in the exploits of Krishna as the divine child, as well as Krishna as the divine lover. Tulsidās' retelling of the Rāma legend in the *Rāmcaritmānas* focused on the sentiment of friendship and loyalty. The synthesis in the medieval period of bhakti ideas with Ṣūfī (mystical) elements from Islām can be discovered in the writings of poet-saints such as Kabīr, devotees of a God whom they were unwilling and unable to delimit by sectarian description.

Bhaktivedanta, A(bhay) C(haranaravinda), also called SWAMI PRABHUPĀDA (b. Sept. 1, 1896, Calcutta—d. Nov. 14, 1977, Vr̥ndāvan, Uttar Pradesh, India), Indian religious leader and author who in 1965 founded the International Society for Krishna Consciousness, commonly known as the Hare Krishna movement.

In 1920 Bhaktivedanta completed his B.A. in chemistry at the Scottish Churches' College

in Calcutta; by that time, his family had arranged a marriage for him, and he later established a pharmacy business. In 1922 his guru, a spiritual leader of the Vaiṣṇava Hindu sect, urged him to preach the teachings of Krishna throughout the Western world. Thereafter Bhaktivedanta devoted much time as lecturer, writer, editor, and translator for the Vaiṣṇava and in 1933 was formally initiated as a disciple at Allahābād.

Because his family did not share his religious interests, Bhaktivedanta turned over his business to a son and renounced all family ties in 1954 to devote his full time to religious work. He received the title of swami in 1959 and in 1965 sailed for Boston, Mass., U.S. Several months later he moved to New York City, where he established the headquarters of the Hare Krishna movement on the Lower East Side. From a storefront, he taught classes on Vedic culture, which he claimed could affect the consciousness of a world afflicted with rampant materialism. The movement became especially popular among young people, and many of the swami's books began to be studied on college and university campuses.

Despite his failing health, Bhaktivedanta by the time of his death had written and published more than 50 books on ancient Vedic culture and had opened more than 100 centres throughout the world.

bhāṇavāra (Sanskrit and Pāli: "recitation section"), any of the units, usually 8,000 syllables in length, into which Pāli Buddhist texts were divided in ancient times for purposes of recitation. The system developed as a means of preserving and transmitting canonical material before it was committed to writing and before written texts were in general use.

At first, different groups of *bhāṇakas* ("reciters") were responsible for different parts of the canon; Dīghabhāṇakas, for example, specialized in the *Dīgha Nikāya* ("Long Collection"). Later, in Ceylon (Sri Lanka), these groups developed into early schools of interpretation, and their differing views are reflected in some of the commentary literature.

Bhandāra, town, northeastern Mahārāshtra state, western India, on the Wainganga River, east of Nāgpur. As a fording place across the river, it developed as a commercial centre; industries include the manufacture of brassware and cigarettes. It houses a college affiliated with the University of Nāgpur. Rice covers most of the surrounding cultivated area. The area is rich in mineral resources, particularly manganese, iron, and chromite. Pop. (2001 prelim.) 85,034.

Bhānder Plateau, plateau in Madhya Pradesh state, north-central India, in the South Central Highlands. Having an area of about 4,000 square miles (10,000 square km), it constitutes a transitional zone between the North Deccan Plateau to the south, the Eastern Plateau to the east, and the alluvial stretch of the Ganges River plains to the north. The plateau is part of the Vindhya Range and is composed of fluvio-marine deposits of Cambrian age that have been uplifted and penetrated several times and are overlain by dissected sandstone. It has an average elevation of 1,600 feet (500 m) and slopes from west to east. The swift-flowing Tons and Sonār rivers have numerous falls and rapids along their courses and have cut deep gorges in the scarplands of the Vindhya.

Forests of teak and catechu trees are characteristic of the plateau. Agriculture is the basis of the economy; rice, wheat, jowar (sorghum), gram (chick-pea), barley, corn (maize), peas, sesame seed, and mustard seed are grown. Although the region is rich in coal and other mineral and forest resources, the only major industrial plant is a large cement factory at Kymore (Katni town); local limestone and coal are utilized. Cottage industries produce

brick and tile, stoneware, cement, glass, and shellac; flour, dal (pigeon peas), and oilseeds are milled.

The plateau is a region of low population density; the only major road is the National Highway through Katni. The other important towns are Damoh, Maihar, and Hatta.

bhāṅgrā, most popular folk dance of the Punjab (India and Pakistan), performed on all festive occasions, particularly at sowing and harvest celebrations. The brightly dressed villagers dance vigorously in a large circle, accompanied by powerful drumming and also by clapping and singing.

Dancers in pairs give spontaneous solo displays that include virile jumps and even acrobatics. Though at one time danced primarily by men, it is now performed by the entire community.

bharata natya, Sanskrit BHĀRATA-NĀTYA ("Bharata's dancing"), the principal of the main classical dance styles of India, the others being kuchipudi, kathak, kathakali, manipuri, and orissi. It is indigenous to the Tamil Nadu (Madras) region and prevalent in southern India. Bharata natya serves the expression of Hindu religious themes and devotions, and its techniques and terminology have been traced back to ancient treatises such as the *Nāṭya-śāstra* (q.v.), by the Brahman sage and priest Bharata. Bharata natya was originally performed exclusively by female temple dancers and was not brought to the stage for public performance until about 1930.

A program of bharata natya usually lasts two hours without interruption and includes a specific list of procedures, all performed by one dancer, who does not leave the stage or change costume. The accompanying orchestra—composed of drums, drone, and singer—occupies the back of the stage, led by the guru, or teacher, of the dancer.

In pure style, bharata natya is classically clear in technique. The feet beat out complicated counter rhythms; the legs are bent in a characteristic low squat; arms, neck, and shoulders are part of the movement. In the pantomime sections, the hands tell the story through conventional gesture language, while the face expresses the mood. In the pure dance the hands are restricted to 11 hand poses.

Bhārata Nāṭya-śāstra: see *Nāṭya-śāstra*.

Bhārati, Subrahmanya C., also spelled SUBRAMANJA C. BHĀRATI (b. Dec. 11, 1882, Ettaiyapuram, Madras presidency, India—d. Sept. 12, 1921, Madras), outstanding Indian writer of the nationalist period who is regarded as the father of the modern Tamil style.

The son of a learned Brahman, Bhārati became a Tamil scholar at an early age. He received little formal education, however, and in 1904 moved to Madras. There he translated English into Tamil for several magazines and later joined the Tamil daily newspaper *Swadesamitran*. This exposure to political affairs led to his involvement in the extremist wing of the Indian National Congress party, and, as a result, he was forced to flee to Pondicherry, a French colony, where he lived in exile from 1910 to 1919. During this time Bhārati's nationalistic poems and essays were popular successes. Upon his return to India in 1919 he was briefly imprisoned and later rejoined the *Swadesamitran*. He was killed by a temple elephant in Madras.

Bhārati's best-known works include *Kaṇṇan Pāṭṭu* (1917; *Songs to Krishna*), *Panchali Sapatham* (1912; *Panchali's Vow*), and *Kuyil Pāṭṭu* (1912; *Kuyil's Song*). Many of his English works were collected in *Agni and Other Poems and Translations and Essays and Other Prose Fragments* (1937).

Bharatiya Janata Party (BJP), English INDIAN PEOPLE'S PARTY, pro-Hindu political party of post-independence India. The party has en-

joyed broad support among members of higher castes and in northern India.

The BJP traces its roots to the Bharatiya Jana Sangh (BJS; Indian People's Association), which was established in 1951 as the political wing of the Rashtriya Swayamsevak Sangh (RSS; National Volunteers Corps). In 1967 the BJS gained a substantial foothold in the Hindi-speaking regions of northern India. Ten years later it joined three other political parties to form the Janata Party, which led a short-lived government in 1979. After a split by dissidents within the Janata faction, the BJS reorganized itself as the BJP in 1980.

The BJP advocated Hindutva, an ideology that defined Indian culture in terms of Hindu values. In 1991 the BJP captured 117 seats in the Lok Sabhā (lower house of the Indian Parliament)—a dramatic improvement on the 2 seats it won in the 1984 elections—and took power in four states.

The demolition of the Babri Masjid (Mosque of Bābur) in Ayodhyā in December 1992 by organizations seen to be associated with the BJP caused a major backlash against the party. In elections in 1996 the BJP emerged as the largest single party in the Lok Sabhā and was invited by the president to form a government, which lasted less than a month. In 1998 the BJP and its allies were able to form a majority government with Atal Bihari Vajpayee as prime minister. In May of that year, nuclear weapons tests ordered by Vajpayee drew widespread international condemnation. After 13 months in office, the BJP-led coalition lost a vote of confidence. In 1999 the BJP contested the elections as part of the National Democratic Alliance (NDA), a coalition of more than 20 national and regional parties. The alliance secured a governing majority, and Vajpayee was again elected prime minister. He made efforts to resolve India's long-standing conflict with Pakistan over the Kashmir region, and under his leadership India emerged as a world leader in information technology. Nevertheless, the NDA was defeated in 2004, and Vajpayee resigned from office.

Bharatpur, former state of India ruled by Hindu princes of the Jāt clan, or caste, situated in east Rājputāna, India, lying to the south of Delhi and bordering on the Mathura and Agra districts of British India. In the 19th and 20th centuries its area was nearly 2,000 square miles (5,200 square km), and its population was something less than 1,000,000. The dominant castes were the Jāts, who were sturdy cultivators, and Brahmans, and the country was agricultural.

In pre-Muslim times the area was divided between the two Rājput clans, the Tomaras of Delhi and the Jadons of Bayānā. Thereafter it was directly under Delhi. Jāt independence began toward the end of the Mughal emperor Aurangzeb's reign (1659–1707), with plundering raids and the establishment of robber forts. In 1722 Bharatpur was recognized by the Mughals as autonomous. Its greatest ruler, Sūraj Mal, plundered Delhi (1753) and took Agra (1761–74). Soon after his death (1763) the state declined, undergoing two sieges by the British. In 1804 the Jāts sided with the Marāṭhā chief Holkar and successfully resisted a siege from January to February 1805. In 1825 a claimant to the throne, Durjan Sal, seized Bharatpur and defied the British again. This time it was captured by Lord Combermere (1826). After Indian independence (1947) Bharatpur was absorbed into the state of Rājasthān.

Bharatpur, also called BHURTPORE, city, eastern Rājasthān state, northwestern India. The city, which was the capital of the former princely state of Bharatpur, was founded c. 1733. Connected by road and rail with Jaipur, Agra, and Mathura, Bharatpur is an important industrial and agricultural market centre. Its

major industries include oil mills, metal-fabricating factories, railway workshops, and small-car factories. The city has several hospitals and two colleges affiliated with the University of

Entrance to the fort at Bharatpur, Rājasthān, India
Baldev—Shostal Assoc./EB Inc

Rājasthān. Nearby Keoladeo National Park is a renowned bird sanctuary known for its flocks of wintering migrant species, including the rare Siberian crane; it was declared a World Heritage site in 1985. Pop. (2001 prelim.) 204,456.

Bhārhut, village, 120 mi (190 km) southwest of Allāhābād, in the Satna district of Madhya Pradesh, India. Bhārhut is famous for the ruins of a Buddhist *stūpa* discovered there by Maj. Gen. Alexander Cunningham in 1873; the *stūpa*'s sculptural remains are now mainly preserved in the Indian Museum, Calcutta, and in the Municipal Museum (Allāhābād).

The *stūpa* (shrine) was probably begun in the time of Aśoka (c. 250 BC); it was originally built of brick, and it was enlarged during the 2nd century BC, when a surrounding stone railing with entrances on the four cardinal points was constructed. This railing bears a wealth of fine relief carving on its inner face. Around the beginning of the 1st century BC four stone gateways (*torāṇas*), each elaborately carved, were added to the entrances. An inscription on these gateways assigns the work to King Dhanabhūti in the rule of the Śuṅgas (*i.e.*, before 72 BC). The sculptures adorning the shrine are among the earliest and finest examples of the developing style of Buddhist art in India.

Bhārhut sculpture, early Indian sculpture of the Śuṅga period (mid-2nd century BC) that decorated the great *stūpa*, or relic mound, of Bhārhut, in Madhya Pradesh state, now largely destroyed. Most of the existing remains—railings and entrance gateways—are now in the Indian Museum, Calcutta.

The Bhārhut style, though at times archaic and primitive in its conception, marks the beginnings of a tradition of Buddhist narrative relief and decoration of sacred buildings that continued for several centuries. Sculptures closely similar to the Bhārhut remains are located throughout northern India, suggesting that the Bhārhut site is the only survival of a once widespread style.

The flat planes, rather stiffly posed figures, and precise, elegant detailing of the ornamentation suggest continuance in stone of an earlier tradition in wood. Some of the uprights bear in relief standing figures of male and female nature deities that have been pressed into the service of the Buddhist religion; a frequent motif is the woman embracing a tree.

The stone railing, which imitates wooden post-and-rail construction, is decorated with medallions and lunates, most of them filled with the lotus ornament, some of them centred by the head of a man or woman. Other railing medallions and the coping also depict *Jātaka* stories (legends of the Buddha's previous births) and events of the Buddha's life.

Since these are labelled, Bhārhut sculpture is indispensable for an understanding of Buddhist iconography. As in all early Indian sculp-

Standard-bearer on horseback, relief sculpture from the *stūpa* of Bhārhut, Madhya Pradesh, mid-2nd century BC; in the Indian Museum, Calcutta

SCALA—Art Resource/EB Inc

ture before the 1st century AD, the Buddha is represented by a symbol such as a wheel, empty throne, or umbrella, never in human form. The composition is simple, even naïve, with overlapping figures used in an attempt to distinguish planes. Animals appearing in the sculptures are treated with the sympathetic understanding characteristic of Indian art at all periods.

Bhartendu (Indian author): *see* Harishchandra.

Bhartṛhari (b. AD 570?, Ujjain, Mālwa, India—d. 651?, Ujjain), Hindu philosopher and poet-grammarian, author of the *Vākya-padīya* ("Words in a Sentence"), regarded as one of the most significant works on the philosophy of language, earning for him a place for all time in the *śabdādvaīta* (word monistic) school of Indian thought.

Of noble birth, Bhartṛhari was attached for a time to the court of the Maitraka king of Valabhī (modern Vala, Gujarāt). Following the example of Indian sages, he believed he must renounce the world for a higher life. After a long self-struggle, Bhartṛhari became a yogi and lived a life of dispassion in a cave in the vicinity of Ujjain until his death.

Bhartṛhari entitled three of his works *śataka* ("century"): The *Śṛṅgāra* (love) *-śataka*, *Nīti* (ethical and polity) *-śataka*, and *Vairāgya* (dispassion) *-śataka*. Although all three are attributed to him, only the first is regarded as his with certainty by most scholars. In another work sometimes attributed to Bhartṛhari, the *Bhaṭṭi kāvya* ("Poem of Bhaṭṭi"), he performs linguistic gymnastics to demonstrate the subtleties of Sanskrit.

Bharūch, also called BROACH, historically BHARUKACCHA, or BHRGUKACCHA, city, southeastern Gujarāt state, west-central India, on the Narmada River near the Gulf of Cambay of the Arabian Sea. Bharūch was one of the most celebrated harbours in ancient India, being mentioned in the *Periplus Maris Erythraei* (c. AD 80) and by Ptolemy as Barygaza. It also occurs in the Hindu epic poem *Mahābhārata*. Ruled in the 2nd century by

Kṣatrapas and in the 7th century by the Gujjaras, the town was incorporated into the Muslim state of Gujarāt and then annexed to the Mughal Empire in 1572. The Marāṭhās ruled it in 1685, and the British captured it in 1782. After changing hands again several times, it was ceded to the East India Company in 1803.

Bharūch is a commercial and industrial centre, with a substantial cotton industry, as well as handloom weaving and ink and glass manufacturing. The town exports cotton, wheat, tiles, dal (pigeon peas), and firewood. It is served by railroads and is on a national highway. Pop. (2001 prelim.) 148,391.

Bhāsa (b. 2nd or 3rd century AD, India), the earliest known Sanskrit dramatist, many of whose complete plays have been found.

In 1912 an Indian scholar discovered and published the texts of 13 of Bhāsa's dramas, previously known only by the allusions of ancient Sanskrit dramatists. His best work, *Svapnavāsavadattā* ("The Dream of Vāsavadattā"), depicts a king losing and then regaining his kingdom from a usurper. The majority of his dramas are ingenious adaptations on themes of heroism and romantic love borrowed from India's two great epics, the *Rāmāyaṇa* and the *Mahābhārata*. Bhāsa deviated from the accepted dramaturgy of the time by portraying battle scenes and killings on the stage. His influence is seen in the works of the great 5th-century dramatist Kālidāsa, who consciously imitated and improved upon some of Bhāsa's literary motifs.

Bhāskara I (fl. c. 629, possibly Valabhī, near modern Bhavnagar, Saurāṣṭra, India), Indian astronomer and mathematician.

Little is known about the life of Bhāskara; in his writings there are clues to possible locations for his life, such as Valabhī, the capital of the Maitraka dynasty, and Ashmaka, a town in Andhra Pradesh and the location of a school of followers of Āryabhaṭa (b. 476). His fame rests on three treatises he composed on the works of Āryabhaṭa. Two of these treatises, known today as *Mahabhaskariya* ("Great Book of Bhāskara") and *Laghubhaskariya* ("Small Book of Bhāskara"), are astronomical works in verse, while *Aryabhatiyabhashya* (629) is a prose commentary on the *Aryabhatīya* of Āryabhaṭa.

Planetary longitudes, heliacal rising and setting of the planets, conjunctions among the planets and stars, solar and lunar eclipses, and the phases of the Moon are among the topics Bhāskara discusses in his astronomical treatises. He also includes a remarkably accurate approximation for the sine function: in modern notation, $\sin x = 4x(180 - x)/(40,500 - x(180 - x))$, where x is in degrees.

In his commentary on the *Āryabhatīya*, Bhāskara explains in detail Āryabhaṭa's method of solving linear equations and provides a number of illustrative examples. Bhāskara particularly stressed the importance of proving mathematical rules rather than just relying on tradition. (T.Hy.)

Bhāskara II, also called BHĀSKARĀCĀRYA, or BHASKARA THE LEARNED (b. 1114, Biddur, India—d. c. 1185, probably Ujjain), the leading mathematician of the 12th century, who wrote the first work with full and systematic use of the decimal number system.

Bhāskara II was the lineal successor of the noted Indian mathematician Brahmagupta (598–c. 665) as head of an astronomical observatory at Ujjain, the leading mathematical centre of ancient India.

In his mathematical works, particularly *Līlāvāṭī* ("The Beautiful") and *Bījagaṇita* ("Seed Counting"), he not only used the decimal system but also compiled problems from Brahmagupta and others. He filled many of the gaps in Brahmagupta's work, especially in ob-

taining a general solution to the Pell equation ($x^2 = 1 + py^2$) and in giving many particular solutions. Bhāskara II anticipated the modern convention of signs (minus by minus makes plus, minus by plus makes minus) and evidently was the first to gain some understanding of the meaning of division by zero, for he specifically stated that the value of $\frac{3}{0}$ is an infinite quantity, though his understanding seems to have been limited, for he also stated wrongly that $\frac{a}{0} \times 0 = a$. Bhāskara II used letters to represent unknown quantities, much as in modern algebra, and solved indeterminate equations of 1st and 2nd degrees. He reduced quadratic equations to a single type and solved them and investigated regular polygons up to those having 384 sides, thus obtaining a good approximate value of $\pi = 3.141666$.

In other of his works, notably *Siddhāntaśiromaṇi* ("Head Jewel of Accuracy") and *Karaṅkūtūhala* ("Calculation of Astronomical Wonders"), he wrote on his astronomical observations of planetary positions, conjunctions, eclipses, cosmography, geography, and the mathematical techniques and astronomical equipment used in these studies. Bhāskara II was also a noted astrologer, and tradition has it that he named his first work, *Lilāvati*, after his daughter in order to console her. His astrological meddling coupled with an unfortunate twist of fate is said to have deprived her of her only chance for marriage and happiness.

bhāṣya (Sanskrit: "that which has to be discussed"), in Indian philosophy, a long commentary on a basic text of a system or school, (shorter commentaries are called *vākyas*, or *ṛttis*). *Bhāṣyas* may be primary, secondary, or even tertiary. The primary *bhāṣyas* are those written on the basic sutras (or texts), such as the Nyāya Sūtras, the Vedānta Sūtras, and the grammatical sutras of Pāṇini. Outstanding examples are Patañjali's *Mahābhāṣya*, on Pāṇini, and Śaṅkara's *Śaṅkarabhāṣya* and Rāmānuja's *Śrībhāṣya*, both on the Vedānta Sūtras.

Bhatgaon, also spelled BHĀDGAON (Nepal): see Bhaktapur.

Bhatinda, also spelled BATHINDA, city, south-central Punjab state, northwestern India. The city is a major rail hub, with lines converging on it from other Indian states and from nearby Pakistan. It is a trade centre for the area's agricultural products; industries include flour milling and handloom weaving. Rajindra College is located in Bhatinda, as is a huge fort, Govindgarh, built in the 16th century, with walls 118 feet (36 m) high. There is also the shrine of a Muslim saint, Babā Ratan.

The surrounding region forms part of the generally flat alluvial plain south of the Sutlej River. The light rainfall is augmented by irrigation canals; wheat, cotton, sugarcane, and gram (chick-pea) are among the crops grown. Pop. (1991) 159,042.

Bhātpāra, town, southeastern West Bengal state, northeastern India, just east of the Hooghly River. Connected by road and rail with Calcutta, it is a major jute-, cotton-, and paper-milling centre. Bhātpāra is an ancient seat of Sanskrit learning, with several schools called *ṭols*. It was constituted a municipality in 1899, when it was separated from Naihati municipality. Pop. (1991) 304,952.

Bhaunagar (India): see Bhavnagar.

bhava (Sanskrit), in the Buddhist chain of dependent origination, the "becoming" that immediately precedes birth. See *pratitya-samutpāda*.

bhava-cakra (from Sanskrit: "wheel [*cakra*] of becoming [*bhava*]"), also called WHEEL OF LIFE, in Buddhism, a representation of the endless cycle of rebirths governed by the

law of dependent origination (*pratitya-samutpāda*), shown as a wheel clutched by a monster, symbolizing impermanence.

In the centre of the wheel are shown the three basic evils, symbolized by a red dove (passion), a green snake (anger), and a black pig (ignorance). The intermediate space between the centre and the rim is divided by spokes into five (later, six) sections, depicting the possible states into which a person can be reborn: the realms of gods, titans (if six states are shown), people, animals, ghosts, and demons. Around the rim of the wheel the 12 *nidānas*, or interrelated phases in the cycle of existence, are shown in an allegorical, or symbolical, manner—ignorance, *karman* formations, rebirth consciousness, mind and body, sense organs, contact, sensation, craving, grasping, becoming, birth, and old age and death.

Bhavabhūti (fl. AD 700), Indian dramatist and poet, whose dramas, written in Sanskrit and noted for their suspense and vivid characterization, rival the outstanding plays of Kālidāsa.

A Brahman of Vidarbha (the part of central India later called Berār), Bhavabhūti passed his literary life chiefly at the court of Yaśovarman of Kanauj. He is best known as the author of three plays: *Mahāvīracarita* ("Exploits of the Great Hero"), which gives in seven acts the main incidents in the *Rāmāyaṇa* up to the defeat of Rāvaṇa and the coronation of Rāma; *Mālatī Mādhava*, a domestic drama in 10 acts abounding in stirring, though sometimes improbable, incidents; and *Uttarāramacarita* ("The Later Deeds of Rāma"), which continues the story of Rāma from his coronation to the banishment of Sītā and their final reunion. This last play, though containing far less action than the other two, shows Bhavabhūti at the height of his power in characterization and in presenting suspense and climax.

Bhave, Vinoba, byname of VINAYAK NARAHARI BHAVE (b. Sept. 11, 1895, Gagode, Gujarāt, India—d. Nov. 15, 1982, Wardha, Mahārāshtra), widely venerated disciple of Mahatma Gandhi, and one of India's best-known social reformers, founder of the Bhudan Yajna, or land-gift movement.

Born of a high-caste Brahman family, he abandoned his high-school studies in 1916 to join Gandhi's ashram (ascetic community). Gandhi's teachings led Bhave to a life of austerity, dedicated to improving Indian village life.

Bhave was interned several times during the 1920s and '30s and served a five-year prison sentence in the '40s for leading nonviolent resistance to British rule. He was given the honorific acharya (teacher).

Bhave's idea of the land-gift movement was conceived in 1951, when, while he was touring villages in the province of Andhra Pradesh, a landholder offered him an acreage in response to his appeal on behalf of a group of landless untouchables, or Harijans (low-caste Hindus). He then walked from village to village, appealing for gifts of land to be distributed among the landless and relating the act of giving to the principle of ahimsa (nonviolence), which had been adopted by Gandhi. According to Bhave, land reform should be secured by a change of heart and not by enforced government action. His critics maintained that Bhudan Yajna encouraged the fragmentation of land and would thus obstruct a rational approach to large-scale agriculture, but Bhave declared that he preferred fragmented land to fragmented hearts. Later, however, he encouraged *gramdan*—i.e., the system whereby villagers pooled their land, after which the land was reorganized under a cooperative system.

Throughout 1975 Bhave maintained a vow of silence over the issue of the involvement of his followers in political agitation. As a result of a fast in 1979, he secured the government's promise to enforce the law prohibiting the

killing of cows (animals sacred to Hinduism) throughout India.

Bhave's original project and his philosophy of life are explained in a series of articles collected and published as *Bhooḍan Yajna* (1953, reprinted 1957).

Bhavnagar, also called BHAUNAGAR, town, south-central Gujarāt state, west-central India, on the western shore of the Gulf of Cambay of the Arabian Sea. Founded in 1723, it has become an important commercial and industrial centre, with spinning and weaving mills, metalworks, tile and brick factories, sawmills, an iron foundry, and a chemical plant. It is connected with the main Western Railway system and has a port for small vessels to the north. The town is the site of the Gandhi Museum.

The surrounding region at one time constituted the princely state of Bhavnagar and was part of the Western India States agency (1944–47). After Indian independence in 1947, Bhavnagar was merged into the new state of Saurashtra, which now forms part of Gujarāt state. The chief agricultural products of the surrounding region are cotton and grains; salt is processed. Pop. (1991) town, 402,338; metropolitan area, 405,225.

Bhawani (India): see Bhiwāni.

BHC: see benzene hexachloride.

bhedābheda (Sanskrit: "identity and difference"), an important branch of Vedānta, an orthodox system of Hindu philosophy. Its principal author was Bhāskara, probably a younger contemporary of the great thinker Śaṅkara of the Advaita (Nondualist) school. The mainstay of Bhāskara's philosophy was the conviction that acts and knowledge are not mutually exclusive but, rather, mutually reinforcing. In contrast, Śaṅkara held that ultimately only total resignation and withdrawal from acts are necessary to attain release. Against this view, Bhāskara upheld the doctrine of the "cumulative effect of acts and knowledge" (*jñāna-karma-samuccaya*) and declared that a person should only withdraw after an active life in which he fulfilled his obligations. On the important issue of the relationship between brahma (the absolute) and the world, Bhāskara taught that the two are identical; if, he said, brahma is the substantial cause of the world, then the world itself is real. Difference occurs when certain limiting conditions (*upādhis*) are imposed on brahma.

Bhāskara's doctrine never became widely accepted, for Śaṅkara had already expounded his own view, which soon gained great influence. Nevertheless his work remains important, for it documents the typical Brahman (priestly class) concern with the implementation of the dharma—that is, those caste and individual obligations that keep the world in balance and produce the good society. In Bhāskara's opinion, the tenet that the world is, in the end, illusory attacks the validity of this dharma, and the commandment of renunciation of the world prevents the fulfillment of it.

Bhêly-Quénun, Olympe (b. Sept. 26, 1928, Donukpa, Dahomey [now Benin]), African French-language novelist, journalist, and short-story writer.

Bhêly-Quénun was educated at home (in what is now Cotonou, Benin) and at the Sorbonne in France. He earned degrees in literature and in diplomacy, taught school, worked at several foreign-service posts, and was (from 1968) a journalist for the United Nations Educational, Scientific and Cultural Organization (UNESCO). He also edited the journals *La Vie Africaine* (1962–65) and *L'Afrique Actuelle* (1965–68).

Bhêly-Quénun's major works include the

novels *Un Piège sans fin* (1960; *Snares Without End*), in which a man's life is ruined when he is unjustly accused of adultery; *Le Chant du lac* (1965; "The Song of the Lake"), which illustrates the modern conflict between educated Africans and their superstitious countrymen; and *L'Initié* (1979; "The Initiate"), the protagonist of which is a French-trained doctor who is also an initiate of a faith-healing cult. A collection of short stories (*Liaison d'une été* [1968; "Summer Affair"]), many of which were written before the novels, introduces his major theme of the supernatural. Bhêly-Quénium was praised in France for his elegant, poetic use of the French language. His novels and stories are for the most part violent episodes tied together by powerful narrative flow. Richly symbolic and metaphorical, they often illustrate an apprehensive, pessimistic view of life.

bhikku (Pāli), feminine BHIKKUNĪ, Sanskrit BHIKṢU, or (feminine) BHIKṢUṆĪ, in Buddhism, one who has renounced worldly life and joined the mendicant and contemplative

Woman worshipping at the feet of a bhikkhu after offering him alms, while he blesses her

By courtesy of the Ceylon Tourist Board, photograph, Gamini Jayasinghe

community. While individuals may enter the monastic life at an early age—some renunciate communities include children in their preteens—a candidate for ordination must be 21 years of age, have parental permission, and be physically healthy, free of debt, and possessed of a sound mind.

The term *bhikku* comes from a verbal root meaning "to beg." Thus, a Buddhist monk or nun is marked primarily by his or her practice of poverty and nonattachment to the material world. Originally, bhikkus were the mendicant followers of the Buddha (6th century BC) who had left their families and worldly pursuits in order to meditate and to apply the Buddha's teachings to their everyday life. Bhikkus tended to live as a group in forest retreats near villages and towns; in exchange for food, the monks taught the townspeople the ways of religious righteousness (*dhamma*; Sanskrit: *dharma*). Buddhist texts indicate that in the beginning the Buddha allowed only men to enter the monastic community (the *sangha*) but later permitted women to take vows as well. However, the female monastic order has never been as large as the male one.

A bhikku must observe all of the rules (227 to 250, depending upon the sect) of the monastic code that regulate all details of daily life; *bhikkunis* observe an even greater number of rules. Violations of the code must be confessed in twice-monthly meetings of the monks (the *uposatha*). Four monastic rules, if broken, result in lifelong expulsion from the order. These prohibit (1) having sexual rela-

tions, (2) taking or ordering the taking of life, (3) taking something as one's own that has not been freely given, and (4) making claims regarding one's spiritual attainments, powers, or degree of enlightenment.

The bhikku's head and face are kept shaven. He wears three garments—an upper and lower robe and a stole—originally made of cast-off rags dyed with saffron, now more likely the gift of a layperson. He is allowed to retain only a minimum of possessions—his robes and stole, a girdle, an alms bowl, a razor, a needle and thread for mending, and a strainer to prevent his harming the small insects that might otherwise enter his drinking water.

The bhikku begs daily for his food; the donation of food by the laity is viewed as meritorious. The bhikku may eat no solid food between noon and the following morning. Except on holy days, which are vegetarian, meat may be eaten but only if it has not been cooked especially for a monk.

In the Theravāda countries of Southeast Asia, the monk commonly is prohibited from handling money and from doing physical labour. This is not the case in China and Japan, where Ch'an (Zen) Buddhism early established the rule, "A day without work, a day without food."

Bhil, ethnic group of nearly 2.5 million people of western India. Many are tribal, and they have been known for rugged independence, sometimes associated with banditry.

The Bhil are distributed widely in upland areas from Ajmer in Rājasthān on the north to Thāna in Mahārāshtra on the south, and eastward as far as Indore in Madhya Pradesh. Nearly all of them engage in agriculture, some of them using the primitive slash-and-burn (*jhum*) method, but most employing the plow. The highland Bhil generally live in scattered houses made of wattle and thatch.

The relationship between the Bhil and neighbouring peoples is not clear. The Bhil follow Rajasthani kinship usages in Rājasthān and Maharashtrian usages in Mahārāshtra, but with easier marriage and divorce procedures. Most Bhil worship local deities in varied pantheons only slightly touching the practices of higher Hinduism; a few aristocratic segments such as the Bhilāla and some plains groups employ Brahman priests; others are converts to Islām. Their dialects are akin to Gujarati or to other Indo-Aryan languages rather than to the Munda or Dravidian tongues of most tribal peoples. The Bhil have evidently received many genetic contributions from the higher Hindu castes, whom many Bhil now resemble more closely than they do the more isolated aboriginal peoples.

Bhilai Nagar, town and major industrial centre, southeastern Madhya Pradesh state, central India, in the Chhattisgarh region. It was part of the Haihaivānśi Rājputs Kingdom until 1740, when it passed to Marāṭhā rule. It was administered by the British from 1853 until its merger with the Indian Union in 1947. Located on the South Eastern Railway about 4 miles (13 km) east of Durg town, Bhilai Nagar is a planned town, divided into sectors with low-density, mostly single-story housing. A major government-operated steel plant, southeast of the town, was built in collaboration with the U.S.S.R. during India's Second Five-Year Plan (1956–61). Iron ore from Dallī-Rājghara, limestone from Nandini, coal from Jharia, manganese from Bālāghāt, electric power from the Kosa thermal-power plant, and water from the Tandula Canal, all nearby, are used in the Bhilai Nagar plant to manufacture rails and structural steel. Pig iron and billets are supplied to foundries and rolling mills located at Kumhari and other sites in central India. Other industries in Bhilai Nagar include a cement plant, a sulfuric acid plant, an ammonium sulfate plant, and sawmills. The Maitri Bāgh ("Garden of Friendship") is

located near the Maroda water tanks (at the steel plant) and symbolizes Indian–Russian cooperation. Pop. (1981) 319,450.

Bhilwāra, town, south-central Rājasthān state, northwestern India. It is a rail and road communications centre as well as a market town, and Bhilwāra's industries include cotton milling, handloom weaving, and the manufacture of hosiery and metalware (especially tinned utensils). It has a hospital and a number of colleges affiliated with the University of Rājasthān.

The surrounding region consists of an elevated plateau sloping toward the hilly, forested northeast. Wheat, corn (maize), barley, and cotton are the chief crops. Fuel and charcoal are marketable products; beryllium, mica, and iron-ore deposits are worked. Formerly a part of Udaipur princely state, Bhilwāra became part of the state of Rājasthān in 1948. Pop. (1991) 183,965.

Bhima River, major tributary of the Krishna River, flowing through Mahārāshtra and Karnāṭaka states, western India. It rises in the Bhimashankar heights of the Western Ghāts and flows southeastward for 450 miles (725 km) in Mahārāshtra to join the Krishna in Karnāṭaka. Major tributaries are the Sina and Nira rivers. The Bhima drainage area is defined by the Western Ghāts (west), the Bālāghāt Range (north), and the Mahadeo Range (south).

The Bhima runs in a well-entrenched valley, and its banks are heavily populated. Its water level is marked by monsoonal changes; it is flooded in August following the rains and is practically stagnant in March and April. Receding floodwaters leave rich alluvial terraces that form fertile farming belts. Local irrigation works augment the scant supply of rainfall; major crops are jowar (sorghum), bajra (pearl millet), and oilseeds. Sugarcane is an important irrigated cash crop.

Bhind, also called BHIND-BHANWARA, town, north-central Madhya Pradesh state, central India. The town is connected by road and rail with Gwalior. It is an agricultural market centre; cotton processing and brassware manufacture are the major industries. It was the seat of the Bhadrīyā Cauhān Rājputs until it fell in the 18th century. The town has an old fort on a lake, Gaurī Tal, in which stands the Vyankateshwar Temple. Constituted a municipality in 1902, Bhind has several colleges affiliated with Jiwaji University.

The surrounding region marks the beginning of the Ganga–Yamuna plains. In the Yamuna–Chambal badlands, it comprises semifertile plains cut by numerous deep ravines along the Chambal, Kunwāri, and Sind rivers, tributaries of the Yamuna. Legumes, wheat, cotton, and millet are the chief crops. Pop. (1991) 109,755.

Bhir, also spelled BĪR, town, central Mahārāshtra state, western India, on a tributary of the Krishna River near a gap in a range of low hills. Known earlier as Champāvatinagar, its modern name probably derives from the Persian *bhir* ("water"). In its early history it belonged to the Čālukya (Chalukya) and Yādava Hindu dynasties. Conquered by the Tughluq Muslim dynasty in the 14th century, it remained part of the Muslim states until 1947. Bhir is known for its leatherwork and its beautiful Kaṅkāleśvar Temple, where a poor Brahman is said to have received 1,000 pots of gold as a reward for his intense devotion. The town has several colleges affiliated with Marāṭhwādā University.

Bhir and its environs lie in the Godāvāri River basin. The Bālāghāt Range is the source of many rivers that drain into the Mānjra River, a tributary of the Godāvāri. The Godāvāri, which lies to the south, is considered sacred by the people of Bhir, and its banks are dotted with shrines.

The area is highly dependent on agriculture and is sparsely populated. A significant number of the region's inhabitants, however, are landless labourers who make seasonal migrations to the sugar factories of nearby Ahmadnagar. Irrigation projects along the Godāvāri have been planned to augment the scanty annual rainfall and to strengthen agricultural production, which is dominated by cotton and jowar (sorghum). Pop. (2001 prelim.) 138,091.

Bhiwāni, also called BHAWANI, city, western Haryāna state, northwestern India. The city is located on a tributary of the Ganges River, northeast of the Great Indian (Thar) Desert. Selected by the British in 1817 as a free-market site, it was incorporated as a municipality in 1867. A road and rail junction, it is a major centre for trade with Rājasthān state. Industries include cotton milling, ginning, and pressing and light manufacturing. Several colleges and one technological institute are affiliated with Kurukshetra University.

The surrounding region includes outlying hills of the Arāvalli Range. Products include grain, cotton, sugarcane, and oilseed, but agriculture has been hindered by poor water resources. Pop. (2001) 169,531.

Bhojpur, historic village, central Madhya Pradesh state, central India, just east of the Betwa River. The village includes the remains of a richly carved Śaivite temple, traditionally said to have been erected by Raja Bhoja, a Paramāra Rājput (member of the warrior caste) in the 11th century; more probably, however, it dates to the 12th or 13th century. The temple is rectangular in plan, its four massive pillars supporting an incomplete dome decorated with excellent carvings; it houses a 7.5-foot (2.3-metre) Śiva lingam, or linga (a phallic symbol). Nearby lies an unfinished Jaina temple of the same period, with a 20-foot (6-metre) statue of Ādinātha, a Jaina saint. Just west are the ruins of two dams, destroyed in the 15th century, that once retained a large lake.

Bhonsle DYNASTY, also spelled BHONSLA, Indian dynasty of the family of the great Marāṭhā king Śivājī. They ruled at Nāgpur in present Mahārāshtra state and were a leading power in the 18th-century Marāṭhā confederacy. They were British clients from 1818 to 1853. Raghujī Bhonsle of Berār founded the dynasty in 1730. There were eight rulers in the line.

Bhopāl, city, capital of Madhya Pradesh state, central India. Lying along the slopes of a sandstone ridge, the city is a major rail junction and has an airport. Industries include cotton and flour milling, cloth weaving and painting, and the manufacture of transformers, switchgears, traction motors, and other heavy electrical equipment, as well as matches, sealing wax, and sporting goods. Just south lie two large lakes, around which are several palaces and a fort from c. AD 1728. Bhopāl has

several mosques, including the 19th-century Tāj-ul-Masjid, the largest mosque in India. Constituted a municipality in 1903, the city has several hospitals and a music academy and is the seat of Bhopāl University (1970), with several affiliated colleges in the city.

The city is situated in an agricultural area in the fertile plain of the Mālwa Plateau. The region was formerly a part of the Bhopāl princely state, which was founded in 1723 by Dōst Mohammad Khān, an Afghan adventurer, and was the second largest Muslim principality of the British Empire. In its struggles with the Marāṭhās, Bhopāl was itself friendly to the British and concluded a treaty with them at the outbreak of the Pindari War in 1817. The Bhopāl Agency, created in 1818, was a subdivision of the British Central India Agency and comprised the former princely states of Bhopāl, Rājgarh, Narsinggarh, and several others. The headquarters was at Sehore.

At India's independence, Bhopāl remained a separate province of India, to which it acceded in 1949. In 1952 the nawab's absolute rule was abolished, and a chief commissioner's state was established. In 1956 it merged with Madhya Pradesh, and Bhopāl city replaced Nāgpur as state capital.

In December 1984 Bhopāl was the site of the worst industrial accident in history, when about 45 tons of the dangerous gas methyl isocyanate escaped from an insecticide plant that was owned by the Indian subsidiary of the American firm Union Carbide Corporation. The gas drifted over the densely populated neighbourhoods around the plant, killing thousands of people immediately and creating a panic as tens of thousands of others attempted to flee the city. The final death toll was estimated to be between 15,000 and 20,000, and some half million survivors suffered respiratory problems, eye irritation or blindness, and other maladies resulting from exposure to the toxic gas. Soil and water contamination in the area has been blamed for chronic health problems of the area's inhabitants. Investigations later established that substandard operating and safety procedures at the understaffed plant had led to the catastrophe. Pop. (2001) 1,437,354.

Bhote (people): *see* Bhutia.

BHP: *see* Broken Hill Proprietary Company Limited.

Bhubaneswar, historically BIJUVANEŚVARA, city, capital of Orissa state, eastern India. Bhubaneswar's history from the 3rd century AD is represented in nearby archaeological remains. Between the 5th and 10th centuries AD it was the provincial capital of many Hindu dynasties and a centre of the Śaivite faith. Its many temples (such as the Mukteswara and Parashurāmeshwar), displaying every phase of Orissan architecture, were built between the 7th and 16th centuries.

The city consists of the old city, containing

about 30 ancient temples, and a planned township built after 1948, when the capital was moved there from Cuttack. In the latter are the state government buildings, the state museum, Utkal University (established 1944

Kedāreśvara and Gaurī temples at Bhubaneswar, Orissa, India

Picturepoint, London

in Cuttack), and the Orissa University of Agriculture and Technology. The Gandhi Memorial Park lies at the city's centre. Bhubaneswar is on the national highway between Kolkata (Calcutta) and Chennai (Madras) and on a major railway line, and it has an airport. Pop. (2001) 648,032.

Bhuj, town, northwestern Gujarāt state, west-central India, situated in the lowlands between the Rann and the Gulf of Kachchh (Kutch). It is a commercial centre for wheat, barley, cattle, cotton, and salt produced in the region. Handicrafts include the manufacture of cotton cloth and silver items. Bhuj is the junction of several state highways and the terminus of a railroad, and it has an airport. The city was devastated by a massive earthquake in 2001; reconstruction has been slow.

bhūmi, in Mahāyāna Buddhism, the stages of spiritual progress of the bodhisattva, or one who, though capable of enlightenment, delays his buddhahood in order to work for the salvation of others. The stages (which are also termed *vihāras*, "stations") appear as 7, 10, and 13 in various texts, but the scheme that is most commonly agreed upon is the one given in the *Daśabhūmika-sūtra* ("The Sūtra on the Ten Spiritual Levels"). It lists the progressively superior stages as: (1) *pramuditā* ("joyful," with the thought that, having begun the career of a bodhisattva, he will attain enlightenment and will help others), (2) *vimalā* ("free from impurities"), (3) *prabhākari* ("luminous" with the noble doctrine), (4) *arciṣmatī* ("brilliant," the rays of his virtue consuming evil passions and ignorance), (5) *sudurjayā* ("hard to conquer"), (6) *abhimukhī* ("turning toward" both transmigration and nirvana), (7) *dūraṅgamā* ("far-going"), (8) *acalā* ("immovable"), (9) *sādhumatī* ("good-minded"), and (10) *dharma-mameghā* (showered with "clouds of dharma," or universal truth).

Bhumibol Adulyadej, also called PHUMIPHON ADUNLAYADET, or RAMA IX (b. Dec. 5, 1927, Cambridge, Mass., U.S.), ninth king of the Chakkri dynasty, which has ruled or reigned in Thailand from 1782.

He was a grandson of King Chulalongkorn and was born while his father, Prince Mahidol

Mosque of Tāj-ul-Masjid in Bhopāl, Madhya Pradesh, India

Baldev—Shostal Assoc./EB Inc

of Songkhla, was studying at Harvard University. He succeeded to the throne after his older brother Ananda Mahidol, who had been king since 1935, was found dead of a bullet wound on June 9, 1946. He was married to Princess Sirikit Kitiyakara in April 1950 and was formally crowned on May 5, 1950.

The absolute monarchy was abolished in Thailand during the reign of King Prajadhipok as a result of the revolution of 1932. King Bhumibol, therefore, wielded little real political power, although the constitution named him as head of state and commander of the armed forces. His most important function was to serve as a living symbol of and a focus of unity for the Thai nation. After the government of Sarit Thanarat in the late 1950s, the king led an active ceremonial life, frequently appearing in public and moderating between extreme parties in Thai politics. Bhumibol's designated heir to the throne was his only son, Crown Prince Vajiralongkorn.

Bhusāwal, city, northern Mahārāshtra state, western India. It lies along the Tāpti River between the Sātpura Range and Ajanta Hills of the Deccan Plateau. Major rail and road routes pass through the town from Mumbai (Bombay) to Kolkata (Calcutta) and Allāhābād. An important commercial centre for the surrounding cotton-growing region, Bhusāwal also trades in bananas, millet, and peanuts (groundnuts) and has a large-scale oil-processing industry. A large locomotive workshop is located there, as is a college affiliated with the University of North Mahārāshtra. Pop. (2001) 172,372.

bhut, Hindi BHŪT, in Hindu mythology, a restless ghost. Bhuts are believed to be malignant if they have died a violent death or have been denied funeral rites; they are particularly feared by women, children, and the newly married.

Bhuts haunt trees, deserts, abandoned houses, the hearths and roofs of homes, crossroads, and boundaries but never rest on the ground. Rudimentary shrines are sometimes established for bhuts, and when in fear of them a believer will invoke Śiva, as he is considered to be their lord.

Bhutan, officially KINGDOM OF BHUTAN, Dzongkha DRUK-YUL, sovereign kingdom in the Himalayas, bounded by China (Tibet) to the north and west and by India to the south, southwest, and east. From 1865 to 1949 Bhutan was under the "guidance" of the British government in external affairs and received a British subsidy. In 1949 it concluded a treaty with India in which the British role in this relationship was transferred in essence to the Indian government. The capital is Thimphu. Area 14,824 square miles (38,394 square km). Pop. (2005 est.) 776,000 (excluding some 100,000 refugees in Nepal).

A brief treatment of Bhutan follows. For full treatment, see MACROPAEDIA: Bhutan.

The land. Bhutan may be divided into three quite distinct physical regions: the Great

Bhutan

Himalayas, the Lesser Himalayas, and the Duārs Plain.

The northern part of Bhutan lies within the Great Himalayas; the snow-capped peaks in that region attain heights above 24,000 feet (7,300 m). High valleys occur at elevations of 12,000 to 18,000 feet (3,700 to 5,500 m), running down from the great northern glaciers. The alpine pastures on the high ranges are used for grazing yaks in the summer months. North of the Great Himalayas are several "marginal" mountains of the Plateau of Tibet that form the principal watershed between the rivers running respectively southward and northward. A dry climate is characteristic of the Great Himalayan region. Until about 1960, the tempo of life continued in the Great Himalayas much as it had for centuries. Long-undisturbed in their ways, Bhutanese traders carried cloth, spices, and grains northward across the mountain passes into Tibet and brought back salt, wool, and sometimes herds of yaks. The Chinese military presence in Tibet from 1950, however, broke the tranquil isolation and disturbed the traditional way of living in those high regions. Some refugees from Tibet subsequently settled in the Great Himalayan region of Bhutan.

Spurs from the Great Himalayas radiate southward, forming the ranges of the Lesser (or Inner) Himalayan region. The north-south ranges of the Lesser Himalayas form watersheds between the principal rivers of Bhutan. Among these, the Black Mountain Range forms the watershed between the Sankosh and Manas rivers. Differences in elevation and the degree of exposure to moist southwest monsoon winds encourage vegetation ranging from dense forest on the rain-swept windward slopes to alpine vegetation at higher elevations. Several fertile valleys of central Bhutan lie in the Lesser Himalayas at elevations varying from 5,000 to 9,000 feet (1,500 to 2,700 m). These valleys are relatively broad and flat, receive moderate rainfall (roughly 40 to 50 inches [1,000 to 1,300 mm] or less per year), and are fairly well-populated and cultivated. A characteristic feature of the country's mountainous regions are the *dzongs*; these fortress-monasteries and administrative centres were first built in the 17th century and continue to serve as focal points of the nation's political, economic, and cultural life.

South of the Inner Himalayas and their foothills lies the narrow Duārs Plain, which forms a strip 8 to 10 miles (13 to 16 km) wide along the southern borders of Bhutan. The narrow Duārs Plain controls access to the strategic passes (known as doors, or *dooars*) that follow the main rivers northward into the fertile valleys of the Inner Himalayas. Subject to excessive rainfall (estimated to amount to some 200 to 300 inches [5,000 to 7,600 mm] annually), the entire Duār tract is unhealthy, hot, and steamy and is covered with dense semitropical forest and undergrowth. The northern part of the Duārs immediately bordering the mountains consists of a rugged, irregular, and sloping surface. At the foot of the mountains, small villages are found in forest clearings, but most of the area is covered with dense vegetation inhabited by elephants, deer, tigers, and other wild animals. The southern part of the Duārs bordering India is mostly covered with savanna and bamboo jungle. In many areas the savanna grasslands have been cleared for rice cultivation.

The people. The three main ethnic groups in Bhutan are the Bhutia (Bhote), Sharchops (Assamese), and Nepalese (including the Gurung). The Sharchops, probably the first to arrive, are Indo-Asiatic people who came from nearby Indian areas to settle in eastern Bhutan. The Sharchops practice Buddhism, but their culture is more akin to the Tibeto-Burmans of northern India and Myanmar (Burma). Comprising about half of the popu-

lation and dominating the country's political life are the Bhutia, whose ancestors came south from Tibet. The Bhutia inhabit northern, central, and western Bhutan and practice Tibetan Buddhism. They speak a variety of dialects, the most common of which is Dzongkha, the country's official language. The Nepalese, historically the most recent arrivals, constitute about one-third of the population and live in the southwest. They speak Nepali and practice Hinduism. Their numbers prompted the Bhutanese to ban Nepalese immigration in 1959, and their movement in Bhutan is restricted. Indians also inhabit areas along the southern border.

The economy. Bhutan's economy is mainly agrarian; most of the population raises crops and livestock. The Bhutanese grow rice, corn (maize), potatoes, and spices, as well as citrus fruits and vegetables. Cattle, pigs, sheep, goats, yaks, and ponies are raised, and woodcarving, metalwork, and weaving are practiced. Nearly all of the commodities (such as electric power, nonmetallic-mineral manufactures, and cement) Bhutan exports go to India.

The government. The monarch, known as the *druk gyalpo* ("dragon king"), though enjoying supreme authority, has a council of ministers and shares administrative responsibility. The 152-member national assembly (Tsongdu) can at times be quite critical of the administration, and its deliberations are not disregarded by the government. Three-fourths of the members of the national assembly are directly elected, and the rest are nominated by the king or the state monastic order. There are no legal political parties in Bhutan.

The high court functions as an appellate authority above the executive, although citizens can appeal to the monarch. In 1998 the king began a series of reform initiatives designed to curb his powers, and a draft constitution was released in 2005 proposing the establishment of a constitutional monarchy.

History. Bhutan's early history remains obscure, but it is fairly certain that Tibetans migrating southward settled in the country beginning in the 9th century AD. Bhutan probably first became a distinct political entity in the 17th century, when a Tibetan Buddhist priest named Shepton La-Pha became the king of Bhutan and acquired the title of *dharma raja*. La-Pha's successors as *dharma raja* consolidated Bhutan's internal administration through the appointment of *penlops* (governors of territories) and *jungpens* (governors of forts). Gradually, the *dharma rajas* confined their authority to spiritual matters and the regulation of the Drukpa sect of Tibetan Buddhism, which became the country's official monastic order. The ministers appointed by the *dharma rajas* to exercise temporal power acquired the title of *deb raja*, and this institution of two supreme authorities—a *dharma raja* for spiritual affairs and a *deb raja* for temporal matters—existed until the early 20th century. Succession to the office of *dharma raja* was dependent on finding a verifiable reincarnation of the deceased *dharma raja*, and this person was usually discovered among the children of the ruling families. The office of *deb raja* was filled by the strongest of the *penlops*, who were perpetually warring with each other for power and influence. In 1907, however, the then-strongest *penlop*, Ugyen Wangchuk, was elected to become the hereditary king (*druk gyalpo*) of Bhutan. Bhutan's present king, Jigme Singye Wangchuk, is the fourth in this line of hereditary rulers.

Bhutan's rugged mountains and dense forests long rendered it inaccessible to the outside world, and the country's feudal rulers reinforced this isolation by banning foreigners until well into the 20th century. The country was nevertheless the object of several foreign invasions over the centuries, and in 1865 the Bhutanese came under British influence after having been successfully invaded by them.

Ugyen Wangchuk became *druk gyalpo* in 1907 with British approval, and in 1910 Bhutan agreed to be guided by Britain in its foreign affairs in return for an annual British subsidy. In subsequent decades Bhutan became oriented toward British-ruled India, though much of its trade continued to be with Tibet. In 1949 India took over Britain's role, and the occupation of neighbouring Tibet by Chinese troops in 1950 further strengthened Bhutan's ties with India. The apparent threat from China made Bhutan's rulers aware of the need to modernize and develop their country with foreign help. The building of a road network connecting Bhutan with India in the 1960s finally brought to an end Bhutan's historic isolation. Since that time, Bhutan has embarked on a program to build roads and hospitals and to create a system of secular education. Its governmental institutions have also been modernized, and the king has undertaken a series of measures to relinquish some of his authority.

Bhutia, also spelled BHOTIA, or BHOTE, also called BHUTANESE, Himalayan people who are believed to have emigrated southward from Tibet in the 9th century or later. The Bhutia constitute a majority of the population of Bhutan and form minorities in Nepal and India, particularly in the Indian state of Sikkim. They speak various languages of the Tibeto-Burman branch of the Sino-Tibetan language family. The Bhutia are mountain dwellers, living in small villages and isolated homesteads separated by almost impassable terrain. They practice a terraced agriculture on the mountain slopes, their main crops being rice, corn (maize), and potatoes. Some of them are animal breeders, known for their cattle and yaks.

Their religion is Tibetan Buddhism, with an admixture of the pre-Buddhist shamanism known as Bon. They recognize the Dalai Lama as their spiritual leader. Their traditional society was feudalistic, with most of the population working as tenants of a landowning nobility, although there were few marked differences in ways of life between landowners and tenants. There were also slaves, most of them descended from captives taken in raids on Indian territory. In the 1960s the Bhutanese

Bhutia village in the Himalayan foothills, Nepal
Harrison Forman

government formally abolished slavery and sought to break up the large estates; the nobility were also deprived of their hereditary titles.

The Bhutia trace their descent patrilineally. They are predominantly monogamous, but polygamy is still practiced in some areas.

Bhutto, Benazir (b. June 21, 1953, Karachi, Pak.), Pakistani politician who became the first woman leader of a Muslim nation in modern history. She served two terms as prime minister of Pakistan, in 1988–90 and in 1993–96.

Bhutto was the daughter of the politician Zulfikar Ali Bhutto, who was the leader of Pakistan from 1971 until 1977. She was educated at Harvard University (B.A., 1973) and subsequently studied philosophy, political science, and economics at the University of Oxford (B.A., 1977).

After her father's execution in 1979 during the rule of the military dictator Mohammad

Zia-ul-Haq, Bhutto became the titular head of her father's party, the Pakistan People's Party (PPP), and endured frequent house arrest from 1979 to 1984. In exile from 1984 to 1986, she returned to Pakistan after the lifting of martial law and soon became the foremost figure in the political opposition to Zia. President Zia died in August 1988 in a mysterious plane crash, leaving a power vacuum at the centre of Pakistani politics. In the ensuing elections, Bhutto's PPP won the single largest bloc of seats in the National Assembly. She became prime minister on Dec. 1, 1988, heading a coalition government.

Bhutto was unable to do much to combat Pakistan's widespread poverty, governmental corruption, and increasing crime. In August 1990 the president of Pakistan, Ghulam Ishaq Khan, dismissed her government on charges of corruption and other malfeasance and called for new elections. Bhutto's PPP suffered a defeat in the national elections of October 1990; thereafter she led the parliamentary opposition against her successor, Nawaz Sharif.

In elections held in October 1993 the PPP won a plurality of votes, and Bhutto again became head of a coalition government. Under new charges of corruption, economic mismanagement, and a decline of law and order, her government was dismissed in November 1996 by Pres. Farooq Leghari. Her autobiography *Daughter of Destiny*, was published in 1989 (originally *Daughter of the East*, 1988).

Bhutto, Zulfikar Ali (b. Jan. 5, 1928, near Larkana, Sindh, India [now in Pakistan]—d. April 4, 1979, Rawalpindi, Pak.), Pakistani statesman, president (1971–73), and prime minister (1973–77), a popular leader who was overthrown and executed by the military.

Born into a noble Rajput family that had accepted Islām, Bhutto was the son of a prominent political figure in the Indian colonial government. He was educated in Bombay and at the University of California, Berkeley (B.A., 1950). Bhutto studied law at the University of Oxford and then practiced law and lectured in England. Upon his return to Pakistan (1953), he set up a law practice in Karachi, where he was appointed a member of Pakistan's delegation to the United Nations in 1957.

After Mohammad Ayub Khan seized the government in 1958, Bhutto was appointed commerce minister and then held other cabinet posts. After his appointment as foreign minister (1963–66), he began working for greater independence from Western powers and for closer ties with China. His opposition to the peace with India after the 1965 war over Kashmir caused him to resign from the government, and in December 1967 he founded the Pakistan People's Party. Bhutto denounced the Ayub Khan regime as a dictatorship and was subsequently imprisoned (1968–69).

After the overthrow of the Ayub Khan regime by General Agha Muhammad Yahya Khan, national elections were held in 1970. Although Bhutto and his party won a sweeping electoral victory in West Pakistan, the biggest election winner was the Awami League, an East Pakistan-based party that had campaigned for full autonomy for East Pakistan. Bhutto refused to form a government with this separatist party, causing a nullification of the election. The widespread rioting that followed degenerated into civil war, after which East Pakistan, with the help of India, emerged as the independent state of Bangladesh. After West Pakistan's humiliating defeat by India in this military conflict, Yahya Khan turned the government over to Bhutto on Dec. 20, 1971. Bhutto placed his predecessor under house arrest, nationalized several key industries, and undertook the taxation of the landed families in his first acts as president. After the new constitution (1973) made the presidency largely ceremonial, Bhutto became prime minister. In both capacities, he

had also filled the cabinet posts of foreign affairs, defense, and interior. His government, retaining martial law, began a process of Islāmization.

Sensing that the public was turning against his rule by decree, Bhutto ordered new elections in 1977 to obtain a popular mandate. His party won by a large majority, but the opposition charged him with electoral fraud. The government was seized by General Mohammad Zia-ul-Haq, the army chief of staff, on July 5, 1977. Soon afterward Bhutto was imprisoned. He was sentenced to death (March 18, 1978) on the charge of having ordered the assassination of a political opponent in 1974; after an appeal to a higher court, Bhutto was hanged, despite appeals for clemency from several world leaders.

Bhuvaneśvara (India): see Bhubaneswar.

bi (Chinese jade): see pi.

Bia River, river in western Africa, rising 25 miles (40 km) west of Sunyani in western Ghana. After entering Côte d'Ivoire, the Bia River flows in a southerly direction to the Aby Lagoon, an inlet of the Atlantic; its total length is 160 miles (260 km). On the river near Ayamé are two hydroelectric plants (1959, 1965), 2.5 miles (4 km) apart, which supply power to Abidjan and southeastern Côte d'Ivoire. From Aboisso, the head of navigation (10 miles [16 km] from the entrance to the lagoon), logs and agricultural produce are sent downstream to Assini for transshipment.

Biafra, secessionist western African state that unilaterally declared its independence from Nigeria in May 1967. It constituted the former Eastern Region of Nigeria and was inhabited principally by Igbo (Ibo) people. Biafra ceased to exist as an independent state in January 1970.

In the mid-1960s economic and political instability and ethnic friction characterized Nigerian public life. In the mostly Hausa north, resentment against the more prosperous, educated Igbo minority erupted into violence. In September 1966, some 10,000 to 30,000 Igbo people were massacred in the Northern Region, and perhaps 1,000,000 fled as refugees to the Igbo-dominated east. Non-Igboes were then expelled from the Eastern Region.

Attempts by representatives of all regions to come to an agreement were unsuccessful. On May 30, 1967, the head of the Eastern Region, Lieutenant Colonel (later General) Odumegwu Ojukwu, with the authorization of a consultative assembly, declared the region a sovereign and independent republic under the name of Biafra. General Yakubu Gowon, the leader of the federal government, refused to recognize Biafra's secession. In the hostilities that broke out the following July, Biafran troops were at first successful, but soon the numerically superior federal forces began to press Biafra's boundaries inward from the south, west, and north. Biafra shrank to one-tenth its original area in the course of the war. By 1968 it had lost its seaports and become landlocked; supplies could be brought in only by air. Starvation and disease followed; estimates of mortality range from 500,000 to several million.

The Organization of African Unity, the papacy, and others tried to reconcile the combatants. Most countries continued to recognize Gowon's regime as the government of all Nigeria, and the United Kingdom and the Soviet Union supplied it with arms. On the other hand, international sympathy for the plight of starving Biafran children brought airlifts of food and medicine from many countries. Côte d'Ivoire, Gabon, Tanzania, and Zambia recognized Biafra as an independent state, and France sent Biafra weapons.

Biafran forces were finally routed in a se-

ries of engagements in late December 1969 and early January 1970. Ojukwu fled to Côte d'Ivoire, and the remaining Biafran officers surrendered to the federal government on Jan. 15, 1970. Biafra, on the point of total collapse, thereupon ceased to exist.

Biafra, Bight of, inlet of the Atlantic Ocean on the western African coast, extending east, then south, for 370 miles (600 km) from the Nun outlet of the Niger River (Nigeria) to Cape Lopez (Gabon). The innermost bay of the Gulf of Guinea, it is bounded by southeastern Nigeria, Cameroon, Equatorial Guinea, and northwestern Gabon and receives portions of the Niger and Ogooué river discharges and also the Cross, Sanaga, and many other rivers. Within the bight are several islands, the largest of which is Bioko, belonging to Equatorial Guinea. Major ports on the bay are Malabo (on Bioko), Port Harcourt and Calabar (Nigeria), Douala (Cameroon), Bata (Equatorial Guinea), and Libreville and Port-Gentil (Gabon).

Between the 16th and the 19th century the Bight of Biafra was the scene of extensive slave-dealing operations, based mainly on the ports of Brass, Bonny, Opobo, and Old Calabar (now Calabar) in Nigeria. By the 1830s the palm-oil trade had surpassed slave trading, and it has maintained its importance. Petroleum, discovered in the late 1950s in the Niger River delta, is a major economic resource.

Biak Island, also spelled **WIAK ISLAND**, Indonesian **PULAU BIAK**, largest of the Schouten Islands (*q.v.*), off the northern coast of Irian Jaya (the Indonesian part of New Guinea) at the entrance to Cenderawasih (Geelvink) Bay. It is 45 miles (72 km) long and 23 miles (37 km) wide and has an area of 948 square miles (2,455 square km). Biak was seized by the Japanese in April 1942 during World War II; it was retaken May 27–July 22, 1944, by Allied forces.

Biak town, where the airport is located, is the chief urban centre. It is also the transportation centre for Irian Jaya, with flights to other towns in Irian Jaya, as well as to Surabaya and Ujung Pandang in Indonesia and to Hong Kong. It has now become an oil boomtown as well.

Biała Podlaska, former (1975–99) *województwo* (province), eastern Poland, now part of Lubelskie (*q.v.*) province.

Biała Podlaska, city, Lubelskie *województwo* (province), eastern Poland. It lies on the Krzna River and near the Belarusian border on the railroad linking Warsaw and Moscow. It was an important village about the 15th century, when it belonged to the Radziwiłł princes. Only a gateway, two towers, and a chapel of the Radziwiłł castle survive. The city is noted for its pottery and carpet manufacturing. An important aircraft industry was destroyed with most of the town in World War II. Historic buildings remaining include the Church of St. Anne, built in 1524, and the Church of the Basilians, built between 1747 and 1759. Pop. (2002) 58,100.

Bialik, Haim Nahman (b. Jan. 9, 1873, Radi, Volhynia, Ukraine, Russian Empire—d. July 4, 1934, Vienna, Austria), a leading Hebrew poet, esteemed for expressing in his verse the yearnings of the Jewish people and for making the modern Hebrew language a flexible medium of poetic expression.

Born into poverty, Bialik was left fatherless when he was five or six and was brought up by his rigidly pious, learned grandfather. After an intensive education in the Jewish classics, he attended for a short time the Jewish academy in Volozhin (now Valozhyn, Belarus). In 1891

he went to Odessa, then the centre of Jewish modernism, where he struck up a lifelong friendship with the Jewish author Aḥad Ha'am, who encouraged Bialik in his creative writing.

Bialik

By courtesy of Bialik House, Tel Aviv-Yafo, Israel

The following year Bialik moved to Zhitomir (now Zhytomyr, Ukraine) and to a small town in Poland. The publication of his first long poem, "Ha-matmid" ("The Diligent Talmud Student"), in the periodical *Ha-shiloah* (edited by Aḥad Ha'am), established his reputation as the outstanding Hebrew poet of his time. The poem is a sympathetic portrait of a student whose single-minded dedication to Talmudic study is awe-inspiring, even saintly.

His writing career assured, Bialik returned to Odessa as a teacher in a Hebrew school, at the same time publishing poems and some of the most highly regarded stories in modern Hebrew literature. His poems inspired by the pogrom that took place in 1903 in the city of Kishinyov (now Chişinău, Moldova) contain some of the fiercest and most anguished verse in Hebrew poetry. In such poems as "Be-ir he-haregah" ("In the City of Slaughter"), Bialik lashes out at both the cruelty of the oppressors and the passivity of the Jewish populace.

His other poems include a fragment of an epic, "Metey midbar" ("The Dead of the Desert"), and "Ha-berekha" ("The Pool"). "Metey midbar" imaginatively builds on a Talmudic legend about the Jewish host (in the biblical book of Exodus) who perished in the desert. "Ha-berekha" is a visionary nature poem in which the body of water reveals to the poet the wordless language of the universe itself.

Bialik translated into Hebrew such European classics as *Don Quixote*, *Wilhelm Tell*, and the Yiddish play *Der dibek* ("The Dybbuk"). An indefatigable editor and literary organizer, he was a cofounder of the publishing firm Devir (with his lifelong associate, the author and editor Y.H. Ravnitzky) and edited *Sefer ha-agadah* (1907/08–1910/11; *The Book of Legends*), a collection of traditional Jewish homilies and legends. He also edited the poems of the medieval poet and philosopher Ibn Gabirol and began a popular modern commentary on the Mishna (the codification of Jewish oral laws).

In 1921 Bialik left Soviet Russia for Germany, where Jewish writers had established a short-lived Hebrew centre, and then settled in Palestine (1924). There he devoted himself to public affairs, producing only a few poems, the most important of which was "Yatmut" ("Orphanhood"), a long poem about his childhood that he wrote shortly before his death.

Białowieża Forest (Poland, Belarus): see Belovezhskaya Forest.

Białystok, former (1975–99) *województwo* (province), northeastern Poland, now part of Podlaskie (*q.v.*) province.

Białystok, city, capital of Podlaskie *województwo* (province), northeastern Poland. It is located in the undulating Podlasie plain. Thought to have been founded by Gediminas, grand duke of Lithuania, about 1320, it was

first chronicled in 1426 and received town rights in 1749. During the 18th century it prospered under the wealthy Branicki family, who erected a Baroque palace known as the Podlasie Versailles. The Branickis invited a number of renowned artists and theoreticians to Białystok, developing a creative and educational centre that became known throughout Europe. By 1863 the town was a major textile community with some 230 factories and 3,000 workers.

Białystok was a major centre of Polish Jewry. At the onset of World War II, the city had a population of 100,000, of whom about 40,000 were Jews; but in 1941–44 the Germans killed half the inhabitants, including all the Jews in the ghetto, and destroyed three-quarters of the industry and buildings. Belarusians are now the city's principal ethnic minority.

After the war, Białystok was rebuilt and became an industrial and cultural centre and a major rail junction. Textiles are the chief product. Other industry includes meat processing; electronics, furniture, and glass manufacturing; and metallurgical works. The Branicki palace, restored after it was burned down by the Germans in 1944, houses an academy of medicine; there is also a technical university, a branch of the University of Warsaw, and a regional museum. Pop. (2002) 291,700.

Bian He (China): see Pien Canal.

Bianco, José (b. Nov. 21, 1908, Buenos Aires, Arg.—d. April 24, 1986, Buenos Aires), novelist and editor for 23 years of the influential Buenos Aires magazine *Sur*, published by a group of Argentine writers that included Jorge Luis Borges, Adolfo Bioy Casares, and Silvina and Victoria Ocampo. Launched in 1931, *Sur* carried translations of European and American authors and became one of the most important literary journals in Latin America.

Bianco, who was a modest and unassuming man, published a collection of short stories, *La pequeña Gyaros* ("Little Gyaros"), in 1932, but his reputation was established with two novellas, *Sombras suele vestir* (1941) and *Las ratas* (1943), published in English as *Shadow Play, The Rats: Two Novellas by José Bianco*. *The Rats* is a psychological story, with a complicated but flawlessly constructed plot that develops inexorably yet unexpectedly to the surprising ending. *Shadow Play* is a fantastic tale in the manner of Borges and Bioy Casares, written in a classic, unobtrusive style that allows for the unsettling of reality to occur almost unnoticed by the reader.

Bianco also published criticism, memoirs, and the long novel *La pérdida del reino* (1978; "Loss of the Kingdom"). (R.G.E./Ed.)

Biarritz, town, Pyrénées-Atlantiques *département*, Aquitaine *région*, southwestern France. It lies along the Bay of Biscay, adjacent to Bayonne and Anglet and 11 miles (18 km) from the Spanish border.

Once a small fishing village, Biarritz was

Small rocky peninsulas and part of the seafloor, Biarritz, France
Club Iris

made fashionable after 1854 by Napoleon III and his Spanish empress, Eugénie. The British are largely responsible for its growth as a winter residence. Visited by Queen Victoria, Edward VII, and Alfonso XIII of Spain, Biarritz began to call itself "the queen of resorts and the resort of kings."

The region's mild climate, the variety of beaches and scenery, and the town's luxurious tourist installations continue to draw an international clientele that sustains Biarritz' prosperity. A promenade runs between the sandy beaches of the Grand Plage, facing northwest, and the Côte des Basques. The beaches are split by a rocky promontory. The folklore and traditions of the Basques of the district are an added attraction. Pop. (1990) 28,887 (quadrupled in the summer season).

Biās River (India): *see* Beās River.

biathlon, winter sports event combining cross-country skiing with rifle marksmanship, probably developed from European military skiing competitions. The Union Internationale de Pentathlon Moderne et Biathlon (founded 1948) worked for the development of both sports in Olympic competition and instituted annual world championships for the modern pentathlon in 1949 and for the biathlon in 1957. The biathlon was first included in the Winter Olympics program in 1960.

Olympic competitors cover a 20-kilometre (about 12.5-mile) cross-country course, carrying a single-shot rifle and ammunition and stopping at four points at or near the 4-, 8-, 12-, and 16-kilometre (2.5-, 5-, 7.5-, and 10-mile) marks to fire five shots at small targets 100–250 m (110–275 yards) away. For the longer range, the shots are fired prone. Contestants are penalized for each miss, and the athlete with the lowest adjusted time for the race wins. In 1968 a four-man biathlon relay event was added to the Olympic program, each man firing twice during each of two 7.5-kilometre (4.7-mile) laps. The first targets, five of 30 cm (11.8 inches) diameter, are shot standing. The second targets, five of 10 cm (4 inches) diameter, are shot prone. Each competitor has eight bullets for each set of targets. Each target missed requires a 200-metre (219-yard) penalty lap. In the 1980 Olympic Games a 10-kilometre (16-mile) individual race, inaugurated in the 1974 World Championship, was introduced. In both Olympic and world championship competition the Soviets dominated until the early 1990s.

Biathlon competitor

By courtesy of the French Government Tourist Office

A combined running and swimming event called the biathlon was instituted in 1968 in Great Britain, mainly to produce modern pentathlon performers.

For world individual and team champions, *see* Olympic Games.

Bibai, city, Hokkaido, Japan. It is located between the cities of Asahikawa to the northeast and Sapporo to the southwest. It was settled in 1891 by Japanese farmer-soldiers (*tondenhei*) and has been the main rice-producing centre of the Sorachi region since 1901.

Development of the city was spurred by the opening of a national road (1890) and a rail-

way line (1891). Exploitation of the Ishikari Coalfield on nearby Mount Bibai began in 1913, but a decline in yield and the introduction of petroleum brought a decrease in population in the 1960s and '70s. The city's industrial sector produces plastic goods, chemicals, beds, and briquettes. Pop. (1990) 35,176.

Bibaud, Michel (b. Jan. 19, 1782, Côte des Neiges, near Montreal [Quebec, Can.]—d. Aug. 3, 1857, Montreal), author of French Canada's first volume of poetry and of a pioneering history of French Canada.

Bibaud, engraving

By courtesy of the Public Archives of Canada

Educated at the Collège Saint-Raphael, Bibaud became a schoolteacher and journalist. He wrote an arithmetic textbook and edited periodicals, of which *La Bibliothèque canadienne*, containing his own historical writing, was the best known. His most important historical work, *Histoire du Canada, sous la domination française* (1837), was the first history of French Canada written by a French Canadian. It covers the period from the founding of Canada to 1731; a second volume (1844) brings the story to 1830. (A third volume, treating events from 1830 to 1837, was written by his son.)

Bibaud's history was poorly received in his time, for it was unimaginative and reflected pro-British sympathies. Though some of his sources were undigested, Bibaud's observations provide a good record of the period. Bibaud's poetry collection *Épîtres, satires, chansons, épigrammes, et autres pièces de vers* (1830) was the first in French Canadian literature; it includes four satires on ignorance, avarice, laziness, and envy.

Biber, Heinrich, in full HEINRICH IGNAZ FRANZ VON BIBER (b. Aug. 12, 1644, Wartenberg, Bohemia, Austrian Habsburg domain [now in Czech Republic]—d. May 3, 1704, Salzburg [Austria]), composer and one of the outstanding violin virtuosos of the Baroque era.

Biber spent most of his life at the court of the archbishop of Salzburg, rising from a humble position to that of high steward and musical director (1676). He also traveled widely as a virtuoso. Biber composed mainly for his own instrument. His sonatas for violin and clavier and his sonatas for solo violin with continuo are well constructed and of some technical difficulty. They show development of the violin's resources, especially the use of *scordatura* (abnormal tuning for special effects). His most famous works are the 15 *Mystery Sonatas* on events in the life of Mary, and his *Passacaglia in G Minor* for unaccompanied violin. He also composed chamber works, concerti, and a few stage works, including an opera, *Chi la dura, la vince* (1687).

Bibiena, Galli da, FAMILY, Bibiena also spelled BIBBIENA, a family of Italian artists of the 17th and 18th centuries.

The family took its name from the birthplace of its progenitor, Giovanni Maria Galli (1625–65), who was born at Bibbiena near Florence.

He studied painting under Francesco Albani and first laid the foundations of an artistry that was carried on by his descendants, who devoted themselves to scenic work for the theatre. Employing freely the highly ornate style of late Baroque architecture and sculpture, the various members of the family produced a series of theatrical and other designs that are amazing for their splendour and spacious proportions achieved by intricate perspective. From about 1690 to 1787, eight Bibienas enchanted most of the courts of Europe with dazzling settings for operas, funerals, and weddings. The Habsburgs were their most lavish patrons.

Ferdinando Galli Bibiena (1657–1743), born at Bologna, was the son of Giovanni Maria. He studied painting under Carlo Cignani and architecture under Giulio Troili, called Paradosso. On Cignani's recommendation he entered the service of the duke of Parma. His chief work at this period was the villa and garden of Colorno, but he soon established a reputation for scenic designs and worked for the theatre. In 1708 he was called to Barcelona to arrange the decorations in connection with the wedding festivities of the future Holy Roman emperor Charles VI; when this prince ascended the imperial throne, Ferdinando went to Vienna and was there employed on designs of scenery and decorations for festivities at the court and at the opera. On his return to Bologna in 1717 he was elected a member of the Clementine Academy. In 1731 he built the royal theatre of Mantua (burned in 1781). He produced several books: *L'Architettura civile* (1711; "Civil Architecture"), which was reissued under various titles, and *Varie opere di prospettiva* (1703–08; "Various Works of Perspective").

Francesco Galli Bibiena (1659–1739), born at Bologna, was the second son of Giovanni Maria. He studied under Lorenzo Pasinelli and Cignani, worked at Piacenza, Parma, and Rome, and then became ducal architect at Mantua. After a stay in Genoa and Naples he was called to Vienna, where he built a large theatre. He was architect of the great theatre at Nancy, Fr.; of the Teatro Filarmonico at Verona, which some called the finest theatre in Italy; and of the Teatro Aliberti in Rome. In 1726 he returned to Bologna and directed the Clementine Academy.

Alessandro Galli Bibiena (1687–1769), eldest son of Ferdinando, was born at Parma. In 1719 he became architect and painter at the court of the elector of the Palatinate (in Germany). Among his works were the right wing of the castle and the opera house (both burned in 1795) and the Jesuit church at Mannheim.

Giuseppe Galli Bibiena (1696–1757), second son of Ferdinando, was the most distinguished artist of the family. He was born at Parma and, as a youth, accompanied his father to Barcelona and afterward to Vienna. Staying on when his father left, he there became the chief organizer of splendid court festivities and functions. He designed catafalques for the funerals of more than 30 nobles and sovereigns, as well as scenery for plays and dances. In 1722 he worked in Munich and in 1723 in Prague. In 1742 he designed the decorations for the Vienna opera; in 1747 he was employed at the opera in Dresden, Saxony; in 1748 he designed the interior of the theatre at Bayreuth; and in 1750 he renovated the Dresden opera (burned in 1849). He died in Berlin. He published his stage sets in three series of engravings: *Alcina* (1716); *Costanza e Fortezza* (1723; "Constancy and Fortitude"); *Architettura e prospettive* (1740–44; "Architecture and Perspective").

Antonio Galli Bibiena (1700–74), third son of Ferdinando, was the architect of the Virgilian Academy at Mantua, Italy, and of the

Teatro Comunale at Bologna. He was also employed at the court of Vienna.

Carlo Galli Bibiena (1728–87), son of Giuseppe, was born in Vienna. This last of the theatrical Bibienas traveled farther than any. He worked in Germany, France, and the Netherlands (1746–60); London (1763); Naples (1772), where he published five opera sets; Stockholm (1774); and St. Petersburg, Russia, until 1778. He died in Florence.

Because the Bibienas' works in theatrical scenery were not executed in durable material and because their decorations for court functions were necessarily of a temporary character, little has survived, and their richness and splendour can be judged only from drawings, which have been preserved in great numbers and are found chiefly at Vienna, Munich, and Dresden.

Bible, the sacred scriptures of Judaism and Christianity. The Christian Bible consists of the Old Testament and the New Testament (*q.v.*), with the Roman Catholic and Eastern Orthodox versions of the Old Testament being slightly larger because of their acceptance of certain books and parts of books considered apocryphal by Protestants. The Jewish Bible includes only the books known to Christians as the Old Testament. The arrangements of the Jewish and Christian canons differ considerably. The Protestant and Roman Catholic arrangements more nearly match one another. (See table.)

A brief treatment of the Bible follows. For full treatment, see MACROPAEDIA: Biblical Literature and Its Critical Interpretation.

Traditionally the Jews have divided their scriptures (*i.e.*, the Old Testament) into three parts: the Torah (the "Law"), or Pentateuch; the *Nevi'im* (the "Prophets"); and the *Ketuvim* (the "Writings"), or *Hagiographa*. The Pentateuch, together with the book of Joshua (hence the name *Hexateuch*) can be seen as the account of how Israel became a nation and of how it possessed the Promised Land. The division designated as the "Prophets" continues the story of Israel in the Promised Land, describing the establishment and development of the monarchy and presenting the messages of the prophets to the people. The "Writings" include speculation on the place of evil and death in the scheme of things (Job and Ecclesiastes), the poetical works, and some additional historical books.

In the Apocrypha of the Old Testament, various types of literature are represented; the purpose of the Apocrypha seems to have been to fill in some of the gaps left by the indisputably canonical books and to carry the history of Israel to the 2nd century BC.

The New Testament is by far the shorter portion of the Christian Bible, but, through its associations with the spread of Christianity, it has wielded an influence far out of proportion to its modest size. Like the Old Testament, the New Testament is a collection of books, including a variety of early Christian literature. The four Gospels deal with the life, the person, and the teachings of Jesus, as he was remembered by the Christian community. The book of Acts carries the story of Christianity from the Resurrection of Jesus to the end of the career of Paul. The Letters, or Epistles, are correspondence by various leaders of the early Christian church, chief among them the Apostle Paul, applying the message of the church to the sundry needs and problems of early Christian congregations. The Book of Revelation (the Apocalypse) is the only canonical representative of a large genre of apocalyptic literature that appeared in the early Christian movement.

bible leaf (herb): see costmary.

biblical criticism, discipline that studies textual, compositional, and historical questions surrounding the Old and New Testaments. Biblical criticism lays the groundwork for meaningful interpretation of the Bible.

A brief treatment of biblical criticism follows. For full treatment, see MACROPAEDIA: Biblical Literature and Its Critical Interpretation.

The major types of biblical criticism are: (1) textual criticism, which is concerned with establishing the original or most authoritative text, (2) philological criticism, which is the study of the biblical languages for an accurate knowledge of vocabulary, grammar, and style of the period, (3) literary criticism, which focuses on the various literary genres embedded in the text in order to uncover evidence concerning date of composition, authorship, and original function of the various types of writing that constitute the Bible, (4) tradition criticism, which attempts to trace the development of the oral traditions that preceded written texts, and (5) form criticism, which classifies the written material according to the preliterary forms, such as parable or hymn.

Other schools of biblical criticism that are more exegetical in intent—that is, concerned with recovering original meanings of texts—include redaction criticism, which studies how the documents were assembled by their final authors and editors, and historical criticism, which seeks to interpret biblical writings in the context of their historical settings.

The scientific principles on which modern criticism is based depend in part upon viewing the Bible as a suitable object for literary study, rather than as an exclusively sacred text. Evaluation of the Scriptures to uncover evidence about historical matters was formerly called "higher criticism," a term first used with reference to writings of the German biblical scholar J.G. Eichhorn, who applied the method to his study of the Pentateuch. In the 20th century, Rudolf Bultmann and Martin Dibelius initiated form criticism as a different approach to the study of historical circumstances surrounding biblical texts. The rapid development of philology in the 19th century together with archaeological discoveries of the 20th century revolutionized biblical criticism.

biblical source, any of the original oral or written materials that, in compilation, came to constitute the Bible of Judaism and Christianity. Most of the writings in the Old Testament are of anonymous authorship, and in many cases it is not known whether they were compiled by individuals or by groups. Nevertheless, by careful evaluation of internal evidence and with the aid of various schools of biblical criticism (*q.v.*), scholars have been able to identify certain sources and to arrange them chronologically in order of composition.

The means by which the basic sources of the Pentateuch were distinguished and their chronology established provided the first clear picture of Israel's literary and religious development. The names by which these sources are now known, in chronological order, are: the Yahwist, or J, source, so called because it employed as the Lord's name a Hebrew word transliterated into English as YHWH (called J from the German: JHVH) and spoken as "Yahweh"; the Elohist, or E, source, distinguished by its reference to the Lord as Elohim; the Deuteronomist, or D, source, marked by distinctive vocabulary and style; and the Priestly code, or P, source, which contains detailed ritual instructions.

Numerous other sources for the Old Testament have subsequently been identified, including two of the earliest books of Hebrew literature, not now extant, parts of which are embedded in the early narratives. These, the "Book of the Wars of Yahweh" and the "Book of Yashar" (the Upright), were probably poetic in form.

The New Testament sources consist of the original writings that constitute the Christian Scriptures, together with the oral tradition that preceded them. The first three Gospels are referred to as synoptic; *i.e.*, they have a common source. Contemporary opinion holds that Mark served as a source for Matthew and Luke and that the latter two also share another common source, called Q (after the German word *Quelle*, "source"), consisting mainly of Jesus' sayings. The Gospel of John apparently represents an independent line of transmission.

Whereas most of the Old Testament authors are anonymous, the major New Testament sources are known, and the essential task in their study is to restore the texts as closely as possible to the original autographs. The main sources of evidence are: manuscripts of the New Testament in Greek dating from the 2nd to the 15th century AD (some 5,000 are known); early versions in other languages, such as Syriac, Coptic, Latin, Armenian, and Georgian; and quotations from the New Testament by early Christian writers.

These sources are collectively referred to as "witnesses." Authoritative Bibles in contemporary translation are usually based on an eclectic text in which the witnesses show variant readings. In such cases, the reading that best suits the context and the author's known style is preferred.

Attempts to go beyond the original writings to reconstruct the oral tradition behind them are the province of the form of biblical criticism known as tradition criticism. Recent scholars have attempted with this method to recover the actual words (*ipsissima verba*) of Jesus by removing the accretions attached to them in the course of transmission.

biblical translation, the art and practice of rendering the Bible into languages other than those in which it was originally written. Both the Old and New Testaments have a long history of translation.

A brief treatment of biblical translation follows. For full treatment, see MACROPAEDIA: Biblical Literature and Its Critical Interpretation.

The Jewish Bible, the Old Testament, was originally written almost entirely in Hebrew, with a few short elements in Aramaic. When the Persian empire controlled the eastern Mediterranean basin, Aramaic became the lingua franca of the area, and for liturgical reasons it became necessary for the Jewish communities of the region to have the Torah, or Pentateuch (the first five books of the Bible), translated into the common language from traditional Hebrew. The resulting Targums (from Aramaic *meturgeman*, "translator") survived after original Hebrew scrolls had been lost.

By the mid-3rd century BC Greek was the dominant lingua franca, and Jewish scholars began the task of translating the Hebrew canon into that language, an undertaking that was not completed for more than a century. Because tradition held that each of the 12 tribes of Israel contributed six scholars to the project, the Greek version of the Jewish Bible came to be known later (in Latin) as the Septuagint (*septuaginta*: "70").

The Hebrew Scriptures were the only Bible the early Christian church knew, and as the young religion spread out through the Greek-speaking world, Christians adopted the Septuagint. In the meantime, many of the books of the Christian Bible, the New Testament, were first written or recorded in Greek, and others in Aramaic.

The spread of Christianity necessitated further translations of both the Old and New Testaments into Coptic, Ethiopian, Gothic, and, most important, Latin. In 405 St. Jerome finished translating a Latin version that was based in part on the Septuagint, and this

Books of the Bible

Note on the Apocrypha. The Protestant Old Testament books of Ezra and Nehemiah are known to Roman Catholics as respectively the first and second books of Esdras. The two Apocrypha books of Esdras constitute an entirely separate entity, usually called together Third Esdras by Roman Catholics. This latter two-book Esdras is not considered part of the Old Testament by either Protestants or Roman Catholics. Eastern Orthodox churches hold all the books, including Third Esdras, to be canonical, or part of the Old Testament. The Prayer of Manasseh was included only in the appendix to the Latin Vulgate Bible.

version, the Vulgate, despite corruption introduced by copyists, became the standard of Western Christianity for a thousand years or more.

Hebrew scholars at Talmudic schools in Palestine and Babylonia about the 6th century AD began trying to retrieve and codify the Hebrew scriptures, restoring them authoritatively and in the Hebrew language. Over centuries they laboured to complete the traditional, or Masoretic, text, which since its completion in the 10th century has come to be universally accepted. The Masoretic version was transmitted by scribes with amazing fidelity down to the time of movable type in the 15th century.

Jerome's Latin Vulgate served as the basis for translations of both the Old and New Testament into Syriac, Arabic, Spanish, and many other languages, including English. The Vulgate provided the basis for the Douai-Reims Version (New Testament, 1582; Old Testament, 1609–10), which remained the only authorized Bible in English for Roman Catholics until the 20th century.

The new learning in the 15th and 16th centuries revived the study of ancient Greek and led to new translations, among them an important one by the Dutch humanist Desiderius Erasmus, who in 1516 published an edition of the New Testament containing the Greek text and his own translation into Latin. Meanwhile, in Germany, Martin Luther produced the first complete translation from the original Greek and Hebrew into a modern European language. His German-language translation of the New Testament was published in 1522 and that of the complete Bible in 1534; this remained the official Bible for German Protestants and was the basis for Danish, Swedish, and other translations.

The first complete English-language version of the Bible dates from 1382 and was credited to John Wycliffe and his followers. But it was the work of the scholar William Tyndale, who from 1525 to 1535 translated the New Testament and part of the Old Testament, that became the model for a series of subsequent English translations. All previous English translations culminated in the King James Version (1611; known in England as the Authorized Version), which was prepared by 54 scholars appointed by King James I. Avoiding strict literalism in favour of an extensive use of synonym, it was a masterpiece of Jacobean English and the principal Bible used by English-speaking Protestants for 270 years.

About the time of the invention of printing in AD 1450, there were only 33 different translations of the Bible. By about 1800 the number had risen to 71; by the late 20th century the entire Bible had been translated into more than 250 languages, and portions of the Bible had been published in more than 1,300 of the world's languages.

New translations of the Bible into English proliferated in the 20th century. Among the more recent Protestant Bibles are the Revised Version (1881–85), a revision of the King James Version; the Revised Standard Version (1946–52) and the *New Revised Standard Version* (1989), which are widely accepted by American Protestants; and the New English Bible (1961–70). Among the Roman Catholic Bibles are a translation by Ronald Knox (1945–49), the Jerusalem Bible (1966), and the New American Bible (1970).

Bibliographic Classification: see Bliss Classification.

bibliography, the systematic study and description of books.

A brief treatment of bibliography follows. For full treatment, see MACROPAEDIA: History, The Study of.

Bibliography is either (1) the listing of books according to some system (descriptive, or enumerative, bibliography) or (2) the study of books as tangible objects (critical, or analytical, bibliography). The word is also used to describe the product of those activities: bibliographies may take the form of organized information about a particular author's works, about all (or selected) works on a given subject, or about a particular nation or period. A bibliography may also consist of meticulous descriptions of the physical features of a number of books, including the paper, binding, printing, typography, and production processes used. These bibliographies are then used by students and scholars to gain access to information about material for study in a given area and to help establish such facts about a book as printing date, authenticity, and its value for textual study.

Descriptive, or enumerative, bibliography. The primary purpose of descriptive bibliography is to organize detailed information, item by item, culled from a mass of materials in a systematic way so that others can have access to useful information. In the earliest bibliographies, the organizing principle was simply that of compiling all the works of a given writer, either a writer's list of his own works (autobibliography) or a biographer's lists of his subjects' writings.

Early Western autobibliographies are those by the 2nd-century-AD Greek physician Galen and the Venerable Bede (included in his *Ecclesiastical History of the English People*, 731). One of the first biographers to include bibliographies in his lives of church writers was St. Jerome in his *De viris illustribus* ("Concerning Famous Men"), in the 4th century.

Bibliography was manageable when books were still manuscripts copied out in the scriptoria of the medieval European monasteries. After the invention of printing in the 15th century, however, books proliferated, and organizing information about them became both more necessary and more practical. As early as 1545 the idea of a universal bibliography aroused the German-Swiss writer Conrad Gessner to compile his *Bibliotheca universalis* of all past and present writers. Part of his plan, completed in 1555, was to divide entries into categories of knowledge. His attempts at both universality and classification earned him the title "the father of bibliography."

The vast numbers of books published as part of the modern knowledge explosion require elaborate methods of classification. Widely used systems are the Dewey Decimal Classification; the Library of Congress Classification, based on its collection; and the Universal Decimal Classification. In the last quarter of the 20th century, the widespread use of computers in processing this systematized information revived the possibility of creating a universal bibliography, including articles in periodicals. The problems threatening its implementation, besides those of worldwide standardization of cataloging entries and programming multi-language materials, are the usual modern ones of cost, labour, and storage. What is meeting the need for comprehensive banks of recorded bibliographic data are the published catalogs of the great comprehensive libraries such as the British Museum and Bibliothèque Nationale de France and the practice of producing and distributing information about newly published materials in machine-readable form, notably by the Library of Congress.

Critical bibliography. Critical, or analytical, bibliography began early in the 20th century when scholars developed the techniques to study the physical features of books. They were first successful at dating, identifying, and authenticating books printed in the 16th century, known as incunabula. Methods demonstrated by Robert Proctor at the British Museum and the University of Oxford's Bodleian Library were accurate in assigning early hand-printed

books not only to countries and towns but to specific printers, and such methods have been extended to the study of physical features of machine-printed books of the 19th and 20th centuries.

The application of the techniques of critical bibliography to rare editions and questionable chronologies or even false editions has had important results for textual criticism. For example, C.J.K. Hinman studied the typesetting of the Shakespeare First Folio to show that it was composed and printed out of normal order by five different compositors; and W.W. Greg proved that the Pavier Shakespeare Quartos were printed in 1619, not before 1610 as previously supposed.

Biblioteca Mediceo-Laurenziana: see Mediceo-Laurentian Library.

Bibliothèque Nationale de France (French: "National Library of France"), most important library in France and one of the oldest in the world, located in Paris.

France's first royal library, the Bibliothèque du Roi ("King's Library"), dated from the reign of Charles V (1364–80), who installed 1,200 manuscripts in the Louvre. This library was dispersed, but under Louis XI (reigned 1461–83) another was created. In 1544 Francis I moved the library to Fontainebleau, and from 1537 it received a copy of every French publication. The library was moved to Paris between 1567 and 1593, and the first real catalog of its holdings was compiled in 1622. First opened to the public in 1692, the library was moved to the Mazarin Palace in the rue de Richelieu in 1721 and underwent successive expansions thereafter.

The library was renamed the Bibliothèque Nationale in 1795, and it benefited by the Revolutionary confiscations of church and parish book collections and later by Napoleon's acquisitions. The collections, which were estimated at about 300,000 volumes at the outbreak of the Revolution, had more than doubled by 1818. During the 19th century, the administrator Léopold-Victor Delisle organized the library's extensive and valuable collection of manuscripts. In 1926 the Bibliothèque Nationale entered a consortium of Parisian libraries that, by the late 20th century, included the Arsenal Library and the libraries of the Opéra and of the National Conservatory of Music.

By the late 20th century the old complex of buildings in the rue de Richelieu could no longer accommodate the continuing expansion of the collections. A new library designed by Dominique Perrault was completed along the Seine River in 1995 and opened the following year. Its controversial facility consists of four 22-story, L-shaped glass skyscrapers grouped around an open square. These new structures house all of the Bibliothèque's books and periodicals and magazines, with a total of more than 12,000,000 printed books.

The Bibliothèque Nationale de France acquires a copy of every publication printed in France (copyright deposit) and publishes the *Bibliographie de la France*. Its foreign acquisitions emphasize the humanities. The library also has some 180,000 manuscripts, an enormous collection of prints, and collections of maps, drawings and paintings, sheet music, phonograph records, and medals and antiques.

bicameral system, a system of government in which the legislature comprises two houses. The modern bicameral system dates back to the beginnings of constitutional government in 17th-century England and to the later 18th century on the continent of Europe and in the United States.

The English Parliament became bicameral in recognition of the distinction between the nobility and clergy and the common people.

When the British colonies were established in America, the colonial assemblies were likewise bicameral because there were two interests to be represented: the mother country, by the governor in council, and the colonists, by their chosen deputies. After the Declaration of Independence in 1776, bicameral systems were established in all the states but Georgia, Pennsylvania, and Vermont. In those three states, single-chamber legislatures were set up, but they were replaced by bicameral legislatures in 1789, 1790, and 1830, respectively. All the new states subsequently admitted into the Union entered with two-house legislatures.

Although the Continental Congresses and the Congress of the Confederation had been unicameral, the Constitutional Convention of 1787 decided that the new national legislature should consist of two branches in order to preserve the identity of the separate states, safeguard the influence of the smaller states, and protect the interests of property.

With the extension of constitutional government throughout the world, most countries set up bicameral legislatures on the English or U.S. models, with large first chambers chosen by popular vote and smaller second chambers whose members were either elected or appointed (or, in some cases, determined by inheritance) and often represented political subdivisions, such as the Swiss cantons. The bicameral plan is usually found in federal governments, such as those of the United States, Australia, Brazil, and Canada, and in quasi-federal governments, such as those of Germany and India.

Theoretically, this dualism in the bicameral system is justified as an application of the principle of checks and balances. A bicameral system is desirable, it has been argued, to avoid hasty and harsh legislation, limit democracy, and secure deliberation. Although the bicameral system remained prevalent in the 20th century, there were reactions against it. Unicameral councils or commissions came to predominate in American cities, which had often been organized along bicameral patterns in the 19th century. Widespread dissatisfaction with American state legislatures led to numerous proposals for a single-chamber system during the second decade of the 20th century, but the adoption in 1934 of a unicameral legislature by Nebraska (effective from 1937) marked the only departure from the bicameral system among the U.S. states.

Constitutional trends after World War II reflected a growing preference for the unicameral system in nonfederal states of the world. Unicameral national legislative bodies were set up in many European countries and several Latin American ones.

In Britain, where the House of Lords had been weakened, and in France, where the Council of the Republic (renamed the Senate in 1958 on the foundation of the Fifth Republic) was practically impotent, the governments operated, in effect, on the unicameral principle. A unitary system of government does not imply a unicameral legislature. Modern constitutional states often retain two chambers even though bicameralism has declined.

bicarbonate of soda, sodium bicarbonate, a white crystalline, weakly alkaline sodium salt. See sodium.

biceps muscle, any muscle with two heads, or points of origin (from Latin *bis*, "two," and *caput*, "head"). In human beings, there are the biceps brachii and biceps femoris.

The biceps brachii is a prominent muscle on the front side of the upper arm. It originates in two places: the coracoid process, a protrusion of the scapula (shoulder blade); and the upper glenoid cavity, the hollow for the shoulder joint. The tendon of this muscle is attached to the inner protrusion near the head of the radius, a bone of the forearm. The biceps brachii bends the forearm toward

the upper arm and is thus used in lifting and pulling movements. It also supinates the forearm (turns the palm forward or upward). The size of the biceps brachii is a conventional symbol of bodily strength.

For a depiction of the biceps brachii in human anatomy, shown in relation to other parts of the body, see the colour Trans-Vision in the PROPAEDIA: Part Four, Section 421.

The biceps femoris is one of the hamstring muscles at the back of the thigh. It originates in two places: the ischium (lower, rear portion of the pelvis, or hipbone) and the back of the femur (thighbone). The fibres of these two origins join and are attached at the head of the fibula and tibia, the bones of the lower leg. This muscle extends the thigh, rotates it outward, and flexes the leg at the knee.

Bichat, Marie-François-Xavier (b. Nov. 11/14, 1771, Thoirette, France—d. July 22, 1802, Lyon), French anatomist and physiologist whose systematic study of human tissues helped found the science of histology.

Bichat, detail of an engraving
H. Roger-Viollet

Bichat studied anatomy and surgery under Marc-Antoine Petit, chief surgeon at the Hôtel Dieu in Lyon. In 1793 he became a pupil, then assistant, of Pierre-Joseph Desault, surgeon and anatomist in Paris. After his teacher's death in 1795, Bichat completed the fourth volume of Desault's *Journal de chirurgie*, adding a biographical memoir of its author.

In addition to his observations at the bedsides of patients at the Hôtel Dieu, Bichat studied the postmortem changes induced in various organs by disease. Without knowledge of the cell as the functional unit of living things, he was among the first to visualize the organs of the body as being formed through the differentiation of simple, functional units, or tissues. This view he developed in *Traité des membranes* (1800; "Treatise on Membranes"). Although Bichat did not use the microscope, he distinguished 21 kinds of tissues that enter into different combinations in forming the organs of the body. His *Recherches physiologiques sur la vie et la mort* (1800; "Physiological Researches on Life and Death") was followed by *Anatomie générale* (1801). He published the first two volumes of *Anatomie descriptive* in 1801-03, and the third was completed by his pupils after his death. By order of Napoleon his bust, along with that of Desault, was placed in the Hôtel Dieu.

BIBLIOGRAPHY. Bichat's role in early French pathology is discussed in Russell C. Maulitz, *Morbid Appearances: The Anatomy of Pathology in the Early Nineteenth Century* (1987).

bichir, also called LOBEFIN, any of about 10 species of tropical African fishes of the genus *Polypterus*. Bichirs and the eel-like reedfish, *Calamoichthys* (sometimes called *Erepetoichthys calabaricus*), are of the family Polypteridae, order Polypteriformes. Like the sturgeons and paddlefishes, they are thought to be members of the superorder Chondrostei, although some authorities question this.

Bichirs are about 0.6 to 0.9 m (2 to 3 feet) long and prey on worms, small fishes, and other animals. They apparently spawn in

swamps during floods. They have fleshy lobes in the pectoral fins, thick ganoid (hard, rhombic, enameled) scales, and functional lungs. The dorsal fin is a series of sharp spines, each

Bichir (*Polypterus delhezi*)
Gene Wolfshamer

with a flaglike end cluster of fin rays. The bichir is eaten in some areas.

Bichitr (fl. 17th century, India), Mughal court painter active during the reigns of the emperors Jahāngīr, Shāh Jahān, and (probably) Aurangzēb.

It seems likely that Bichitr was reared at the court. The earliest work known to be by him dates from about 1615 and shows a fully mature style. He may still have been painting about 1660. He included a self-portrait in a picture of the Mughal emperor Jahāngīr painted about 1616, where he appears as a man of some 30 years in Hindu court costume. He may have had the most brilliant court style of all the Mughal painters.

As a portraitist and a commemorator of great occasions, Bichitr was superb, painting with faultless technique and majestic formality. While his earlier painting shows some soft and romantic qualities, his later work is characterized by clear, hard line and brilliant colour that barely manage to avoid cold perfectionism. His interest in European paintings and prints, some of which he studied in careful copies, led him to model his figures with shadows and to include European cherubs, or *putti*, hovering among the great. Like other court painters, Bichitr used Indian landscapes in European perspective, and this too was quite probably influenced by European works; yet his painting is a magnificent reflection of his own place and time.

bichloride of mercury, mercury(II) chloride, an odourless, colourless, water-soluble compound of mercury (*q.v.*).

Bickerdyke, Mary Ann, née BALL (b. July 19, 1817, Knox county, Ohio, U.S.—d. Nov. 8, 1901, Bunker Hill, Kan.), organizer and chief of nursing, hospital, and welfare services

Mary Ann Bickerdyke
By courtesy of the Library of Congress, Washington D.C.

for the western armies under the command of General Ulysses S. Grant during the U.S. Civil War.

She attended Oberlin College and later stud-

ied nursing. Early in the war Mrs. Bickerdyke, then a widow, set herself up as a "botanic physician" in Galesburg, Ill., and then attracted the attention of General Grant by her vigorous attack on filth, malnutrition, and disease at the Cairo, Ill., military installations. Thereafter she received Grant's sanction for her efforts and served throughout the war. She followed his army down the Mississippi River, setting up hospitals as they were needed, and later accompanied the forces of General William Tecumseh Sherman on their march through Georgia to the sea. Through her efforts, provisions were made for frequent medical examinations and for transporting men who could no longer walk. Under Mrs. Bickerdyke's supervision, about 300 field hospitals were built with the help of U.S. Sanitary Commission agents.

After the war she became a pension attorney for veterans and also organized veterans' homestead plans.

BIBLIOGRAPHY. An account of her work is given in Marjorie Barstow Greenbie, *Lincoln's Daughters of Mercy* (1944), a history of the U.S. Sanitary Commission.

Bickerstaffe, Isaac (b. c. 1735, Ireland—d. c. 1812), Irish playwright whose farces and comic operas were popular in the late 18th century. There is no apparent connection between his name and the pseudonym earlier adopted by Jonathan Swift and also used by Joseph Addison and Richard Steele for *The Tatler*.

The real Isaac Bickerstaffe is said to have been a page to the lord lieutenant of Ireland and to have become an officer in the royal marines. His first theatrical success, *Love in a Village* (1762), was followed by many others, including *The Maid of the Mill* (based on Samuel Richardson's *Pamela*), *The Padlock*, and *The Hypocrite*. A frank plagiarist, he depended for his success on his lively lyrics and his sparkling dialogue. Bickerstaffe's future appeared bright until 1772, when he was forced into exile by allegations of sodomy, then a capital offense. He lived in great poverty for many years, probably in France. The exact date and place of his death are unknown.

Consult the INDEX first

Bicol, also spelled BIKOL, Spanish BICOLANO, fifth largest cultural-linguistic group in the Philippines, numbering about 4,070,000 in the late 20th century. Their indigenous region is commonly considered to be "Bicolandia," a region composing part of the Bicol Peninsula and neighbouring islands of southeast Luzon.

The Bicol are largely an agricultural and rural people, producing rice, coconuts, and hemp. Nearly all of them are Roman Catholics. Their language is closely related to others of the central Philippines, all of which belong to the Austronesian (Malayo-Polynesian) family of languages.

Bicol Peninsula, peninsula, southeastern Luzon, Philippines. It is irregular in form, with several deep coastal bays, large subpeninsulas, and a lengthy coastline. The peninsula has an area of about 4,660 square miles (12,070 square km). It comprises the Bicol Plain, a large lowland area important in the production of rice, and volcanic highlands. A well-watered area, it is densely populated although largely rural and agricultural. The peninsula is the homeland of the Bicol, the fifth largest ethnolinguistic group in the Philippines, whose educational and commercial centre is Naga. The peninsula has been a stronghold of Philippine communists.

bicycle, also called BIKE, lightweight, two-wheeled, steerable machine that is propelled

by its rider. On a standard bicycle, the wheels are mounted in a line in a metal frame, and the front wheel is held in rotatable forks. The rider, sitting on a saddle and steering by handlebars attached to the forks, turns a driving sprocket attached to two cranks on which are pedals for his feet. Power is transmitted from

the seated rider propelled himself simply by paddling his feet against the ground. Steerable, crude, and clumsy, it worked after a fashion. But it was not until Kirkpatrick Macmillan, a blacksmith of Dumfriesshire, Scot., completed four years of experiments in 1839 that a self-propelled bicycle appeared.

(Left) Starley's "penny-farthing" bicycle, 1883, and (right) a mountain, or all-terrain, bicycle (Left) Science Museum, London, Crown copyright, (right) © Lon Adamski Peek/Tony Stone Images

this sprocket to a second sprocket on the rear wheel by means of an endless chain running over both sprockets.

Bicycles are widely used throughout the world. They are easily mastered and can be ridden with little effort at 10–15 miles (16–24 km) per hour—i.e., about four to five times a walking pace. The bicycle is said to be the most efficient means yet devised to convert human energy into propulsion. Because it is easy to house and carry, inexpensive to purchase and maintain, and simple in construction, the bicycle is a valuable instrument of self-transport, and provides pleasant recreation and exercise even while being used for purposes of utility. Bicycle "touring"—traveling or sightseeing—is most widely practiced in Great Britain and western Europe, but it also has become popular in other countries, notably the United States; the oldest touring club is the Pickwick Bicycle Club of London, founded in 1870. Bicycles are also widely used for racing, especially in western Europe, Britain, and the United States.

Early bicycles. The first two-wheeled, rider-propelled machine of which there is evidence was the *draisienne*, invented by Baron Karl de Drais de Sauerbrunn and exhibited in Paris on April 6, 1818. It was made of wood, and

Macmillan's machine had wheels rimmed with iron and, though lighter in appearance than the *draisienne*, it was still heavy. With a steerable front wheel about 30 inches (75 cm) in diameter and a driven rear wheel of about 40 inches (100 cm) in diameter, it could move at a brisk pace. In 1842 Macmillan successfully challenged a post carriage.

Instead of pedals attached directly to the rear wheel, Macmillan's vehicle had two swinging cranks mounted at the front. The rider rested his feet on the cranks and swung them back and forth, moving a pair of rods that were linked to two levers, located on either side of the rear wheel. Pressing down on one crank pulled the rod forward, which in turn drew the uppermost of the levers forward in an arc, thus turning the wheel and bringing the opposing lever uppermost for the cycle to be repeated with the other foot.

The machine never became popular and, though copied, passed out of fashion. Thus, while Macmillan may fairly be claimed as the inventor of the bicycle, the first usable mechanism that survived in principle was the work of two Frenchmen, Pierre Michaux and his son Ernest. In Paris in 1861 the Michaux family built a machine on which they attached two cranks to the front wheel. The cranks could

Components of a modern 10-speed bicycle
Encyclopædia Britannica, Inc.

be rotated by the rider's feet, an arrangement that, according to Henry Michaux in 1893, was an adaptation of the crank handles of a vertical grindstone the inventors had seen. Their machine immediately caught on, though its wood and iron frame gave it the sobriquet of "boneshaker." That year they made only two machines. In 1862 they made 142 of the *vélocipèdes*, as they had come to be known. By 1865 the Michaux family was making 400 a year. In 1866 their mechanic, Pierre Lallement, emigrated to the United States, where with James Carroll of Ansonia, Conn., he took out the first U.S. patent.

On May 31, 1868, the first recorded bicycle race was won in the Saint-Cloud Park (near Paris) by James Moore, an Englishman, who also won the first road race (Paris to Rouen) in November 1869. Reportedly, he rode a 160-pound (73-kilogram) machine that had solid rubber tires and ball bearings, and he covered the 83 miles (134 km) in 10 hours 25 minutes. Some 200 bicycles started the race.

Rowley B. Turner of the Coventry Sewing Machine Company, England, persuaded that factory's management to make 400 Michaux bicycles. They were originally intended to be sold in France, but the outbreak of the Franco-German War left Turner to sell them in England. James Starley, an inventive young foreman of the Coventry Company, immediately began development work on the primitive machines and became known in England as the father of the bicycle industry. Starley set out to reduce the weight of the clumsy *vélocipèdes*. In 1870 he made a bicycle with a large front wheel and a small rear wheel, derisively nicknamed "penny-farthing" after the largest and smallest English copper coins of the period. He developed a gear that allowed the wheel to be turned twice for each revolution of the pedals. He lightened the wheels by making them of iron with wire spokes under tension. His spokes were a single reel of wire looped through holes in the rim and the hub to which he applied tension by screwing up the threads, an arrangement improved further by the introduction in 1874 of eyed and threaded nipples to hold the spokes individually. Later that year Starley thought of tangential spoking—as distinct from radial—to ease the sideways stresses on the spokes. A party of riders rode these high bicycles from London to John O'Groats, some 690 miles (1,110 km), in 15 days. These machines typically weighed about 50 pounds but could be built as light as 21 pounds for track racing, with a driving wheel ranging from 40 to 60 inches (100 to 150 cm) in diameter, according to the owner's leg length.

The first chain-driven bicycle was designed by H.J. Lawson in 1874. It had two medium-sized wheels of equal diameter, the rear wheel being driven by a chain as in a modern bicycle. Called the safety bicycle, this design had decisive advantages in stability, braking, and mounting over the high front-wheeled "ordinary." The safety bicycle did not become fully established until the advent in 1885 of the Rover Safety model, which was manufactured by Starley's nephew, John K. Starley. This type dominated the market by 1889, and by the early 1890s no more ordinaries were being produced. The early bicycles had solid rubber tires. In 1888 John Boyd Dunlop, a Belfast veterinarian, introduced a pneumatic tire. The combination of the pneumatic tire and the safety bicycle gave an immense impetus to the bicycle industry, which was reorganized in the 1890s to build inexpensive, practical machines. By 1893 the design of the bicycle had been stabilized into the modern diamond-pattern frame with roller-chain drive and pneumatic-tired wheels. The newer models could freewheel and were easily braked.

The next improvement was the introduction of gears. Patents based on the epicyclic principle, using sun and planet wheels inside an an-

nulus ring, were taken out by H. Sturmev and J. Archer between 1901 and 1906. Sturmev-Archer gears, first two-speed, then three, were located inside the rear hub of a bicycle and weighed about 2 pounds (0.9 kg).

Derailleur gears—i.e., gears that move or derail the chain from one sprocket to another—were less successful at first because mud from the road interfered with their operation, but eventually they proved highly reliable and convenient.

From the 1890s the basic design of the bicycle remained static, though many refinements were made to its construction, including stronger and lighter frames, improved gears and brakes, better placement of the saddle, and different handlebar designs.

Modern bicycles. Most bicycles fall into one of four main categories: utility, touring, racing, and mountain bicycles. Utility bicycles are commonly used by children or for riding short distances. They have one to five speeds, heavy frames, wide tires and seats, and simple brake and gear systems, and they often weigh 30 pounds (14 kg) or more. They are ruggedly built, inexpensive, and easy to maintain. Touring bicycles have lightweight frames, derailleur gears with at least 10 speeds, narrow tires and saddles, and handlebars that are typically dropped. They weigh from 20 to 30 pounds (9–14 kg). Racing bicycles are designed for maximum speed and weigh less than 20 pounds. They have extremely light but strong frames, together with narrow wheels, handlebars, and saddles, and derailleur gears of at least 10 speeds; models used for track racing are stripped of their brakes and have only one direct-drive gear. Mountain, or all-terrain, bicycles, were developed in the mid-1970s and became extremely popular. They combine characteristics of both touring and utility bicycles, with lightweight frames and wheel rims, up to 21 gear speeds, and wide, heavy-treaded tires for good traction on off-road terrain. Mountain bicycles weigh from 25 to 35 pounds (11 to 16 kg).

Variants on the standard bicycle design include the tricycle, which has two rear wheels for increased stability and typically is used by small children; the tandem bicycle, in which two riders sit one behind the other, the front one steering; the recumbent bicycle, in which the rider sits with the legs extending in front; and the stationary exercise bicycle.

Basic components. The tubes that make up bicycle frames usually are made of steel alloys, the best of which are chrome-molybdenum alloys; aluminum and carbon-fibre compounds also are used. There are three main types of bicycle frame. The most common is the diamond pattern, which is formed by three triangles of tubing. One triangle is formed by a horizontal (top) tube joined to a nearly vertical (seat) tube, the two ends being linked by the down tube, which forms the third side. The seat tube is also the base for the other two triangles, which project rearward from it in a narrow V. They are formed by the seat stays, which extend downward from the top of the seat tube, and the chain stays, which are nearly horizontal and which project from the base of the seat tube. At the top and bottom of the seat tube, respectively, are the saddle and the driving sprocket. The rider sits on a saddle at the top of the seat tube. At the apex of the forward triangle is the short headtube, which holds the steering forks and handlebars; the apex of each rear triangle holds one side of the rear wheel. Each tube is subjected only to compression along its length, except for the steering forks, which are deliberately curved. The curved forks furnish two advantages: they absorb some road shock through natural springiness and, under the weight of the rider, they tend to return to the straight-ahead position after being turned.

The second type of frame is the cross frame, which was used by an English engineer,

Alexander Moulton, to create a new type of bicycle in 1962. This design has a single large tube as its main horizontal member. From this main member project two parallel tubes: the seat tube and the head tube. The latter holds the bearings for the steering forks. Parallel with the main tube at the rear are two tapered forks that hold the rear wheel. A rubber block is mounted so that vertical movement of the fork end compresses it, providing adequate suspension. The front forks have a splined vertical column allowing for vertical movement, with a coil spring and rubber providing the suspension medium. This design forms the basis of the Moulton suspended bicycle and other small-wheeled bicycles, which proved popular in the United Kingdom.

The third frame type, the recumbent, contains modifications that allow the rider to sit low to the ground in a slightly reclined position, with the legs driving cranks that are attached to a tube horizontal to the ground. The wheelbase is extended and the front wheel reduced in size.

A bicycle wheel consists of a rim to hold the tire, a ball-bearing hub, and spokes between hub and rim. Spokes typically are made of wire, laced tangentially, and maintained under tension by nipples in the rims that can be adjusted to keep the rim true.

The hubs may be held in the frame either by nuts screwed onto a spindle or by a cantilever lever utilizing a hollow spindle. The spindle also holds the cones of the ball races, which are used for adjustment and to take up wear in the races that are integral with the hub barrel.

Rims come in a variety of sizes, from 14 to 28 inches (36 to 71 cm) in diameter, and in three basic types: Westwood, Endrick, and tubular. Westwood rims are simple in form, broad with a depression for the spoke nipples in the center of the section. Rolled sides contain the wired edges of the tires. Endrick rims are flat-sided for use with caliper brakes, which grip the rims when applied. Tubular rims are made in the shape of a flat U with a hollow section formed by extrusion. They are used with tubular racing tires, which are attached to the rim with an adhesive rather than wired on.

Tires have an outer cover of canvas and rubber and an inner inflatable tube. The outer cover may either be stitched together to contain the inner tube, as in a racing tire, or have circles of light, springy wire in the edges to keep the cover circular. While outer covers normally contain a large proportion of natural rubber, inner tubes most frequently are made from butyl.

In specialized racing tires the inner tubes are normally of ultrathin natural rubber, and in the interests of lightness and strength, the canvas may be of finer cotton or silk. These tires are usually run at pressures up to 150 pounds per square inch. The most common type of tire valve utilizes a restricting cone actuated by the pressure in the tire.

Although experiments have been made with shaft transmission and bevel gears, as well as with belt transmission, bicycles generally are driven by chains. Roller chains are assembled from pin links and roller links. A pin link consists of two side plates connected by two tightly fitted pins. A roller link consists of two side plates connected by two tightly fitted bushings on which hardened steel rollers are free to rotate. When assembled the pins are a free fit in the bushings.

Devices to improve the speed of the bicycle for a given pedaling rate are of two types: the derailleur, which requires movement of the chain from sprocket to sprocket, and the epicyclic, which alters the speed of the driver sprocket relative to the rim of the wheel.

A derailleur gear consists of a mechanism to move the chain from one sprocket wheel to another of different size. By varying the size of the driving sprockets, the rear wheel can be made to pass through more or fewer revolutions for each turn of the crank. Cyclists can use up to 7 sprocket wheels on the rear freewheel and 3 on the cranks, providing 21 different ratios. The rear-sprocket derailleur mechanism is spring-loaded to absorb chain slack and is controlled by a cable from the frame or handlebars.

Epicyclic gears are made in England, Germany, Japan, and the United States in two-, three-, four-, and five-speed models incorporated in the rear hub. They are controlled by levers or twist-grip mechanisms, utilizing cables mounted on the handlebars or on the frame tubes. A two-speed hub gear is also made in brake-hub form, controlled by rotating the sprocket in the reverse direction.

The simplest brake is the coaster brake. It is operated on the rear wheel by a backpedaling action that leaves the rider's hands free. The coaster brake is the only brake unaffected by oil or water and in normal use lasts the life of the bicycle with no more than occasional adjustment. Besides the internal coaster, bicycle brakes are made in three principal types: caliper, rod, and drum.

Caliper brakes function by squeezing two blocks of high-friction material against the sides of the wheel rim. Rod brakes consist of two similar pads of friction material that are pulled against the rim from the inside by rods connected to handlebar levers. Drum brakes may be operated by cable or rod connected to a lever that, when rotated, opens two arcs of friction material mounted on shoes inside a steel drum on the hub.

For comfort the rider sits on a saddle made of a resilient material such as leather, rubber, or plastic resins. About 90 percent of all saddles are built up with a girder steel frame of similar shape on which is mounted a hammock of small steel springs and padding of various sorts, covered by polyvinyl chloride sheet. This type of saddle is easily cleaned, waterproof, inexpensive, and easily mass-produced. Another form, which became popular in the 1970s, is the plastic saddle made by injection molding. It is the least expensive of all but has the disadvantage of resisting changes in shape because of its tough, formed nature.

Tools and luggage are commonly carried in baskets or panniers that often are attached to racks bolted to lugs that are brazed onto the frame. Small children can be carried in specially designed seats attached to the frame. The rider is protected from spray from the wheels by simple sheet metal or plastic guards bolted to the frame and held off the wheel by wire stays.

Bida, town and traditional emirate, Niger state, west-central Nigeria. The town is on the Bako River, a minor tributary of the Niger, and lies at the intersection of roads from Jebba, Zungeru, and Agaie. Originally a small settlement of the Beni (Bini) people, a subgroup of the Nupe, it was captured about 1531 by Tsoede (Edegi), the founder of the Nupe kingdom and the first *etsu Nupe* ("king of the Nupe people"). When the kingdom was conquered about 1806 by Fulani warriors, its central region was incorporated as the Nupe emirate in the Fulani empire. Emir Usman Zaki proclaimed himself *etsu Nupe* in 1835; and, after defeating Umar Bahaushe, a rival Fulani emir, in the Nupe civil war (1847–56) at Bida, he named Bida to replace the emirate's old capital at Raba (Rabba), 67 miles (110 km) west.

The town wall, which now encloses 5 square

miles (13 square km), was begun in the 1850s. During Emir Masaba's second reign (1859–73), when Nupe became the most powerful kingdom in central Nigeria, Bida's three royal palaces, the night market, and the central mosque were constructed. Trade relations with the British Royal Niger Company were established in 1871. Later disputes over both trade and slave dealing led to a British campaign against Nupe and the defeat of the Fulani army at Bida in 1897. The reinstatement by Nupe of the Fulani emir ousted by the company led to British occupation of the town in 1901. Under British rule, Nupe emirate became known as Bida emirate; and in 1908 it was incorporated into the newly created Niger province. Bida's emir resides in a palace outside the town's west gate.

Modern Bida is well known for its crafts, notably brass and copper goblets, other metal products, glass beads and bangles, raffia hats and mats, and locally dyed cotton and silk cloth. The craftsmen work by hand on their own premises in distinctive wards and are organized into close-knit guilds. Most of the town's predominantly Nupe population live in mud houses that are grouped into customary compounds. The town is the chief collecting point for the swamp rice cultivated in the *fadamas* ("floodplains") of the Niger and Kaduna rivers. Bida also trades in yams, sorghum, millet, shea nuts, tobacco, cotton, peanuts (groundnuts), palm oil and kernels, onions, indigo, sugarcane, fruits, goats, sheep, and pottery.

Bida is the site of a federal polytechnic and other colleges. Pop. (1993 est.) town, 116,500.

bid'ah, in Islām, any innovation that has no roots in the traditional practice (sunnā) of the Muslim community. The most fundamentalist legal school in Islām, the Hanābilah (and its modern survivor, the Wahhābiyah sect of Saudi Arabia) rejected *bid'ah* completely, arguing that the duty of a Muslim was to follow the example set by the Prophet (sunnā) and not try to improve on it.

Most Muslims, however, agreed that it was impossible to adapt to changing conditions without introducing some types of innovations. As a safeguard against any excesses, *bid'ahs* were classified as good (*ḥasan*) or praiseworthy (*maḥmūdah*), or bad (*sayy'ah*) or blameworthy (*madhmūmah*). They were further grouped under the five categories of Muslim law as follows: (1) among *bid'ahs* required of the Muslim community (*farḍ kifāyah*) are the study of Arabic grammar and philology as tools for the proper understanding of the Qur'ān, evaluation of Hadith (traditions or sayings of the Prophet Muḥammad) to determine their validity, the refutation of heretics, and the codification of law; (2) strictly forbidden (*muḥarramah*) are *bid'ahs* that undermine the principles of orthodoxy and thus constitute unbelief (*kufur*); (3) recommended (*mandūb*) is the founding of schools and religious houses; (4) disapproved (*makrūh*) are the ornamentation of mosques and the decoration of the Qur'ān; and finally (5) the law is indifferent (*mubāḥah*) to the *bid'ahs* of fine clothing and good food.

Bidar, city, northeastern Karnāṭaka (formerly Mysore) state, southern India. It lies at 2,300 feet (700 m) above sea level and is 68 miles (109 km) northwest of Hyderābād. The city contains some of the finest examples of Muslim architecture in the Deccan.

Bidar was important under the medieval Hindu dynasties when it was captured in 1324 by the Muslim prince Muḥammad ibn Tughluq, who became the sultan of Delhi the following year. In 1347 the Deccan region broke away from the sultanate's control under the leadership of the Bahmanīs, whose ruler Ahmad Shah Bahmanī moved the site of his capital from Gulbarga to Bidar about 1425. He rebuilt and extended the fort that still domi-

nates the city's layout. Bidar later became an independent sultanate under the Barīd Shāhī dynasty in 1531. The city was annexed by the sultanate of Bijāpur in 1619–20 but was captured by the Mughal viceroy Aurangzēb in 1657 and formally annexed to the Mughal Empire in 1686. Upon that empire's breakup, Bidar fell to the nizām of Hyderābād in 1724. When Hyderābād state was partitioned in 1956, Bidar city and district were transferred to Mysore (now Karnāṭaka) state.

The fortress that Aḥmad Shāh Bahmanī rebuilt about 1428 at Bidar has a triple moat and walls built of red laterite. Within the fortress complex is the Rangīn Mahal ("Painted Palace"), so called from its elaborate decoration with coloured tiles; the Takht Mahal, or throne room; and several other palaces. Elsewhere in Bidar are the Jami Masjid ("Great Mosque") and the Sola Khamba ("Sixteen-Pillar") mosque; these are typical Bahmanī buildings without minarets or prominent domes. Another notable Bahmanī monument is the great madrasah, or Islāmī college, that was built in 1472–81 and is now a massive ruin. East of the town are the domed tombs of eight Bahmanī kings, while to the west lie the royal necropolis of the Barīd sultans.

Since the 14th century, Bidar has been noted for its production of Bidrī ware—metal articles damascened (ornamented with wavy lines) in floral and geometric designs with silver wire. Several colleges in the city, including schools of law and commerce, are affiliated with Gulbarga University, which was established in 1980. Bidar is reached by northward branches of the Hyderābād-Bombay road and railway.

The surrounding lowland area is drained by the Karanja River and produces millet, wheat, and oilseeds. Kalyāni, 42 miles (68 km) west of Bidar, was the capital of the second Cālukya dynasty (10th–12th century). Pop. (1991 prelim.) 107,542.

Bidault, Georges, in full GEORGES-AUGUSTIN BIDAULT (b. Oct. 5, 1899, Moulins, France—d. Jan. 27, 1983, Cambou-les-Bains, near Bayonne), French Resistance leader during World War II and three times minister of foreign affairs, who late in his career vigorously opposed General Charles de Gaulle's Algerian policy and was forced into exile.

Bidault
Haringue—H. Roger-Viollet

Bidault attended an Italian Jesuit school, served briefly with the French Army of Occupation in the Ruhr in 1919, and returned to the Sorbonne, receiving a degree in history and geography in 1925. In 1932 he founded the leftist Roman Catholic daily *L'Aube* ("The Dawn"), for which he wrote a foreign affairs column until 1939. Imprisoned in Germany (1940), he returned to France in 1941 and began working with the National Council of Resistance, which he headed in 1943. He was discovered by the Gestapo in 1944 but managed to avoid arrest, meanwhile founding the Mouvement Républicain Populaire, a Christian-Democratic Party. Bidault supported de Gaulle's wartime government.

As foreign minister in de Gaulle's provisional government in 1944, Bidault signed

the Franco-Soviet alliance in December and in the following year supported the Yalta plan, concluded economic agreements with the Benelux countries, and signed the United Nations Charter. After heading the provisional government in 1946, he again became foreign minister in 1947–48. His policy consistently favoured containment of Germany and European union, including Communist participation in the U.S. Marshall Plan for European redevelopment. After the 1948 Communist takeover in Czechoslovakia, however, he began negotiations for a strong western European customs union and an Atlantic defense alliance, which ultimately became the North Atlantic Treaty Organization (NATO).

As defense minister (1951–52) and foreign minister (1953–54), Bidault, fearful of Arab nationalism and Communism, supported French dominance in Indochina and Algeria. With the collapse of the Fourth Republic and the return of de Gaulle to power (1958), Bidault broke with his wartime friend over the issue of Algerian independence. Bidault founded (1958) a new, right-wing Christian-Democratic Party. When de Gaulle put down a coup and negotiated Algerian independence in 1961, Bidault, still a member of the National Assembly, created a national council of resistance that advocated terrorism in France and Algeria to prevent Algerian independence, and went underground, claiming the illegality of de Gaulle's government. Charged with conspiracy and stripped of his parliamentary immunity from arrest, Bidault fled France in 1962, living in neighbouring countries and Brazil (1963–67). He returned in 1968 to live in Paris after the warrant for his arrest was suspended. In that year he founded the right-wing Mouvement pour le justice et la liberté, but he was thereafter never actively effective in politics, becoming honorary president of the Christian-Democratic Party in 1977.

Biddeford, city, York county, southwestern Maine, U.S., at the falls of the Saco River, opposite Saco, on the Atlantic coast, 16 mi (26 km) southwest of Portland. Englishmen led by Richard Vines settled the area in 1630. Named for the settlers' home in Biddeford, Devon, Eng., the communities on the two sides of the river separated in 1762. Industrial growth was spurred by the availability of waterpower; lumber and cotton textiles remain important manufactures. The University of New England (formerly St. Francis College, founded in 1953), now incorporates the New England College of Osteopathic Medicine. Biddeford Pool, Fortunes Rocks, and Hills Beach are nearby resorts. Inc. town, 1718; city, 1855. Pop. (2000) 20,942.

Biddle, James (b. Feb. 18, 1783, Philadelphia—d. Oct. 1, 1848, Philadelphia), career U.S. naval officer who negotiated the first treaty between the United States and China.

Biddle attended the University of Pennsylvania, Philadelphia, before entering the navy as a midshipman in 1800. Retained despite a severe cutback in naval manpower, Biddle served in the war against the Barbary pirates. During that conflict he was captured (Oct. 31, 1803) and imprisoned for more than a year and a half in Tripoli.

Upon his release, Biddle was given command of a gunboat and assigned to protect the South Atlantic coast from pirates. He took a leave of absence in 1807 to serve as first officer on a merchant ship to China. On his return he helped to enforce Pres. Thomas Jefferson's embargo on American trade, and in the years immediately preceding the War of 1812, he served on a number of naval vessels.

During the war, Biddle was first lieutenant on the "Wasp" when it captured the British ship "Frolic." He was later taken by the British and imprisoned in Bermuda. He was released before the end of the war and was promoted to master commandant. Biddle took command

of the "Hornet," and his ship conquered the "Penguin," then made a heroic escape from a much larger British vessel in the final naval engagement of the war.

In 1817 Biddle was sent to the Columbia River to claim the Oregon Territory for the United States. He subsequently served in the West Indies, off the coast of South America, and in the Mediterranean. He was serving as commodore of the East India Squadron when he became responsible for negotiating the first treaty between the United States and China (1846), for which he is perhaps best remembered. His last command took him to the Pacific Coast during the Mexican War.

Biddle, John (b. 1615, Wotton-under-Edge, Gloucestershire, Eng.—d. Sept. 22, 1662, London), controversial lay theologian who was repeatedly imprisoned for his anti-Trinitarian views and who became known as the father of English Unitarianism.

Biddle was educated at the grammar school of his native town in Gloucestershire and at Magdalen Hall, Oxford, being subsequently appointed to the mastership of the free school in Gloucester. His reputation as a heretic in Anglican eyes originated with his manuscript of about 1644, *Twelve Arguments Drawn out of Scripture, Wherein the Commonly Received Opinion Touching the Deity of the Holy Spirit Is Clearly and Fully Refuted*, which was given to magistrates by a treacherous friend.

In 1645 Biddle was summoned before the parliamentary committee, then sitting at Gloucester, and committed to prison. He was released on bail in 1647, but the publication of his manuscript the same year brought another parliamentary inquiry. Biddle was once again taken into custody, and his *Twelve Arguments* was seized and burned. Two additional tracts were subsequently suppressed for attacking the doctrine that the three Persons of the Trinity—Father, Son, and Holy Ghost—were coequal. Biddle chose to elevate the Father and to consider the other two Persons as subordinate to him. Under pressure from the Westminster Assembly, originally convened to reform the Church of England, Parliament in 1648 made this heresy a cause for the death penalty, but influential friends made it possible for Biddle to live in Staffordshire under surveillance until 1652, when he was again imprisoned.

Freed in the same year under the protectorate of Oliver Cromwell, Biddle and his adherents, called Biddellians, or Unitarians, began to meet regularly for Sunday worship. For the resemblance of their views to those of the Italian anti-Trinitarian Faustus Socinus (1539–1604), they were also known as Socinians. Soon after Biddle's translation of a biography by S. Przykowski (*Life of Socinus*, 1653) and publication of his own *Two-Fold Catechism* (1654), Biddle was summoned before Parliament in December 1654 and imprisoned; his *Catechism* was burned by the common hangman. When Parliament was dissolved the next month, Biddle was free briefly but was then rearrested and tried for his heresy. Reluctant to see him executed, Cromwell rescued Biddle and sent him to one of the Scilly Isles in October 1655. In 1658 some of Biddle's friends sought and obtained his release, and he retired to the country to teach. On his return to London as a preacher in 1662 he was again arrested and fined £100. Unable to pay, he was immediately confined to prison, where he died.

Biddle, Nicholas (b. Jan. 8, 1786, Philadelphia—d. Feb. 27, 1844, Philadelphia), financier who as president of the Second Bank of the United States (1823–36) made it the first effective central bank in U.S. history. He was Pres. Andrew Jackson's chief antagonist in a conflict (1832–36) that resulted in termination of the bank.

Biddle was a contributor to and later (1812)

editor of *Port Folio*, the first U.S. literary journal. He served as secretary to Pres. James Monroe (1806–07), then minister to England, and, afterward, while practicing law in the United States, he wrote *History of the Expedition of Captains Lewis and Clark* (1814)

Nicholas Biddle

By courtesy of the Library of Congress, Washington, DC

from the explorers' notes. In 1815, while a member (1814–18) of the state senate, Biddle drafted and wrote Pennsylvania's rejection of the Hartford Convention's proposed constitutional amendments to limit the powers of Congress and of the executive. In 1819 President Monroe commissioned him to compile a digest of foreign legislation affecting U.S. trade and appointed him one of the directors of the Second Bank of the United States.

As president of the bank, Biddle sponsored policies that restrained the supply of credit to the country's banks; stabilized the investment, money, and discount markets; regulated the money supply; and safeguarded government deposits. Between 1832 and 1836 the bank came under the attack of Jackson's Democratic Party, which sought to eliminate it, while the Whigs supported it. After Jackson won termination of the bank's national charter in 1836, Biddle became president of the rechartered Bank of the United States of Pennsylvania. After retiring in 1839, Biddle helped to establish Girard College in Philadelphia and held celebrated literary salons at Andalusia, his country estate.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Bideford, small port, Torrridge district, county of Devon, England, at the lowest bridging point of the Torrridge River Estuary, which empties into Bideford, or Barnstaple, Bay and the Atlantic Ocean. The medieval community grew mainly as a result of the wool trade, and Bideford received its market charter in 1573 and was incorporated soon after.

The coming of the railway (1856) increased Bideford's importance as a resort. Boatbuilding and the manufacturing of concrete products and leather goods are main industries. The town and the surrounding district were used by Charles Kingsley as locations in his novel *Westward Ho!* (1855). Pop. (1991) 14,326.

Bidens, genus of weedy herbs in the family Asteraceae, consisting of about 230 species, variously known as bur-marigold, sticktight, beggar-ticks, and tickseed-sunflowers, distributed throughout the world. Some have divided leaves with toothed segments and long ray flowers; others have undivided, lance-shaped leaves and short ray flowers or none at all.

All species have yellow disk flowers and fruits with two to four barbed bristles that become attached to animal coats or to human cloth-

Bidens cernua
Dorothea W. Woodruff—EB Inc

ing. One species, *B. ferulaefolia*, is cultivated as a garden ornamental.

Bidlack Treaty, also called NEW GRANADA TREATY (Dec. 12, 1846), pact signed by New Granada (now Colombia and Panama) and the United States, which granted the U.S. a right-of-way across the Isthmus of Panama in exchange for a U.S. guarantee of neutrality for the isthmus and the sovereignty of New Granada thereafter. The treaty was named for the U.S. chargé d'affaires in New Granada, Benjamin Alden Bidlack. The threat of British intrusion on the coast of Central America had shown the need for such a pact.

After gold was discovered in California in 1848, a U.S. company began to construct a transisthmian railroad, which was completed in 1855. Thereafter, U.S. influence in the region increased because the Colombian government often called upon the United States to prevent closing of the isthmus route during civil wars. In 1902 the U.S. Congress authorized the president to spend \$40,000,000 to obtain rights held by the French New Panama Canal Co. for building a canal. The act stipulated that Colombia concede a strip of territory across the isthmus "within a reasonable time"; in the event that Colombia refused to make such a concession, the president was permitted to negotiate with Nicaragua for a right-of-way across its territory. Accordingly, Pres. Theodore Roosevelt bought the French company's rights, and in 1903 the Hay-Herrán Treaty was concluded between the United States and Colombia. The Colombian senate, however, withheld ratification to secure better terms. Thereupon the U.S. government engineered the secession of Panama from Colombia and then reached an agreement (Hay-Bunau-Varilla Treaty) with the new Republic of Panama, by which Panama became a U.S. protectorate and the U.S. government gained exclusive control of the Panama Canal Zone and permission to construct a canal. See also Hay-Bunau-Varilla Treaty.

Bidpai, The Fables of, European title for the collection of Indian animal fables known in Sanskrit as *Pañca-tantra* (q.v.).

Bidri ware from Andhra Pradesh, 19th century; in the Prince of Wales Museum of Western India, Bombay
P Chandra

Bidri ware, metal decorative objects ornamented with a type of Indian inlay work. The ware derives its name from the town of Bidar, in Andhra Pradesh, though it is not made exclusively in that town; Lucknow and Murshidābād are also very important centres of Bidri manufacture.

The metal commonly used is an alloy composed mostly of zinc with a small amount of copper, darkened to achieve a black colour that does not fade. There are two main types of Bidri work. In the first type, the pattern is deeply incised, then silver or gold is cut to the exact size, the shape of the incised pattern is embedded in the incision, and the surface is finally smoothed and polished. In the second, encrusted type, the outline of the design is engraved and shaped gold or silver leaf affixed after the cavities have been filled with lead.

Bidri ware generally consists of hookah bases, dishes, cups, vases, jars, and spice boxes. The commonest patterns are diapers (overall diamond patterns) and a variety of floral sprays, leaves, fishes, and lozenges. Ambitious large works are no longer attempted, modern production chiefly consisting of cigarette cases, ashtrays, and jewelry.

Bidwell, John (b. Aug. 5, 1819, Chautauque County, N.Y., U.S.—d. April 4, 1900, near Sacramento, Calif.), California civic and political leader who ran unsuccessfully for U.S. president in 1892 as the candidate of the Prohibition Party.

The Bidwell family moved from New York to Pennsylvania in 1829 and to Ohio in 1831. In 1836 Bidwell walked 300 miles from the family home in Ashtabula to enroll at Kingsville Academy—of which he was made principal the following year at the age of 17.

After returning to Ashtabula to accept a teaching position, Bidwell moved west, settling temporarily in Missouri before joining the first emigrant group to travel by wagon train from the town of Independence to California. On arrival there, Bidwell went to work at Sutter's Fort and, after a few years, became a naturalized Mexican citizen. Reluctant to join the Bear Flag revolt of Americans in California against Mexico, he nonetheless helped draw up the Bear Flag Republic's resolution of independence in July 1846.

Bidwell fought in the Mexican War, marching to Monterey (California) with Colonel John C. Frémont, serving as civil magistrate in Los Angeles, and finally assisting Commodore Robert F. Stockton in the recapture of Los Angeles in 1847. At the end of the war he returned to Sutter's Fort and became the first to find gold on the Feather River.

With his newly discovered wealth Bidwell purchased a 22,000-acre ranch, Rancho Chico, north of Sacramento. There he became the state's leading agriculturalist while simultaneously taking a prominent role in California politics. He served in the state senate and

was a delegate to several Democratic Party national conventions. With the advent of the Civil War, Bidwell, a staunch Unionist, became a supporter of Lincoln.

Elected to the House of Representatives in 1864, Bidwell declined renomination in order to run for governor of California on the Republican ticket in 1867; his bid was unsuccessful, as were his two others, one in 1875 as an anti-monopolist independent and another in 1890 as a candidate of the Prohibition Party, which nominated him for president in 1892.

Bidyasagar, Isvarcandra (1820–91): see Vidyasagar, Isvar Chandra.

Bié, province, central Angola, on the elevated Bié Plateau, drained by northward-flowing branches of the Kwanza River. Its area is 27,150 sq mi (70,300 sq km). It is largely upland savanna. The climate is tempered by altitude. Crops, grown chiefly in the central section, include corn (maize), rice, sisal, coffee, and sugarcane. The capital and largest settlement is Kuito. Bié province is bisected from east to west by the Benguela Railway. Pop. (1995 est.) 1,246,000.

Bieber, Owen (Frederick) (b. Dec. 28, 1929, North Dorr, Mich., U.S.), U.S. labour leader and president, since 1983, of the United Automobile Workers (UAW; formally the United Automobile, Aerospace and Agricultural Implement Workers of America).

Bieber, after graduating from high school, took a factory job at a company making seats for Hudson and Chevrolet cars. Within a year, at age 19, he was a union shop steward; and by 1956, at age 26, he was president of Local 687 in the Grand Rapids area. In 1980 he was elected a vice president of the entire UAW and became chief of the General Motors department, which traditionally has been a springboard to the presidency. In 1982 he was nominated and in 1983 elected president of the union, succeeding Douglas A. Fraser.

Biedermeier style, in art, transitional period between Neoclassicism and Romanticism as it was interpreted by the bourgeoisie, particularly in Germany, Austria, northern Italy, and the Scandinavian countries. Following the Napoleonic sieges, the Biedermeier style grew during a period of economic impoverishment from 1825 to 1835. The name Biedermeier was derogatory because it was based on the

"Girl Embroidering," Biedermeier-style painting by Georg Friedrich Kersting, oil on canvas, c. 1814; in the Kunstsammlungen, Weimar, Ger.

caricature "Papa Biedermeier," a comic symbol of middle-class comfort. Such comfort

emphasized family life and private activities, especially letter writing (giving prominence to the secretary desk) and the pursuit of hobbies. No Biedermeier household was complete without a piano as an indispensable part of the popularized soiree. Soirees perpetuated the rising middle class's cultural interests in books, writing, dance, and poetry readings—all subject matter for Biedermeier painting, which was either genre or historical and most often sentimentally treated. The most representative painters include Franz Krüger, Georg Friedrich Kersting, Julius Oldach, Carl Spitzweg, and Ferdinand Georg Waldmüller.

Biedermeier furniture derives essentially from the Empire and Directoire styles; while plump and naively grotesque at its worst, it did often reach remarkable simplicity, sophistication, and functionality. Stylistically, Biedermeier furniture softened the rigidity of the Empire style and added weight to Directoire; it made the elevation of Empire realistic and the delicacy of Directoire durable. While Empire was grandiose and usually of dark woods with ormolu mounts, Biedermeier—identifying more closely with Directoire in this sense—was executed in light, native woods and avoided the use of metal ornamentation. Surfaces were modulated with natural grains, knot-holes, or ebonized accents for contrast; though modest, inlay was occasionally used. An identifying feature of Biedermeier furniture is its extremely restrained geometric appearance. Some furniture took on new roles; for example, the table *à milieu*, rather than an isolated centrepiece, became the family table, around which chairs were set for evening activities.

In general, the Biedermeier style offered visual evidence of the conflict of ideas between Classicism and Romanticism that continued during the first half of the 19th century. With time the Biedermeier style was romanticized: straight lines became curved and serpentine; simple surfaces became more and more embellished beyond the natural materials; humanistic form became more fantastic; and textures became experimental. Yet the original focus on lightness, utilitarianism, and individuality characterized a revival of the Biedermeier style during the mid-1960s.

Biel (German), French BIENNE, town, Bern canton, northwestern Switzerland. It lies at the northeastern end of Lake Biel (Bieler See), northwest of Bern city. Of Celtic origin (Belenus) and inhabited in Roman times, the town dates from the 11th century and was chartered in 1275. It was for centuries under the jurisdiction of the prince-bishops of Basel. In 1279 (permanently in 1352) it joined in an alliance with Bern. After being seized by the French in 1798, the town became part of Bern canton in 1815. Biel is situated on the language boundary, and as a result its population is two-thirds German-speaking and one-third French-speaking. It is the only officially bilingual town in Switzerland.

Biel's medieval landmarks include the late Gothic town church of St. Benedict (1451; restored 1775), with fine 15th-century stained glass, and the town hall (1534). The Schwab Museum has a collection of artifacts from the lake pile dwellings of the La Tène (Iron Age) period. The town's chief industries are watchmaking and the manufacture of chains and machinery. Pop. (2002 est.) 49,328.

Biel, Gabriel (b. c. 1420, Speyer [Germany]—d. Dec. 7, 1495, Tübingen, Württemberg), German philosopher, economist, and one of the most distinguished Scholastic theologians of the late Middle Ages.

Having studied at various German universities, Biel became vicar and cathedral preacher at Mainz about 1460. In 1468 he entered the Order of the Brothers of the Common Life, a religious community devoted to education and the care of the poor, and he was subsequently made prior of the brother house at

Butzbach (1470) and then at Urach (1479). In 1484 he became professor of philosophy and theology at the University of Tübingen, where he served as rector in 1485 and 1489. He was named prior of Schönbuch in 1492.

Biel's *Collectorium circa IV libros sententiarum*, a classical commentary on the celebrated *Sentences* by Bishop Peter Lombard of Paris, gives a clear and methodical exposition of the teaching of the great English philosopher William of Ockham, whose doctrine Biel supported. The work was so influential that Ockhamists at the universities of Erfurt and Wittenberg were known as Gabrielistae. Left unfinished by Biel, the *Collectorium* was completed by one of his followers, Wendelin Steinbach, at Tübingen in 1520; the complete work was printed at Brixen in 1574.

A notable political economist, Biel wrote, in addition to theological treatises, a progressive work on economic theory, *De potestate et utilitate monetarum* (printed 1516; *Treatise on the Power and Utility of Moneys*), in which, among several other issues, he favours fair taxation and price control. He has been called *ultimus scholasticorum* ("the last of the Scholastics").

BIBLIOGRAPHY. Heiko Augustinus Oberman, *The Harvest of Medieval Theology: Gabriel Biel and Late Medieval Nominalism*, 3rd ed. (1983).

Biela's Comet, comet discovered (1826) by and named for the Austrian astronomer Wilhelm, Baron von Biela (1782–1856). It was identified by Biela as a periodic comet that returned every 6.6 years.

Biela's Comet underwent remarkable transformations; it was observed in 1846 to break in two, and in 1852 the fragments returned as twin comets that were never seen thereafter. In 1872 and 1885, however, when the Earth crossed the path of the comet's known orbit, bright meteor showers (known as Andromedids, or Bielids) were observed, lending strength to astronomers' postulation that some meteors are composed of fragments of disintegrated comets.

Bielefeld, city, Detmold *Regierungsbezirk* (administrative district), North Rhine-Westphalia *Land* (state), northwestern Germany. It lies on the northern edge of the hilly Teutoburg Forest. First mentioned as Bilifelde in the biography of Bishop Meinwerk of Paderborn between 1015 and 1036, the old town was probably founded and chartered in 1214 by Count Hermann of Ravensberg; the "new town" arose from a religious settlement around the Marienkirche (St. Mary's Church, still standing) during the late 13th century. It joined the Hanseatic League in the 14th century, and, along with the county of Ravensberg, it passed to Jülich in 1346 and to Brandenburg in 1647. Heavily damaged in World War II, Bielefeld has since been rebuilt.

Bielefeld has historically been the centre of the Ravensberg linen industry, which became important in the 16th century. The first mechanized mills in Germany were established there in 1851. Bielefeld's most important industries now include electrical engineering, publishing, and the production of machinery, paper products, clothing, and foodstuffs. Sparrenburg Castle, dating from 1250, was rebuilt after a fire in 1877. Other notable medieval buildings include the Altstädter Nicolai Church, the Jodokus Church, and the Gothic Crüwell House (1530). The city has a concert hall, opera, playhouse, and a gallery of modern art; it is also home to farmhouse and playing-card museums. The city is the seat of Bielefeld University (1969). Annexation of several neighbouring cities in 1973 doubled the size of Bielefeld, and construction of a city-wide rail system (Stadtbahn), underground within the inner city, has helped tie the city together. Pop. (2002 est.) 323,373.

Biella, city, capital of Biella *provincia*, Piemonte (Piedmont) *regione*, northwestern Italy. It lies at the foot of the Alps, on the Cervo River, northeast of the city of Turin (Torino). A Gallic and Roman centre, Biella was a medieval possession of the counts of Vercelli before it was passed to the house of Savoy in 1379. Biella is divided into Biella PIAZZO (upper) and Biella PIANO (lower) towns, which are joined by a cable railway. There are many medieval and Renaissance mansions in the upper town, while the lower town is distinguished by a 15th-century cathedral (1402; remodeled), 10th-century baptistry, and the Renaissance churches of San Sebastiano (1504) and San Girolamo (1512–17). Biella also has an archaeological museum and an art gallery. On Alpine slopes above the city is the famous pilgrimage resort of Santuario di Oropa, which is believed to have been founded in 369 by St. Eusebius of Vercelli. A major centre of the Italian woolen industry, Biella also manufactures cotton, silk, and linen textiles. Pop. (2001 est.) 45,740.

Bielsko-Biala, former (1975–99) *województwo* (province), southern Poland, now part of Śląskie (*q.v.*) province.

Bielsko-Biala, city, Śląskie *województwo* (province), southern Poland. It lies in the foothills of the Carpathian Mountains. Incorporated in 1951, the city existed previously as two separate towns on either side of the Biala River. Bielsko originated as a 13th-century settlement around a stronghold and developed during the 16th century through its textile industry. It received town rights in the 18th century, as did Biala. The city is now a major industrial centre, notably for automobile manufacturing. It is also a tourist resort, due in part to its picturesque mountain surroundings. It has a rail line and road connections to Kraków and the Czech Republic. Pop. (2002) 178,028.

Bien Hoa, city, southern Vietnam. Bien Hoa is located 19 miles (30 km) northeast of Ho Chi Minh City (formerly Saigon), on the left bank of the Dong Nai River, northeast of the Mekong River delta. It is one of the oldest cities of southern Vietnam. The French conquered it in 1861 after prolonged Vietnamese resistance. It has several hospitals and a ceramics school. Prior to 1975 the city's industrial-park district had industries producing steel, metal products,

The Dong Nai River at Bien Hoa, Vietnam

refrigeration equipment, motorbikes, batteries, paper products, knitted textiles, chlorine, caustic soda, and radios and televisions. The industrial park underwent heavy damage during the fighting in 1975, but many factories have been restored to operation, and new factories have been constructed. Paper pulp,

pressed wood, rolled steel, tools, refined sugar, condensed and powdered milk, and tractors are some of the manufactured products. Power is provided by the Dai Nham hydroelectric plant. Older industries include brick, tile, and pottery making, and the production of construction stone. Granite quarries are worked, and there is a large airfield nearby. Pop. (1989) 273,879.

Biencourt, Charles de, BARON DE SAINT-JUST (b. 1591/92, Champagne, Fr.—d. 1623/24, Port Royal, Acadia, New France [now in Canada]), French colonizer who commanded the French colony of Port Royal.

In 1606 Biencourt sailed with his father, Jean de Biencourt de Poutrincourt, Baron de Saint-Just, to New France (Canada). In 1607 they abandoned their establishment and fort at Port Royal, Acadia, because of insufficient funds. Failing to obtain a Canadian fur-trade monopoly while in France, father and son returned to Acadia and to Port Royal in 1610. In 1611 Jean de Biencourt was appointed vice admiral of the seas of New France; he placed Port Royal under his son's administration.

Charles was not effective in exerting authority, especially over the Jesuits. In 1613–14 the British, under Sir Samuel Argall, attacked Port Royal. The elder Biencourt returned to the devastated settlement and made over his holdings to his son, who stayed on with a few colonists. Charles and his colleagues built up the fishing and fur-trading business there and established a new company. In 1618 Charles appealed unsuccessfully to Paris for fortification against the English. The settlement did not prosper, and Biencourt lived with Indians during his last years.

Bienert, Richard, Freiherr von (baron of), also called (after 1915) GRAF (count) VON BIENERTH-SCHMERLING (b. March 2, 1863, Verona, Venezia, Austrian Empire [now in Italy]—d. June 3, 1918, Vienna, Austria), Austrian prime minister (1908–11).

After service under the governor of Steiermark, or Styria, Bienert was transferred to the Austrian Ministry of Education (1886), of which in 1905 he was named director and elevated to the Privy Council. Appointed minister of the interior for Austria (June 1906), he became a supporter of the ministerial program of suffrage reform. In November 1908, upon the resignation of Max, Baron von Beck, and with the patronage of the Austro-Hungarian foreign minister, Count Lexa von Aehrenthal, he succeeded Beck as Austrian prime minister. In the manner of his predecessor, Bienert planned Czech and German reconciliation in Bohemia through a program of territorial autonomy, but, lacking Beck's competence, he accomplished little toward this end. Unable to command a parliamentary majority after the elections of 1911, he resigned; subsequently he served as *Statthalter* ("governor") of lower Austria (1911–15).

Bienne (Switzerland): see Biel.

Bienville, Jean-Baptiste Le Moyne de (baptized Feb. 23, 1680, Montreal, New France [now in Canada]—d. March 7, 1767, Paris, Fr.), French explorer, colonial governor of Louisiana, and founder of New Orleans.

Jean-Baptiste was the eighth son of Canadian pioneer Charles Le Moyne. He entered the French navy at age 12 and served with his noted elder brother, Pierre Le Moyne d'Iberville, in naval engagements (1696–97) in Hudson Bay and the North Atlantic during King William's War (War of the Grand Alliance).

When the conflict with England ended in 1697, he accompanied his brother on an expedition from France to explore the mouth of the Mississippi River and to plant a colony

there. A settlement was founded near the area of modern Biloxi in early 1699, and Bienville was made second in command of the colony when his brother departed in the spring. He explored the lower Mississippi and the Red River (1699–1700), and, when the colony's leader, one "Sauvole," died in 1701, Bienville was commissioned as commandant. In 1702 he moved the colony to Fort Louis on Mobile Bay, and in 1711 it was established at the present site of Mobile, Ala.

Bienville remained as commandant of the French colony until 1712 despite numerous complaints against his rule. He was replaced by Antoine Laumet de Lamothe Cadillac, under whom he served as deputy for three years. In 1716 he led a campaign against the Natchez Indians, and two years later, after Cadillac's recall, Bienville was restored to the position of commandant. At that time he founded the settlement of New Orleans on the Mississippi River, and four years later he made that city the new capital of the colony.

During his second term as Louisiana commandant, he captured Pensacola from the Spanish and instituted a strict "Black Code" regulating the conduct of black slaves. When the Company of the Indies, which had been financing Louisiana, became unable to continue its support, Bienville's enemies succeeded in having him recalled to France and dismissed as commandant. He returned as governor in 1733, however, after the colony came under royal control. His final term, which lasted for a decade, was marked by intermittent Indian wars. He voluntarily resigned the governorship in May 1743 and retired to Paris.

Bierce, Ambrose (Gwinnett) (b. June 24, 1842, Meigs county, Ohio, U.S.—d. 1914, Mexico?), American newspaperman, wit, satirist, and author of sardonic short stories based on themes of death and horror, whose life ended in an unsolved mystery.

Reared in Kosciusko county, Ind., Bierce became printer's devil on a Warsaw, Ind., paper after about a year in high school. In 1861 he enlisted in the 9th Indiana Volunteers and fought in a number of American Civil War battles, including Shiloh and Chickamauga. Seriously wounded on Kenesaw Mountain in 1864, he served until January 1865; he received a merit promotion to major in 1867.

In San Francisco, which was experiencing an artistic renaissance, he began contributing to periodicals, particularly the *News Letter*, of which he became editor in 1868. Bierce was soon the literary arbiter of the West Coast. "The Haunted Valley" (1871) was his first story. In December 1871 he married Mary Ellen Day, and from 1872 to 1875 the Bierces lived in England, where he wrote for the London magazines *Fun* and *Figaro*, edited the *Lantern* for the exiled French empress Eugé-

Bierce

nie, and published three books, *The Fiend's Delight* and *Nuggets and Dust Panned Out in California* (both 1872) and *Cobwebs from an Empty Skull* (1874).

In 1877 he became associate editor of the

San Francisco *Argonaut* but left it in 1879–80 for an unsuccessful try at placer mining in Rockerville in the Dakota Territory. Thereafter he was editor of the *San Francisco Wasp* for five years. In 1887 he joined the staff of William Randolph Hearst's *San Francisco Examiner*, for which he wrote the "Prattler" column. In 1896 Bierce moved to Washington, D.C., where he continued newspaper and magazine writing. In 1913, tired of American life, he went to Mexico, then in the middle of a revolution led by Pancho Villa. His end is a mystery, but a reasonable conjecture is that he was killed in the siege of Ojinaga in January 1914.

Bierce separated from his wife, lost his two sons, and broke many friendships. As a newspaper columnist, he specialized in critical attacks on amateur poets, clergymen, bores, dishonest politicians, money grabbers, pretenders, and frauds of all sorts. His principal books are *In the Midst of Life* (1891), which included some of his finest stories, such as "An Occurrence at Owl Creek Bridge," "A Horseman in the Sky," "The Eyes of the Panther," and "The Boarded Window"; *Can Such Things Be?* (1893), which included "The Damned Thing" and "Moxon's Master"; and *The Devil's Dictionary* (1906), a volume of ironic definitions, which has been often reprinted. His *Collected Works* was published in 12 volumes, 1909–12. *The Enlarged Devil's Dictionary*, edited by E.J. Hopkins, appeared in 1967.

bieri, wooden mortuary figure of the Fang tribe of Gabon, Africa, that traditionally guarded the skulls of deceased ancestors. These

figures were somewhat naturalistic, representing the ancestor whose skull was kept in a small, barrel-shaped bark container to which the figure was traditionally attached.

Because of the spiritual powers attributed to deceased ancestors, these mortuary figures were originally carved to protect the ancestor's bones from possession by evil spirits and to shield the tribesmen from unwittingly coming into contact with the skull's potentially dangerous powers. Through the aesthetic refinement of generations of sculptors, the *bieri* became figures of symbolic rather than spiritual significance.

Bierstadt, Albert (b. Jan. 7, 1830, near Düsseldorf, Westphalia [Germany]—d. Feb. 19, 1902, New York, N.Y., U.S.), American artist who painted landscapes and whose tremen-

dous popularity was based on his panoramic scenes of the American West. Among the last generation of painters associated with the Hudson River school, Bierstadt, like Frederick Church and Thomas Moran, covered vast distances in search of more exotic subject matter. His reputation was made by the huge canvases that resulted from his several trips to the Far West—e.g., “The Rocky Mountains” (1863; Metropolitan Museum of Art, New York City) and “Mount Corcoran” (c. 1875–77; Corcoran Gallery of Art, Washington, D.C.). Executed in his studio in New York, the large works do not have the freshness and spontaneity of the small on-the-spot paintings from which they were produced. They are, however, immense in scale and grandiose in effect. Bierstadt freely altered details of landscape to create the effect of awe and grandeur. His colours were applied more according to a formula than from observation: luscious, green vegetation, ice-blue water, and pale, atmospheric blue-green mountains. The progression from foreground to background was

your girl and take a twirl!” were given by a caller, but more enterprising dancers, singly or in couples, frequently improvised.

big-bang model, widely held theory of the evolution of the universe. Its essential feature is the emergence of the universe from a state of extremely high temperature and density—the so-called big bang that occurred at least 10,000,000,000 years ago. Although this type of universe was proposed by Alexander Friedmann and Abbé Georges Lemaître in the 1920s, the modern version was developed by George Gamow and colleagues in the 1940s.

The big-bang model is based on two assumptions. The first is that Einstein’s general theory of relativity correctly describes the gravitational interaction of all matter. The second assumption, called the cosmological principle, states that an observer’s view of the universe depends neither on the direction in which he looks nor on his location. This principle applies only to the large-scale properties of the universe, but it does imply that the universe has no edge, so that the big-bang origin occurred not at a particular point in space but rather throughout space at the same time. These two assumptions make it possible to calculate the history of the cosmos after a certain epoch called the Planck time. Scientists have yet to determine what prevailed before Planck time.

According to the big-bang model, the universe expanded rapidly from a highly compressed primordial state, which resulted in a significant decrease in density and temperature. Soon afterwards, the dominance of matter over antimatter (as observed today) may have been established by processes that also predict proton decay. During this stage many types of elementary particles may have been present. After a few seconds, the universe cooled enough to allow the formation of certain nuclei. The theory predicts that definite amounts of hydrogen, helium, and lithium were produced. Their abundances agree with what is observed today. About 1,000,000 years later the universe was sufficiently cool for atoms to form. The radiation that also filled the universe was then free to travel through space. This remnant of the early universe is the microwave background radiation (three degree background radiation) discovered in 1965 by Arno A. Penzias and Robert W. Wilson.

In addition to accounting for the presence of ordinary matter and radiation, the model predicts that the present universe should also be filled with neutrinos, fundamental particles with no mass or electric charge. The possibility exists that other relics from the early universe may eventually be discovered.

Big Belt Mountains, segment of the northern Rocky Mountains, paralleling the eastern bank of the Missouri River for about 80 mi (129 km) in west central Montana, U.S. Mt. Edith (9,504 ft [2,897 m]) is the highest point. Lying within a division of the Helena National

Forest, the area was the scene of much gold prospecting in the late 1860s. A prominent limestone belt encircles the mountains, hence their name.

Big Ben, tower clock famous for its accuracy and for its 13-ton bell, designed by Edmund Beckett, Baron Grimthorpe, and housed in

often a dramatic one without the softness and subtlety of a middle distance.

Bierut, Bolesław (b. April 18, 1892, Rury Jeziwickie, near Lublin, Poland—d. March 12, 1956, Moscow), statesman and Communist Party official who came to be called the Stalin of Poland after playing a major role in his party’s takeover of the Polish government after World War II.

Influenced by leftist-socialist ideas, Bierut joined the Polish Communist Party in 1918 and spent the rest of his life organizing and publicizing communist ideas in Poland as well as in Bulgaria, Czechoslovakia, and Austria. Arrested and imprisoned several times in the 1920s and 1930s for his activities in Poland, he went to Russia after his release in 1938 and remained there during most of World War II. He returned to Poland at the end of 1943. With the backing of Stalin and the Soviet Army, Bierut and his fellow Communists were able to dispose of all effective opposition by 1947, and he began his efforts to Sovietize all aspects of Polish life. Always a loyal follower of party directives from Moscow, Bierut, who had been president of the Polish republic from 1945, was instrumental in the 1948 deposition of Władysław Gomułka, the secretary of the Polish Workers’ Party, who had attempted to bend the Soviet party line to Polish circumstances. Bierut replaced him and reorganized the party to form the Polish United Workers Party (PZPR) in 1948. In 1952 he left the presidency to become premier, but resigned that post also in 1954. He was attending the Soviet Communist party’s 20th Congress in Moscow, at which Khrushchev presented his famous “Crimes of the Stalin Era” report, when he died.

big apple, 1930s square-dance version of the jitterbug that was named for the Columbia, S.C., club where it originated. Assembled in a large circle, dancers did a basic shuffling step or other jitterbug step like the lindy hop. Directions such as “right foot forward” or “get

cupies 1,252 square miles (3,243 square km). Named for a wide bend in the Rio Grande, which skirts its southern edge, it has magnificent mountain and desert scenery, deep canyons carved by the river, and spectacular geologic formations. There are more than 1,000 species of plants, including stunted oak, piñon pine, yucca, strawberry cactus, and creosote bushes. Wildlife includes coyotes, pumas, kit foxes, mule deer, and roadrunners.

Big Bertha, any of several 420-millimetre (16.5-inch) howitzers that were used by advancing German forces to batter the Belgian forts at Liège and Namur in August 1914, at the start of World War I.

The guns were designed and built by the firm of Krupp, Germany's largest armaments manufacturer, in the years before the war for the express purpose of overcoming modern forts built of reinforced concrete. The Big Berthas were the largest and most powerful artillery produced to that time. Each gun propelled a shell weighing 950 kg (2,100 pounds) for a distance of almost 14 km (9 miles). The shells were equipped with delayed-action fuses to explode after having penetrated a fortified target. The gun and its carriage, when fully assembled, weighed about 75 tons and was operated and serviced by a crew of about 280 men. For transport to the battlefield, the howitzer was disassembled and carried by train to Belgium. There the sections were hauled by tractor-driven wagons to the firing sites and reassembled. Big Berthas and Austrian Skoda 305-millimetre howitzers were used first on Aug. 12, 1914; they destroyed most of the forts around Liège in the next four days, thereby enabling the German army to sweep westward through southern Belgium and on to France.

In popular usage, the name Big Bertha was also applied to the extreme long-range cannons with which the Germans shelled Paris in 1918, but these guns are more properly known as Paris Guns.

Big Black River, Battle of (May 17, 1863), American Civil War victory of Union forces under General Ulysses S. Grant, who were pursuing Confederate troops under General John C. Pemberton toward Vicksburg, Miss. After his defeat at Champion's Hill (May 16), Pemberton left 5,000 troops to make a stand on both sides of the Big Black River, while he withdrew with his main command to nearby Vicksburg. Ten thousand attacking Union troops led by Grant routed the demoralized Confederate defenders, inflicting heavy losses and capturing over 1,700 prisoners. The survivors began a disorderly flight and retreated within the entrenched lines of Vicksburg, which was soon besieged by Grant's army.

Big Boy, one of the largest and most powerful types of steam locomotives ever built. Designed primarily to handle heavy freight traffic in the United States during World War II, 25 Big Boys were produced from 1941 to 1944 exclusively for the Union Pacific Railroad. They were gradually replaced by the diesel-electric locomotive; the last Big Boy was taken out of regular service in 1959.

The Big Boy along with its tender weighed about 604 tons and measured more than 40 m (132 feet) in length. It had a maximum power capacity of more than 6,000 horsepower and could exert 135,400 pounds of tractive force. It could haul a 3,600-ton train unassisted up a 1.14 percent grade and could achieve a speed of 112 km (70 miles) per hour pulling freight on level track. The Big Boy had an articulated design; the frame of the front engine was hinge-connected to the rear engine under a single boiler. Its wheel arrangement was designated 4-8-8-4—i.e., a set of 4 pilot wheels led a set of 8 coupled driving wheels, which were

compounded by another set of 8 coupled drivers, with 4 trailing wheels.

Big Cypress Swamp, large forest morass lying mainly in Collier county, southern Florida, U.S., and covering 2,400 square miles (6,200 square km). The region merges into the swampy Everglades on the east. It is dominated by cypress trees, and wildlife is abundant. Sunniland, a village in the swamp 40 miles (64 km) southeast of Fort Myers, was the site of the first oil wells in Florida. The Seminole Indians have reservations in the area, which is crossed west to east by the Everglades Parkway.

Big Dipper, The, constellation of the seven brightest stars of the larger constellation Ursa Major (*q.v.*).

big-eared bat: see long-eared bat.

big-eared fox: see bat-eared fox.

Big-Game Hunting Tradition, any of several ancient North American cultures based on hunting herd animals such as mammoth and bison; remains of these cultures have been found mainly in the North American Plains as well as in the eastern and southwestern regions of North America. The Big-Game Hunting Tradition may date from about 13,000 or 14,000 BC; it began to decline or change after 8000 BC. See also Clovis complex; Folsom complex.

Big Sandy River, river formed by the confluence of Levisa and Tug forks at Louisa, Lawrence county, eastern Kentucky, U.S. The river, made navigable by a series of locks and dams, flows generally north for 27 miles (43 km) along the Kentucky–West Virginia border to the Ohio River near Catlettsburg, Ky., where the three states, Kentucky, West Virginia, and Ohio, meet. The Breaks of Sandy—5 miles (8 km) of gorge and rapids—are on Russell Fork, a tributary of Big Sandy.

Big Sioux River, river rising in Grant county, north of Watertown, S.D., U.S. It flows south and southeast past Sioux Falls, where its 20-foot (6-metre) drop is utilized by a hydroelectric power station, and enters the Missouri River near Sioux City, Iowa, after a course of 420 miles (676 km). Between Sioux Falls and Sioux City the river forms the boundary for about 80 miles (129 km) between Iowa and South Dakota and between the corn- (maize-) growing region to the east and the cattle-raising region to the west. It is not navigable. Its main tributary is the Rock River.

Big Spring, city, seat (1882) of Howard county, western Texas, U.S., at the foot of the Cap Rock Escarpment, 111 miles (179 km) west-southwest of Abilene. It was named for the "big spring" in nearby Sulphur Draw, a frontier watering place and an area that was disputed between Comanche and Shawnee peoples. White settlement, based on cattle and homesteading, developed after the arrival of the Texas and Pacific Railway in 1881, and Big Spring became a railroad divisional point. Its growth accelerated after the discovery of oil in 1925. Refining and the production of petrochemicals and carbon black are basic to the economy. Pop. (2000) 25,233.

Big Stick Policy, in American history, policy popularized and named by President Theodore Roosevelt of asserting U.S. dominance when such dominance was considered the moral imperative.

Roosevelt's first noted public use of the phrase occurred when he advocated before Congress increased naval preparation to support the nation's diplomatic objectives. Taken from an African proverb, "Speak softly and carry a big stick; you will go far," the phrase was also used later by Roosevelt to explain his relations with domestic political leaders and his approach to such issues as the regulation of

monopolies and demands of trade unions. The phrase came to be automatically associated with Roosevelt and was frequently used by the press, especially in cartoons, to refer particularly to Roosevelt's foreign policy; in Latin America and the Caribbean, he enacted the Big Stick Policy (in foreign policy, also known as the Roosevelt Corollary to the Monroe Doctrine) to police the small debtor nations with unstable governments.

Big Stone Lake, source of the Minnesota River in the U.S., on the Minnesota–South Dakota border, 300 miles (480 km) west-northwest of Minneapolis. Once part of the southern outlet of the extinct glacial Lake Agassiz, its name comes from red granite outcrops in the vicinity. Its waters are impounded in a narrow spillway by the delta of the Whetstone River. The lake is 26 miles (42 km) long and 0.75 to 1.25 miles (1.2 to 2 km) wide, has an area of 17 square miles (44 square km), and at 962 feet (293 m) is the lowest point in South Dakota. Its level is raised by water diversion from the Whetstone River and regulated by a dam at its outlet near Ortonville. The lake is used as a storage reservoir for spring floodwaters, which otherwise might inundate the Minnesota River valley.

Big Sur, scenic region in western California, U.S., that comprises a 100-mile- (160-kilometre-) long, ruggedly beautiful stretch of seacoast along the Pacific Ocean. It extends southward from Carmel just south of Monterey (whence the name El Sur: "The South") to the Hearst Castle at San Simeon.

A winding, narrow, mountainous coastal road affords some spectacular views of the Pacific and the wayside wilderness areas of the Los Padres National Forest. The Pfeiffer–Big Sur State Park (821 acres [332 hectares] of coastal redwood and chaparral) contains the village of Big Sur (30 miles [48 km] south of Monterey) and borders the Big Sur River, a short stream in the Santa Lucia Range.

The area, now popular with tourists and naturalists, was once a bleak wilderness. The splendour of its scenery and the loneliness of its 19th-century homesteaders have been interpreted by Robinson Jeffers in such poems as *Women at Point Sur* (1927). The poet's home (which he built of local rock and stone) is one of the area's landmarks. In 1986 a comprehensive zoning plan was adopted by Monterey county authorities that severely limited commercial development along a 68-mile (109-kilometre) stretch of Big Sur's twisting and mountainous shoreline.

Big Ten Conference, formerly WESTERN INTERCOLLEGIATE CONFERENCE, one of the oldest college athletic conferences in the United States, formed in 1896 by the universities of Chicago, Illinois, Michigan, Minnesota, and Wisconsin and Purdue and Northwestern universities. The University of Iowa and Indiana University were added in 1899 and Ohio State in 1912. Chicago terminated its football program in 1939 and officially withdrew from the conference in 1946, and the conference did not again include 10 teams until Michigan State was added in 1949. Pennsylvania State University joined the Big Ten in 1990. The Big Ten traditionally has been one of the strongest football conferences in the nation. Together with the Pacific-10 Conference, the Big Ten also resisted the over-commercialization of college football by allowing only one member team to compete in a bowl game each year, a policy that stood until 1975. From 1947 to 2001, the Big Ten has sent a representative team, usually its conference champion, to the Rose Bowl, oldest of the postseason invitational events. This exclusive arrangement ended when the Rose Bowl, which became part of the Bowl Championship Series in 1998, hosted its first national championship game in January 2002. Competition among the

member schools now extends over a variety of sports for both men and women.

big tree (*Sequoiadendron giganteum*), also called GIANT SEQUOIA, or SIERRA REDWOOD (as distinct from the redwood of coastal areas, genus *Sequoia*), coniferous evergreen of the deciduous cypress family (Taxodiaceae), found in scattered groves on the western slopes of the Sierra Nevada Range of California at elevations between 900 and 2,600 m (3,000 and 8,500 feet). The big tree is the largest of all trees in bulk; once reputed as the oldest living thing, the largest stumps examined in tree-ring studies were found to be less than 4,000 years old (bristlecone pines are older).

Big tree (*Sequoiadendron giganteum*)
Grant Heilman

The big tree is distinguished from the coastal redwood by having uniformly scalelike, or awl-shaped, leaves that lie close against the branches, scaleless winter buds, and cones requiring two seasons to mature. The pyramidal tree shape, reddish brown furrowed bark, and drooping branches are common to both genera. The largest specimen is the General Sherman tree in Sequoia National Park. This tree measures 31 m (101.5 feet) in circumference at its base, is 83 m (272.4 feet) tall, and has a total estimated weight of 6,167 tons. A few specimens are more than 90 m (300 feet) high but have less bulk than the General Sherman tree. Although several groves of big trees were cut, the big tree's lumber is more brittle than that of the redwood; since the lumber is less desirable, it has been easier to save the big trees from destruction. Most of the 70 distinct groves are now under the protection of state or national forests or parks.

Big Twelve Conference, original name BIG SIX CONFERENCE, American collegiate athletic organization, composed of the universities of Kansas, Nebraska, Oklahoma, Colorado, Texas, and Missouri, as well as Kansas State, Oklahoma State, Iowa State, Baylor, Texas A & M, and Texas Tech universities. Kansas, Nebraska, Oklahoma, Missouri, Iowa State, and Kansas State had been members of the Missouri Valley Conference (formed in 1907) but split in 1928 to form the Big Six Conference. It became the Big Seven when Colorado joined the conference in 1948, and the Big Eight in 1959, when Oklahoma State was added. The conference grew in 1996, when four Texas universities left the Southwest Conference.

Bigelow, Erastus Brigham (b. April 2, 1814, West Boylston, Mass., U.S.—d. Dec. 6, 1879, Boston, Mass.), American industrialist, noted as the developer of the power carpet loom and as a founder of the Massachusetts Institute of Technology (MIT).

From age 10, Bigelow was obliged to work

and to forgo a formal education. At the age of 23 he invented his first loom for lace manufacture. Bigelow followed this with other power looms for weaving a variety of figured fabrics, tapestry carpeting, and ingrain carpeting. In 1843 he and his brother Horatio established a gingham mill, around which the town of Clinton, Mass., grew. Several years later, he founded the Bigelow carpet mills there. From 1845 to 1851 Bigelow developed his greatest invention, a power loom for the manufacture of Brussels and Wilton carpets. His inventions provided a large impetus to carpet manufacture in Europe as well as in the United States.

In two authoritative works on economics (1862 and 1877), Bigelow defended protective tariffs. He was a leading member of a committee appointed in 1861 to implement proposals that led to the establishment of MIT.

Bigelow, John (b. Nov. 25, 1817, Bristol, N.Y., U.S.—d. Dec. 19, 1911, New York, N.Y.), American author, journalist, and diplomat who was the discoverer and first editor of Benjamin Franklin's long-lost *Autobiography*. As U.S. consul in Paris during the American Civil War, he also prevented the delivery of warships constructed in France for the Confederacy.

Called to the New York bar in 1838, Bigelow was managing editor and, with the poet William Cullen Bryant, part owner of the *New York Evening Post* (1849–61). In the election campaign of 1856 he was a principal adviser of the Republican Party's first presidential candidate, John Charles Frémont.

John Bigelow
By courtesy of the Library of Congress, Washington, D.C.

Appointed consul in Paris (1861), Bigelow adroitly gained support for the Union cause, emphasizing ideological considerations to the French liberal press and the trading potential of the Northern industrial states to French businessmen. In *France and the Confederate Navy, 1862–1868* (1888), he recounted the episode of the French-built warships, which, if manned by Confederate crews, might have broken the Union blockade of the South. As U.S. minister to France (April 1865–September 1866), he dealt tactfully with the problem of the French-backed Mexican empire of Maximilian.

While living in Paris, Bigelow found and edited (1868) a manuscript of Franklin's *Autobiography*; he later edited Franklin's complete works, 10 vol. (1887–88). He also wrote a biography of U.S. presidential candidate Samuel Jones Tilden (1895) and several works on the theology of Emanuel Swedenborg.

bigeye, any of about 18 species of marine fishes comprising the family Priacanthidae (order Perciformes). Some members of the family are also known as catalufas. Most bigeyes are bright red in colour, but many species can change from a pale hue to a deep, mottled shade. Most have large round eyes. Representatives of the family are found in tropical and subtropical marine environments in all of the major oceans. Most species are carnivorous and nocturnal. In the Atlantic the com-

mon bigeye (*Priacanthus arenatus*) attains a length of about 41 cm (16 inches). The glass-eye snapper (*P. cruentatus*), also called the catalufa, about 30 cm long, is found in both the Atlantic and Pacific. The popeye catalufa (*Pristigenys serrula*) is a Pacific ocean species.

Biggs, E. Power, in full EDWARD GEORGE POWER BIGGS (b. March 29, 1906, West-cliff-on-Sea, Essex, Eng.—d. March 10, 1977, Boston, Mass., U.S.), English-born American organist who brought to many listeners their first acquaintance with the distinctive, incisive colours of the Baroque organ and with the monumental Baroque organ repertoire.

Biggs, after training at the Royal Academy of Music in London, settled in the United States in 1930. Through appearances with major orchestras and weekly radio broadcasts (1942–58), he established the organ as a concert instrument. Refusing to perform on electronic organs, he sought out and recorded on organs surviving from the era of Johann Sebastian Bach and George Frideric Handel. He also commissioned organ works by Walter Piston, Roy Harris, and other 20th-century composers. After arthritis forced him to retire, he published editions of early organ music. His playing was marked by a classical clarity and severity.

bighorn, also called MOUNTAIN SHEEP, either of two similar North American sheep: the Canadian bighorn (*Ovis canadensis*) and the Dall sheep (*O. dalli*), both belonging to the family Bovidae (order Artiodactyla). The bighorn's body is compact and muscular; the muzzle, narrow and pointed; the ears, short and pointed; the tail, very short. Both sexes have transversely ribbed horns that, in the male, may curve in a spiral more than 1 m (39 inches) long on the outer curvature. The fur is deerlike and usually a shade of brown with a whitish rump patch; in the Dall sheep it varies from white to almost black. Height at the shoulder is about 1 m; the weight of rams reaches about 90 kg (200 pounds) in the Dall sheep, 155 kg in the Canadian bighorn.

Bighorn live in the remote crags and cliffs of mountainous areas. Formerly, the Canadian bighorn ranged from northern Mexico to Canada, but it is now reduced to small bands protected by inaccessible habitat or by refuges. Dall sheep range from Alaska to British Columbia.

Bighorn feed mainly on grasses, but in the desert mountains of the Southwest they eat shrubs and even cacti. Surefooted, they leap easily from rock to rock and climb seemingly sheer cliffs. The cloven hooves are sharp-edged, elastic, and concave. Bighorn breed in November and December, the rams battling

Canadian bighorn sheep (*Ovis canadensis*)
Harry Engels—The National Audubon Society Collection/Photo Researchers

for possession of the ewes. One or sometimes two lambs are born after six months' gesta-

tion. Bighorn are gregarious, but in summer the rams live apart from the ewes and lambs.

Bighorn Mountains, range of the northern Rocky Mountains in southern Montana, U.S., extending southeastward in an anticlinal arch across north-central Wyoming for 120 miles (193 km). Varying in width between 30 and 50 miles (50 and 80 km), the mountains rise abruptly 4,000 to 5,000 feet (1,200 to 1,500 m) above the surrounding Great Plains and Bighorn Basin. Their average height is 8,000 to 13,000 feet (2,400 to 4,000 m), with the highest point being Cloud Peak (13,165 feet [4,013 m]) in Wyoming. In addition to the unique geologic formations, the scenic beauty of the mountain slopes is enhanced by the pine, fir, and spruce of the Bighorn National Forest. Hunting, camping, and fishing are popular in the area. The Powder River rises in several headstreams in the southern foothills. On Medicine Mountain is

Yellowtail Reservoir area in the Bighorn Mountains, southern Montana

Roger and Joy Spurr—Bruce Coleman Inc

the "Medicine Wheel," a prehistoric relic constructed of rough stones laid side by side, forming a circle 70 feet (20 m) in diameter with 28 spokes leading from the centre hub, which is about 12 feet (3.5 m) in diameter.

Bighorn River, largest tributary of the Yellowstone River, draining west-central Wyoming and a small area of south-central Montana, U.S. Topographically, it includes three subbasins, known in downstream order as the Wind River in Wyoming, the Big Horn in Wyoming and Montana, and the Lower Big Horn in Montana.

Wind River, master stream of the upper basin, originates in the high areas of the Wind River and Absaroka Mountains in northwestern Wyoming. Flowing southeastward to a lowland area in west-central Wyoming, it is joined by the Popo Agie River and Little Wind rivers near Riverton. Turning north, it passes out of the upper basin through Wind River Canyon, a deep, spectacular gorge through the Owl Creek Mountains. Boysen Dam is located in the southern section of the canyon. North of the canyon the stream becomes the Bighorn River. Continuing northward it flows through the Big Horn Basin—collecting its two principal tributaries, the Greybull and Shoshone rivers—to the Wyoming-Montana boundary, where it turns northeastward through Bighorn Canyon to cross the Lower Big Horn Basin and empty into the Yellowstone River at Bighorn, Mont., after a course of 461 miles (742 km).

There are major irrigation projects on the river at Riverton and Bighorn. The Little Bighorn River, site of the Custer Battlefield National Monument, joins the main stream at Hardin, Mont. The Bighorn Canyon National Recreation Area stretches along Bighorn Canyon on both sides of the border.

Bignoniaceae, the trumpet creeper or catalpa family of the figwort order of flowering plants (Scrophulariales). It contains about 112 genera

African tulip tree (*Spathodea campanulata*)

W.H. Hodges

and more than 725 species of trees, shrubs, and, most commonly, vines, chiefly of tropical America, tropical Africa, and the Indo-Malayan region. They form an important part of the tropical forest vegetation because of the numerous climbing vines. A few are found in temperate regions, notably the catalpa tree (*Catalpa*), the trumpet creeper (*Campsis*), and the cross vine (*Bignonia*).

The family is characterized by oppositely paired, usually compound leaves and bell- or funnel-shaped, bisexual flowers having a five-lobed calyx and corolla; two long and two short stamens arising from the corolla tube; and a pistil positioned above the attachment point of the other flower parts, on a disk, and consisting of two fused, ovule-bearing carpels enclosing two, or rarely one, chambers that contain many ovules attached along the central axis. The seeds are usually flat and winged.

Among the important ornamental and useful members are the African tulip tree (*Spathodea*), calabash tree (*Crescentia cujete*), sausage tree (*Kigelia pinnata*), trumpet creeper (*Campsis*), cross vine (*Bignonia capreolata*), cat's claw (*Doxantha unguis-cati*), the timber-producing West Indian boxwood (*Tabebuia*), jacaranda (*Jacaranda*), empress tree (*Paulownia*), flowering willow (*Chilopsis*), and Cape honeysuckle (*Tecomaria capensis*).

Biggsby, John Jeremiah (b. Aug. 14, 1792, Nottingham, Nottinghamshire, Eng.—d. Feb. 10, 1881, London), English physician and geologist whose extensive geologic studies of Canada and New York revealed much of the structure of the underlying rock strata and uncovered many new species of prehistoric life.

Biggsby studied at the University of Edinburgh (M.D., 1814). After moving to Canada in 1818, he was appointed to report on the geology of Upper Canada the following year. He served as British secretary and medical officer to the Canadian International Boundary Commission from 1822 until he returned to England in 1827. He then practiced medicine in Newark, Essex, until 1846 and in London until 1881. His works include *Thesaurus Siluricus* (1868) and *Thesaurus Devonico-Carboniferus* (1878). In 1877 he established the Biggsby Medal of the Geological Society of London to be awarded biennially to geologists under 46 years of age.

Bihać, town, northwestern Bosnia and Herzegovina, located on the banks of the Una River. First mentioned in 1260 as the site of an abbey, it was occupied by the Turks and became part of Bosnia in 1878. In 1942 the Bihać Republic became briefly a free territory. During World War II Bihać was also the headquarters of the general staff of the National Army of Liberation and the site of the first session of the war parliament of Yugoslavia (AVNOJ, or Anti-Fascist Council of National Liberation of Yugoslavia) in November 1942. The town was the scene of heavy fighting between Bosnian government forces and Serbian

militias following Bosnia's secession from Yugoslavia in 1991.

The modern economic activities of Bihać revolve around the timber and textile industries. It is a rail and market centre and has a hydroelectric plant. Pop. (1991) 45,995.

Bihār (city, India): see Bihār Sharif.

Bihār and Jharkhand, constituent states of India, lying in the northeastern part of the country. In 2000 the state of Jharkhand was carved from Bihār's southern districts. Bihār is bounded to the north by Nepal and, in India, to the east by West Bengal, to the south by Jharkhand, and to the west by Uttar Pradesh. Its capital is Patna. Jharkhand is bounded to the north by Bihār, to the east by West Bengal, to the south by Orissa, and to the west by Chhattisgarh and Uttar Pradesh. Its capital is Rānchi. Area Bihār, 38,301 square miles (99,200 square km); Jharkhand, 28,833 square miles (74,677 square km). Pop. (2001 prelim.) Bihār, 82,878,796; Jharkhand, 26,909,428.

A brief treatment of Bihār and Jharkhand follows. For full treatment, see MACROPAEDIA: India.

The states of Bihār and Jharkhand roughly correspond to the ancient kingdoms of Videha, north of the Ganges River, and Magadha, south of the river. The political supremacy of the Magadha kingdom, founded in the 6th century BC, persisted under the Nanda dynasty (4th century BC) and the Mauryan dynasty (4th–2nd century BC) and, after a decline, resurged under the Guptas (4th–5th century AD). Muslim occupation ensued in the early 13th century and lasted more than 500 years.

Under British domination from the 1760s, the region was the scene of several revolts, notably the Santhāl rebellion of 1855 (an important prelude to the Indian Mutiny in 1857) and Mohandas Gandhi's nonviolent movement in Champāran district (Bihār) in 1917 protesting the exploitation of Indian peasants by local European indigo planters. Bihār was constituted a separate province of British India in 1936. Upon Indian independence in 1947 the province became a state of the new country. Calls for establishing a separate state to be created from Bihār's southern districts date from that time and led to the creation of Jharkhand in 2000.

Physiographically, Bihār encompasses the middle Gangetic Plain, which is bisected by the Ganges River and consists of new alluvium. The gently sloping plain lies mostly below 250 feet (75 m) in elevation and is susceptible to large-scale flooding during the rainy season, but its extremely fertile soils support a dense agricultural population. Both states are prone to violent seismic activity, but the most severe earthquakes were recorded in the northern part of the Gangetic Plain in 1934 and 1988.

Jharkhand is situated at a notably higher elevation and is spread across the Chota Nāgpur Plateau, the main foundation of which dates to Precambrian time (more than 540 million years ago). The plateau lies mostly above 500 feet (150 m) in elevation, and its highest point is the granite peak of Parasnāth—at 4,477 feet (1,365 m)—in Hazārībāg.

Both states experience a subtropical monsoon climate, with three well-defined seasons: the cool season, from November to February; the hot season, from March to mid-June; and the rainy season, from mid-June through October. Jharkhand experiences somewhat greater moisture, although both states receive about 50 inches (1,270 mm) of precipitation annually. Both states experience mild temperature extremes (Jharkhand's averages being somewhat warmer). December and January temperatures fall to 41° F (5° C) and below, while those in May rise above 104° F (40° C).

Hindi is the most prevalent language in both states, but other languages are widely spoken, including Santhālī—the most common tribal

language in Jharkhand—and the Bihārī languages (*q.v.*). Urdū and Bengali are spoken in both states. Slightly fewer than half of Bihār's inhabitants and slightly more than half of Jharkhand's are literate. The predominant religion of both states is Hinduism, accounting for more than four-fifths of the aggregate population. Most others practice Islām, although Christianity and tribal religions are also observed.

Despite its reduced area following the creation of Jharkhand, Bihār remains one of the most populous states of India. Only about one-tenth of Bihār's population lived in urban areas in the early 21st century, making the state one of the least urbanized in India. Half of all workers in Bihār are engaged in agriculture, and nearly half of the state's area is cultivated. Rice is the principal crop, followed by wheat, millet, lentils, oilseed, sugarcane, potatoes, and cotton. Irrigation is widespread during the dry season. The middle Gangetic Plain has numerous sugar, cotton, and rice mills. Dālmianagar is a centre for the production of cement, asbestos, chemicals, sugar, paper, and plywood, and Barauni has a petrochemical complex.

Although Jharkhand's population is also largely rural (about 80 percent), it has a much lower population density. Roughly 30 percent of workers engage in agriculture. Mining is a major employer, and the Chota Nāgpur region yields more than one-third of India's annual mineral production, the most of any state or union territory. Most of this output, by value, derives from coal; other minerals are pyrite, mica, bauxite, fireclay, and iron ore. Chota Nāgpur is also the principal location of Jharkhand's manufacturing industries: iron and steel in Jamsheḍpur and Bokāro, heavy engineering in Rānchi, and coal-based fertilizers and chemicals in Sindri. Both states are well serviced by road and rail networks.

Bihār's state legislature is bicameral. The upper house gains its members through indirect election and by gubernatorial nomination; the more powerful lower house is elected by direct adult franchise. The president of India appoints the governor, but real executive authority lies with the chief minister, who is elected by the upper house. Administratively, Bihār is divided into 37 districts.

Jharkhand has a unicameral legislature, and, like its northern neighbour, the governor is appointed by the federal president, with the chief minister exercising executive authority. Jharkhand is divided into 18 districts. The judiciary in both states is separate from the executive-legislative branch.

Both states offer an educational system with 10 years of basic schooling, a two-year precollege program, and three years of college. In Bihār, the universities at Patna, Darbhanga, Muzaffarpur, Bhāgalpur, and Buddh Gaya have medical colleges and there are engineering colleges at Patna and Bhāgalpur. In Jharkhand there are a number of technical and engineering colleges, including those located at Sindri and Dhanbad. Most other institutes of higher education are located in Rānchi.

Bihārī culture is based largely on ancient Aryan Hindu elements. Places of religious and cultural interest abound in the plains. Nālanda is the seat of the ancient and celebrated Nālanda Buddhist monastic university. Pawapuri is the place where Mahāvira, the founder of Jainism, attained nirvana. Gaya is an important place of Hindu pilgrimage, and nearby Buddh Gaya (Bodh Gaya), where the Buddha attained Enlightenment, is one of Buddhism's holiest sites.

Annual religious festivals remain an important part of village life in both states. In Jharkhand, rural Chota Nāgpur has retained much of its aboriginal way of life, and a series of 24 Jain temples atop Mount Parasnāth are a major site of pilgrimage.

Bihār Sharīf, also spelled BIHĀRSHARIF, also called BIHĀR, city, central Bihār state, north-eastern India, east of the Paimār River, a tributary of the Ganges. It served as the capital of the Pāla dynasty (10th century AD) and contains a 5th-century-AD Gupta pillar and several Muslim mosques and tombs. Nearby lie the remains of Odantapuri (*q.v.*), a great *vihāra*, or college of Buddhist learning, from which the name Bihār was derived. In 1869 it was constituted a municipality. The city is now a road and rail hub, as well as an agricultural-trade centre. It has several colleges affiliated with Magadh University at Buddh Gaya. Pop. (2001 prelim.) 231,972.

Bihārī languages, eastern Indo-Aryan languages spoken in the states of Bihār and Jharkhand in India, and in the Tarai region of Nepal. There are three main languages: Maithilī (Tirhutī) and Maghī in the east and Bhojpūrī in the west, extending into the southern half of Chota Nāgpur. Maithilī, spoken in the old country of Mithilā (Tirhut), was famous from ancient times for its use among scholars, and it still retains many antiquated linguistic forms. It is the only Bihārī dialect with any real literature and has been the object of increasing interest since 1947. Maghī is considered the modern representative of the Magadhī Prakrit. The Bihārī languages are linguistically related to Bengali but are culturally identified with Hindi.

Bihor, *județ* (county), western Romania, bounded on the west by Hungary. It was formerly included in feudal Transylvania. The oak- and beech-covered Western Carpathians, including the Apuseni Mountains, rise above settlement areas in intermontane valleys and lowlands. The Crișu Negru River and its tributaries flow westward, draining the region. Oradea, the county seat, has industries that produce machinery, chemicals, textiles, and footwear. Wood products are manufactured in Tileagd and Ioaniș towns, and bricks are produced in Aleșd town. A hydroelectric plant operates on the Crișu Repede River near Aleșd. Bauxite mines are worked near Roșia and Zece Hotare, and Beiuș, a textile centre, is known for its red and black pottery. Băile 1 Mai and Băile Victoria are thermal resorts. Karst formations in the Apuseni Mountains include underground streams and caverns. Oradea is a centre for air, highway, and rail connections. Area 2,909 square miles (7,535 square km). Pop. (1997 est.) 625,596.

Bihor Massif, Romanian MUNȚII BIHORULUI, mountain massif, the highest part of the Apuseni Mountains, part of the Western Carpathians, western Romania. It is roughly 16 miles (25 km) long from northwest to southeast and 9 miles (14 km) wide. The summit is almost smooth, broken by a few peaks of harder rock. Curcubăta Mare, at 6,066 feet (1,849 m), is the highest point. A northern extension, Vlădeasa, is a volcanic range reaching 6,023 feet (1,836 m), which spawns the Crișu Repede and the Someșu Cald rivers.

Biisk (Russia): *see* Biysk.

Bijagós Islands, Bijagós also spelled BISSAGOS, Portuguese ARQUIPÉLAGO DOS BIJAGÓS, islands of Guinea-Bissau, 30 miles (48 km) off the Guinea coast of western Africa. They compose an archipelago of 15 main islands, among which are Caravela, Carache, Formosa, Uno, Orango, Orangozinho, Bubaque, and Roxa. They are covered with a lush vegetation and have sandy beaches, and their principal cash crops are palm products. Pop. (1991) 26,691.

Bijāpur, city, northern Karnāṭaka (formerly Mysore) state, southern India. An important site of medieval Indian Islāmīc architecture, it was formerly called Vijayapura (meaning "city of victory") and was an important community under the Yādava dynasty for more than a century until 1294, when it became a provin-

cial capital of the Bahmanī. In 1489 with the advent of Yūsuf 'Adil Shāh, the first 'Adil Shāhī sultan, its dominions grew to include

Tomb of Göl Gumbaz, Bijāpur, Karnāṭaka, India
Mitt and Joan Mann—CAMERAMANN INTERNATIONAL

Goa, where a navy was maintained. Although defeated (1686) by the Mughal emperor Aurangzeb, the 'Adil Shāhī dynasty left a legacy of outstanding Islāmīc buildings, aesthetically the most satisfactory of the Deccan styles, including the domed tomb of Göl Gumbaz and the mausoleum of Ibrāhīm Rawza.

The modern city has major road and rail facilities and an expanding tourist economy. Industries include cotton ginning, oilseed milling, and the related manufacture of soap, chemicals, and dyes. Bijāpur's colleges of commerce, science, and arts are affiliated with Karnāṭak University in Hubli-Dhārward. Pop. (2001 prelim.) 245,946.

Bijār carpet, floor covering handwoven by Kurds in the vicinity of the village of Bijār in

Bijār carpet from Iran, 20th century; in the possession of Neshan G. Hintlian, Washington, D.C.

In possession of Neshan G. Hintlian, Washington, D.C. photograph Otto E. Nelson

western Iran. The carpets are known for their weight, sturdiness, and remarkable stiffness and resistance to folding. Woven on a woolen foundation, in the Ghiordes knot, these carpets are said to be double warped. This refers to the way the warps are strung closely together, and alternate weft shoots are pulled so tight that the warp lies on two levels, one almost precisely behind the other. This is also a Kerman characteristic and may have been borrowed from that centre.

Many Bijār carpets have clumsy medallion decorative schemes in which the medallion and corners are ornamented but the balance of the field remains a solid red. Other examples show repeat patterns, including the ubiquitous *herāti*, in which a diamond lattice peeps through a tangle of roses. From Bijār come a remarkable number of *vāgīrehs*, weavers' samples, used as models for large carpets, that show portions of several patterns and borders.

Bijnor, city, northwestern Uttar Pradesh state, northern India. It lies near the Ganges River, northeast of Delhi, with which it is linked by road and rail. A trade centre for agricultural products, Bijnor is also noted for thread manufacturing. It was ceded to the British East India Company in 1801. Pop. (1991) 66,486.

Bijsk (Russia): see *Biysk*.

Bikaner, city, north-central Rājasthān state, northwestern India. It lies 240 miles (386 km) west of Delhi.

The city was the capital of the former princely state of Bikaner. About 1465 Bika, a Rājput chieftain of the Rathor clan, began to conquer the area from other Rājput clans. In 1488 he began building the city of Bikaner ("the settlement of Bika"). He died in 1504, and his successors gradually extended their possessions. The state adhered loyally to the Mughal emperors, who ruled in Delhi from 1526 to 1857. Rai Singh, who succeeded as chieftain of Bikaner in 1571, became one of the emperor Akbar's most distinguished generals and was named the first raja of Bikaner. As Mughal dominance ebbed, wars between Bikaner and the princely state of Jodhpur raged intermittently in the 18th century. A treaty establishing British paramountcy was concluded in

Camel Corps passing by the royal tombs at Bikaner, Rājasthān, India

John Lewis Stage—Photo Researchers

1818, and order was restored in the country by British troops. The rebellious behaviour of the local *thakurs*, or subsidiary chiefs, continued, however, until the princely state was made subject to the Rājputāna agency in 1883. The state's military force included the Bikaner Camel Corps, which gained renown in China during the Boxer Rebellion (1900) and in the Middle East during World War I. In 1949 Bikaner, which by then totaled more than 23,000 square miles (60,000 square km) in area, became part of the Indian state of Rājasthān and was divided into three districts.

The old part of Bikaner city is surrounded by

a stone wall that is 15–30 feet (5–9 m) high and has five gates. Bikaner is now a trade centre for wool, hides, building stone, salt, and grain. Bikaneri woolen shawls, blankets, carpets, and sugar candy are famous, and there are also ivory and lacquerware handicrafts. The city has engineering works, railway workshops, and factories that manufacture glass, pottery, felts, chemicals, shoes, and cigarettes. The old part of the city is overlooked by a fort and has numerous buildings of bright red and yellow sandstone. Within the fort are several palaces of different periods, a museum housing Rājput miniature paintings, and a library of Sanskrit and Persian manuscripts. The city's colleges (including a medical school and a teachers' training institute) are affiliated with the University of Rājasthān.

Bikaner is situated in an arid tract of undulating sand hills where the breeding of camels, horses, and sheep is the principal occupation. Because there are no rivers, irrigation is chiefly by means of deep tube wells. Bajra (pearl millet), jowar (sorghum), and pulses are the chief crops. Pop. (1991) 416,289.

Bikini, an atoll in the Ralik (western) chain of the Marshall Islands in the central Pacific Ocean. The atoll was used for experimental peacetime atomic explosions by the United States between 1946 and 1958.

Lying north of the equator, Bikini is 225 miles (360 km) northwest of Kwajalein and 190 miles (305 km) east of Enewetak Atoll. It consists of a ring of about 20 small coral islands whose average elevation is only some 7 feet (2.1 m) above low tide level. The area of the group amounts to little more than 2 square miles (5 square km) of dry land, distributed about the edges of an oval lagoon 25 miles (40 km) long and 15 miles (24 km) wide. The largest islands are Bikini and Enyu (or Eneu). The atoll was known before World War II as Escholtz Atoll. It was administered by the United States from 1947 as part of the U.S. Trust Territory of the Pacific Islands under a United Nations trusteeship until it became part of the Republic of the Marshall Islands in 1979.

After Japan had been driven from the Marshall Islands in 1944, the islands and atolls, Bikini among them, came under the administration of the U.S. Navy. In 1946 Bikini became the site of Operation Crossroads, a vast military-scientific experiment to determine the impact of atomic bombs on naval vessels. The tests made it necessary to first relocate the atoll's 166 native Micronesians to Rongerik and then to Kili Island, about 500 miles (800 km) southeast of Bikini. The world's first peacetime atomic-weapons test was conducted at Bikini on July 1, 1946. A 20-kiloton atomic bomb was dropped from an airplane and exploded in the air over a fleet of about 80 obsolete World War II naval vessels, among them battleships and aircraft carriers, all of them unmanned. The second test, on July 25, was the world's first underwater atomic explosion; it raised an enormous column of radioactive water that sank nine ships. Further tests, some of them thermonuclear, were conducted from 1954 to 1958, when Bikini, together with Enewetak Atoll, constituted the Pacific Proving Ground of the United States Atomic Energy Commission. In 1956 Bikini was the test site of the first hydrogen bomb dropped by a U.S. airplane.

The atoll suffered serious radioactive contamination from these tests. In 1969 the U.S. government began work on a long-range project to reclaim the land and, ultimately, to repatriate the Bikinian population. Some native islanders began returning to Bikini in the late 1960s, but they had to be moved back to Kili in 1978 when it became clear that radioactivity levels at Bikini were still dangerously high. In 1985, in response to a lawsuit filed by Bikini islanders, the U.S. government

agreed to fund a cleanup of the island chain. Work began in 1991, and the first cleanup project was completed in 1998. However, radiation levels were still considered too high to allow resettlement, although they were deemed low enough to permit tourism on the atoll. In 1996 it was opened for scuba diving among the lagoon's sunken warships, and sport fishing began two years later.

Biko, Stephen, in full BANTU STEPHEN BIKO (b. Dec. 18, 1946, King William's Town, S.A.F.—d. Sept. 12, 1977, Pretoria), founder of South Africa's Black Consciousness Movement. His death while in police custody made him an international martyr for South African black nationalism.

After being expelled from high school for political activism, Biko enrolled in and graduated (1966) from St. Francis College, a liberal boarding school in Natal, and then entered the University of Natal Medical School. There he became involved in the multiracial National Union of South African Students (NUSAS), a moderate organization that had long espoused the rights of blacks. He soon grew disenchanting with NUSAS, believing that instead of simply allowing blacks to participate in white South African society, the society itself needed to be restructured around the culture of the black majority. In 1968 he cofounded the all-black South African Students' Organization (SASO) and became its first president the following year. SASO was organized around the philosophy of black consciousness, which encouraged blacks to recognize their inherent dignity and self-worth. In the 1970s the Black Consciousness Movement spread from university campuses into urban black communities throughout South Africa.

Biko drew official censure when he and other SASO members were banned in 1973, restricting their associations, movements, and public statements. He then operated covertly, establishing the Zimele Trust Fund in 1975 to help political prisoners and their families. He was arrested four times over the next two years and held without trial for months at a time. On Aug. 18, 1977, he and a fellow activist were seized at a roadblock and jailed in Port Elizabeth. Biko was found naked and shackled outside of a hospital in Pretoria, 740 miles (1,190 km) away, on September 11 and died the next day of a massive brain hemorrhage.

Police initially denied any maltreatment of Biko; it was later determined that he had probably been severely beaten while in custody, but the officers involved were cleared of wrongdoing. In 1997 five former police officers confessed to having killed Biko, but in 1999 they were refused amnesty by the Truth and Reconciliation Commission, a body convened to review atrocities committed during the apartheid years. Donald Woods, *Biko* (1977; 3rd rev. ed., 1991), depicts his friendship with Biko, and their relationship is portrayed in the film *Cry Freedom* (1987).

Bikol (people): see *Bicol*.

Bila Tserkva, Russian BELAYA TSERKOV, city, Kiev oblast (province), north-central Ukraine, on the Ros River. Founded in the 11th century, Bila Tserkva ("White Church") long remained a minor regional centre. In modern times industry has developed, including machine building, tire production, furniture making, canning, flour milling, and the making of knitwear. A feature of the city is its large park, landscaped in the 18th century and containing many exotic botanical species. The city has an agricultural institute. Pop. (1998 est.) 215,200.

Bilāspur, also called KAHLUR, city, southern Himāchal Pradesh state, northwestern India. The city lies on the edge of Govind Sāgar, an artificial lake northwest of Simla, the state capital. Bilāspur was the capital of an independent Punjab Hill State until 1814, when

the Gurkhas overran it; the British drove them out the following year. It is a trade centre for locally grown wheat, corn (maize), and rice. Pop. (1991) 10,609.

Bilāspur, city, Chhattisgarh state, central India, lying just west of the Arpa River. Bilāspur was the capital of a Goṇḍ kingdom until captured by the Marāṭhās in the 18th century. Just north lies Ratanpur, an ancient Hindu capital of the Haihaya dynasty of Chhattisgarh; its ruins date from the 8th century AD. A major rail junction with extensive workshops, Bilāspur has agricultural trade and is a centre of rice and flour milling, sawmilling, and the manufacture of shellac. Bilāspur was constituted a municipality in 1867 and has a musical academy and several colleges affiliated with Ravishankar University. Pop. (1991) city, 179,833; urban agglomeration, 229,615.

Bilbao, port city, capital of Biscay (Vizcaya, or Biskaia) provincia, in the *comunidad autónoma* ("autonomous community") of the Basque Country, northern Spain. Bilbao lies along the Nervión River, (Ría de Bilbao), 7 miles (11 km) inland from the Bay of Biscay. It is the largest city in the Basque Country.

Bilbao originated as a settlement of seafaring people on the banks of the Nervión's estuary. They exported the iron ore found in large quantities along the river's eastern bank and the products of their ironworks, which became well known in Europe. Don Diego López de Haro, lord of Biscay, in 1300 gave the city a charter and privilege of self-government in an independent municipality. Bilbao's port was also a centre for the export of wool from Burgos, in the interior of Castile, to Flanders. In 1511 the city obtained the right to its own commercial tribunal that could issue laws in the form of ordinances. The last of these, promulgated in 1737, formed the basis of the first Spanish commercial code in 1829. In the 18th century Bilbao derived great prosperity from trade with the American colonies of Spain. The city was sacked by French troops in the Peninsular War (1808) and besieged four times during the Carlist Wars. These struggles produced a strong communal spirit that after 1874 directed itself toward industrialization.

Bilbao is the most important port in Spain. It also has one of the nation's largest concentrations of metallurgical industries, which arose in the 19th century based on the exploitation of the local iron ore deposits. Bilbao also produces industrial and railway equipment, aeronautical equipment, automobiles, chemicals, hand and machine tools, tires, and paper and is a financial centre. Tourism and services are growing in importance since the decline of steel and shipbuilding in the 1960s and '70s. Fishing still contributes to the economy.

The old part of Bilbao (Casco Viejo) lies on the eastern bank of the Nervión River, its nucleus being formed by the Siete Calles ("Seven Streets"), a series of parallel streets leading to the riverbank. The old city's notable landmarks include the Gothic-style Cathedral of Santiago (14th century), the Plaza Nueva (late 19th century), and the churches of San Antón, Santos Juanes, and San Nicolás. Several towns on the west bank of the river were annexed after 1890, forming the modern extension of the city. This section is a banking and commercial centre and is the site of government offices. Nine bridges cross the Nervión to link the old and new parts of the city. Institutions of higher education include the University of Deusto (1886) and the University of the Basque Country (1968). The city began to recover from its decline in 1997 with the opening of the Guggenheim Museum Bilbao, designed by American architect Frank Gehry in curving, titanium-clad shapes. Other city redevelopment projects include a subway system, upgrading of the airport and harbour, construction of a conference centre and concert hall (1999; home of the Bilbao Symphony

Orchestra), cleanup of the river, and waterfront development near the Guggenheim, replacing former shipyards with a cultural and business centre. There are museums devoted to fine arts, religious art, bullfighting, and Basque culture and history. Pop. (1998 est.) 358,467.

Bilbays, also spelled BILBEIS, or BILBĪS, town, southwestern ash-Sharqīyah *muhāfazah* (governorate) in the eastern Nile River delta, Lower Egypt. Bilbays lies northeast of Cairo, on the main road from Ismailia and Port Said and on the al-Ismlā'īyah Canal. Its name is an Arabic corruption of the Coptic Pheebes. Situated on a caravan and natural invasion route from the east, Bilbays was conquered in AD 640 by the Arabs, who in 727 resettled some of the Qays tribe there and later built a chain of fortresses to protect Cairo. In 1163 the Frankish crusaders under Amalric I occupied the town, which had often served as a camping place for Arab armies moving east. The modern town has textile manufacturing and is served by a railway station at Mīt Ḥamal, just northwest. Bilbays military base with an airfield is 3 miles (5 km) southeast. Pop. (1996) 113,608.

bilberry, also called WHORTLEBERRY (*Vaccinium myrtillus*), low-growing deciduous shrub belonging to the family Ericaceae. It is found in woods and on heaths, chiefly in hilly districts of Great Britain, northern Europe, and Asia. The stiff stems, from 15 to 60 cm (6 to 24 inches) high, bear small egg-shaped leaves with serrated margins and small, globose, rosy flowers tinged with green. The dark blue berries have a waxy bloom and are about 1 cm in diameter. They are a principal food of the grouse and are used for tarts and preserves. The berries are borne singly, in contrast to those of the much more productive, cultivated blueberries of the United States (*V. australe*), which are borne in racemes (long clusters). *V. myrtillus* is partly self-sterile, but has been hybridized with the foxberry, *V. vitis-idaeus*.

Bilbo, Theodore G., in full THEODORE GILMORE BILBO (b. Oct. 13, 1877, near Poplarville, Miss., U.S.—d. Aug. 21, 1947, New Orleans, La.), American politician and Democratic senator from Mississippi (1935–47), best known for his racist and demagogic rhetoric.

Bilbo managed despite poverty to attend Peabody College and the University of Nashville (Tennessee) for a time and later studied law at Vanderbilt University in Nashville. In 1907 he won a seat in the Mississippi state senate, running as an antirailroad populist and supporter of white supremacy. In 1911 he was elected lieutenant governor and then became governor in 1916, but was defeated when he ran in 1924.

Leaning heavily on racist invective, Bilbo regained the governorship in 1928. He fired many faculty members of Mississippi's colleges and universities and brought the state almost to bankruptcy. In 1934, after a campaign in which he made more than a thousand speeches—characterized by biblical phraseology and highly imaginative language—Bilbo won a seat in the U.S. Senate. There he remained for almost the rest of his life, blocking any attempt at ameliorating racial injustice and advocating the deportation of blacks to Africa in order to preserve "racial purity."

After evidence of influence peddling was uncovered and during further investigation of his unethical practices, several senators recommended that Bilbo be barred from the Senate chambers, a suggestion that met with firm opposition from Bilbo's Southern supporters in the Senate. Before the issue was resolved, Bilbo, who was ill, left Washington, D.C., for medical treatment and never recovered.

Bildad, also spelled BALDAD, in the Old Testament, one of the three principal comforters

of Job. Bildad is introduced (Job 2:11) as a Shuhite, probably a member of a nomadic tribe dwelling in southeastern Palestine.

Bildad's arguments with Job reveal him to be a sage who looks to the authority of tradition. His wounded orthodoxy provokes the lack of courtesy in his initial reply. In his first speech (chapter 8), he begins abruptly by asking Job how long he will make speeches full of wind. He then implies that Job's children died deservedly because of transgressions. He states that the wisdom of the patriarchs teaches that wicked men will perish as surely as reeds without water, but that it is not too late for Job to repent and be returned to God's favour.

In his second speech, Bildad, rankled by Job's denunciation of the three comforters as being more stupid than beasts, compares Job to a beast in his angry tearing of himself. He then describes the terrifying fate of the wicked man, who, although he may enjoy what appear to be happiness and prosperity for a time, must in the end face "the king of terrors." His memory will vanish from the earth and he will have neither "offspring or descendant."

In his third speech, which some scholars believe to be an edited fragment of the original one (possibly parts of the original were given to Job to soften the force of his heresies), Bildad does not answer Job directly but instead praises the transcendence of God, before whom man is infinitely imperfect, "a maggot, and the son of man, who is a worm."

In Job 42:7 God reprimands Bildad and the two other comforters for not having spoken rightly of him and requires them to make a sacrifice to appease his anger.

Bilderdijk, Willem (b. Sept. 7, 1756, Amsterdam, Neth.—d. Dec. 18, 1831, Haarlem), Dutch poet who had considerable influence not only on the poetry but also on the intellectual and social life of the Netherlands.

Born of a strongly Calvinist and monarchist family, Bilderdijk spent a precocious childhood among books. After studying law at Leiden, he practiced as an advocate at The Hague until 1795, when, as an Orangist, he was forced into exile for his refusal to take the oath of allegiance to the republic established by the French. He went to Germany and then to London, where he met Katherina Schweickhardt, also a poet, whom he married in 1802 after divorcing his first wife. In 1806 he returned to the Netherlands. After the restoration he hoped in vain for a professorship at Amsterdam.

Although much of his prolific output was in the dry, rhetorical style of previous generations, he occasionally produced a poetic diction and ideas on poetry that were totally

Bilderdijk, detail of an oil painting by C.H. Hodges; in the Rijksmuseum, Amsterdam
By courtesy of the Rijksmuseum, Amsterdam

new to the Netherlands. With his passionate Gothic-style verse rendering (1803) of the 18th-century ballads of Ossian, *Bilderdijk* set the scene in the Netherlands for early-19th-century Romantic nostalgia. In his poem *De kunst der poëzij* (1809; "The Art of Poetry") he maintained the importance of feeling in the writing of poetry, a principle that he introduced to the Netherlands but rarely lived up to himself. *Bilderdijk's* profusely religious poems, the most sensitive of which is *Gebed* (1796; "Prayer"), inspired theologian poets throughout the 19th century. The work for which he is best remembered is the unfinished epic poem *De ondergang der eerste wereld* (1810; "The Destruction of the First World"), which dramatically portrays the primordial struggle between Cain's son and the progeny of his daughters.

Bildungsroman (German: "novel of formative education"), class of novel in German literature that deals with the formative years of an individual.

The folklore tale of the dunce who goes out into the world seeking adventure and learns wisdom the hard way was raised to literary heights in Wolfram von Eschenbach's medieval epic *Parzival* and in Hans Grimelshausen's picaresque tale *Simplicissimus* (1669). The first novelistic development of this theme was J.W. von Goethe's *Wilhelm Meisters Lehrjahre* (1795–96; *Wilhelm Meister's Apprenticeship*), and it remains the classic example of the type. Other examples are Adalbert Stifter's *Nachsommer* (1857; "Indian Summer") and Gottfried Keller's *Grüne Heinrich* (1854–55; *Green Henry*). The Bildungsroman ends on a positive note, though it may be tempered by resignation and nostalgia. If the grandiose dreams of the hero's youth are over, so are many foolish mistakes and painful disappointments, and a life of usefulness lies ahead.

A common variation of the Bildungsroman is the *Künstlerroman* (q.v.), a novel that deals with the formative years of an artist. Other variations are the *Erziehungsroman* ("novel of upbringing") and the *Entwicklungsroman* ("novel of character development"), although the differences between these terms and the Bildungsroman are so slight that they are sometimes used interchangeably.

bile, also called **GALL**, greenish yellow secretion that is produced in the liver and passed to the gallbladder for concentration, storage, or transport into the first region of the small intestine, the duodenum. Its function is to aid in the digestion of fats in the duodenum. Bile is composed of bile acids and salts, cholesterol, pigments, water, and electrolyte chemicals that keep the total solution slightly acidic (with a pH of about 5 to 6). Bile is continually secreted from the cells of the liver into the common bile duct and gallbladder; once in the gallbladder it is usually concentrated to about 5 times—and sometimes as high as 18 times—the strength of the original secretion. The amount of bile secreted into the duodenum is controlled by the hormones secretin, gastrin, and cholecystokinin and also by the vagus nerve. About 250 to 1,000 millilitres of bile (before concentration) are produced daily by the liver.

Bile salts are composed of the salts of four different kinds of free bile acids (cholic, deoxycholic, chenodeoxycholic, and lithocholic acids); each of these acids may in turn combine (conjugate) with glycine or taurine to form more complex acids and salts. Bile salts and acids can be synthesized from cholesterol or extracted from the bloodstream by the liver. They pass from the liver into the intestine, where they act as detergents to emulsify fat and reduce the surface tension on fat droplets
